Wheel, Carriage.....	C. C. Ayer.....	70, 681
Wheel, Carriage.....	W. H. Marshall.....	71, 193
Wheel, Carriage.....	J. Raddin.....	72, 538
Wheel, carriage, Metallic.....	A. W. Ware.....	61, 962
Wheel, Emery.....	C. G. Marshall.....	65, 924
Wheel, Emery, for grinding and polishing saws.....	G. L. Benton.....	70, 393
Wheel, Fly or balance.....	R. Rice.....	68, 530
Wheel for chain horse power.....	S. Perry.....	69, 243
Wheel for vehicles.....	G. F. Elliott.....	62, 402
Wheel for vehicles.....	E. Hoxie.....	65, 385
Wheel for vehicles.....	W. T. Sawyer.....	70, 027
Wheel for vessels, Floating.....	J. Spilman.....	66, 532
Wheel for wagons and carriages.....	F. G. Simmons.....	72, 233
Wheel, Friction.....	T. Hotchkiss.....	63, 520
Wheel, Friction, brake and crank.....	R. M. Van Sickler.....	69, 727
Wheel, Gear cutting.....	T. B. Russell.....	67, 219
Wheel gearing, Differential.....	C. F. Cooke and J. Standfield.....	70, 416
Wheel hub box.....	E. G. Woodside.....	70, 670
Wheel or pulley, Grooved.....	J. H. Barnes.....	60, 668
Wheel, Paddle.....	E. Banks.....	60, 988

Alphabetical list of inventions—Continued.

Invention or Discovery.	Name of Patentee.	No.
Wheel, Paddle	N. T. Edison	64, 295
Wheel, Paddle	E. Spencer	65, 023
Wheel, Paddle	A. McKenzie	65, 252
Wheel, Paddle	E. Matteson	65, 495
Wheel, Paddle	W. Goodwin	70, 083
Wheel, Paddle	W. Goodwin	70, 084
Wheel, Paddle	E. C. Smith	70, 637
Wheel, Paddle	W. Hunter	70, 851
Wheel, Paddle	E. T. Bostrom	70, 947
Wheel, Plow	G. Dodge	67, 513
Wheel, Plow	L. E. Palmer	69, 834
Wheel, Plow	J. B. Webster and R. Baxter	71, 827
Wheels, car, Casting	S. H. Whitaker	70, 486
Wheels, carriage, Compressing	H. Killam	69, 818
Wheels, carriage, Washing	W. T. Sweet	63, 960
Wheels, cog, Mechanical movement or substitute for	G. H. Knight	68, 754
Wheels, Locomotive and other	G. Tefft	64, 595
Wheels, locomotive driving, Turning crank pin on	C. J. Clifford	68, 415
Wheels, Lubricating	J. C. Fish	64, 961
Wheels of vehicles on their axles, Securing	C. Oyster	67, 794
Wheels on shafts, Tightening and loosening	L. H. Olmsted	65, 420
Wheels, paddle, Feathering	G. A. Keene	67, 437
Wheel, Spinning	J. H. Rowe	70, 622
Wheel, Spinning	H. Miller	71, 897
Wheel spoke machine	A. Humphries and J. Keethler	67, 306
Wheels, teeth of, Cutting	J. Underwood	70, 293
Wheels, tires, &c., by casting, Forming	W. Butcher, jr., and T. Shaw	65, 642
Wheels to axles, Securing	J. Miller, jr.	70, 594
Wheels to vehicles, Attaching	L. Crouch	70, 352
Wheels, turbine, Molding	J. Cairnes	60, 686
Wheels, wagon, Driving spokes in	G. W. Miles	68, 773
Wheels, water, Curb for	J. H. Hartsuff	70, 561
Wheels, water, Curb for	A. Winton	71, 936
Wheels, water, Guide for	N. F. Burnham	72, 450
Wheel toys	J. Syrcer	60, 961
Wheel, Turbine	B. Holly	64, 977
Wheel, Vehicle	H. A. Potter	68, 002
Wheel, Wagon	S. B. Welton	68, 017
Wheel, Wagon	F. J. Weber	69, 286
Wheel, Wagon	A. Beswick, P. Richardson, and J. W. Brown.	69, 307
Wheel, Wagon	J. Maris	71, 774
Wheel, Water	G. W. McCann	60, 766
Wheel, Water	H. P. Bradbury	60, 854
Wheel, Water	A. Wrealsh and W. Burns	60, 983
Wheel, Water	W. H. Elmer	61, 059
Wheel, Water	J. Hemenway	61, 066
Wheel, Water	A. A. Wood	61, 299
Wheel, Water	A. P. Johnson	61, 667
Wheel, Water	G. Arrison	61, 792
Wheel, Water	R. Chapman	62, 473
Wheel, Water	M. Carpenter	62, 605
Wheel, Water	S. J. Bridge and A. M. Craig	62, 929
Wheel, Water	T. J. Kindleberger	63, 058
Wheel, Water	T. G. Hall	64, 395
Wheel, Water	E. G. Budd	65, 539
Wheel, Water	G. W. Holden	65, 572
Wheel, Water	E. Tuttle	66, 189
Wheel, Water	T. Pattison	66, 382
Wheel, Water	E. Briggs, sr.	66, 456
Wheel, Water	J. Todd	66, 651
Wheel, Water	F. Post	66, 735
Wheel, Water	S. Fletcher	66, 821
Wheel, Water	R. Dunbar	67, 174
Wheel, Water	R. Dunbar	67, 175
Wheel, Water	W. G. McGargy	67, 203
Wheel, Water	O. W. Ludlow	67, 994
Wheel, Water	W. F. Browne and A. J. Hoyt	68, 039
Wheel, Water	T. Welham	68, 325
Wheel, Water	J. D. Bryson	68, 945
Wheel, Water	L. W. and R. A. Blood	69, 163
Wheel, Water	L. Wynkoop	69, 204
Wheel, Water	J. Mumma	69, 360
Wheel, Water	W. Cooper	69, 410
Wheel, Water	S. Shive	69, 495
Wheel, Water	P. D. Pike	69, 932
Wheel, Water	G. W. Herring	70, 211
Wheel, Water	S. Webb	70, 301
Wheel, Water	H. W. Shipley	71, 335
Wheel, Water	A. H. Crozier	71, 461
Wheel, Water	H. W. Shipley	72, 331

Alphabetical list of inventions—Continued.

Invention or Discovery.	Name of Patentee.	No.
Wheel, Water.....	R. Chapman.....	72, 454
Wheel, Water.....	G. M. Conner.....	72, 159
Wheel, Water.....	J. Raney.....	72, 680
Wheel, Wind.....	M. W. Woodruff.....	68, 404
Wheel, Wind.....	L. H. Wheeler.....	68, 674
Wheel, Wind.....	E. W. Mills.....	69, 828
Wheel, wind, Toy.....	M. Miller.....	60, 772
Wheelwright's machine.....	O. O. Chapman.....	62, 182
Wheelwright's machine.....	C. W. Corr.....	64, 201
Wheelwright's machine.....	S. Mills and J. R. McIrvin.....	66, 163
Wheelwright's spoke-driving bench.....	F. M. Lemmon.....	60, 752
Whiffletree.....	O. N. Weaver.....	61, 781
Whiffletree.....	M. C. Chamberlin.....	62, 814
Whiffletree.....	E. N. Dodge.....	64, 290
Whiffletree.....	J. W. Larmore.....	69, 105
Whiffletree.....	G. Watt.....	72, 248
Whiffletree coupler.....	F. B. Morse.....	67, 208
Whiffletree, Detachable.....	J. W. Melcher.....	70, 348
Whiffletree iron.....	F. B. Morse.....	68, 570
Whiffletrees, Evener for.....	M. Gally.....	63, 238
Whiffletrees, Evener for.....	M. Gally.....	68, 729
Whiffletrees, Hitching device for.....	H. and J. M. Saunders.....	69, 369
Whiffletree, trace clutch, or cock-eye.....	W. W. Gordon.....	70, 197
Whip hanger.....	S. S. Merriam.....	72, 748
Whip holder, Self-adjusting.....	H. M. Curtis and A. Worden.....	70, 075
Whip-rolling machine.....	H. Axtell.....	70, 501
Whips, Coating and water-proofing.....	M. Anton.....	68, 590
Whips, Covering.....	G. King.....	65, 917
Whips, Holding.....	J. Gibson, jr.....	68, 360
Whip socket.....	J. Steger.....	62, 506
Whip socket.....	T. Weaver.....	67, 237
Whip socket.....	E. W. Scott.....	70, 627
Whip socket, India-rubber.....	L. Elliott, jr.....	62, 261
Whip socket to carriages, Securing.....	F. Wood.....	69, 291
Whips, Rolling.....	J. P. Luther.....	68, 762
Whip stock.....	L. Hull.....	61, 070
Whistle, Alarm.....	W. J. McLea.....	67, 329
Whistle, alarm, Atmospheric.....	S. G. Cabell.....	66, 459
Whistle or bird-call.....	S. McClain.....	61, 846
Whistle, Signal.....	P. S. Burditt and O. Preston.....	64, 483
Whistle, Steam.....	T. Shaw.....	64, 716
Wick, Lamp.....	C. F. Martine.....	62, 657
Willow, Peeling.....	G. Healy.....	62, 629
Willow, Stripping.....	J. Swan.....	70, 288
Winch.....	R. D. Rogers.....	68, 792
Winch or capstan.....	J. L. Heald.....	65, 486
Winch for center-boards.....	H. V. Corbett.....	71, 283
Windlass.....	R. H. Emerson.....	64, 005
Windlass.....	N. Robbins, jr.....	66, 634
Windlass.....	D. P. Nickerson.....	67, 569
Windlass and chain stopper.....	W. D. Baker.....	66, 282
Windlass, Boat.....	E. Huson.....	71, 762
Windlass crank power.....	J. H. Fleming.....	71, 292
Windlasses, Lever for.....	F. A. Jameson and C. W. Ripley.....	68, 083
Windlass for vessels.....	H. Thompson.....	65, 450
Windlass, Well.....	F. H. Jones.....	63, 800
Window.....	J. B. Mulvey.....	64, 441
Window and door fastener.....	W. I. Corthell and P. Richards.....	70, 699
Window and door frame.....	W. W. Maughlin.....	64, 779
Window blinds and curtains, Raising and lowering.....	G. Allix.....	71, 114
Window blind fastener.....	C. B. Francis.....	60, 872
Window blind fastener.....	E. A. Holbrook, J. E. Dodge, and G. H. Marshall.....	71, 009
Window cornice.....	A. J. Holmes.....	63, 893
Window fastener.....	L. C. Wing and A. R. Bradeen.....	61, 497
Window fastener.....	J. D. Simmons.....	62, 078
Window fastener.....	C. H. Sawin and J. A. Titus.....	66, 400
Window fastening.....	J. D. Smith.....	63, 113
Window fastening.....	P. Verbeck.....	64, 601
Window fastening.....	B. F. Carleton.....	67, 633
Window fastening.....	J. Luther and A. Marsh.....	67, 891
Window fastening.....	G. B. Kirkham.....	70, 444
Windows, Fly and mosquito bar for.....	F. D. Wright.....	66, 272
Window frame.....	G. K. Dearborn.....	61, 611
Window frame.....	C. Croley.....	63, 616
Window frame.....	J. H. Thomas.....	64, 597
Window jack, Painter's.....	S. P. Loomis.....	71, 027
Window, Railway carriage.....	E. T. Colburn.....	60, 694
Windows and doors, Locking.....	A. H. Boyd.....	69, 753
Window sash.....	G. Dewey.....	64, 288
Window sash elevator.....	J. Le Ferre.....	64, 985

Alphabetical list of inventions—Continued.

Invention or Discovery.	Name of Patentee.	No.
Window sash elevator.....	J. Le Ferre.....	69, 952
Window sashes, Attaching ends to.....	C. Swift.....	62, 701
Window sash fastener.....	H. G. Arnold.....	69, 746
Window sash fastening.....	R. Hutton.....	60, 735
Window sash frame.....	E. Clark.....	64, 074
Window sash material.....	G. L. Kely.....	70, 236
Window sash stop.....	J. K. Andrews.....	68, 933
Window sash stop.....	J. G. Jewell.....	70, 222
Window shade.....	M. Vetter.....	66, 915
Window shade.....	P. and L. Lindemeyer.....	71, 187
Window shade fixture.....	L. A. Tripp.....	67, 465
Window shades to windows, Applying.....	H. J. Cox and W. Hill.....	67, 272
Window shutter fastening.....	C. Leonard.....	62, 493
Window shutter fastening.....	R. Reed.....	68, 387
Window shutter holder.....	W. F. Hofman.....	66, 710
Windows, Mosquito frame for.....	A. E. Horton.....	69, 343
Window washer.....	N. Palmer.....	66, 249
Wines and liquors, Ageing and refining.....	R. D. Turner.....	69, 275
Wines, high and low, Separating.....	E. B. McDowell and T. W. Wilson.....	63, 409
Wire, Annealing.....	H. C. Gee.....	65, 481
Wire, Coiling.....	W. Weaver.....	63, 445
Wire, Covering, with fine wire.....	W. H. Rodgers.....	61, 261
Wire, Cutting and forming.....	J. Wasson.....	71, 091
Wire dish stand.....	E. P. Woods and D. Sherwood.....	72, 770
Wire dish stands, Making.....	E. P. Woods and D. Sherwood.....	70, 770
Wire figure.....	W. R. Boerner.....	71, 573
Wire for needle blanks, Reducing.....	T. Fowler.....	68, 430
Wire, Hardening and tempering.....	J. C. Walter.....	65, 780
Wire or wire rope together, Fastening.....	M. F. Maury.....	64, 018
Wire, Pointing and reducing.....	O. L. Hopsom and H. P. Brooks.....	62, 336
Wire-pointing machine.....	J. Lockwood.....	63, 270
Wire rein snap.....	W. B. Hayden.....	62, 194
Wire rope bands, Preventing the untwisting of the ends of.....	A. Barbarin.....	71, 839
Wire, Skirt.....	G. W. Hubbell.....	63, 253
Wire, Skirt.....	G. W. Reynolds.....	70, 018
Wire, skirt, Making in lengths for hoops.....	J. Fraser.....	61, 660
Wire, skirt, Tempering.....	J. H. Monk.....	70, 881
Wire, steel, Tempering.....	J. Hallas.....	65, 215
Wires, telegraph and circuit, Insulating covering for.....	S. C. Bishop.....	71, 658
Wires, telegraphic, Compound for coating and insulating.....	R. S. Tucker.....	62, 236
Wires, Tool for cutting.....	W. H. Flinn.....	65, 557
Wire, Twisting.....	P. L. Slayton.....	65, 699
Wire-twisting machine.....	T. B. Smith.....	63, 570
Wire work.....	C. Shortan.....	66, 896
Wood and metals, Painting and varnishing.....	W. R. Boerner.....	70, 946
Wood and other materials, Composition for coating.....	W. Piotrowski.....	62, 222
Wood and other materials to form paper pulp, Disintegrating and bleaching.....	C. L. Robertson.....	63, 428
Wood and timber, Preserving.....	J. B. Biron.....	67, 941
Wood, Bending.....	D. R. Prindle.....	63, 306
Wood, Bending.....	J. Klahr.....	71, 886
Wood, Bending.....	L. Heywood.....	72, 292
Wood, Bending.....	L. Heywood.....	72, 293
Wood bending machine.....	J. A. Dann.....	63, 997
Wood bending machine.....	O. W. Stearns.....	66, 409
Wood bending machine.....	S. C. and E. O. Frink.....	68, 621
Wood bending machine.....	D. Catchpole and J. Havens.....	69, 313
Wood, Bundling.....	D. D. Sherwood.....	71, 798
Wood, Carving.....	A. Basse.....	71, 568
Wood, cloth, metal, and for forming various articles, Composition for coating.....	A. Pelletier.....	63, 087
Wood, Coating.....	P. S. Devlan.....	63, 618
Wood, Coating, with rubber and gutta-percha.....	K. W. Hoimes and A. Albright.....	64, 419
Wood, Composition for filling the pores of.....	J. F. Bernard.....	69, 165
Wood, Composition for hardening and preserving.....	H. L. Houghton.....	65, 674
Wood, Composition for imitating.....	H. Carter.....	68, 952
Wood, Composition for stuffing.....	H. Smith.....	70, 277
Wood, Enameled.....	C. L. Robertson.....	67, 679
Wooden structures, Composition for coating.....	J. Heckel.....	71, 752
Woodenware.....	A. R. Reese.....	70, 263
Wood, Finishing.....	G. Chambers.....	72, 366
Wood for musical instruments, Preparing.....	W. H. May.....	72, 877
Wood for the manufacture of labels, tags, &c., Preparing.....	J. Melling.....	66, 512
Wood from decay, Preserving.....	A. Holmes.....	62, 334
Wood gear, Cutting.....	T. F. Freeman.....	70, 192
Wood, Imitation of open carving in.....	W. H. May.....	61, 549
Wood, Impregnating, with oleaginous and saline matters.....	C. A. Seely.....	69, 260
Wood, Impregnating, with tar and other materials.....	G. Pustkuchen.....	64, 703
Wood, iron, and paper, Composition for coating.....	A. Pelletier.....	71, 210
Wood, kindling, Bundling.....	J. Richardson and F. H. Stevens.....	66, 254
Wood, metals, or other articles, Cleaning.....	C. S. Toms.....	65, 139

Alphabetical list of inventions—Continued.

Invention or Discovery.	Name of Patentee.	No.
Wood-mitering machine	R. E. Tomkins	69, 510
Wood-planing machine	G. H. Ober	66, 988
Wood, Polishing	E. Weissenborn	67, 240
Wood, Preparing and preserving	T. Hanvey	62, 956
Wood, preparing and hardening, and preserving the same, Com- position for	J. L. Samuels	60, 794
Wood, Preserving	C. E. Clarke, G. Hadley, and J. C. Clifford	67, 104
Wood, preserving, Compound for	S. T. Harding	68, 069
Wood, Preventing decay in	J. H. Taylor	70, 761
Wood, Seasoning and preserving	S. Constant and J. Smith	65, 545
Wood-splitting machine	J. Davock	60, 702
Wood-splitting machine	L. Tilton	65, 303
Wood to be used in the manufacture of paper and for other purposes, Preparing	C. K. Marshall	70, 872
Wood to metal, Securing	R. Howdon	64, 767
Wood, toy pails from, Cutting	H. Mellish	63, 415
Wool and palm-leaf warp for weaving, Preparation of	F. Perrin	65, 266
Wool and woolen fabrics, Scouring and cleaning	O. Macdoniel	71, 191
Wool, burring, ginning cotton, &c., Machine for	R. J. Clay	63, 471
Wool, burrs from, Removing	Z. Parkhurst	62, 877
Wool-carding machine	S. C. Plilbrick	71, 784
Wool, Cleaning	S. R. Parkhurst	67, 901
Wool, Cleaning	H. Hayward and J. S. Pendleton	71, 170
Wool dryer	C. Beu	61, 145
Wool, Drying	L. W. Boynton	62, 468
Wool from mixed articles and fabrics, Extracting	A. & J. Knowles and J. Barraclough	62, 139
Wool, oiling, Composition for	J. Gomershall	61, 532
Wool, oiling, Composition for	J. McCabe	72, 658
Wool packer	A. Saeger	68, 240
Wool presser	G. M. Briggs	62, 930
Wool, Removing burrs and other substances from	W. A. Govern	70, 065
Wool, Removing burrs from	W. Sykes	72, 563
Wool, Shearing and clipping	R. T. Smith and J. K. Priest	72, 103
Wool tier and sheep holder, Combined	A. M. Culver	63, 222
Wool, &c., Burring	R. J. Clay	67, 394
Wool, &c., Drier for	L. W. Boynton	63, 462
Work bench, Carpenters'	J. Bragdon	71, 126
Wrench	R. S. Stenton	60, 801
Wrench	T. Pratt	61, 097
Wrench	J. C. Jackson	61, 340
Wrench	J. L. Peake	61, 355
Wrench	P. Sommer	61, 575
Wrench	T. Earle	61, 929
Wrench	J. B. Savage	62, 291
Wrench	S. B. Hill	62, 630
Wrench	S. S. Barnaby	63, 459
Wrench	J. E. Crouk	63, 481
Wrench	J. A. Partridge	63, 935
Wrench	W. H. Landbeck	64, 676
Wrench	L. Jordan	65, 489
Wrench	W. P. Dunlap	65, 550
Wrench	G. B. Keeler	65, 678
Wrench	D. A. Kellogg	65, 679
Wrench	I. H. Smith	66, 051
Wrench	J. V. H. Secor	66, 177
Wrench	G. C. Taft	67, 818
Wrench	J. A. Talpey	68, 128
Wrench	T. D. Christopher	68, 168
Wrench	J. N. Freestone	68, 431
Wrench	C. T. Poulton	68, 787
Wrench	J. Mott	69, 575
Wrench	D. Harrigan	69, 911
Wrench	B. S. Lawson	70, 005
Wrench	E. Perry	70, 605
Wrench and pruning shears, Combined	J. S. Kalb	67, 987
Wrench and tongs	J. N. Arvin	63, 356
Wrench bars, Heating	T. C. Rice	64, 364
Wrench bars, Rolling	T. C. Rice	64, 447
Wrench, boot-jack, and nail-pull	O. Shepard	66, 643
Wrench, Pipe	J. W. Close	61, 715
Wrench, Pipe	R. Bain	63, 689
Wrench, Pipe	M. H. Freeman	64, 656
Wrench, Pipe	J. L. Ordner	65, 111
Wrench, Pipe	J. R. Brown	65, 162
Wrench, Pipe	W. C. Abbe	67, 937
Wrench Pipe and stud	J. B. Barnes	65, 465
Wrench, Self-adjusting	A. M. Olds	63, 588
Wringer and mop-pail	E. H. Lord and E. Hinman	68, 447
Wringer, Clothes	G. Palmer	61, 353
Wringer, Clothes	A. H. Page	61, 680

Alphabetical list of inventions—Continued.

Invention or Discovery.	Name of Patentee.	No.
Wringer, Clothes	J. Young	64, 180
Wringer, Clothes	C. H. Amidon	64, 932

Wheel, Pending	J. Kirchof	2,665
Window fastener	G. B. Kirkham	2,848
Wrench, tack-drawer, and hammer, combined	A. Iske	2,676

REISSUES.

Invention or Discovery.	Name of Patentee.	No.
A.		
Acid, Phosphoric, and phosphates for use in preparation of food and for other purposes.	The Rumford Chemical Works	2,597
Album, Photographic	W. W. Harding	2,617
Animal matters for use as a fertilizer, Preparing	A. Smith	2,507
Auger	R. Cook	2,513
Auger	A. C. Kasson and N. C. Gridley	2,551
Auger	W. W. Grier and R. H. Boyd	2,712
B.		
Bark, tan, and other materials, Obtaining the extractive matter of, by displacement.	W. H. Burrigge and J. Brainerd	2,523
Battery, Galvanic	E. A. Hill	2,502
Beam, Sheet metal	R. Montgomery	2,668
Bed bottom	G. L. Gerard	2,677
Bed bottom	L. S. Babbitt	2,736
Bedstead, Sofa	C. F. Martine	2,757
Beehive	A. T. Wright	2,540
Bell	A. Patterson	2,793
Boiler, Wash	M. W. Staples	2,816
Boiler, Water	C. A. Harper	2,806
Bolt-tapping and drilling machine	C. W. Coe	2,487
Bone black, Cleaning and purifying	C. N. Brock	2,679
Bones, fish, and other substances, Steam digester for treating	W. Perry	2,663
Bonnets, hats, &c., Fabric for	Modena Hat Company	2,587
Boot crimper	De Witt C. Mowrey	2,826
Boot detaching tackle	T. Huntington	2,478
Boot heels. Attaching and finishing	The McKay Heeling Machine Co	2,527
Boot and shoe	G. Hawkes	2,867
Boots and shoes, sole of, Finishing	J. Purinton, jr	2,556
Boot tree	C. T. Eames	2,466
Bottle for druggists and chemists	W. N. Walton	2,631
Box, Fruit	N. Hallock	2,441
Brace for bits	N. Spofford	2,576
Brake, Car	J. A. Goeway, E. S. Wood, and J. Jones	2,696
Brake, car, Railroad	J. W. Latcher and W. J. Powell	2,747
Brick machine	E. J. Bradford, J. H. Renick, and O. A. Clough	2,553
Brick machine	P. H. Kells	2,810
Brick machine	P. L. Sword	2,532
Brick machine	J. Watson	2,533
Brick and tile for roofing	R. O. Lowrey	2,591
Bridge	D. Hammond	2,586
Bridge	D. Hammond and W. R. Reeves	2,701
Bridge	P. M. Frees and Z. King	2,707
Broom	W. H. Cooy	2,598
Brooms, Clamp for making	J. Day	2,495
Brush holder	B. Morahan	2,750
Buckle	E. Cole	2,823
Burner, Gas	E. P. Gleason	2,605
Burner, Lamp	A. J. Walker	2,492
Butter worker	J. P. Corbin	2,776
C.		
Cake baker and egg pan	The Russell and Erwin Manufacturing Company	2,450
Can, Paint	H. Miller	2,592
Cans, Sealing preserve	H. S. Fisher	2,801
Capstan, Power	D. N. B. Coffin, jr., and I. D. Spaulding	2,558
Capstan, Power	D. N. B. Coffin, jr., and I. D. Spaulding	2,559
Capstan for steamboats	J. Schaffer	2,437
Carding machines, Stripping top flats for	W. B. Bates	2,705
Carding machines, Stripping top flats in	W. B. Bates	2,706
Car's, railway, street, Braking and starting	A. Higley	2,460
Cartridge, Metallic	I. M. Milbank	2,716
Cartridges, metallic, Priming	H. Smith and D. B. Wesson	2,636
Caster	J. T. Barnes	2,644
Caustic alkali, Manufacture of	G. Thompson	2,569
Caustic alkali, Manufacture of	G. Thompson	2,571
Caustic alkali, Putting up	G. Thompson	2,570
Ceiling and roof, Fire-proof	J. Gilbert	2,794
Chair, Railroad	J. McMurtry	2,767
Charcoal, animal, Cleaning	The Union Sugar Refinery	2,778
Chimney holder for gas burners	E. P. Gleason	2,813
Clasp for metallic hoops	J. R. Speer	2,491
Coal and ores, Desulphurizing	J. J. Storer	2,629

Alphabetical list of reissues—Continued.

DESCRIPTIONS.

28 C P

THE NATIONAL BUREAU OF INVESTIGATION

WASHINGTON, D. C. 20535

REPORT OF THE DIRECTOR

TO THE ATTORNEY GENERAL

DATE: [Illegible]

RE: [Illegible]

[The remainder of the page contains extremely faint and illegible text, likely a detailed report or memorandum.]

DESCRIPTIONS AND CLAIMS OF PATENTS

ISSUED IN THE YEAR 1867.

ILLUSTRATED WITH ENGRAVINGS.

60,658.—I. H. ABELL, East Hampton, Conn.—*Fastening Sleigh Bells.*—January 1, 1867.—The inverted ends of the hooks are rebent so as to form catches, which spring out and retain the sleigh bell in position.

Claim.—The spring hooks *b* of the catch *B*, adapted to enter the slot *a* of the bell, and hold the bell by the expansion of the shanks of the hooks, in the manner and for the purpose specified.

60,659.—D. D. ADAMS, Brookline, Mass.—*Scaffold.*—January 1, 1867.—The frames which support the floor have adjustable connecting rods and pawl and brace arms, by which they are attached to the corner blocks and brick work.

Claim.—First, an improved scaffold, formed by combining the front rails *C*, the central rails *A*, the back rails *D*, the side bars *B*, the pawls *H*, the corner blocks *E*, and connecting rods *I* with each other, the various parts being constructed and arranged substantially as herein described and for the purpose set forth.

Second, the combination of the braces *K* and brace hangers *L*, constructed as described with each other and with the side bars *B* and front rails *C*, substantially as described and for the purpose set forth.

60,660.—GEORGE ADAMSON, Philadelphia, Pa.—*Apparatus for Coating Fabrics with Fluid or Semi-fluid Substances.*—January 1, 1867.—The lower roller is covered with rubber, and its lower surface is submerged in the adhesive solution in the trough. The paper or other fabric is passed between the two rollers and its lower surface coated with the solution.

Claim.—The employment, substantially in the manner described, of the gum-elastic roller *D* and the rigid roller *E* for transferring fluid or semi-fluid substances to fabrics in the manner described.

60,661.—N. B. ALLEN, Newport, R. I.—*Boat Detaching Apparatus.*—January 1, 1867.—The boat is sustained by the down-curved ends of the longitudinal rods, and freed by their inversion, which may be accomplished by a universal joint at their connection, or by gearing to another bar.

Claim.—The hooks *C* which are secured to the bars *A*, or their equivalents *D E*, and which are operated by the lever *B*, substantially as and for the purpose herein shown and described.

60,662.—W. D. ANDREWS, New York, N. Y.—*Steam Generator.*—January 1, 1867.—The fire box extends the whole length of the boiler, and in a combustion chamber beyond are apertures for the introduction of air. The caloric current is returned through tubes in the water space to the ascending flue or chimney.

Claim.—A boiler having a fireplace extending over its entire horizontal area, with the exception of a narrow water-space surrounding it and a series of tubes, whether one or more, passing horizontally through the water-space above the fireplace, when the said fire-space and the said tube or tubes are connected by and communicate through a combustion chamber formed outside the boiler, having openings, adjustable or otherwise, for the admission of atmospheric air thereto, and an opening or openings passing through

the water-space surrounding the fireplace and communicating with the latter, when the whole is constructed and arranged so as to operate substantially in the manner described and for the purpose specified.

60,663.—ELMCOIT D. AVERELL, New York, N. Y.—*Ruling Paper by Electro-Magnetism.*—January 1, 1867.—Improvement on his patent of June 12, 1866. The electro-magnet at one end of the pen board of the ruling machine is combined with an armature and break-circuit finger to raise and lower the gang of pens.

Claim.—The application of an electro-magnet for the purpose of ruling paper in combination with the circuit-breaker finger *F*, in the manner and substantially as described in the foregoing.

60,664.—ALBERT BALL, Windsor, Vt., assignor to himself and WINDSOR MANUFACTURING COMPANY, same place.—*Cartridge Retractor for Breech-loading Fire-arms.*—January 1, 1867.—The opening of the carrier block operates upon a notched plate pivoted on the same screw to withdraw the shell of the cartridge. A spring retains this plate in its open or closed position, and also withdraws the shell.

Claim.—First, the carrier block *B*, in combination with the shoulder *r* of the rotating ejector, or equivalents, for the purpose of creating the gradual movement of the cartridge shell when the carrier block is being swung open, as described.

Second, the operating spring *S*, in combination with the notch *n* and shoulder *v* of the rotating ejector, or equivalents, for the purpose of creating the jerk movement and restricting the same, as described.

Third, the combination of the spring and hinge and ejector, to hold the carrier block open or shut.

Fourth, the combination of the spring, and hinge, and ejector, and carrier block and ways, to cast the cartridge shell out when the ejector is operated by opening the carrier block, as and for the purposes substantially described.

60,665.—GEORGE A. BANTA, New York, N. Y.—*Refrigerator.*—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, an ice box for a refrigerator lined with slate, in combination with air passages surrounding said ice box, through which air circulates to and from the refrigerator and is cooled by contact with the exterior of such slate ice box, substantially as specified.

Second, in a refrigerator, the perforated trough *m*, receiving the water that comes from the ice box and delivering it through a series of small holes, so as to flow over the outside of a barrel or other vessel for cooling its liquid contents, as set forth.

Third, a receptacle for water in a refrigerator, formed of slates in the manner specified, so that the water shall be cooled by the air circulating in contact with its exterior surface, as set forth.

Fourth, the ascending air passage *7* and descending passage *8*, in combination with the ascending air passages *10* and descending passage *12*, whereby the air is caused to travel around the ice box in passing to and from the chamber of the refrigerator, as set forth.

Fifth, the valve *13*, in combination with the air passages *11* and *14*, whereby said valve can be employed

for closing the passage 11 for ventilating the refrigerator, or opening it for effecting a circulation of the air, as set forth.

60,666.—ARCHIBALD H. C. BARBER, Clinton, Ill.—*Grain Dryer*.—January 1, 1867.—Air is forced through the annular chambers of drums within a furnace, and then through a cylinder containing a rotary gauze screen, through which the grain passes.

Claim.—The hollow rings G and connecting pipes H, constructed as described, in combination with each other and with the furnace of a drying kiln, substantially as described and for the purpose set forth.

60,667.—N. H. BARBOUR, New York, N. Y.—*Peat Machine*.—January 1, 1867; antedated December 21, 1866.—The revolving cylinder is mounted on a hollow stationary shaft, and has a series of molds, which extend from the periphery to the hollow shaft. The peat passes through an opening in the shaft to the molds, which are fitted with plungers operated by cams. A segment retains the peat in the mold while it is being compressed, and after the mold has passed the segment the compressed block is discharged and falls on the chute, which conducts it out of the machine at the end of the hollow cylinder opposite that at which it was received.

Claim.—First, the revolving annular cylinder A, provided with a series of holes a and plungers B, which revolve with said cylinder in combination with the hollow shaft E, stamp seat G, and cams H J K, constructed and operating substantially as and for the purpose described.

Second, feeding the material to be compressed through one end of the hollow shaft and discharging it through the other, substantially as and for the purpose set forth.

Third, making the cam H adjustable, substantially as and for the purpose described.

60,668.—JOHN H. BARNES, Brooklyn, N. Y.—*Grooved Wheel or Pulley*.—January 1, 1867; antedated December 2, 1866.—Portions of the rims of the grooved pulley are cut away at intervals on alternate sides, for safety in carrying the rope and for economy in material.

Claim.—A grooved wheel or pulley having the opposite sides of the groove entirely cut away or removed, substantially as described, so as to permit the wheel or pulley to be cast or struck up, substantially as and for the purposes set forth.

60,669.—W. B. BARTRAM, Danbury, Conn.—*Sewing Machine*.—January 1, 1867.—The shaft by being turned backward reverses the feed, making no other change in the sewing. The tension device is a glass cylinder surrounding the spool, and capable of being turned on its axis to tighten the coil of thread about it. The loop plays in a path at right angles to the line of feed. The motion of the looping hook is at right angles to that of the feed, and may be actuated by a cam on the driving shaft or an obliquely slotted longitudinally reciprocating sleeve on the hook shaft. The upper frame is laterally adjustable on the stand to tighten the belt. The spool is placed in, and the thread issues from the side of a cylinder having rotary adjustment to regulate the tension by the length of thread coiled upon it. The needle arm is actuated by a pin projecting from a ring having play in an eccentric groove of the driving disk. A wrist pin plays in the spreading notch of a lever connected to the feed bar by a set screw, by which the rate of feed is regulated.

Claim.—First, the looping hook E, when arranged in a sewing machine having a reversible feed so as to move in a plane at right angles to the line of feed, and so timed to the movement of the needle that the two will operate in proper relation to each other without regard to the direction in which the feed is moving.

Second, the combination of the driving wheel D and pulley C of a sewing machine when they are arranged so that the distance between them may be varied by sliding the machine sideways upon its table and securing it by the devices shown.

Third, the adjustable tension cylinder O, constructed and operating substantially as set forth.

Fourth, the combination of the eccentric groove in the pulley L, the ring M, fitted loosely in the said

groove, and the pin N, through which the needle arm is actuated.

Fifth, in combination with a rectilinear feeding dog of a sewing machine, the tapering notched lever J, and eccentric pin I, substantially as and for the purpose set forth.

60,670.—JOHN A. BASSETT, Salem, Mass.—*Capillary Material for Filling Gas and Air Carburetors*.—January 1, 1867.—The material known commercially as "Excelsior," and consisting of wooden fiber torn into shreds, to form a stuffing for mattresses, &c., is used as a capillary material in the chambers where the air or gas is carburetted.

Claim.—An absorbent and capillary material for gas and air carburetors, composed of the substance described and prepared substantially in the manner set forth.

60,671.—ERNEST BAZIN, Paris, France.—*Recovering Sunken Ships*.—January 1, 1867.—A gigantic net is spread out upon the water by means of a marginal flexible air tube, to which it is attached by pieces of rope, which are cut to sink the net. The head of the net passes through a sheet iron buoy, which settles down on the submerged ship when water is admitted thereto. The expulsion of the water constitutes the buoy the floatative agent, the net being the grappler. A raft consisting of connected tubes is attached by hinged arms to a quay, and sunk beneath the ship, which is floated above and further raised by filling the tubes with air.

Claim.—First, the gigantic cast net A, or analogous apparatus, by means of which the wreck or sunken vessel may be seized or grappled, in combination with the circular tube B, covered with cloth in caoutchouc or any other kind of supple or waterproof material, sustaining the net and allowing of its extension on the surface of the water, substantially in the manner and for the purpose herein set forth.

Second, the floating tube E, in combination with the air tube B, cast net A, to sustain and spread it out on the surface of the water, substantially as and in the manner hereinbefore described.

Third, the lifting buoy K, traversed by a chimney, so as to guide its immersion in a vertical manner, substantially as hereinabove described.

Fourth, the floating buoy R, in combination with the lifting buoy K, the former serving to sink and lower this latter on to the sunken vessel, substantially as hereinbefore set forth and described.

Fifth, the cages Y, serving to build up the temporary chimney Q, in order to facilitate the moorings above water, in combination with the lifting buoy K, so as to connect the cast net with the lifting buoy K, substantially as hereinbefore set forth and described.

Sixth, the raft, serving to emerge the wreck, substantially as hereinbefore described and represented in Figures 9 and 10, in combination with the embankment A', substantially as described.

60,672.—FREDERICK BECK, New York, N. Y.—*Glazing Paper*.—January 1, 1877.—The surface of the paper is covered with stearic acid and is subjected to the action of friction rolls.

Claim.—The within-described process of treating paper with stearic acid, substantially in the manner and for the purposes set forth.

60,673.—MATTHEW BENNETT, Kilbourne City, Wis.—*Door Fastening*.—January 1, 1867.—The spring latch is driven into the door. The bolt unites the knobs and works under and raises the latch. The notch in the stop takes hold of the plate on the outside. When the latch is opposite the mortise in the spring catch the latter flies forward and engages the latch.

Claim.—The combination of the devices constructed and arranged as described.

60,674.—HERMANN BERG and ANDREW BLESSING, Smithfield, Mass.—*Gas Burner and Reflector*.—January 1, 1867.—The globular reflector is surrounded by the burners.

Claim.—As a new article of manufacture a gas burner, having a globular or dome-shaped reflector arranged between the lights of the same, substantially as herein set forth.

60,675.—L. C. and M. C. BIGNALL, Medina, N. Y.—*Sink.*—January 1, 1867.—The sink top is of cast iron, rectangular outside and rounded within. It has a down-curved edge to receive the top of its supporting wooden frame, and an extension at one end to hold a wooden shelf for the support of a pump.

Claim.—The sink basin A, when constructed with flanges *a* curved or recessed on the under side to receive the ends *b* of the boards which form its support, and with right-angled exterior corners *c* to correspond with the square or rectangular top of the wooden support, and the rounded interior corners *d*, combined and arranged substantially as and for the purposes set forth.

Also, in combination with the sink basin A, the extension frame I, formed of a continuation of the sides of the basin and flange *a*, and provided with the shelf C, to form, in connection with said basin and its support B, a seat or bearing for the pump, when arranged substantially as set forth.

60,676.—VIRGIL W. BLANCHARD, Bridport, Vt.—*Harvester.*—January 1, 1867.—The two driving cog wheels on the axle shaft are of different diameters, and engage loose pinions on another shaft, to which either one may be connected by a clutch. Another clutch upon the shaft connects it to one of two bevel wheels of varying diameters. By this arrangement the speed of the cutter bar is regulated. The front ends of the guards are vertically adjusted by set nuts upon a bolt traversing a guide piece which embraces a curved bar connected to the guard bar. A pin in the rear end of the curved bar has play in a vertical slot of an arm projecting forward from the frame. A short arm is hinged to the curved bar and runs over a spring piece of india-rubber. Its other end is held down by a projection on the guide piece, and a set screw rests on the rubber spring to adjust the counterpoise to the finger bar. The grain is automatically gathered and clasped between the two vertical belt arms, and discharged upon the ground. The supporting wheel of the cutter is on one end of a pivoted bar. The other end rests on a rubber spring.

Claim.—First, the arrangement of the collar D with the wheels E or F attached, or both the sliding parts *a a'*, or their equivalents, of the clutches G G', and the spring H or its equivalent, all placed on the axle C to operate in connection with the pinions I or J or both, substantially as and for the purpose set forth.

Second, the clutches G G' L L' and O O', when combined and arranged with sliding collars or sleeves, and with variable or differential gearing, substantially as and for the purpose specified.

Third, the curved bar E*, in combination with the adjustable guide F*, arranged as shown for the purpose of elevating or depressing the front ends of the fingers or guards, as described.

Fourth, the arm K* connected to the rear side of the curved bar E*, as shown, in combination with the adjustable guide F* connected with the bar E*, as shown, for the purpose specified.

Fifth, the bar H* connected to the upper side of the bar E* by a hinge or joint *e**, and provided with india-rubber spring *d**, as shown, in combination with the lip *b** on the adjustable guide F*, substantially as and for the purpose described.

Sixth, the grain-discharging device, composed of two shafts P* Q*, arms Y*, arranged with the chains X* and pulleys Z*, and operated automatically from the axle C, or other suitable driving shaft, by the lever R*, pin *b***, substantially in the manner as herein set forth.

60,677.—THOMAS BOYD, Cambridgeport, Mass.—*Ventilator for Mining Shafts, Buildings, &c.*—January 1, 1867.—The lenses conduct the sun's rays to a chamber connected with and drawing air from the space to be ventilated. The rarified air is made to take a rotary motion as it ascends to agitate the air and assist ventilation. Artificial heat communicated to a central globe may be made to operate in place of solar heat.

Claim.—The method of ventilating buildings, &c., by the use of a metallic chamber conducting the heat of the sun's rays to the air within the same, with or without glazed orifices, operating substantially as described.

Also, the combination of the above-described metallic chamber, having glazed orifices, with an interior

metallic surface, whether globular or of other form, so arranged as to receive the heating rays of the sun and radiate the heat to the air within the chamber, substantially as set forth.

Also, the employment of orifices in the metallic chamber fitted with plain glass lenses or other translucent material, to allow the direct transmission of the sun's rays to the air within the said metallic chamber, operating substantially as described.

Also, in combination with the above, the vibrating cap G, operating substantially as described, for the purpose set forth.

Also, the use of the tubes *a b*, so arranged as to produce a rotary motion of the air within the chamber A, substantially as described.

Also, the use of one or more twisted or smooth tubes *e f*, in combination with the chamber A, substantially as and for the purpose set forth.

Also, introducing artificial heat from a furnace or other heating apparatus into the hollow ball D and chamber A, so as to heat the same and increase the upward current in the absence of the sun's rays, substantially as described.

60,678.—JACOB R. BRESEE, Middleton, N. Y.—*Gate.*—January 1, 1867.—The slats of the trellis gate are pivoted at the intersections, so that the whole can be condensed laterally toward the hinge post. The gate is sustained on arms whose forward ends form two of the slats, but whose rear ends are enlarged, and play in diagonal passages in the gate post. The lower one is pivoted, and the upper has an anti-friction roller at the end.

Claim.—Attaching the gate B to the gate post A, provided with a diagonal guide, as described, by means of the crossed bars C D, arranged and operating substantially as and for the purposes specified.

60,679.—GEORGE BRICKER, Sr., Newville, Pa., assignor to himself and S. I. IRVIN, same place.—*Furniture Polish and Restorer.*—January 1, 1867.—The polish is composed of alcohol, sandarac or other gum, and prepared galls.

Claim.—A furniture polish or polish restorer compounded of an alcoholic solution of gum and galls, substantially as described.

60,680.—FRANKLIN H. BROWN, Chicago, Ill., assignor to himself and JAMES F. GRIFFIN, same place.—*Coal Oil Stove.*—January 1, 1867.—The burner consists of an annular trough with a horizontal diaphragm, beneath which is placed wicking and above it incombustible porous material. Above the burner is a funnel-shaped deflector which admits of inversion, in which case it acts as a concentrator of heat to the central hole. The supply of burning fluid is regulated by a screw valve.

Claim.—First, the reversible heat deflector E, arranged and operating substantially as and for the purposes specified and shown.

Second, in combination with a stove constructed substantially as herein described, the burner L, provided with a passage beneath the perforated partitions *a* to effect an equal diffusion of the oil through the burner, when arranged and operating substantially as set forth.

Third, in combination with a burner L, constructed as described, the reservoir J, the tube M, provided with a slot *m*, and the plug N, operating substantially as and for the purpose set forth.

Fourth, the combination of the deflector E and plate D, when arranged within the stove, substantially as described.

Fifth, in combination with a stove constructed substantially as described, the plate A and passage B, when arranged substantially as and for the purposes set forth.

60,681.—J. HAMILTON BROWN, Watertown, Mass.—*Hand Pegging Machine.*—January 1, 1867.—The spiral spring is placed inside the plunger so as to allow of the whole surface of the latter acting as a guide. A single blow upon the plunger head moves the instrument the distance between the pegs, drives the pegging awl, severs the peg and drives it into the hole previously made. The peg strip is carried forward by a spring follower, and is presented sideways of the grain.

Claim.—The plunger F, made hollow for the reception of the spring *d*, substantially as and for the purpose set forth.

Also, the plunger F, with its exterior surface so formed as to give to the lever J the required movements for causing the knife E to cut a single peg on the commencement of the downward stroke of the plunger, for the purpose specified.

Also, the plunger F, with its groove K and exterior surface so formed as to cause the lever K to operate the feeding point, substantially as set forth.

Also, the table L, so formed that in connection with the lever K a uniform sliding and rocking motion, viz: down and forward, up and back, will be given to the feeding point, for the purpose described.

Also, the gauge plate O, operated by its spring *f*, and having the lower end *q* of its shank so formed as to fit snugly a slot of corresponding form in the plate M, by which it is prevented from turning therein when in use after adjustment, substantially as described.

Also, the pin 13 or its equivalent, for performing the double office of keying theawl and peg driver to the plunger, as set forth.

Also, the removable head G for confining the spring *d* within the plunger F, substantially as described.

60,682.—LEWIS BUDD BRUEN, New York, N. Y.—*Sewing Machine.*—January 1, 1867.—This is an adaptation of the "Sibley" or "Bruen" attachment to the elliptic hook machines which employ a looper describing an elliptic path about the lower disk bobbin; such attachment enables these machines to make the lock stitch, the Grover and Baker stitch, or three or more threaded stitch.

Claim.—First, the devices described, attached to the cloth plate of elliptic-hook machines, constructed and operating substantially as explained, for forming double loop and three or more thread stitches thereby at pleasure.

Second, the combination of cloth plate D, elliptic hook F, with or without bobbin G, needle arm C, thread carrier P, and the other usual and essential operative parts of elliptic-hook machines, constructed and operating together substantially as and for the purposes described.

Third, remover S, to withdraw the threads from the line of travel of the hook, substantially as described.

60,683.—WILLIAM BURLINGAME, Exeter, N. H.—*Making Reamers.*—January 1, 1867.—The cutters and shanks of steel are placed in the mold and the melted iron run through until a partial weld takes place between the iron and steel.

Claim.—The reamer consisting of the cast-iron body A, steel cutters B, and steel shank C, when constructed as herein shown and described, as and for the purpose specified.

60,684.—SANFORD S. BURR, Dedham, Mass.—*Crib and Walking Stool.*—January 1, 1867.—The stool top is divided centrally, and each section has a descending frame which is so pivoted that it may be turned out and form an extension. The rockers have hinged connections to the stool frame, and are folded up when not in use.

Claim.—The combination of a crib or cradle with a walking stool in one piece of furniture, constructed and operated substantially as above described and for the purposes above set forth.

Also, the frame A B and C, resting upon casters *b*, and connected by pivot at *o* with the top H and its connections, and by the bar D with the rocker F, substantially as herein shown and described.

Also, the rocker F attached to a walking stool, constructed and operating substantially as herein shown and for the purposes above set forth.

Also, the top H with its connections J and K, pivoted at *o*, constructed and operating substantially as herein shown and for the purposes above set forth.

60,685.—WILLIAM CADY, Marietta, Ohio.—*Oil Filter.*—January 1, 1867.—The oil is placed in the upper tank and allowed to flow into the lower division of the filter, which division contains water. In the filter is a horizontal perforated plate, having a sheet of flannel on its lower side, through which the oil ascends. A pipe opening into the water space may convey steam thereto.

Claim.—First, the process substantially as herein described of filtering and depriving petroleum of its earthy impurities by passing the same under a head or pressure, through a suitably heated medium or fluid

of superior density, in an upward course or direction through a filtering diaphragm or medium, essentially as herein set forth.

Second, the combination of the oil tank A and filtering vessel D, having a lower chamber C covered by a filtering cloth or diaphragm, also provided with a suitable heating device or contrivance and arranged below the level of the tank with which it is connected, substantially as and for the purpose herein set forth.

60,686.—JAMES CAIRNES, Philadelphia, Pa.—*Molding Turbine Wheels.*—January 1, 1867.—The cores for the inter-bucket spaces are placed around the pattern, and sand rammed between them and the flask. The pattern is then raised. The cores are so deep as to have a bearing against each other at their periphery beyond the bucket flukes.

Claim.—Forming the molds for the buckets of turbine wheels by means of the cores C, without the use of a pattern, the said cores having a close fit outside of the bucket spaces *b*, as and for the purpose specified.

60,687.—F. B. CARLETON, Cambridge, Vt.—*Elastic Hoof Pad.*—January 1, 1867.—A band surrounds the hoof at its crest, with flexible projections to prevent injury from "interfering."

Claim.—As a new article of manufacture, an elastic hoof pad constructed substantially as described and represented.

60,688.—THOMAS B. CARROLL, Noblesville, Ind.—*Broom Head.*—January 1, 1867.—The butts of the corn brush are inserted under the wire rings from the upper side. They are then bent down and sewed to the thin end of the central plate.

Claim.—First, the combination of the core *a'*, core B, wires C D, and corn F, secured thereto as described, and flanged cap G, substantially as and for the purpose specified.

Second, the combination of the projecting wires or railings C and D with the metallic core B, substantially as described and for the purpose set forth.

60,689.—A. CAVLEER, WM. MCCUDDY, and P. N. WOLISTON, Springfield, Ohio.—*Ice Cream Freezer.*—January 1, 1867.—The annular cream chamber revolves by a horizontal hand crank, and has inclined stirring arms attached to its periphery. Inclined plates within the cylinder carry the colder liquid upward.

Claim.—First, the hollow tube D open at the bottom and surrounding the pivot rod E, constructed as described, operating with the revolving cylinder B in combination with plate G, pins *d*, and strips I, to which the upwardly-inclined lifting plates *f f* are secured, all substantially as described, for the purpose specified.

Second, the cover C and crank *a*, connected together substantially as and for the purpose specified.

60,690.—G. L. CHAMBERLAIN, Marietta, Ohio.—*Combined Square and Level.*—January 1, 1867.—The leveling block has a graduated semicircular scale and concentrically pivoted frame with pointers upon it to act as a clinometer. The pivoted frame is set to any inclination by a set screw.

Claim.—The block A, having a graduated semicircular plate C at one or both sides, and a level B inserted in one edge, in combination with the adjustable frame D applied to block A, substantially as and for the purpose herein set forth.

Also, the adjustable or sliding bar E in combination with the shaft or arbor *b*, to which the frame D is attached, substantially as and for the purpose specified.

Also, the pins *g* on the projection *f* of one of the strips *d* of the frame D, in combination with the spring *h* in block A, substantially as and for the purpose set forth.

60,691.—CHARLES CLIFTON, Jersey City, N. J.—*Paint Mill.*—January 1, 1867.—The grinder and scrapers are kept in contact with the side of the revolving cylinder by adjustable weights, and are connected to the axial fixed bar. The cylinder receives motion from a cog wheel upon its periphery, and runs on anti-friction rollers. The paint is fed from a hopper by a screw worm rotating in a pipe in the axial shaft at the

smaller end of the cylinder, and is drawn from a pipe at the other end.

Claim.—First, the cylinder A, in combination with the grinder or pulverizer O, when arranged together and operating substantially as and for the purpose described.

Second, the grinder or pulverizer O, when made hollow, substantially as and for the purpose described.

Third, the spiral screw shaft or conveyer W, or its equivalent, when arranged within the stationary center shaft C, on which the cylinder A revolves or turns, substantially as described, for the purpose specified.

Fourth, removing the material ground in the cylinder A from the same through a pipe or tube I², arranged or formed within the center and stationary shaft C so as to form a communication between the inside and outside of the cylinder.

60,692.—WILLIAM F. COCHRANE, Springfield, Ohio.—*Harvester.*—January 1, 1867.—The main axle extends through the frame and acts as a rock shaft for the raising of the frame, which is accomplished by a lever. The frame is retained to any adjustment by a stirrup piece, which engages one of a series of steps on the tongue.

Claim.—The side pieces of the frame with the segmental slots formed in them made in one piece, substantially as described.

Also, the segmentally slotted frame arranged between the wheels and in combination with the main axle of the machine, substantially as described.

Also, the employment of the main axle as a rock shaft, in combination with the segmentally slotted frame, sliding up and down on said axle, substantially as described.

Also, the slotted lever K, or its equivalent, connected to and operating the main axle and frame of the machine, substantially as described.

Also, the combination of the slotted lever and adjusting stirrup with the segmentally slotted frame, substantially as described.

Also, the adjusting stirrup in combination with a toothed rack, and a segmentally slotted frame for locking the said frame when the cutting apparatus is adjusted to the desired height, substantially as described.

Also, the divided boxes or bearings for the crank shaft in combination with the divided tubular transverse pieces or girders and the through bolts, or their equivalent, substantially as described.

60,693.—WILLIAM F. COCHRANE, Springfield, Ohio.—*Harvester.*—January 1, 1867.—The frame has slots in which the axle has play in raising or lowering the frame. This vertical adjustment of the frame is accomplished by segmental racks which engage spur-wheels upon the axle. The fore end of the tongue has adjustable link connection to the frame by which its horizontal position may be maintained under alteration in altitude.

Claim.—The combination of the main frame of the machine with the tongue and main axle in such manner that said frame may be raised and lowered bodily, maintaining its parallelism with or relation to the ground at whatever height therefrom it may be adjusted or set, substantially as described.

Also, the combination of a pivoted swinging yoke with a segmentally slotted frame, arranged to slide up and down on the main axle, substantially as described.

Also, the combination of geared segments with a segmentally slotted frame which is adjusted up and down on the axle, substantially as described.

Also, the main axle provided with pinions and made to operate as a rock shaft, by which, through geared segments or their equivalents, to raise and lower the slotted frame, substantially as described.

Also, the pivoted swinging yoke in combination with the tongue and slotted frame, substantially as described.

Also, a swinging yoke attached to the tongue and frame, made adjustable for varying the movements of the frame in raising and lowering the cutters, substantially as described.

60,694.—ELISHA T. COLBURN, Boston, Mass.—*Railway Carriage Window.*—January 1, 1867.—The moving sash of a railway carriage contains a separate centrally hinged sash, whose free side engages behind the extended bead piece of the outer sash.

Claim.—The arrangement and application of the

auxiliary sashes C C', with the window sash B, or its equivalent, substantially in manner and by means as specified.

Also, the combination, as well as the arrangement of the window frame, the main sash B, and the auxiliary sashes C C', applied together, and to the main sash, substantially as specified.

60,695.—GEORGE A. COLTON, Adrian, Mich.—*Burglar Alarm.*—January 1, 1867.—The pallet is held fast, so that it cannot operate the bell by means of the short arm of a straight steel lever. The upper end of the lever is curved, and fastens around the door knob, the turning of which lets off the pallet that carries the bell hammer, or the keeper arm may enter between the door and jamb, and release the alarm on the opening of the door.

Claim.—The arrangement of the spring M, with its stop L, in combination with the escapement or pallet G, substantially as and for the purpose described.

Also, the hook O, or its equivalent, in combination with the above, substantially as described and for the purpose specified.

60,696.—JAMES CONNOLLY, Boston, Mass.—*Journal Box.*—January 1, 1867.—The absorbing cord draws the lubricant from the reservoir beneath the box, and discharges it on the points of friction. The journal box has cast upon it a collar guard, which acts as a protection from dust, and as a drip cup for superfluous oil.

Claim.—The combination of the box or bearing a, the reservoir d, and the enlarged extensions or cups f, when of size sufficient to receive and protect the shaft collars i, and when cast in one piece, substantially as described.

60,697.—THOMAS CONNOLLY, New York, N. Y.—*Saw Set.*—January 1, 1867.—The frame has adjustable guide plates, and the saw passes between two levers, each carrying a set punch to operate simultaneously on the teeth. Set screws in the levers regulate the amount of "set" given. The jaws have longitudinal adjustment to suit fine or coarse teeth.

Claim.—First, in combination with the jaws A A, the two levers F F, with the two steel punches G G, which are attached to the levers, and which operate simultaneously upon two teeth of the saw, in the manner as set forth.

Second, the small thumb screw Q, in combination with set screw P, and jaws A A, all constructed and arranged as set forth.

Third, the two thumb screws I I, in combination with the jaws A A and levers F F, constructed and operating in the manner as set forth.

Fourth, the arrangement as described of all the parts, so that the device may be adjusted to set the teeth of either fine or coarse saws accurately, and otherwise operate as set forth.

60,698.—SILAS CRISPIN, New York, N. Y.—*Breech-loading Fire-arm.*—January 1, 1867.—The cartridge chamber is bisected transversely, and the cartridge is circumferentially ridged at the place of bisection.

Claim.—As new in that class of breech-loading fire-arms, which have the charge chamber bisected as described and shown, the recessed rear portion 2b', in combination with the ribbed and recessed forward portion a' of the charge chamber, the whole constructed and operating together to receive and retain while being fired the kind of cartridge herein referred to.

60,699.—W. C. CUMMING, Peekskill, N. Y.—*Hanging Mirrors.*—January 1, 1867.—The mirror is pivoted on the bifurcated frame, and has a thumb-screw by which it is fixed to any angle. The support consists of telescopic tubes, which slide within each other for vertical adjustment.

Claim.—The slotted and notched sleeves or tubes F, whether one or more, for the rod D, to which the mirror is attached, substantially as and for the purpose specified.

60,700.—C. N. CUTTER, Worcester, Mass.—*Button-hole Cutter.*—January 1, 1867.—The movement of the pivoted arms is regulated by a set screw beyond the pivot, and the cutter is pivoted at the end of the upper blade, so that its range of operation on the

anvil upon the lower arm may be circumscribed to the desired length of the button hole.

Claim.—The cutter blade D, adjustable graduated cutter blade D², pivot *c*, set screw G, and slot *d*, in combination with the handles A A and screw N, so that a button hole may be cut any length without measuring, substantially as herein set forth.

60,701.—J. DAVIS and J. McKELVEY, Pawtucket, R. I.—*Tanning.*—January 1, 1867.—The hides are handled in a solution of gambier, 330 pounds; glauber salt, 20 pounds; sal soda, 10 pounds; oil of vitriol, 10 pounds, with a sufficient quantity of water. Additional quantities are added as required, and at the last addition 10 pounds chalk substituted for the sulphuric acid. The operation requires from two to six weeks.

Claim.—The described improvement in the process of tanning.

60,702.—JOHN DAVOCK, New York, N. Y.—*Wood-splitting Machine.*—January 1, 1867.—The frame that carries the rotary splitter shaft is actuated by a pitman from a crank on the main shaft. The splitter shaft has a slight rotary movement given to it at each elevation, and this movement forces down rods on each side of the splitter to release the wood. The endless feed belt has intermittent motion by the reciprocation of the splitter frame.

Claim.—First, the rotary spindle G, with the attached knife Z or knives, in combination with the crosshead F, arranged substantially as herein shown and described.

Second, in combination with the rotary spindle G, the vertically sliding rod *t*, operated by the cams *s s*¹, &c., substantially as and for the purpose herein specified.

Third, the combination of the crosshead F, with the lever H, rack *e*, connecting rod *f*, and toothed wheels O O¹, the whole being arranged and operating substantially as and for the purpose herein set forth.

Fourth, the arrangement and combination of the feed rollers M M¹, endless belt *y*, gear wheels *w w*¹, rack N, and pin *v*, the whole being arranged and operating substantially as and for the purpose herein specified.

60,703.—LEVI S. DEMING, Newington, Conn.—*Door and Gate Closer.*—January 1, 1867.—A sectional plate on the weighted lever has a grooved arc for the reception of a cord running around a pulley on the hinge pintle. The gravitation of this lever closes the door.

Claim.—The employment of the lever segment weight *h f g*, in combination with the pulley *e*, cord *n*, substantially as and for the purpose described.

60,704.—GEORGE DRAPER, Milford, Mass.—*Spindle and Bolster for Spinning Machines.*—January 1, 1867.—Improvement on the patent of Amasa Houghton, of July 13, 1858. The helical oil-elevating groove is cut in the spindle and ends above in an annular groove in the latter and a coincident groove in the bolster.

Claim.—The arrangement of the helical groove in the upright spindle, when the groove is used in combination with the covered cup or closed oil chamber applied to the spindle and bolster, and formed in the sleeve D, as set forth.

Also, the combination, as well as the arrangement of both of the annular grooves *d e*, with the helical groove *c*, formed in the spindle, and to operate in the bolster, and extend up from the oil cup *a* thereof, substantially as and for the purpose specified.

Also, the arrangement of both the grooves *c* and *d* in the spindle, when they are used in connection with an oil cup applied to the spindle, or arranged in the bolster as specified.

60,705.—CLAUDE DUCRUX, New York, N. Y.—*Safety Attachment to Carriages.*—January 1, 1867.—The backward movement of the perpendicular hand lever releases the harness attachments to the thills, and operates the braking cups on the rear axle to bring them in contact with the wheel hubs.

Claim.—First, the combination of a detaching apparatus with the brakes of a vehicle, substantially as herein shown and described.

Second, the combination of the pins *c*, with the oscillating cross bar D, substantially as and for the purpose herein shown and described.

Third, the manner of securing the pins *c* to the swinging cross bar D, by means of plates *d*, substantially as and for the purpose herein shown and described.

Fourth, the combination of the brake draw rod O, and the strap rods F G or I, with the oscillating cross bar D, substantially as and for the purpose herein shown and described.

Fifth, the combination of the lever H, with the cross bar D, pins *c* and sliding bars E F G, substantially as and for the purpose herein shown and described.

Sixth, the combination of the sliding bar I, with the tongue S and the oscillating lever D, substantially as and for the purpose herein shown and described.

Seventh, the bars F and G, and upright arms *g h h*, or the bar I and arms *l l* combined, and operating substantially as and for the purpose herein shown and described.

Eighth, the manner of operating the sliding bars E, by means of slotted upright arms *e* and pins *f*, substantially as herein shown and described.

Ninth, the combination of the spring fastening *i*, with the swinging bar D, substantially as and for the purpose herein shown and described.

Tenth, the construction of the disengaging apparatus, substantially as herein shown and described, so that by the movement of the lever the braces and all the harness straps are simultaneously released, as set forth.

Eleventh, the construction of the brakes M, substantially as described, so as to act upon the hubs of the wheels, as set forth.

60,706.—R. EATON, Lee, England.—*Fire Grate for Steam Boilers.*—January 1, 1867.—The grate bars are broad, and overlap each other in ascending series to the center. Pendant arms from the bars have connection to a bell-crank lever to open or close the spaces between them to regulate the admission of air. A wire gauze before the ash pit prevents the outflying of sparks, &c. Pipes with regulating dampers supply air above the grate bars.

Claim.—First, the improved fire grate for wood or peat, formed of broad grate bars, placed one above another in steps or terraces, with their edges or sides over and under lapping each other, directing the passage of air into the fire laterally between them, and to prevent the dropping of hot coals into the ash pan, constructed and arranged substantially as herein described.

Second, the combination of the broad grate bars A A A with the levers *b b* and *d*, connected by the rods *e e* to open and close the air passages *a a a* between the grate bars, as described, substantially arranged as herein described.

Third, the wire gauze or perforated plate *gnard h*, in combination with the dampers *i i*, and the ash pan C, constructed and arranged substantially as and for the purposes herein described.

Fourth, the air pipe *k*, in combination with the grates A A A, arranged substantially in the manner and for the purposes herein described.

60,707.—M. EVANS, Russiaville, Ind.—*Boot and Shoe.*—January 1, 1867.—The tongue is extended side-wise and its edges stitched to the quarter flaps, to render the gaiter water tight to the top. The ornamental fastening has straps for attachment to buttons on each side.

Claim.—In gaiter boots, provided with flaps, B B, formed with an extension of the quarter and a fold connecting them, so as to make the boot water tight to its top, the double row of buttons, D E, and ornamental guard C, the latter serving to conceal the ends of the flaps, and having straps, C' C' C' C', to take over the buttons D E, as and for the purposes specified.

60,708.—C. J. FAY, Hammonont, N. J.—*Roofing and Siding for Houses.*—January 1, 1867.—The paper has folding and nailing marks formed upon it. In attachment the nail is driven through the single fold in the paper, which is then refolded over so as to cover the nail head.

Claim.—The use of and the manner of applying paper for roofing and clapboarding, substantially as described.

60,709.—THOMAS M. FELL, New York, N. Y.—*Cylindrical Amalgamator.*—January 1, 1867.—The ore is amalgamated in a cylinder which receives oscillating motion by the connection of its cranks with other cranks connected to a rotating shaft. A longitudinal partition reaches nearly to the bottom, beneath which the ore and quicksilver pass as the cylinder is oscillated. Steam is introduced through a longitudinal pipe traversing the cylinder. The amalgamated product is allowed escape through three valves in each end of the cylinder.

Claim.—First, the introduction of the alternating sluice or flood motion for obtaining entire suspension and trituration of the mass, accomplished by what we designate a dash or sluice board, acting in connection with a vibrating or oscillating cylinder, substantially as above set forth, for the purpose of amalgamation of gold and silver ores.

Second, the introduction, for the purpose of amalgamation, of an oscillating or vibrating cylinder, to which I attach my dash or sluice board, all substantially in the manner herein described.

60,710.—JOSEF FLEISCHL, New York, N. Y.—*Paper File.*—January 1, 1867.—One side bar is cylindrical and has a sliding embracing clamp plate. The other side piece has a flattened side and removable caps which carry spring clamps.

Claim.—A paper file, provided with a segmental clamp *b*, and with spring clamps *d e*, which act in combination with the bars *a c*, substantially in the manner set forth.

60,711.—ROBERT G. FOWLER, Olney, Ill.—*Burglar Alarm.*—January 1, 1867.—A wire spring is wound around a mandrel, and one end has a nipple for a percussion cap. The spring is held back by a notch in the side of the casing. The device is fastened to the door by a screw upon an extension of the mandrel. The opening door releases the spring arm from the detaining notch and the cap is discharged.

Claim.—The arrangement of the wire *C d*, mandrel *B*, notched casing *A a*, substantially as described and represented.

60,712.—KASSON FRAZER, Syracuse, N. Y.—*Hollow Ring.*—January 1, 1867.—The hollow ring is constructed from sheet metal, and consists of two parts swaged up in dies. One portion has a flange on the outer edge which laps around the other part, and is spun down so as to hold the two parts together.

Claim.—A hollow metal ring composed of two parts, held together by a self-sustaining lap joint, substantially as and for the purposes herein specified.

60,713.—WILLIAM H. GATES, Louisville, Ky.—*Machine Belting.*—January 1, 1867.—The cord is covered by winding around it a sheet of raw rubber, after which it is wrapped in cloth and subjected to the vulcanizing process.

Claim.—First, a round belt composed of a non-elastic central cord, coated with vulcanized rubber or other elastic material, substantially as described and for the purpose set forth.

Second, the combination of two or more twisted cords coated with, or surrounded by, a coating of vulcanized rubber or other elastic material, to form an improved driving belt for machinery.

Third, the process of coating a cotton or other cord as the base of a round belt, with vulcanized rubber or other elastic material, substantially as described and for the purpose set forth.

60,714.—JOHN GIBSON, Jr., Albany, N. Y.—*Street Car Heater.*—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, the stove *C*, arranged within the space between the seat and the bottom of the car *A*, and provided with the ash box *b* beneath it, substantially as herein set forth.

Second, the perforated protecting plate *D* on the front side of the seat, at the point where the stove is placed, substantially as and for the purpose specified.

Third, the combination of the ash pan *b*, draught doors *m m*, and pinch screw *p*, when arranged as herein shown and described and for the purpose specified.

60,715.—BARNARD GOODRICH, Brentwood, N. H.—*Root Extractor.*—January 1, 1867.—The share is forked and attached beneath the beam by straps which embrace projecting lugs on its front and rear.

Claim.—The bush or root extractor, made substantially as described, viz., of the duplex-pronged share, the beam and handles arranged and for use as specified.

60,716.—JOHN C. GOVE, Cleveland, Ohio.—*Preserving House.*—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, the ice chambers or boxes *C C* arranged above the preserving room *E* and below the receptacle *B*, said boxes being separated from each other and the sides of the house by air chambers *D D*, and being provided with doors at their ends and outside of the house, as and for the purpose herein specified.

Second, the arrangement of the fruit-house *A*, with a room *E*, for preserving fruit, &c., with ice boxes *C C*, chamber or receptacle *B*, and air spaces *D D*, the preserving room and ice chambers being provided with doors which are separate and distinct, and opening into each from the outside of the house, as and for the purpose specified.

60,717.—FREDERICK J. GRACE, Fort Lee, N. J.—*Printing Press.*—January 1, 1867.—The form is carried on a cylinder and the paper passes from a roller over an impression roller beneath the cylinder. Springs beneath the journal boxes of the impression roller keep the paper to the type cylinder, except when the shear lever is depressed. By this lever the paper is cut and the impression roller lowered so as to stop the feed of the paper.

Claim.—First, the impression roller *p* mounted upon springs, in combination with the levers *u u* for moving the roller *p* back to prevent the paper being moved, as set forth.

Second, the adjustable shear *r s*, in combination with the actuating lever *u*, and pins and cams *x* and *y*, as and for the purposes specified.

60,718.—HARRISON GRAMBO, Philadelphia, Pa.—*Machine for Manufacturing Candles.*—January 1, 1867.—The material is forced from the receiving chambers into a cylinder, where it is acted on by a plunger and driven down into the space before a tubular plunger which contains the candle presser and the wick tube. The tallow is pressed into the mold and then ejected from it, and the wick tube drawn back. The wick is held by a clamp and is severed by draw-shears. The candle, on ejection, enters a second mold, which may be surrounded by ice or cold water, and from this mold is ejected on to arms and conveyed to an endless carrier.

Claim.—First, the receiving and reducing mills *B C C*, supply chambers *L*, *L*, *M Q*, pistons *L L*, plungers *N S*, and molds *R*, all combined and arranged substantially as and for the purpose specified.

Second, the pistons *S*, operating in combination with the plunger *S* and molds *R*, substantially in the manner and for the purpose set forth.

Third, the combination with the plunger *S* and pistons *S*, of the wick tubes *a*, arranged and operating substantially as described.

Fourth, the clamps *d d*, arranged and operating substantially as and for the purpose set forth.

Fifth, the receiving and discharging tubes *Y*, when arranged and employed in the manner and for the purpose set forth.

Sixth, the combination with the tubes *Y*, of the stationary pistons *Y*, arranged and operating in the manner and for the purpose specified.

Seventh, the box *Y*, affording a bearing and inclosing case for the tubes *Y*, and reciprocated therewith by the means and for the purpose described.

Eighth, the arms or rails *h*, and levers *h h*, arranged and operating substantially as and for the purpose specified.

Ninth, the endless band *g*, arranged and operating in the manner and for the purpose set forth.

Tenth, the combination with the reducing mills or chambers *B B* of the steam chests or jackets *B*, substantially as described.

Eleventh, the knife *W*, when operated in the manner specified, and employed in connection with the clamps *d d*, for the purpose set forth.

Twelfth, the combination of the dog U with the reels T T, for limiting the let-off motion, as described.

Thirteenth, the within described candle-making apparatus, consisting of the receiving mills or chambers B B, supplying chambers L M Q, plungers and pistons N S S' L L, wick tubes a, reels T T, and clamps d d, all arranged and operating substantially as set forth.

60,719.—JOHN GRAY, East Aurora, N. Y.—*Wear Plate for the Soles and Heels of Boots and Shoes.*—January 1, 1867.—These segmental plates have an inward perforated flange, with guide marks on the outer thicker part indicating the position of the soles.

Claim.—The web or flange d, provided with a continuous series of perforations, in combination with the corresponding guide marks of the rim c, constructed and arranged substantially as and for the purposes set forth.

60,720.—GEORGE HAMEL, Abington, Pa.—*Safety Pocket.*—January 1, 1867; antedated December 30, 1866.—A box, with a snap opened by a thumb-pin, is attached to the bottom of the pocket.

Claim.—A box of any suitable shape and size with spring lid, fastened by seam or otherwise to the bottom of any pocket, for the purpose hereinabove described.

60,721.—JAMES M. HAMMITT and HENRY T. MILLER, Toledo, Iowa.—*Plow Carriage.*—January 1, 1867.

—The plow clevis has chain connection to the axle, and is raised or lowered by a pivoted lever having a segmental rack and spring pawl for adjustment by the rider.

Claim.—A plow carriage having bar D, spring G, lever E, swing F, swinging lever H, ratchet K, pawl L, and handle and spring M, adjusted, combined, and arranged substantially as herein specified.

60,722.—A. P. HAMMON, J. H. LINCOLN, S. LINCOLN, and T. W. HAMMON, Montfort, Wis.—*Cultivator.*—January 1, 1867.—The tongue is pivoted in the frame, and its back end has lateral oscillating motion from chains passing over pulleys to treadles. The pivoted plow standards are connected from side to side by a chain passing around pulleys on the front of the frame.

Claim.—First, the pivoting of the draught pole D to the frame A, and the connecting of the rear end of the former to treadles I I, substantially as and for the purpose set forth.

Second, the connecting of the plow standards of the two beams J J, in the manner shown, or in any equivalent way, so that when the plows of one beam are moved or shoved backward, those of the opposite beam will be moved forward, and *vice versa*, for the purpose specified.

60,723.—L. M. HART, Philadelphia, Pa.—*Making Steel-headed Rails.*—January 1, 1867.—The steel head-plate has longitudinal corrugations coming in contact with complementary corrugations on the base part, to which it becomes united by the heating and rolling process.

Claim.—A fagot for making a steel-capped railroad rail, composed of the corrugated steel bar A, and iron bar B, arranged and piled with the other parts, in the manner shown and described.

60,724.—MICHAEL W. HELTON and JAMES H. REBFIELD, Bloomington, Ind.—*Grinding Mill.*—January 1, 1867.—The grinding machinery operates a screw to release the alarm mechanism at the completion of a certain amount of movement of the said machinery.

Claim.—The horizontal and vertical shafts G and D, with the worm and worm-wheel E and d, the springs I and J, and the belt K, when arranged and combined substantially as herein described and for the purposes set forth.

60,725.—WEBSTER HERRICK, Northampton, Mass.—*Saw Mill.*—January 1, 1867.—The roller axis is tapered in such form that the weight of the carriage will center it truly in its headstock.

Claim.—A saw mill carriage roller with tapering journals, substantially as herein shown and described.

60,726.—LOUIS HEUSER, Boston, Mass.—*Machine for Embossing Consecutive Numbers.*—January

1, 1867.—The undermoving strips have intaglio dies and the upper strips have cameo dies working in unison owing to perpendicular pieces on the under strips which form guides for the upper ones. Each pair of upper and under die strips may be placed in such relative position to the others as to emboss any desired number. The number is indicated by the lever plate, which, by entering the notches, insures the proper position of the numbers in line. The reciprocating motion is continually communicated to the upper end of the pitman, which has sliding motion on the lower end, and the insertion of a spring pin communicates motion to the lower end and operates the dies.

Claim.—The combination of a series of slides, each made up of two pieces f and i, when provided with male and female dies, and are all arranged to be operated at the same time by the plunger m, for the purpose set forth.

Also, guiding and controlling the position and movement of the pieces i, with reference to the pieces f, by means of the guides h, and springs j, as described.

Also, the combination of the inclined bed and wedges e, with the compound slides i f, and plunger m, for the purpose of graduating the amount of impression to be given by descent of the plunger.

And in combination with the compound slides i f, the means described by which the plunger is made to descend only at the will of the operator, while the driving shaft is kept constant in motion.

60,727.—ERNST F. HOFMANN, Poughkeepsie, N. Y.—*Window Latch.*—January 1, 1867.—Closing the spring stop locks an ordinary revolving latch.

Claim.—The stop c, in combination with the catch D, spring b, and latch A, constructed and operating substantially as and for the purpose set forth.

60,728.—GEORGE HOOVER and A. N. HADLEY, Richmond, Ind.—*Machine for Spinning, Twisting, and Reeling.*—January 1, 1867.—The spindles are arranged in line upon the counterbalanced sash and driven at uniform speed by a single belt. The spindle is used simply as a stem for the bobbin upon which the thread is directly spun and wound.

Claim.—The arrangement and combination of the mechanical devices herein set forth and described for producing a spinning, twisting, and reeling machine, substantially as set forth and for the purposes described.

60,729.—H. W. HOPKINS, Milford, N. H.—*Sad Stone.*—January 1, 1867.—The sad stone of steatite is pivoted in the handle, and projections on its pivots enter cavities in their bearings when either side is in position for use. One side has rounded and the other angular edges.

Claim.—A reversible sad stone, consisting of the body A, having plates C at both ends, provided with shoulders B, the rear one having a projection thereon adapted to fit in a corresponding recess in the lower end of the handle B, which is pivoted to the projections, and operating in the manner described for the purpose specified.

60,730.—BENNET HOTCHKISS, New Haven, Conn., assignor to himself and CHARLES MONSON.—*Peat Machine.*—January 1, 1867.—The peat passes from the hopper between two rollers; the superfluous moisture is carried off by an apron. The peat is molded in a revolving wheel and expelled from the molds by reciprocating plungers. The blocks are carried off by an endless apron.

Claim.—First, the use, in a machine for preparing peat or other plastic material, of the grinding surfaces A A', having unequal rates of surface motion, co-operating in the manner described, to effect disintegrating the material, expressing the surplus water, and taking up the product upon the grinding surface having the faster rate of movement, substantially as set forth.

Second, the combination in such machine of the following instrumentalities: the cylinders A A', or equivalent grinding surfaces, having unequal rates of surface motion, and the scraper E, substantially as described for the purposes specified.

Third, the combination in such machine of the following instrumentalities: the said grinding surfaces A A', having unequal rates of surface motion, the

scraper E, and the receiving and conducting trough F, substantially as described for the purposes specified.

Fourth, the combination in such machine of the following instrumentalities: the said grinding surfaces A A', having unequal rates of surface motion, and the apron D, or other equivalent device, for receiving and conducting away the surplus water expressed by the cylinders, substantially as set forth.

Fifth, combining in such machine grinding surfaces operating as described, with an apparatus for molding the peat or other plastic material, the combination being substantially as specified.

Sixth, constructing the cylinder H with molding boxes and pistons, substantially as described, and operating the same in combination with the cam presser G, substantially as set forth.

60,731.—F. W. HOVEY, Boston, Mass.—*Ladder*.—January 1, 1867.—The front edges of the steps are pivoted to the sides, and the steps are connected by slide pieces to a supplemental bar. An inclination of the ladder gives the bar a forward longitudinal movement, in respect to the sides, and keeps the steps longitudinal.

Claim.—First, the combination of the bar D and pivoted steps C, wheels B, and sides A of the ladder with each other, substantially as herein shown and described.

Second, the combination of the notched arm E with the steps C and bar D of the ladder, substantially as herein shown and described.

Third, the combination of the bar D and the removable pivoted steps C with the rounds and sides of the ladder, substantially as herein shown and described.

Fourth, the combination of the slotted bar F and pin *f* with the bar D and steps C of the ladder, substantially as herein shown and described.

60,732.—HENRY HOWARD, Springfield, Mass., assignor to himself and RICHARD F. HAWKINS.—*Hot-Water Heating Apparatus*.—January 1, 1867.—The boiler consists of series of tubes placed in regular vertical and horizontal planes, with tubular connections so disposed as to form vertical divisions at right angles to the main tubes. By a damper the aëric current may be forced through the diving passage between the tubular connection. The doors to the furnace and to the flue chamber are connected by chains to the opposite ends of a centrally-pivoted lever, to which is suspended a globe which an extreme pressure of steam fills with water and moves the lever to close the furnace door and open the flue door. The radiators are formed with larger and smaller pipes to cause the unequal cooling and consequent circulation of water.

Claim.—First, the arrangement of a number of boilers, one above another, in such a manner as to form flues by their sides, and having tubular bars connecting them, substantially in the manner and for the purpose set forth.

Second, the combination with a boiler, by means of a flexible pipe, of a hollow vessel, arranged and operating for the purpose of regulating the fire, substantially as described.

Third, the radiators formed as described, having one part R larger than the other part S, substantially as herein set forth.

60,733.—EDWIN HOYT, Stamford, Conn.—*Tobacco Pipe*.—January 1, 1867.—Beneath the bowl bottom is a cup, whose top has radial perforations for the collection of nicotine, which discharges into a removable lower cup.

Claim.—First, the nicotine and saliva cup C, in combination with the bowl of a tobacco pipe, constructed and arranged substantially as herein specified.

Second, the socket D, provided with a neck *d*, in combination with the cup C, bowl A, and stem B, substantially as and for the purposes herein specified.

Third, the combination of the cup C, bowl A, cap or bulb *c*, socket D, and stem B, substantially as herein shown and described.

60,734.—Z. HUSSEY, Wilmington, Ill.—*Heating Stove*.—January 1, 1867.—The heater pipe has a small

air inlet below and a large vertical exit above. The smoke has a side discharge.

Claim.—A heating stove, constructed with a laterally-flattened and curved internal flue or pipe G, opening upwards through the top H and downwards through the side of the stove, and having a draught opening D below, and a regulating damper E above the fire, said several parts being constructed and arranged for use, substantially as and for the purpose set forth.

60,735.—ROBERT HUTTON, Brooklyn, N. Y.—*Window Sash Fastening*.—January 1, 1867.—The sash acting on the teeth of the sliding wedge draws it down. The friction roller in the rear of the wedge forces the teeth into the sash and supports it.

Claim.—A window sash fastening, composed of a socket C, provided with a friction roller E, or its equivalent, and a wedge or key D, applied to a window frame, and in such a relative position, with the sash B as to operate in the manner substantially as and for the purpose herein set forth.

60,736.—ROBERT HUTTON, Williamsburg, N. Y., assignor to himself and WILLIAM MEE, same place.—*Blind*.—January 1, 1867.—The upper slats are axially pivoted to the sides of the frame, and are connected by the vertical operating rods which are pivoted to their ends. A spiral spring in one of the pivot sockets acts by friction to retain the slats in any position.

Claim.—A blind, having its rod for operating the slats of the same hung to one end of such slats, substantially as and for the purpose described.

60,737.—FREEGHT JACKSON, Sparta, Ohio.—*Combined Seat and Top for Carriages*.—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, attaching a carriage top to a supplementary seat B, which may be placed above a permanent seat A or removed, so as to form a covered or uncovered seat, substantially as described.

Second, connecting the frame supporting the carriage top with the permanent seat A by means of slides and grooves, so as to permit the frame and top to be removed or attached by a single movement, substantially in the manner set forth.

60,738.—JOHN C. JEWETT, Buffalo, N. Y.—*Slop Jar*.—January 1, 1867.—An annular water groove around the top of the jar receives the downcurved edge of the cover, and the downturned edge around the central opening dips into a water cup and forms an air trap.

Claim.—A slop jar provided with the annular water recess formed between the sides *ff* and rim C, submerged flange *e e* and central orod trap and the concave cover B, constructed and arranged substantially as and for the purposes set forth.

60,739.—GILBERT D. JONES, New York, N. Y.—*Quartz Mill*.—January 1, 1867.—Scrapers are attached to the common Chilian machine, and are adjusted to keep the ore in its place while being ground, and to discharge the pulverized ore from the mill.

Claim.—The adjustable or rising and falling scrapers M and the fixed scrapers G, arranged and applied to operate substantially in the manner as and for the purpose set forth.

60,740.—LOUIS PAUL JUVET, Glen's Falls, N. Y.—*Time Globe*.—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, making the axis of the daily wheel *e* of a chronometer, (applied to revolve a hollow globe, and located in its interior,) coincident with the axis of said globe, in the manner substantially as shown and described, and for the purpose set forth.

Second, winding the said chronometer from the outside of the globe, without the use of a key, by means of the thumb-piece T and sleeve *b*, and its connections, in the manner substantially as shown and described, and for the purpose set forth.

Third, the combination of the solid axis *a a'* with the sleeves *b* and *d d'*, the former *b* by which to wind up the works from the outside, and the latter *d d'* by which to transmit the proper motion to the globe, said parts being constructed, arranged, and operating in the manner substantially as shown and described, and for the purpose set forth.

60,741.—JOHN KELLY, Woodberry, Md.—*Car Coupling*.—January 1, 1867.—A prong projects forward above the hook shank to prevent accidental uncoupling.

Claim.—The wrought-iron hook A, provided with a prong C, arranged to act upon the coupling, as described.

60,742.—WILLIAM KERR, Jr., Boston, Mass.—*Clamp for Holding Smoking Pipes for Finishing*.—January 1, 1867.—The frame has an adjustable plate in which the top of the unfinished pipe is placed and keyed by a wedge.

Claim.—The combination with the thumb nuts and enlarged recesses formed in the face plate of springs, arranged and operating substantially as shown and set forth.

60,743.—H. M. KINSLEY, Chicago, Ill.—*Lunch Heating Apparatus*.—January 1, 1867.—The shallow annular receptacle for the burning alcohol is permanently attached beneath a sheet-metal preserving or other can, whose contents are heated by the flame.

Claim.—The combination of a chamber B, for containing alcohol, or its equivalent, with a preserving can A, substantially as and for the purpose herein specified.

Also, the combination of a burning cup or dish C with a chamber B, for containing alcohol, or its equivalent, and a preserving can A, substantially as and for the purpose herein specified.

60,744.—GEORGE B. KIRKHAM, New York, N. Y.—*Key-board for Musical Instruments*.—January 1, 1867.—The key-board has a side movement by means of a pivoted lever, to which it is connected by a rod and an adjustable slide-block. By this movement the keys may be changed higher or lower one-half or a full tone—more or less.

Claim.—First, the levers *k k'*, in combination with the manual keys *z z*, &c., and their common support *l*, acting on the levers *i i*, substantially as and for the purpose set forth.

Second, the combination of the arm *d*, the lever *e*, with its adjusting screw *g*, and slots *ff*, as described, and for the purpose set forth.

60,745.—LANCELOT KIRKUP, Brooklyn, N. Y., assignor to himself, ALBERT PALMER, JOEL PARKER, and W. M. HUDSON.—*Anvil*.—January 1, 1867.—The steel top is secured to the iron base by a dovetail joint and keys.

Claim.—The anvil, constructed substantially as shown, for the purposes specified.

60,746.—EVEN KOONS, Funkstown, Md., assignor to ELIAS EMMERT, Washington county, Md.—*Tuyere*.—January 1, 1867.—The hinged valve block beneath the hearth plate is operated by a jointed rod, to open or close the outer blast openings.

Claim.—First, in combination with the blast openings in the bed of a forge or furnace, the above-described swinging valve or plug, constructed and operated substantially as set forth.

Second, the combination of the cap E, rod D, and hinged valve or plug C, constructed substantially as specified.

60,747.—MAX H. KRÜGER, New York, N. Y.—*Apparatus for Filtering and Refining Oil*.—January 1, 1867.—Glass filters are suspended in a box the sides of which have panes of glass to enable inspection. A steam-pipe passes through the box, by which the temperature is regulated.

Claim.—The movable filters B, suspended from rods *a*, within the steam-box A, for the purpose described, substantially as specified.

60,748.—J. J. LAHAYE and S. P. REEVES, Reading, Pa.—*Slide Valve*.—January 1, 1867.—This is a balance slide valve, and is explained by the claim and illustration.

Claim.—The arrangement of the valve B, with its recess containing an elastic packing material, and the plate D, with its rib *c*, substantially as and for the purpose described.

60,749.—NOYES D. LAMB, Norwich, Conn.—*Leak Signal for Vessels*.—January 1, 1867.—The upward

movement of the spherical float releases the escape-ment to sound the alarm.

Claim.—In combination with a lever *i*, hinged or pivoted to the frame or case and to the stem of the float, the arranging of the bent arm *h*, escapement *g*, and bell hammer *m*, all upon one and the same shaft, by which means I very much cheapen and simplify the construction, and render its action more certain by dispensing with parts that are liable to become disarranged, all substantially as described and represented.

60,750.—GEORGE P. LANG and PETER LAUSTER, Allegheny, Pa.—*Making Jug Tops*.—January 1, 1867.—The collar, lid, and hinge plate are each formed from one piece of metal, the former bent around the neck of the jug and the other fitted to it and connected by a pintle.

Claim.—First, making jug tops of thin sheet metal, consisting of a body section *a*, lid *b*, button *e*, hinge piece *c*, and ring *d*, cut, shaped, and joined substantially in the manner hereinbefore described.

Second, the construction, from thin sheet metal, of the main or body section *a* of a jug top, when the spout *n* forms a part of such section, substantially as and for the purpose above described.

60,751.—CHARLES W. LE COENT, Norwalk, Conn.—*Lathe Dog*.—January 1, 1867.—To secure lightness with a given amount of material the dog is cast hollow except in that portion through which the screw passes. The outer rib strengthens the angle.

Claim.—The hollow dog or carrier, constructed in the manner substantially as and for the purposes set forth.

60,752.—F. M. LEMMON, Shelbyville, Ill.—*Wheelwright's Spoke-Driving Bench*.—January 1, 1867.—The hub is clamped on the bench and the spokes supported in turn by a vertically adjustable post; an upper clamp prevents the bouncing of each spoke while being driven.

Claim.—The bench B, clamping rod D, adjustable rest C *c*, and holding rod and lever G E, all arranged and operating as and for the purpose herein set forth.

60,753.—CHARLES LENNIG, Philadelphia, Pa.—*Compound for Sabine Medicated Baths*.—January 1, 1867.—Composed of silica, 0.0495; chloride of iron, 0.1465; barium, 0.3336; strontium, 0.0039; chloride of calcium, 57.9737; chloride of magnesium, 23.6823; chloride of sodium, 4.0380; chloride of potassium, 1.2785; iodide of magnesium, 0.1412; bromide of magnesium, 1.1316; magnesia, 11.2629; alumina, 0.00083—phosphate alumina. The compound is molded into blocks, kept in air-tight packages, and is used with double the quantity of common salts in a bath.

Claim.—The composition of matter called "strumatic salts," put up in the form and packages as above named, substantially as above set forth.

60,754.—CHARLES LEWANDOWSKI, Paris, France, assignor to himself and EMILE GRANIER, same place.—*Apparatus for Preparing Cotton*.—January 1, 1867.—The cotton passes between feed rollers to a comb cylinder, from which it is taken by the brush arms of a wheel of superior velocity. It then passes over an endless screen apron acted on by beaters. From thence it passes between feed rollers to the ventilating beating cylinder, which has a screen case beneath. The fiber then traverses a metal duct to the classifying chamber, from whence the shorter and lighter fibers are delivered above and the longer ones below, after passing between a series of compressing rollers.

Claim.—In combination with the double combing and beating cylinders, and the single air duct, for separating and classifying the fibers, the double delivering mechanism for separately discharging the thus separated and classified fibers in laps or slivers, the whole operating in the manner substantially as and for the purpose described.

60,755.—JOHN S. LIPPS, Brooklyn, N. Y., assignor to himself and EDWIN SANDERSON, New York, N. Y.—*Composition for Fuel and other Purposes*.—January 1, 1867.—Coal dust is mixed with charcoal or coke and dextrine, dissolved in water.

Claim.—The composition of matter, substantially as herein described, and composed of coal, coke or char-

coal dust admixed with dextrine and powdered pitch and baked, essentially as herein set forth.

60,756.—HORACE T. LOVE, Vermillion township, Kansas.—*Fastening for Railroad Rails.*—January 1, 1867.—The screw head is so inclined on its under side as to have a fair bearing on the base flange of the rail. A segment is cut from one side to allow the flange of the rail to pass when necessary.

Claim.—Such an inclination of the under surface of a screw head, truncated in its relation to the gauge of the thread of the screw, as to necessitate a bearing of that surface upon the flange of the rail, so as to make the rail tight when screwed down, and the rail released by a reverse operation of the screw, the truncation being tangential to the shank of the screw, in the manner and for the purpose herein described.

60,757.—ORAZIO LUGO, New York, N. Y.—*Deodorizing Petroleum.*—January 1, 1867.—For two gallons oil take a mixture of niter, two pounds; common salt, a half ounce, and bichromate of potash, one drachm; add sulphuric acid, one pound. The oil is treated with this compound while the materials are acting on each other. It is then treated with hypochlorite of soda.

Claim.—The use of chromic acid and hypochlorite of soda, or their equivalent, for the purpose of deodorizing offensive smelling kinds of petroleum.

60,758.—GEORGE B. and CLARK LEWIS, Adams Centre, N. Y.—*Device for Suspending Horse Hay Forks, &c.*—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, a clutch for suspending horse hay forks, &c., consisting of the movable and adjustable bars A A pivoted together, and having penetrative points G G, substantially as described and for the purpose set forth.

Second, in combination with the above, the crocheted bolt B, handle nut C, and bolt H, applied and operating, substantially as and for the purpose specified.

Third, the sliding or movable ring F, in combination with the adjustable clutch A A, as and for the purpose specified.

60,759.—JOSEPH D. LOFTUS, Chelsea, Mass.—*Concentrating Sulphuric Acid.*—January 1, 1867.—The acid is concentrated to 62° or 63° by Beaume's scale in open iron pans, and then to 67° by heat in an iron still.

Claim.—In the process of concentration or distillation of sulphuric acid, the employment of iron vessels or tanks, substantially as set forth.

60,760.—JAMES H. LOOMIS, Attica, N. Y.—*Ventilating and Heating Rooms.*—January 1, 1867.—The induction and eduction pipes pass to and from the heating drum, which is traversed by vertical flues and has a diaphragm with circular series of perforations around the said flues.

Claim.—The pipes G H, in combination with the stove-pipe heater B, constructed as described, for conveying cold air from and returning warm air to another apartment, arranged and operating substantially as set forth.

Also, constructing the heater B, with the diaphragm *f*, provided with annular perforations *i i* around the flues *d*, substantially in the manner and for the purpose described.

Also, the damper *n o*, in combination with the drum-heater B, air induction pipe G, and stove A, arranged and operating, substantially as and for the purposes set forth.

60,761.—C. E. GAGE, Fond du Lac, Wis.—*Wringer for Clothes and Mops.*—January 1, 1867.—The upper roller has movement in a slot to or from the lower one by means of a foot bar on its frame, and is rotated by a hand crank on its shaft.

Claim.—The frame composed of the slotted side bars A A, foot piece D, with roller D², in combination with the frame C carrying roller E, when arranged together, substantially in the manner and for the purpose described.

60,762.—CEPHAS MANNING, West Albany, N. Y.—*Tempering Steel Springs.*—January 1, 1867.—A composition of linseed oil and common salt is used for

tempering, to prevent cracking of the steel and to produce a tougher spring.

Claim.—The use of the combination of linseed oil, raw or boiled, with as much common salt as the oil will take up, in the manner and for the purpose specified.

60,763.—EDWARD A. MARSH and JARVIS P. KELLY, Chicopee, Mass.—*Machinery for Punching Steel Pen Blanks.*—January 1, 1867.—The plate is clamped to a sliding carriage and intermittently fed beneath the punch by an eccentric, connecting by pitmans and bell crank to a collar carrying spring pawls, which act on a ratchet wheel of the carriage-driving shaft.

Claim.—In combination with the die, reciprocating punch, stripper, and carriage, the jaws *t*, when arranged to clamp or grasp the plate at the centre line thereof, and draw it progressively and intermittently to the action of the punch, substantially as set forth.

Also, in combination, the subjects of the first claim, the guides *w* and *x*, and guide rolls *y* and *z*, arranged to operate substantially as set forth.

Also, the arrangement of mechanism for tripping or disengaging the series of ratchet pawls, substantially as described.

60,764.—HENRY D. MARTIN, Ypsilanti, Mich.—*Machine for Cutting Fly Nets.*—January 1, 1867.—The leather is passed over the table, and is slit by two sets of knives which are alternately projected up through the table by cam rollers beneath.

Claim.—The combination of the bar knives and springs D D and the cam roller C C, substantially in the manner and for the purpose set forth in this specification.

60,765.—WILLIAM M. C. MATHWES, Summer Hill, Pa.—*Sleigh.*—January 1, 1867.—The box is carried on bolsters similar to those of a wagon. The rear bolster is pivoted to the raves and the fore bolster is connected by a king bolt to a transverse bar, reinforced by upper and under metal plates, and also pivoted to the raves.

Claim.—First, pivoting the bolsters of a bob sleigh to the bobs, substantially as herein shown and described.

Second, the combination of the bars F, iron bar N and bar or plank L, with each other and with the beams E and bolsters G of the forward bob of the sleigh, substantially as herein shown and described.

Third, the combination of the bars F and iron bar N with each other and with the beams E and bolster H of the rear bob of the sleigh, substantially as herein shown and described.

60,766.—GEORGE W. McCANN, Springfield, Ohio.—*Water Wheel.*—January 1, 1867.—The water has an upper entrance and an exit beneath. The port gate-plates are connected to the upper inclined deflecting plates so that their position may correspond with the amount of water admitted. The buckets are in two or more annular series, of which either one or both may be used.

Claim.—First, the wheel D with two or more series of buckets, substantially as described, in combination with the independent gates H H', for the purpose set forth.

Second, in combination with the gates H H', the springs N N, substantially as and for the purpose set forth.

60,767.—ANNE S. McLEAN and JAMES P. McLEAN, Brooklyn, N. Y.—*Breast Pad.*—January 1, 1867; antedated December 12, 1866.—A quilted padding next the person is secured to an outer covering of straw matting, upon which there may be a spiral spring to give prominence to the dress.

Claim.—A pad having a mat A and cushion N combined therein, whether with or without a spring or springs, all substantially as described.

60,768.—M. MELLINGER, Dayton, Ohio.—*Cane Stripper.*—January 1, 1867.—The outer stripper knives spring outward and allow the canes to fall into the circular stripping opening. The latter is adjustable in size vertically by a slot in its lower limiting plate.

Claim.—The shoulders *i* in stationary blade D and spring blades E, operating in combination with the

slotted spring blades G, as and for the purpose specified.

60,769.—M. H. MERRIAM, Charlestown, Mass., assignor to himself and E. L. NORTON.—*Feed Mechanism for Sewing Machines.*—January 1, 1867.—The ratchet segments on each side of the needle unite in one frame, which receives vertical and oscillating motion from two rocker shafts.

Claim.—First, the eccentric and its motor, the crank, link, and their motor, when combined and arranged with a feeding device, so as to operate it, substantially as described.

Second, a feeding device for sewing machines, in which a reciprocating shuttle moves at right angles, or nearly so, to the path of the vibrating feeding movements of the feeding device, when constructed substantially as set forth, and arranged to operate as specified.

60,770.—PHILIP P. MEYER, New York, N. Y.—*Making Sheet-metal Vessels of Two Thicknesses.*—January 1, 1867.—The inner-plating metal is spun on a chuck and the outer case of metal spun on over the plating metal, with or without strengthening rings between.

Claim.—First, the process described for forming a vessel of two or more metals by spinning them, one upon the other, for the purpose set forth.

Second, the combination with a vessel constructed of two or more metals, spun together as set forth, of strengthening bars or rings, substantially as herein set forth.

60,771.—WILLIAM J. MILLAR, McKeesport, Pa.—*Apparatus for Steering Vessels by Steam.*—January 1, 1867.—The steering wheel has gear connection with the crank shaft of the "nigger" (or freight) windlass engine, and is rotated in different directions by the reversal of the action of this engine.

Claim.—First, the combination of the levers *p* and *r* and the cut-off lever *h* of the nigger engine with the steering wheel *d* and the gear wheels *n*, *n'*, *o*, and *o'*, connecting it with the engine, constructed and arranged substantially as and for the purposes hereinbefore described.

Second, the check lever *t*, operated by means of stops or buttons on the tiller rope, in combination with the cut-off lever of the steam engine, constructed and operating substantially as hereinbefore described, for the purpose of stopping the steering engine when the tiller is turned to its utmost limit in either direction.

60,772.—MAX MILLER, Brooklyn, N. Y.—*Toy Wind Wheel.*—January 1, 1867.—The helical plate is rotated by the breath issuing from the holes in the chamber beneath.

Claim.—An improved toy wind wheel, formed by the combination of the mouth piece A, air tube B, air chamber C, pivoting post D, and revolving wheel E, or equivalent, with each other, substantially as herein described, as a new article of manufacture.

60,773.—MATTHEW MITCHELL, Crown Point, Ind.—*Hay Elevator.*—January 1, 1867.—The derrick is supported on a sled. The rotary post is pivoted in one of the benches and supported by a frame. The elevating rope passes over pulleys on the post and the compound lifting lever.

Claim.—First, the shaft D, lever E, provided with the friction roller *a*, in combination with the lever F and rope R, for the purposes and substantially as described.

Second, the side pieces or frame A and posts B, in combination with the levers E and F and shaft D, substantially as herein described.

60,774.—JAMES MOLYNEUX, Bordentown, N. J., assignor to the BORDENTOWN MACHINE COMPANY, same place.—*Excavator.*—January 1, 1867.—The buckets are carried on an endless chain and pass around a frame which has an oscillating adjustment. The main frame may be rotated or moved either longitudinally or laterally.

Claim.—First, a frame H, carrying an endless chain of buckets and hung to a frame capable of being turned on a platform or truck, all substantially as described, for the purpose specified.

Second, the bucket frame H, hung to a bolt or shaft arranged to slide in slots in the frame and controlled by screw rods N and N', or their equivalents, substantially as and for the purpose herein set forth.

Third, the combination of the tubular shaft G, chain pulley I, driving pulley or wheel *e*, bolt F, and slotted plates E and E'.

Fourth, the combination of the tubular shaft G, its nuts *l*, and the screw rods N and N'.

Fifth, the framework carrying the bucket frame H and endless chain of buckets, in combination with the truck P, on which the said framework turns, and the platform R, on which the truck and the entire machine are arranged to traverse—all substantially as described.

60,775.—THOMAS C. MOORE, Wilmington, Ohio, assignor to himself and WM. A. FALLIS, same place.—*Smoothing Iron.*—January 1, 1867.—A round lug with side projections at its top is cast on the body of the iron. The said lug enters a hole in the base piece of the handle, and is tightened by giving the same a turn of 90°. Heel-like projections on the body of the iron sustain it in its vertical position when the handle is detached.

Claim.—The pin *a*, with its projections *c c*, on the body A of the flatiron, in combination with the hole and its side notches *d d*, in the handle B, substantially as and for the purpose herein specified.

Also, the heel projections *g g*, in combination with the device for coupling the handle B to the body A, for the purpose set forth.

60,776.—DAVID MORRIS, Bartlett, Ohio.—*Rotary Harrow.*—January 1, 1867.—Explained by the claim and illustration.

Claim.—The rotary harrow, having a bent post, upon which a spade wheel is so journaled that the spades, by contact with the soil, shall arrest the spokes and rotate the harrow without the intervention of gearing, substantially as described.

60,777.—THOMAS NEWELL, Oskaloosa, Iowa.—*Slope-pipe Thimble.*—January 1, 1867.—The shoulders on the stone rest upon cleats fastened to the joists, and the dovetailed groove beneath permits a neat finish to the plastering of the ceiling below.

Claim.—The quadrilateral-shaped stone A, with two shoulders *a a* for resting it upon cleats between the joists, and annular dovetailed grooved ring B, constructed, as described, of one piece of stone, as and for the purposes set forth.

60,778.—NELSON PALMER, Hudson, N. Y., assignor to himself and T. G. Palmer, Schultsville, N. Y.—*Threshing Machine.*—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, arming a threshing cylinder with teeth, which have their opposite faces rough and smooth, as and for the purpose specified.

Second, making the teeth in the cylinder and concave, cone-shaped, or pyramidal, so that by adjusting the concave nearer the cylinder the surfaces of the teeth shall approach nearer to each other.

Third, such a construction and arrangement of threshing machines, having two concaves, as described, that, by the rotation of the threshing cylinder in one direction, the smooth faces of the teeth are caused to act in concert with the smooth faces of the teeth in one concave, and by reversing the rotation of the cylinder the rough faces of the teeth are caused to act in concert with the rough faces of the teeth in the other concave.

60,779.—JAMES L. PATTERSON, Wheeler Station, Ind.—*Broom Hanger.*—January 1, 1867.—The conical ring has a screw socket, by which it is attached to the end of a broom handle.

Claim.—The ring A, in combination with a ball or hook B, arranged and operating substantially as and for the purposes set forth.

60,780.—HENRY PEMBERTON, Allegheny City, Pa.—*Manufacture of Sulphate of Alumina, Alum, and other Aluminous Compounds.*—January 1, 1867.—The acid to be used is obtained by treating the acid residuum from the refining of petroleum, in the manner described in the patent of the same inventor, dated August 2, 1859.

Claim.—The employment, in the manufacture of sulphate of alumina, alum, and other aluminous compounds, of the acid solution obtained from the tarry acid residuum of the treatment for the purpose of refining petroleum, coal oils, and other hydro-carburets.

60,781.—CHARLES H. PERKINS, Providence, R. I.—*Finishing Sheet Metal.*—January 1, 1867.—The plates, after cleaning and brightening, are subjected to the action of heat in a tight flask, the plates being arranged so that their surfaces shall not come in contact with each other. They are afterward rolled or hammered.

Claim.—First, the process herein described of annealing and imparting a blue color to sheet-metal plates, consisting in subjecting such plates, which have been previously suitably cleansed and brightened, to the action of heat applied while the plates are enclosed in a close flask, the plates being so arranged within the flask that their surfaces shall be surrounded by a free air space, substantially as set forth.

Second, the process herein described of finishing sheet-iron plates by first coloring the same in the manner above set forth, and, secondly, in subjecting the plates, after being colored, to the action of pressure rollers, or equivalent means for producing a dense and lustrous surface, substantially as described.

60,782.—GEORGE H. POOL, New York, N. Y.—*Spring Bed.*—January 1, 1867; antedated December 19, 1866.—The main slats rest upon the ends of elastic wooden slats, set at an angle in the sides of the end bed rails, and are held by pins passing through slats in the spring slats.

Claim.—The rails *c c'* resting on the springs *d d'* and *f f'*, and attached thereto by means of the pins *h h'* passing through the slots *g g'*, said springs being made of greater or less elasticity by varying their length or the angle at which they are inserted in *a* and *a'*, or by both of these means, as described and arranged.

60,783.—SAMUEL L. POTTER, Wyandotte, Mich.—*Fagot for Railroad Rails.*—January 1, 1867.—The steel is enclosed by the iron, except on one side, and the pile so rolled as to leave the steel exposed over the wearing surface of the finished rail.

Claim.—A pile or fagot for rolling railroad bars, constituted of iron and steel bars, arranged substantially as herein represented and described.

60,784.—EDWARD POWELL, Conneautville, Pa.—*Spring Crupper.*—January 1, 1867; antedated December 29, 1866.—The spring frame is attached to the loop of the crupper, and operated to raise the tail of the horse.

Claim.—The metal frame A A, in combination with the spiral spring B B and tail supporter C C, substantially as described.

60,785.—GEORGE PURRINGTON, jr., New York, N. Y., and JAMES H. PURRINGTON, Mattapoisett, Mass.—*Carpet Sweeper.*—January 1, 1867.—The brush shaft is rotated by a corrugated pulley driven by contact with the rubber periphery of one of the sustaining wheels. The dust is caught and retained by the receivers.

Claim.—The adjustable axles or bearings K, constructed and arranged substantially as herein described, in combination with the drive wheels J and frame A of the sweeper, as and for the purpose herein set forth.

60,786.—ELIAS RHOADES, jr., and J. W. RHOADES, Clyde, Ohio.—*Spring Fish-hook.*—January 1, 1867.—The hook shanks are attached to one plate and pass through a second. The shanks are bent in such shape that when the plates are drawn together the hook ends will spring out. A spiral plate causes the revolution.

Claim.—The hook and rods A B, having swells D and contraction C, in combination with the ways F F, stationary head E, cross head G, spiral plate H, as and for the purpose substantially as specified.

60,787.—SENECA M. RICHARDSON, Worcester, Mass.—*Planing Machine.*—January 1, 1867.—The segmental pressure plate has guide grooves concentric with the cutter shaft, and is kept forward by a spring.

Claim.—In a tonguing and grooving or other like

machine, the combination with the cutter head of an adjustable mouth piece or presser bar attached to the bed piece of the machine, so that, while separate and distinct from the cutter head, it may be capable of moving concentrically therewith, the whole being constructed and arranged for operation substantially as shown and described.

60,788.—WILLIAM L. RICHARDSON, Reading, Mass., assignor to himself and F. E. NUTTING, Florence, Mass.—*Level.*—January 1, 1867.—The disk plate of the spirit level has a scale upon it, and may be set to any inclination and retained by a pin on its spring, which enters perforations upon it. The pivot stud of the tube plate has grooves upon it by which, in combination with a set screw, the tube can be set at a required angle to its previous position. The upper frame is carried on a ball-and-socket joint, and from the center of the ball depends a plummet line.

Claim.—First, a ball joint having the plummet line attached to the center of the ball, substantially as and for the purpose described.

Second, the stud H, having the grooves *c d e*, arranged with the set screw *b*, substantially as and for the purpose described.

Third, the tube S mounted upon the frame L, and having the reversible level M, arranged as described, and being detachable from the rest of the instrument, so that it can be used as a mason's level and plumb, substantially as described.

60,789.—JAMES C. ROBERTS, Adamstown, Md.—*Grinding Mill.*—January 1, 1867.—The controlling mechanism is regulated by a governor which effects the adjustment of the millstones, as well as the feed of the grain to the mill, to the speed of the motor.

Claim.—In combination with a governor operated from the mill gear, a regulating mechanism operated through the intervention of a screw shaft, a traveling poise, and scale beam, that will change and adapt both the feed and the set of the stones to the varying speed of the runner caused by changes in the motive power, and thus produce a uniform grade of flour or meal, substantially as described.

60,790.—A. J. ROBINSON, Troy, N. Y.—*Mop Wringer.*—January 1, 1867.—The mop cloth is thrust down into the conical cavity between the spirals, and its handle turned to eject the water.

Claim.—An improved mop wringer formed by the combination of the bar B and wringer C, constructed with a circular rim *c*², two or more descending spiral arms *c*³, lower central part *c*¹, and tenon *c*⁴, substantially as herein described and for the purpose set forth.

60,791.—WILLIAM N. ROWE, Washington, D. C.—*Safety Nipple for Fire-arms.*—January 1, 1867.—The nipple has a turn cap whose hole may be made to coincide with that in the nipple or otherwise; in the latter case to prevent ignition when the hammer falls.

Claim.—In combination with the nipple of a fire-arm, a cylinder shield or cap that can turn thereon, and having an opening through it, that in one of its positions closes, and in its other position discloses the opening through or the powder in the nipple, and so that a cap may be exploded upon it in its closed position without firing the charge in the arm and fire it in its other disclosed position, substantially as described.

60,792.—G. RUSSELL, New York, N. Y., and THOMAS B. HULL, Brooklyn, N. Y.—*Printer's Ink Roller.*—January 1, 1867.—The roller is formed on a tube whose end plugs are prolonged to form journals.

Claim.—First, the construction of a stock on which to cast or form printers' rollers for receiving or distributing ink in such a manner that the journals on which it turns may be removed and replaced at pleasure.

Seco: 1, the use of a cylinder or tube as a stock for a printers' roller.

60,793.—JOHN S. RYAN, Berlin, Wis.—*Means for Rocking Cribs or Cradles.*—January 1, 1867.—The cradle is actuated by connecting a rocker to a crank on a revolving wheel shaft. Power is communicated from a coiled spring.

Claim.—The combination of the platform A, spring B, wheels C D, and crank wheel E, arranged in con-

nection with the shaft G, arm H, and adjustable rod I, in the manner and for the purposes specified.

60,794.—JOHN LEWIS SAMUELS, San Francisco, Cal.—*Composition for Preparing, Hardening, and Preserving Wood.*—January 1, 1867.—Sulphate of iron, 1 lb., and lime, $\frac{3}{4}$ lb., are mixed with 1 gallon of water for injection into the pores of the wood.

Claim.—The use of the above-mentioned composition of sulphate of iron, common lime, and water, in about the above-mentioned proportions, for the purpose of injecting wood and timber to render them impervious to the influence of wet and dry rot and the attacks of worms and insects.

60,795.—BERNARD SCHAEFER, Chicago, Ill.—*Boiler Flue Cleaner.*—January 1, 1867.—Two semi-circular flanges are carried on the expanding spring arms. Inclined guides project from the periphery of the flange at the point of junction with the arms.

Claim.—The construction and arrangement of the springs A A with the disks B B, plate C, and guides D D, as herein described and for the purpose set forth.

60,796.—ELI SECOR, Lawrence, Mich.—*Box for Transporting Small Fruit and Berries.*—January 1, 1867.—A number of trays are connected together vertically and are supported on spiral springs. The trays have a hinged portion at bottom to allow downward discharge.

Claim.—First, a fruit box for the transportation and safe keeping of fruits or berries, constructed and arranged substantially as herein shown and described.

Second, the tray C, either separately or in combination, constructed and arranged substantially as herein shown and described and for the purposes specified.

60,797.—MARTIN L. SENDERLING, Jersey City, N. J.—*Apparatus for Mixing Sugar.*—January 1, 1867.—The various qualities of sugar pass between rollers beneath the hopper and fall on the revolving mixer.

Claim.—First, the process, substantially as herein described, of mixing sugars through centrifugal force by means of a wheel receiving upon it sugars of different grades or qualities.

Second, the mixing wheel, acting by centrifugal force, constructed with vanes inclining on their faces upwardly in a backward direction in relation to the run of the wheel, essentially as specified.

Third, the combination with the centrifugal mixing wheel of a crushing mill arranged to deliver the crushed sugar directly upon said wheel, substantially as herein set forth.

Fourth, the combination of a divided hopper, crushing mill, and centrifugal mixing wheel, essentially as specified.

60,798.—JAMES W. SINGLETON, Quincy, Ill.—*Gate.*—January 1, 1867.—Levers in the wheel tracks are connected to segmental blocks whose arcs carry ropes so coiled and connected to the gate as to open and close the same by the passage of a carriage.

Claim.—The apparatus constructed and arranged substantially as herein described for the purpose of opening and closing gates and fastening and releasing them when either open or closed, as herein set forth.

60,799.—FRANCIS SMITH, Boston, Mass., assignor to EDWARD WARD WILDER, same place.—*Caster for Furniture.*—January 1, 1867.—The roller arm carries a transverse roller which has bearings in the concavity of the bottom of the table leg.

Claim.—The formation of the lower end of the leg E with the curved concavity *d*, and the formation of the roller C and its arrangement with respect to such concavity and the shank B of the roller frame A, substantially as set forth.

60,800.—HIRAM SMITH and THOS. J. LUMIS, Norwich, Conn.—*Machine for Tenoning Blind Slats and Boring the Stiles.*—January 1, 1867.—The tenons are cut simultaneously by revolving hollow cutters, and the slat presented while it is held upon the cutters to two circular saws that form the shoulders. A spring gauge-pin determines the distance for boring the holes in the stiles.

Claim.—First, the use of the vibrating centering cutters *d' d'* in combination with circular saws *c c*, the

said cutters and saws being brought into action by means such as described, or the equivalent thereof, and operating substantially as described, for the purpose of forming tenons on slats.

Second, constructing the tenon cutters *d' d'* in such manner as to compress and taper the extreme outer ends of the tenons on the slats, substantially as described.

Third, the combination of tubular longitudinal cutting and centering tenon cutters *d' d'* with slat rests *g g*, which are constructed and arranged substantially as described.

Fourth, the combination of the shafts C C', adjustable standards D D and E E, with the slat supports H H, which are also adjustable, the said parts being brought into action by means such as described, or the equivalent thereof, substantially as described for the purpose set forth.

Fifth, the spring pin *n* applied to adjustable arms *m m'*, in combination with the stile support K and boring tool *o o'*, substantially as described.

Sixth, holding the slats by means of the tubular cutters, cutting the shoulders of the tenons with the saws, and then finishing the tenons by means of the same tubular cutters, which hold the slats while the saws are operating, all substantially in the manner herein described.

60,801.—R. S. STENTON, Brooklyn, N. Y.—*Wrench.*—January 1, 1867.—Explained by the claim and illustration.

Claim.—Making the inclining jaws A and B at such an angle with the straight shank C¹ as to embrace four sides, and to grasp in parallel contact three sides of a hexagon nut, in combination with a sufficient elongation of the lower jaw, so as to grasp two sides of a square nut as set forth.

60,802.—FRANCIS A. STERRY, Canton, Mass.—*Adjusting Spindles in Ring Spinning.*—January 1, 1867.—The bolster and step are adjustable laterally to restore the spindle to position after becoming worn.

Claim.—Adjusting the spindle E by the bolster F and the step G, nuts *f g*, and openings O O, substantially in the manner and for the purposes herein set forth.

60,803.—CHARLES L. STEVENS, Galesburg, Ill.—*Water Elevator for Railroad Tanks.*—January 1, 1867.—The frame has inclined rails by which it is depressed by the passage of cars, giving by the pivoted levers the up stroke to the pump pitmans. Weights on the levers cause the down stroke.

Claim.—First, the arrangement of the three levers C C' C, constructed with friction rollers *f* on their ends, for operating the pumps by the depressing and elevating movement of the platform beams *b* resting directly thereon, and weights E connecting therewith substantially in the manner and for the purpose as set forth.

Second, weather-tight planked rail platform, resting directly on the friction rollers *f* of the ends of the levers C, substantially in the manner and for the purpose as set forth.

Third, the platform beams *b* having shaft rods constructed with friction rollers *c* on their ends, and operating in vertical openings *g* in the bed sills D, and under the rails, substantially in the manner and for the purpose as set forth.

Fourth, the friction rollers *h* as arranged on the corners of the ends of the platform, to serve as lateral guides in the depressing and elevating movement of the platform, substantially in the manner and for the purpose as set forth.

Fifth, the weights E, as arranged in their connection with the levers, substantially in the manner and for the purpose as set forth.

Sixth, the side plates *a* on the sides of the rails A of the platform, substantially in the manner and for the purpose as set forth.

60,804.—ALBERT STUCKENRATH, New York, N. Y.—*Cut-off for Steam Engines.*—January 1, 1867.—Improvement on his patent of May 1, 1866, (No. 54,439.) The cut-off is regulated by levers from the governor which, by a rack and pinion, turn a shaft within the steam chest. A pointer attached to the shaft in combination with a scale indicates the pressure of steam and point of cut-off.

Claim.—The lever L, adjustable ring R, constructed substantially as and for the purpose set forth, and shown in the accompanying drawings.

Also, the combination of the pronged lever L, adjustable ring R, levers *u*, and index of the graduated dial D, substantially as set forth.

60,805.—WILLIAM TOSHACH, New York, N. Y.—*Car Spring.*—January 1, 1867.—The spring has plates of gradually increasing lengths upward and downward from the middle diaphragm, and are inclosed in a case whose top and bottom plates are movable and have bearings on the ends of the longer and outer spring plates. Rubber springs are interposed between the movable plates of the case and the spring plates.

Claim.—A series of thin, elastic, rectangular metallic plates, either straight or curved, of graduated lengths, in combination with compensating rubber springs, and a suitable casing when so arranged as to be deflected if made straight, or straightened if used in a curved form, by means of flanged pressure plates, the whole constructed and operating substantially in the manner and for the purpose herein set forth.

60,806.—JOSEPH TRENT, Millerton, N. Y.—*Liquid Measure.*—January 1, 1867.—The funnel is so hinged to the nozzle of the measure that it can be applied to its general use or as a cover. A cylindrical portion at its larger end enters the measure and directs the drip thereinto when the funnel is inverted.

Claim.—The combination of the can A, and the funnel B, and the double-jointed hinge H, substantially as arranged and described.

60,807.—HENRY S. VROOMAN, Hoboken, N. J.—*Channeling Machine.*—January 1, 1867.—An improvement on the "McKay channeler." The arm carrying the channelling cutters and the upper feed-roller is removable without removal of its pivot pin. The operating parts are adjustable to cut the channels to the required depth and distance from the edge.

Claim.—First, so applying the arm L to the machine that it may be removed from the frame or standards without withdrawing the pin *a*, upon which it swings.

Second, the provision for longitudinal movement of the arm to adjust the cutters with reference to the edge guide wheel, substantially as set forth.

Third, in combination with the arm L the block N, or the auxiliary block O, carrying the cutters, and made capable of vertical adjustment to simultaneously regulate the depth of cut of the knife, and grooved substantially as described.

Fourth, the slotted construction of the knife-stock Q, in combination with a groover stock and other parts of a channelling machine, to permit its removal without withdrawing the screw *h*, substantially as set forth.

Fifth, in combination with the stock Q the gange plate P, for determining the position of the knife when replaced substantially as described.

60,808.—JAMES T. WATSON, Richmond, Ind.—*Gate Hinge.*—January 1, 1867.—One of the wings has a sliding adjustment in its attaching bracket so as to be regulated in distance from the pintle, for the purpose of adjusting vertically the outer end of the gate.

Claim.—The combination and arrangement of the butt A, bar or wing B, bracket C, and thumb-piece and screw-bolt D, when constructed and operating as and for the purposes set forth.

60,809.—ISAAC P. WENDELL, Philadelphia, Pa.—*Mode of Lubricating Journals.*—January 1, 1867.—The oil box has tubes communicating with the lower face of the journal, and contains spiral wires to conduct the oil to the journal on the exhaustion of air at the upper ends of the tubes.

Claim.—An oil box A, having a tube D, in combination with plate B, having orifices *b b*, and journal E, substantially as described.

60,810.—WILLIAM WESTLAKE, Brooklyn, N. Y., assignor to CROSS, DANE & WESTLAKE.—*Lantern.*—January 1, 1867.—A zone of colored glass is placed over the glass globe for use as a signal. The cap is held on by catches which are released by thumb pins. The usual top plate is perforated at the mar-

gin, and an additional top is attached outside the perforation.

Claim.—First, converting the "conductor's" lantern into a "signal" lantern, by the means and substantially as herein recited.

Second, accommodating the globe, or glass of the lantern, by means of the screw plate connected to the part *c*, substantially as herein described.

Third, the cap *h* above the plate *g*, for preventing the escape of the oil as herein named.

60,811.—MARTIN V. B. WHITE, Ballston, N. Y.—*Ice Spur.*—January 1, 1867.—A plate having two end loops projecting forward is attached to the front of the heel, and a bar with a spur attached is slipped under these loops and retained by a spring and a projecting lip.

Claim.—The combination of the detachable and adjustable ice spur A with the metallic piece B, or its equivalent, operating in the manner and for the purposes substantially as herein fully described and set forth.

60,812.—BAXTER D. WHITNEY, Winchendon, Mass.—*Planing Machine.*—January 1, 1867.—The pressure feed-roller on the planed part runs at different speed from the other feed-rollers to keep its face clear by slight friction upon the board.

Claim.—Having the size of the back pressure feed-roller, or rolls, or the size of the gear wheels that drive them, such as will give the surface of the roll or rolls a trifle greater or less motion than the front feed-rolls and lumber to be planed have, thus causing the back roll or rolls to slide a trifle on the planed surface, thereby preventing any substance from adhering and accumulating on the rolls.

60,813.—MARK WILDER, East Princeton, Mass.—*Threshing Machine.*—January 1, 1867.—The concave is radially adjustable. The dust is drawn in from the mouth of the machine by a rotary fan, and is discharged through a spout at the tail end by another fan. The object is to prevent the diffusion of dust among the operators.

Claim.—First, the combination of fan D with the separating parts of the machine, substantially as and for the purposes stated.

Second, the combination of fan C with the threshing parts of the machine, substantially as and for the purposes stated.

Third, the combination and arrangement of fans C and D with cylinder B, substantially as set forth.

Fourth, the combination and arrangement of fans C and D and threshing cylinder B with frames O and K, as and for the purposes set forth.

Fifth, the combination with the front of box E of the guards *o* and adjustable frame *p*, substantially as and for the purposes set forth.

Sixth, supporting bed piece H by means of hinged supports I and J, for the purposes stated.

Seventh, the combination of the adjustable damper R with the fan D, substantially as and for the purposes set forth.

60,814.—O. F. WINCHESTER, New Haven, Conn.—*Metallic Cartridge.*—January 1, 1867.—The cartridge shell has a cap over the rear front, and a cushion interposed between the two rear disks to prevent accident and relieve the breech-pin when firing.

Claim.—A cartridge case consisting of the case A and cap B, with the intervening disk or cushion *b*, arranged to operate substantially as and for the purpose set forth.

60,815.—EMANUEL ZORGER, Greensburg, Ind.—*Car Coupling.*—January 1, 1867.—The coupling is self-attaching, the entering link raising the lever catch, an angular part of which drops into a complementary slot in the catch plate of the draw-head. The draw-head is held in place for attachment by friction plates backed by springs. A groove in the catch receives the link when coupled.

Claim.—First, the hinged gravitating catch D, when constructed with the concavity I and chamfered faces *g g'*, and with the slot *f*, and used in combination with a draw-head, with converging throat and V-shaped pocket I, and also in combination with the hinged bar *k*, said parts being constructed sub-

stantially in the manner and employed for the purpose set forth.

Second, in combination with the draw-bar *a'* and draw-head A, constructed and arranged to act automatically, substantially as set forth, the friction plates N N' and tension springs O P for holding the draw-head in any required position when coupling the cars, substantially as set forth.

60,816.—E. H. ASHCROFT, Lynn, Mass.—*Globe Valve for Steam Engines.*—January 1, 1867.—The valve stem is hollowed axially, and the hollow has raised radial continuations above the valve for the passage of grinding material. The stem admits of free rotation for grinding by disconnecting the upper nut from the body.

Claim.—First, the hollow valve stem D, constructed in the manner substantially as described and for the purpose set forth.

Second, the combination of the said stem with the globe valve B and screw nut F.

60,817.—E. H. ASHCROFT, Lynn, Mass.—*Boiler Gauge Cock Handle.*—January 1, 1867.—The wooden handle disk is secured to the stem between two metal plates by traversing rivets.

Claim.—A handle for gauge or water cocks for steam boilers, constructed in the manner substantially as shown and described and for the purpose set forth.

60,818.—STEPHEN L. AVERY, Norwich, N. Y.—*Pump.*—January 1, 1867.—The wrist pin of a crank upon the driving-pinion shaft has play in the slide slot of the inclined cross-head of the pitman. A spiral spring counterbalances the pitman rod and buckets.

Claim.—Improved pump, constructed of the sliding plate *g*, compensating spring *z*, metallic plunger or piston *d*, and suitable valve and valve seats *j*, arranged in combination with the tubing of a well A, and operating substantially in the manner hereinbefore described.

60,819.—DAVID M. AYER, Lewiston, Maine.—*Preparing Sole Leather for Boots and Shoes.*—January 1, 1867.—The leather when damp is run between a fluted and plain roller, and afterward dried between heated plates of similar conformation.

Claim.—First, the method herein described of preparing sole leather for the construction of boots and shoes, with air cells between the outer and inner soles.

Second, as an article of manufacture and sale, sole leather corrugated or fluted, and hardened, substantially as described.

60,820.—FREDERICK G. BAKES, Vevay, Ind.—*Hillside Plow.*—January 1, 1867.—The plow has right and left wings as upward additions to the mold boards; these are adapted to be used alternately; they have devices for securing them in their places to the beam or mold board.

Claim.—First, the provision in a hillside plough of right and left wings, or mold boards G G', adapted to be alternately secured in the active and inactive positions substantially as set forth.

Second, in the described combination with the reversible share F, and wings G G', the latch K, lips P, lugs L L', M M', eye N, and hook O, or their mechanical equivalents, for the purpose explained.

Third, the arrangement of duplicated wings G G', pivoted near their front ends to the sheath, and secured alternately to their upper or inactive positions by the hook Q, and the eye R, or their equivalents.

60,821.—GEORGE BALDWIN and ALLEN B. CHASE, Italy Hill, N. Y., assignors to ALLEN B. CHASE.—*Wool Press.*—January 1, 1867.—The table has three sections; those at the side hinged to the central one. The fleece is placed on the table and the side leaves raised to fold in the sides. The hinged ends of the central section are then raised, folding in the ends of the fleece. The underlying cords are then tied over the fleece. A treadle releases the catches which hold up the folded leaves.

Claim.—The latches D and D, rolling catch E, provided with the weighted arm G, and treadle F, when constructed and arranged substantially as specified and used for the purpose set forth.

60,822.—E. D. BARRETT, New Haven, Conn., assignor to himself and JULIUS B. SAVAGE.—*Die for Cutting Screws.*—January 1, 1867.—The cutters are lodged in a recess in the cutter heads, and are adjustable tangentially to the article being turned by set-screws on one side and a wedge-shaped piece operated by set-screws on the other; the different positions to which the cutters may be adjusted remain always in planes parallel one with another.

Claim.—The combination of the lever E, the wedge I, cutter *e*, and set-screws *g* and *c*, so as to operate substantially in the manner herein set forth.

60,823.—THOMAS J. BARRON, Brooklyn, N. Y.—*Converting Iron into Steel.*—January 1, 1867.—The iron, after fashioning to any form, is confined in a retort with hydrogen, carbon and nitrogen in stated proportions, and subjected to heat.

Claim.—First, the use and application, for converting iron into steel, of the compound gas composed of carburetted hydrogen with nitrogen and cyanogen, or with nitrogen and carbonic oxide, and either with or without ammoniacal and chlorine gases, applied substantially as described.

Second, the use, in combination with the process of converting iron into steel by the application of such gases, of chlorine gas, preliminary to such process, for the purpose and in cases as set forth.

Third, protecting the metal after it has been steeled or converted into steel, and when the same is to be hardened while being transferred to the hardening bath, from contact with the atmosphere, for the purposes set forth.

60,824.—WILLIAM BATTY, Cincinnati, Ohio.—*Powder for Facing Molds.*—January 1, 1867; antedated December 23, 1866.—The facing powder is made from the crusted residuum of petroleum stills or coal-gas retorts. The cinder is pulverized and bottled to prepare it for use.

Claim.—The molder's facing powder, composed and prepared in the manner described.

60,825.—CHARLES BEACH, Penn Yan, N. Y.—*Corn Sheller.*—January 1, 1867.—The hopper has inclined ribs within. The concave shelling face consists of narrow pendent plates confined by a ring made vertically adjustable to limit the space between the grinding surfaces. The corn and cobs are swept over the sieve bottom, and the cobs pass over an inclined riddle. The corn is delivered on one side and the cobs on the other. A blower disperses the chaff.

Claim.—First, the adjustable ring D, in combination with the shelling bed composed of the spring sections *b b*, operating substantially in the manner and for the purpose herein specified.

Second, the combination of the inclined wings *a a*, with the hopper B, shelling bed C, and cylinder or cone E, arranged and operating as herein set forth.

Third, the combination of the curved arms G G, with the perforated floor H, and cob outlet *f*, when arranged in connection with the shelling mechanism C E, substantially as described.

Fourth, in combination with the subject matter of the preceding claim, the arrangement of the perforated chute L, with hinged valve N, and the reverse discharge board M, the whole arranged and operating as described.

Fifth, the special construction and arrangement of the machine, consisting, essentially, of the bed C, cylinder or cone E, arms G G, perforated floor H, discharge board L, exhaust fan P, and the inclined chutes L M, operating substantially as set forth.

60,826.—JOHN H. BEAR, York, Pa.—*Horse Hay Rake and Seeder Combined.*—January 1, 1867.—Seed hoppers are attached to the rake axle for distribution of seed or fertilizers. The rake lever will either raise the rake for the discharge of hay, or depress it to act as a harrow.

Claim.—First, securing one or more seed hoppers, which are provided with seed-dropping devices or guano distributors to the axle-tree of a hay rake, the teeth and driver's seat of which are applied to said axle, substantially as described.

Second, the combination of the hopper box G, axle-tree A, driver seat D, and a lever for enabling the

driver to hold the rake teeth down for harrowing in the seed, substantially as described.

60,827.—ASA BEE, White Oak, West Va.—*Saw.*—January 1, 1867.—The planing bits are attached to the sides of the saw to plane both sides of the kerf. The lower sides of these bits are grooved to an edge and set at an angle with the plane of the cutting line of the saw.

Claim.—The plane bit or iron *a*, when constructed with a groove or gutter *a'*, and secured to the blade of a saw, substantially as and for the purpose specified.

60,828.—EDWIN L. BERGSTRESSER, Sunbury, Pa.—*Gate.*—January 1, 1867.—The gate is centrally pivoted on a longitudinal arm supported by rollers at the rear gate post. The gate is opened by being turned 90° and then moved backward with its supporting arm to the rear post.

Claim.—First, pivoting the gate centrally to an overhanging sliding bearer, arranged substantially as and for the purpose specified.

Second, the sliding bearer to which the gate is pivoted, arranged to operate substantially as and for the purpose specified.

Third, the arrangement of the friction rollers, in the described relation to the post, and to the sliding bearer passing through said post, for the purpose specified.

Fourth, the employment of a weight or counterpoise upon the outer end of the sliding bearer, which has the gate pivoted to its inner end, substantially as and for the purpose specified.

60,829.—JOHN F. BOYNTON, Syracuse, N. Y.—*Anti-friction Oil.*—January 1, 1867.—Vegetable oils and gums are placed in a closed vessel with hydrocarbons to be oxidized under heat in the presence of sulphur. The ingredients used are noted in the claims.

Claim.—First, a material for lubricating machinery, formed by combining sulphur with hydro-carbon oils, tars, or their equivalents, substantially as described.

Second, the combination of linseed oil with the products of gas tar and sulphur.

Third, the combination of any of the petroleum series of hydro-carbons with the gas tar series, as herein described, for the purpose set forth.

Fourth, the combination of the petroleum and gas tar series of the hydro-carbons with sulphur, for the purpose set forth.

60,830.—JOHN F. BOYNTON, Syracuse, N. Y.—*Roofing Material.*—January 1, 1867.—Composed of gas tar, 40 gallons; pitch, 20 gallons; distillate from gas tar, 10 gallons; clay, 20 pounds; carbonate of lime, 20 pounds; sulphate of iron, 3 pounds; sulphur, 2 pounds; and chloride of calcium, 1 pound. These are mixed with peat, muck, or proper fibrous or ligneous material.

Claim.—First, the combination of peat with gas tar or gas tar products, as and for the purpose described.

Second, the combination of muck with gas tar or gas tar products, as and for the purpose described.

Third, the combination of ground ligneous and fibrous materials, peat and muck, with gas tar or gas tar products, for the purpose described.

Fourth, peat, muck, and disintegrated ligneous and ground fibrous materials combined with asphaltums, gas tar and its products, substantially as set forth and for the purposes herein described.

Fifth, the combination of the silicate of soda, silicate of magnesia, and the chloride of calcium, for the purposes above specified.

60,831.—C. H. BUTTERFIELD, Sturbridge, Mass., assignor to J. E. TAYLOR, Sutton, Mass.—*Carriage Spring.*—January 1, 1867.—The spring plates are bolted to the perches, and pass through loops thereon with a longitudinally extended top. The springs are jointed to the body loops, and these latter have slots for the passage of screws for their attachment to the frame.

Claim.—First, the clasp D, constructed as shown, in combination with a single leaf spring C, as described.

Second, securing the spring C to the bearing H B, by means of the close joint E, in combination with the clasp D, as and for the purpose set forth.

60,832.—A. ALPHONSE CHASSFQOT, Paris, France.—*Needle Gun.*—January 1, 1867.—The needle is attached to the end of the hammer rod, which is enveloped in an oscillating sleeve having a projection on it that enters a suitable cavity in the barrel, when the gun is charged. The hammer rod and sleeve have such projections and slots that the gun must be cocked, and the sleeves so turned as to retain the parts in that position before the needle mechanism can be drawn back for the insertion of the cartridge. After the replacement of these parts the turning of the sleeve to the position for firing transfers the onus of retention of the hammer to the tumbler, which is operated by the trigger. An annular packing of vulcanized rubber is confined between the end of the sleeve and a flange on the needle case, so that the pressure of the discharging cartridge shall pack the barrel. The fore end of the needle case has an annular chamber around it for the reception of the residuum of the cartridge.

Claim.—First, in a breech-loading fire-arm, the rigid connection between the needle-carrying rod and the cock or hammer by which the said rod is operated and withdrawn from the breech bolt, substantially as shown and set forth.

Second, the combination with the tubular breech bolt of the needle rod and its rigidly attached cock or hammer and actuating spring, under such an arrangement that by the retraction of the said rod from the breech bolt the spring shall be compressed, and the gun cocked, substantially as herein shown and described.

Third, in combination with the needle-carrying rod, and the cock to which it is rigidly secured, supporting and holding the spring which surrounds the needle rod, between the front end of the said rod and the rear end of the breech bolt, substantially as shown and described.

Fourth, the combination of the needle rod and cock or hammer for operating the same, with a sliding and rotary breech bolt, provided with slots, grooves, or equivalent devices for limiting and determining the forward movement of the said hammer and rod, as herein set forth.

Fifth, the combination of the needle-carrying rod and its tenon *l*, with the plug or bolt screwed in the rear end of the breech bolt, and perforated and recessed for the reception of the said rod and tenon, substantially as and for purposes described.

Sixth, in a breech-loading fire-arm, as herein described, the combination with the tubular bolt or breech sliding in the breech receiver as specified, of the movable sheath or tube for receiving the needle, capable of a sliding and rotary motion upon the axis of the said breech, substantially as shown and set forth.

Seventh, interposing between the head of the breech bolt and the flange formed on the movable needle sheath, a cylindrical disk or tube of vulcanized india-rubber, whose diameter is such as to allow it to slide freely in and out of the charge chamber; but at the same time to cause it to hermetically close the said chamber when compressed between the needle sheath and the breech bolt by the action of the gases generated by the ignition of the charge, as herein shown and set forth.

60,833.—ALVIN B. CLARK, Richmond, Ind.—*Apparatus for Turning the Leaves of Music.*—January 1, 1867.—The clips are attached to the leaves, and carried along the curved bar in such a manner as to detach them from the magnet at the proper time. The magnet arm is actuated by a treadle.

Claim.—First, the swinging magnet D, in combination with the clip B attached to the leaf, when operating substantially in the manner and for the purpose set forth.

Second, in an apparatus for turning the leaves of sheet music, suspending a magnet upon an oscillating arm, and so connecting the arm with a pedal, by intermediate mechanism that the leaves may be turned successively by the action of the foot of the player, substantially as described.

Third, in combination with the swinging magnet D, the clips B, attached to the rod C, when the latter is so arranged in relation to the centre of oscillation that the magnet shall be detached as the leaf is turned, substantially in the manner set forth.

60,834.—AMASA COBBS, Pittsburg, Pa.—*Photographic Bath.*—January 1, 1867; antedated December 19, 1866.—The plate is laid on the dipper rod, which is then introduced through the opening in the box, and laid on the pivoted oscillating bottom.

Claim.—The combination of the oscillating bottom F with the box A in a nitrate bath, substantially as described and for the purposes set forth.

60,835.—JOHN F. COLLINS, New York, N. Y.—*Manufacture of Alcohol and other Pure Distillates.*—January 1, 1867.—Phosphate of lime or equivalent is added to the wash or mash in heating, to neutralize or prevent the formation of acids. The distillation is carried on below 177° Fahrenheit, to prevent formation of acid. A current of gas is driven into the still to aid the escape of volatile parts.

Claim.—First, the products derived from hydrocarbon, coal, or mineral oils, petroleum or turpentine, distilled substantially as described.

Second, spirituous liquors, alcoholic substances and essential oils, distilled from wash, mash, or other substances, in the manner substantially as described and set forth.

60,836.—E. P. CONNOR, Jeffersonville, Ohio.—*Detaching Runaway Horses.*—January 1, 1867.—The hinged plate upon the back of the doubletree is thrown off its detent by a cam upon the tongue, worked by a lever on the fore axle. Raising the plate frees the doubletree.

Claim.—The arrangement of cap E e G, notch c, detent F, and cam H, or their equivalents, constructed and operating as set forth.

60,837.—JOHN CUPS, Chicago, Ill., and AMOS R. HARPER, Grandville, Mich.—*Converting Reciprocating into Rotary Motion.*—January 1, 1867.—The segmental racks engage spur-wheels so coupled by ratchet spring collars to the driving shaft as to produce continuous rotary motion.

Claim.—The employment of two rack wheels, or segmental circular racks, in combination with two pinions on the driving shaft, arranged so as to be coupled alternately thereto, in such a manner as to produce continuous rotary motion in one direction, substantially as and for the purpose herein specified.

60,838.—JONATHAN DAVIDSON, Edinburgh, Scotland.—*Apparatus for Reefing Sails.*—January 1, 1867.—The sail is sustained on the upper cross-shaft, to whose ends are hung the swinging arms, carrying at their lower ends the revolving yard on which the sail is wound. The upper yard is fixed to the two chains passing over pulleys on the upper shaft and sprocket wheels on the lower yard. The pressure of the wind, if extreme, causes the lower yard to swing forward, and spur wheels upon its ends engage a rack to wind the sail upon the yard. This action of the wind is partially counterbalanced by a spring or weight connected by a cord to the revolving yard.

Claim.—First, effecting the automatic reefing of sails by means of spring, lever, or equivalent mechanism, arranged and applied to the sails, substantially as described, so that the extent of surface of the sails exposed to the action of the wind shall always be inversely proportionate to the pressure of the wind upon the said sails, substantially as herein shown and set forth.

Second, the herein described apparatus for effecting the self-reefing of sails, the same consisting of a shaft or roller connected with a spring lever or equivalent mechanism, and engaging with one or more racks or guiding arms, projecting out from the mast, the said apparatus being so combined with the sail that the movement of the roller along its rack or guiding arm shall cause the sail to increase or diminish in size in inverse proportion to the force or pressure of the wind, substantially as herein specified.

60,839.—ELIJAH F. DUNAWAY, Indianapolis, Ind.—*Machine for Wiring Blind Slats.*—January 1, 1867; antedated December 19, 1866.—The upward movement of the hand lever operates the feed lever by a cord. The feed lever acts on the ratcheted slide, to which the rod is connected to feed it forward the length of one ratchet tooth at each movement.

Claim.—The arrangement of the cord T, with the

lever C and J, and pulley S, as herein described and for the purposes set forth.

60,840.—B. WELLS DUNKLEE, Boston, Mass.—*Coal Stove.*—January 1, 1867.—The air tubes have downward extensions nearly reaching the floor of the cold-air chamber. The caloric current may have direct exit or be made to pass out through a diving flue.

Claim.—The arrangement of the combustion chamber B, with its smoke exits E F and H, with respect to the air tubes D D, &c., of the furnace, substantially in manner and for the purpose as above described.

Also, the combination and arrangement of the flues E F and J, and their relative position with respect to the fuel supply door of the furnace, essentially as set forth and explained.

60,841.—J. E. DUST, Hyattsville, Ohio.—*Table.*—January 1, 1867.—Two of the legs are so jointed to the others as to permit their approach when the leaf is lowered. The moving legs are connected to the top by a dovetail slide. A waiter board of smaller diameter than the top is centrally pivoted upon it.

Claim.—The folding table A B, stationary legs C C', sliding legs D D', rotary waiter G, forming a convertible self-waiting and folding table and side-board.

60,842.—JOHN ALEXANDER, Greenpoint, N. Y.—*Grate for Furnaces.*—January 1, 1867.—The furnace is intended for burning slack. The grate bars have rounded grooves and small holes flaring downward. The two end sections of the grate interlock over a central lateral support.

Claim.—First, in grate bars, the grooves e and tapering holes e', arranged in the manner and so as to perform the functions herein specified.

Second, in combination with the above the locking parts E² E³ on the ends of the perforated and grooved sections E¹, and adapted to serve in combination therewith, as herein specified.

Third, in combination with the perforations e' and grooves e, the continuation of the webs E¹ over the bearers, so as to provide free access for the draft to the holes and grooves located in that part of the grate.

60,843.—JUAN S. L. BABBS, New Albany, Ind.—*Dovetail Machine.*—January 1, 1867.—An improvement on the Hartwell patent. The two platforms receive respectively the match sides to be dovetailed. The adjustable clamps may be used with either platform, having screw attachment in each case to the other platform. The gauge teats are adjustable in prominence.

Claim.—First, the construction and arrangement of the two platforms A A, when applied in combination to the Hartwell patent dovetail machine, or its equivalent, substantially as and for the purposes herein described.

Second, the use of the holdfasts or clamps in combination with the adjustable blocks C C, as applied to the combined platforms A A, when arranged and operating as and for the purposes herein described.

Third, the use of the four spring check gauges D D D D, in combination with the platforms A A, substantially as arranged and for the purposes as herein described.

Fourth, the construction and arrangement of the two graduating gauge teats E E, in combination with the combined platforms A A, operating substantially as arranged and for the purposes as herein described.

60,844.—WILLIAM A. BARLOW, Elkhorn, Wis.—*Heating Stove.*—January 1, 1867.—The chimney descends into the smoke chamber, which is surrounded by an annular air chamber and has a tilting bottom or damper. The annular air chamber has perforations at its lower edge for the introduction of air to the combustion chamber, and is surrounded by a flue space. The air has exit holes in the stove crown.

Claim.—The interior chamber C, provided with a tilting or otherwise opening bottom H and a downwardly projecting pipe or flue D, substantially as and for the purpose herein specified.

Also, the combination of the chamber C, constructed and arranged as above specified, and chamber B, substantially as and for the purpose herein set forth.

Also, the combination of the air-circulating cham-

ber G with the chambers B and C, constructed and arranged as above specified, substantially as and for the purpose herein specified.

Also, the air-supplying openings or passages *d d* at the base of the chamber C, constructed and arranged as above specified, substantially as and for the purpose herein set forth.

60,845.—WILLIAM A. BARLOW, Elkhorn, Wis.—*Heating Stove.*—January 1, 1867.—Air is introduced to the combustion chamber by a pipe whose exit is at the center of the deflecting plate above the grate. The calorific current passes around the edge of the deflector and up through a central flue, which is surrounded by an air chamber having holes at top.

Claim.—A deflecting plate B, in combination with one or more air-supplying pipes C, arranged and operating substantially as and for the purpose herein specified.

Also, in combination with the foregoing, the interior downwardly extending pipe or flue D, and an air-circulating chamber E surrounding said pipe or flue, substantially as and for the purpose herein set forth.

60,846.—D. C. BAUGHMAN, Föft Seneca, Ohio.—*Seeding Machine.*—January 1, 1867.—The machine has a drill hopper for grain and a broadcast hopper for grass seed or fertilizers. The seeding wheels in the drill hopper are operated by a belt from the agitator shaft of the other hopper. The seed apparatus may be thrown out of gear by a lever and a ratchet clutch upon the axle.

Claim.—First, the combination of the two hoppers G and J with the shafts *g h*, spur wheels *a a'*, pulleys *g' g''*, or their equivalents, and clutch *b b'* upon the axle C and lever *e*, which is acted upon by the bar E, to which the drill teeth are attached, all operating substantially as described.

Second, adapting the shaft *h* of the hopper J to serve as an agitator for this hopper, and also as a means for transmitting motion from the axle C to the shaft *g* of the hopper G, substantially as described.

Third, the construction of the seed guards *l* with openings *m* in their sides, in combination with the rotary seed dischargers, substantially as described.

Fourth, making the openings through the sides of the seed guards *l* larger at their upper ends than at their lower ends, substantially as described.

Fifth, constructing the rotary seed dischargers *k* with discharging wings on each side, substantially as described.

60,847.—A. M. BEARD, Hillsborough Bridge, N. H., assignor to himself and SOLOMON MCNEIL, same place.—*Head Block for Saw Mills.*—January 1, 1867.—The log rest has lateral movement by a double pawl actuated by a lever. The pawl is held to the advancing or retracting action by a slide bar which engages a notch upon it. The pawl engages a spur wheel which revolves a shaft carrying spur wheels gearing in mortise racks. Two adjustable end rests are provided for tapering or crooked logs. A rack upon the log-rest engages a wheel on a shaft carrying index disks which indicate the lateral movement.

Claim.—First, the rotating index 4, supported on and carried by the log-rest B, and operated by a fixed rack 1 and pinion 2, substantially as and for the purpose herein specified.

Second, in connection with the graduated indicating disk or index 4, pinion 2, rack 1, and log-rest or head block B, an adjustable secondary index or graduated disk 3, arranged and operating substantially as and for the purpose explained.

Third, a hand lever D having a double pawl *d*, which is controlled by an eccentric G and sub-lever I pivoted thereto, and having a second eccentric or cam *j* and rod J for lifting the head block or rest pawl *g*, in connection with a spur wheel E, pinions *c c*, racks *a a'*, and rest B, as and for the purpose shown and explained.

Fourth, the balanced elbow-shaped pawls *z*, in connection with the stands O and sliding dogs T, as and for the purpose described.

Fifth, the rollers *q* pivoted to the tops of the stands D, as and for the purpose set forth.

Sixth, the stands D, in combination with the movable rest B, when the said stands are adjustable on the said rest B, substantially as and for the purpose set forth.

60,848.—EDMUND BECKER, Cincinnati, Ohio.—*Roofing.*—January 1, 1867.—Narrow strips are secured centrally over each rafter by cords or wires, and side pieces are fastened to these strips. The side pieces have grooves in their lower sides to contain the up-turned side edges of the roof sheets. The strips and their side pieces are covered by metal, and the metal cover and the up-turned edges of the sheets are traversed by horizontal pins, which attachment allows the expansion or contraction of the sheets.

Claim.—First, the bars B, constructed substantially in the manner and secured at their base to the rafters of the roof, as and for the purpose described.

Second, the pins *k* driven into the bars B, in combination with the notched plates A, substantially as described and for the purpose specified.

Third, the construction of the metallic sheets A, provided at their upright sides with notches *h*, and secured to the roof by the bars B so as to have full liberty to expand and contract in all directions, as and for the purpose set forth.

60,849.—OTIS T. BEDELL, New York, N. Y.—*State Washer.*—January 1, 1867.—Explained by the claim and illustration.

Claim.—A slate washer composed of a compressible water vessel A and absorbent wiper B, combined substantially as herein set forth.

60,850.—CHARLES BEMIS, Mishawaka, Ind.—*Car Brake.*—January 1, 1867.—The lever and the chain connected thereto actuate the oscillating block by which the brakes are operated.

Claim.—The arrangement of the lever *n*, the chain *k*, the pulleys *m m*, and the shaft *e*, connected with the shoes *a a* by the arms *e e* and the rods *g g*, to operate as a railroad car brake as herein described.

60,851.—FREDERICK BENNETT, Watford, England, assignor to JOHN S. GEORGE, Nassau, New Providence.—*Manufacture and Coating of Lead Pipe.*—January 1, 1867.—The pipe is made over a fixed mandrel, which is made hollow for the passage of the tin when the pipe is to be lined.

Claim.—First, the within described process of manufacturing lead pipe by the use of a stationary mandrel in contradistinction to the mandrel generally used, which moves with the piston of the hydraulic ram, substantially as and for the purpose described.

Second, the within described process of coating the interior of lead pipes with tin or other suitable material during the process of manufacturing the same, by means of a hollow stationary mandrel, substantially as set forth.

60,852.—GEORGE F. BLAKE, Boston, Mass.—*Direct Acting Engine.*—January 1, 1867.—The tappet rod extends through stuffing boxes into the steam and pump cylinders, and the pistons impinge on its ends to work a slide valve, which directs the steam to an upper valve cylinder to operate the valve plunger therein.

Claim.—First, the tappet rod F, arranged as described, for the purpose specified.

Second, the combination of the rod F, lever G, and valve rod H, substantially in the manner described.

Third, the auxiliary exhaust, arranged and operating substantially as specified.

Fourth, so controlling the supply ports of the main cylinder by the conjoint action of valves M and N that those valves shall together constitute a cut-off to arrest the supply of steam to either end of the main cylinder while that end is exhausting, substantially in the manner and for the purpose set forth.

60,853.—JAMES BOWDEN, New York, N. Y., assignor to himself, WILLIAM H. COLBANKS and HORACE THEALL, same place.—*Fastening Boiler Tubes.*—January 1, 1867.—The tube holes are bushed with inward flaring ferrules, and the tube end is surrounded with a ferrule whose outward surface is brought in contact with the inner surface of the bushing by a nut screwing on its outer end.

Claim.—The wedge-shape ferrule C D, in combination with the nut E, tube B, and tube-sheet A, substantially as set forth.

60,854.—HENRY P. BRADBURY, Springfield, Ohio.—*Water Wheel.*—January 1, 1867.—The water is re

ceived at the side and discharged at bottom. The upper stream passes horizontally between vertical buckets and then acts while descending upon inclined buckets. The lower flow descends over the inclined buckets at the periphery of the wheel. The balanced gates for admittance of water are opened by segmental racks on their shafts, which engage with similar racks on an upper wheel.

Claim.—First, the combination of the three sets of buckets, C E F, substantially as and for the purpose set forth.

Second, the horizontal buckets C, in combination with the vertical buckets F, and the annular chamber G, substantially as and for the purpose set forth.

Third, in combination with a wheel receiving its water horizontally, the post M and balanced gates R, operated by the segment S and geared ring T, substantially as and for the purpose set forth.

60,855.—SAMUEL BRISTOW, Bedford, Ind.—*Saw Mill.*—January 1, 1867.—The actuating chain passes around pulleys on the driving shaft and rope drum. The pulley end of the drum has vertical movement by means of a lever to tighten the chain sufficiently to rotate the drum and adjust the log.

Claim.—The grooved pulley E on the drum shaft D, one end of said shaft having bearings in a movable standard, grooved pulley C on the driving shaft A, chain h, and lever F, when constructed and arranged as herein set forth.

60,856.—N. H. BRUCE, Forge Village, Westford, Mass.—*Tag or Label.*—January 1, 1867.—The cord passes under a metal plate secured underneath by the folded end of the tag.

Claim.—A tag having a cord or string, or its equivalent, secured to it by passing such cord through a metallic tube or casing, or its equivalent, attached to the tag, substantially as and for the purpose described.

60,857.—W. H. BURRIDGE, Cleveland, Ohio.—*Apparatus for Charging Gas or Air with Hydrocarbon Vapor.*—January 1, 1867.—The gas enters the chamber through a tube and is discharged near the bottom of the vessel into a tortuous passage forming a volute of cloth or wood, and then passes over the stepped plates of absorbent material so as to be fully charged with vapor.

Claim.—First, the stepped or shelved partitions provided with basins or cups and flocculent material, in combination with the case A, substantially as and for the purpose set forth.

Second, arranging the steps or pans so as to enlarge the area or surface of the same from top to bottom, and so that the evaporating capacity will be increased in proportion to the increasing density of the fluid by the elimination of the lighter portions.

Third, the plate C', volute chambers C, in combination with the partitions B', arranged substantially as and for the purpose set forth.

60,858.—BENJAMIN CHURCHILL, Wareham, Mass.—*Weighing Apparatus.*—January 1, 1867.—Two beams are employed, each furnished with a sliding scale and weight capable of being passed across the axis of the beam. Nearly all the mechanism is enclosed in a box.

Claim.—Connecting the auxiliary rod or beam F to the main beam by means of the arms F' P', each side of the axis of motion of the beam, so that the poise on the auxiliary beam may be traversed across the axis of the beam, outside of or beyond the axis of the beam, substantially as described.

60,859.—ROBERT J. CLAY, Williamsburg, N. Y., assignor to J. H. CLARK, E. WALSH, J. DONALDSON, and T. H. WALSH.—*Machine for Cleaning Cotton, &c.*—January 1, 1867.—The matted cotton passes between feed rollers to a cylinder armed with pyramidal-ended pickers, and is then carried over endless and circular screens and repicked. A blast of air carries off the dust during the operation.

Claim.—First, the machine for cleaning and relinting damaged cotton, constructed and arranged substantially as herein described.

Second, the footed revolving cylinders E E' and the rubber-sheathed rollers e e' f f' and g g', in combination with the fan-blower G, the travelling screens B B', and the revolving wire cylinders D D', con-

nected and operated substantially as and for the purposes herein described.

Third, the cylinder teeth e e, chamfered on four sides to form a pyramidal-pointed picker, in the manner and for the purposes herein described.

60,860.—WILLIAM F. COCHRANE, Springfield, Ohio.—*Flour Bolt.*—January 1, 1867.—The meal is fed to the bolt by the action of a plunger operated by connections from the bolt shaft.

Claim.—First, the combination with the reel, reel spout, and pump, of the ventilating valve E', as and for the purpose described.

Second, the arrangement of the feed spout, pump barrel, packed piston, and reel spout, with relation to each other and to the reel, as and for the purpose described.

Third, the combination with the feed spout and pump barrel of a flour pump, of the piston-packing blocks, spring blocks, spring boxes, and woollen packing, as and for the purpose described.

60,861.—STEPHEN F. DAVENPORT, Hallowell, Me.—*Steam Engine.*—January 1, 1867.—The outer piston is a cylinder whose two heads are packed in the main cylinder. The steam is received through a hollow fixed piston within the larger piston. An axial pipe conducts the steam thereto. The steam first acts on the inner side of the outer piston head, and exhausts to act expansively on the outer end of the outer piston. It then passes through the annular space between the side of the outer piston and the main cylinder to the exhaust ports.

Claim.—Improved steam engine, made substantially as described, viz: of the cylinder A, the internal piston cylinder B, the piston C, and their steam passages, ports, and valves, arranged in manner as represented, and so as to operate as described in order to cause the piston head B to be moved by the unexpanded and expanded steam, substantially as explained.

60,862.—CHARLES A. DEMLING, New York, N. Y.—*Target for Air Guns.*—January 1, 1867.—The different objects are carried on rods hinged to a bar, and lean toward the marksman. The blow of the bullet swings them over their balance and out of sight. A rear hinged bar is operated by a cord to restore all to the upright position.

Claim.—Dividing a target into a series of parts C, each of which is acted upon separately by the ball or projectile, but all of which are readjusted at the same time by a combination of the rail e, springs or weights f, and rope g with the bar B, rails d, and post A, substantially in the manner and for the purpose herein specified.

60,863.—CHARLES R. DUMMER, New York, N. Y.—*Toy Gun.*—January 1, 1867.—The ball is held in the barrel by the trigger, and upon its release is ejected by the elastic cord which lies in the groove of the barrel.

Claim.—A toy gun, constructed substantially as described, to project a ball secured to the end of an elastic cord, which is stretched between the ends of the barrel portion.

60,864.—SIDNEY S. DURFEE, Chicago, Ill., assignor to himself and CHARLES A. GREGORY, same place.—*Removing Bars from Rivers and Harbors.*—January 1, 1867.—Chains bearing conical blocks and concave-convex anchors are laid on bars beneath the water to cause the removal of the sand and soil by the counter-currents produced.

Claim.—The method of removing bars of sand, or mud, or gravel, in the beds of rivers, or at the mouths of ports and harbors, or similar places, by placing obstructions or agitators upon said bars for the purpose of breaking up the current and thereby causing it to cut into and wash away the bar, all substantially as above shown.

60,865.—RICHARD EATON, Montreal, Canada.—*Railroad Freight Car.*—January 1, 1867.—The axle housings are of wrought iron. The car body has side rests on anti-friction rollers upon the frames of the six-wheeled trucks.

Claim.—First, the truck for freight cars with six wheels and wrought-iron housings H, constructed and

arranged substantially as and for the purpose described.

Second, the cogged friction rollers *f f*, placed between bearing plates on the ear bed and truck frame respectively, and operating substantially as described.

60,866.—CHARLES EDDY, Grass Lake, Mich.—*Scaffold Bracket.*—January 1, 1867.—The divaricating arms of the upper end of the bracket have upwardly-projecting spurs upon their extremities, and there is a similar downward spur upon the heel. From the heel ascends the perpendicular bar to hold the scaffold.

Claim.—The bar *A*, provided with the arms *B B*, the said arms being provided with spurs *a a* and *e e*, either or both, for the purposes and substantially as shown and described.

60,867.—WILLIAM ENNIS, Hudson, N. J.—*Furnace.*—January 1, 1867.—The sides of the grate consist of broad longitudinal bars, overlapping each other in ascending series toward the sides. An arched furnace top forms the bottom to a fuel chamber, and has openings near the side for the admission of fuel to the furnace.

Claim.—The combination of the basket grate with its sides made of overlapping slats, as described, air chambers *G*, and supply apertures *a a*, constructed and arranged substantially as and for the purpose or purposes herein specified.

60,868.—JOSEPH S. FAIRFAX, Wheeling, West Va.—*Railroad Car.*—January 1, 1867.—This relates to street railroad cars. The trucks have a king-bolt attachment to the framework of the body, and are turned at curves in the track by connections to the splinter bar.

Claim.—The arrangement of the vibrating pedestals *B B*, connected with and supported by the cross braces *b b* and the centre block *c*, combined with the rods *e e*, the splinter bar *f*, and the spring *g g*, when applied to a street railroad car, constructed and operating substantially as and for the purposes herein described.

60,869.—D. P. and M. P. FARNHAM, Janesville, Wis.—*Combined Foot Stove and Lantern.*—January 1, 1867.—The heat chamber has a double top to equalize the temperature of the upper plate. This chamber has a telescopic arrangement for elongation when used as a lantern; the upper parts of the sides are perforated to allow passage of light.

Claim.—First, plate *s*, heat distributors *t t t t*, and lid *A*, when constructed and combined substantially as and for the purposes described.

Second, the foot stove *A B*, lamp and lantern *E F*, when constructed and combined substantially as and for the purposes described.

60,870.—HENRY FEYH, Columbus, Ohio, assignor to himself and GEORGE T. EMERY.—*Steam Generator.*—January 1, 1867; antedated September 13, 1866.—The water is conducted from the main water chamber through the fire box by horizontal pipes, and re-passes through lower pairs of pipes of smaller diameter to an inner water chamber having an upward discharge.

Claim.—First, pipes or tubes leading from the main water chamber through the fire box, communicating with pipes or tubes which also lead through the fire box, but which enter a water chamber *E* that extends above the water level, for producing a forced circulation of water in steam boilers, substantially as described.

Second, pipes or tubes of different diameters, the smaller of which lead through the fire box and into a chamber that extends above the water level, for conducting the water from the main water chamber of a boiler, substantially as described.

60,871.—NEHEMIAH T. FOLSOM, Laconia, N. H.—*Atmospheric Dental Plate.*—January 1, 1867.—A slight continuous ridge is formed on the inside of the plate to form a chamber between the plate and the gum, from which the air is partially exhausted to retain the plate in position by atmospheric pressure.

Claim.—First, a packing ridge applied to the surface of the atmospheric plates of artificial teeth, substantially as and for the purpose herein specified.

Second, this invention, whether as a single ridge or

more, whether entirely encircling the plate or partially only, whether close to the edge or further from it, and in different directions, and with any materials, as set forth.

60,872.—CHARLES B. FRANCIS, Newark, N. J.—*Window Blind Fastener.*—January 1, 1867.—One of the slats has a strap plate which engages the pin of the slotted arm. A friction screw traverses the slot and holds the slats to any adjustment.

Claim.—The metallic strap *D* and slotted bar or lever *E*, for the purpose of holding the slats of window blinds at any desired angle, substantially as and for the purposes herein described.

60,873.—JACOB J. FRIEND, Altona, Ill.—*Portable Field Fence.*—January 1, 1867.—The foundation board is secured by stakes driven through it into the ground, and the panel posts and braces are attached to it by traverse pins. The rails overlap their posts sufficiently to have a bearing on the posts of the panels on each side. The adjacent posts are attached together by a keyed pin. Wires extend from post to post to keep cattle from contact with the fence.

Claim.—The rails *B*, so arranged as to have their ends project from the panels *A* of one section on to the back edges of the panels of another section, and intervene between the rails of the panels thereof, and the bolt *E* and key *F*, in combination with the panels, brace, and foot-board, substantially in the manner and for the purpose as herein set forth.

60,874.—E. L. GAYLORD, Terryville, Conn.—*Drawer Lock.*—January 1, 1867.—The wards consist of a set of pivoted plates, which have a set screw by which their relative prominence may be varied.

Claim.—The adjustable wards *D*, in combination with the bolt *B* and one or more tumblers *C*, arranged substantially in the manner as and for the purpose herein set forth.

60,875.—P. M. GILBERT, Kewanee, Ill.—*Plow.*—January 1, 1867; antedated July 1, 1866.—The adjustable standard of the subsoil plow is attached to the beam and braced to the mold board of the upper plow.

Claim.—The arrangement and combination of the subsoil plow *F*, the bar *D*, loop *H*, and clasp *E* with the beam of any ordinary mold board or gang plow, as and for the purpose specified.

60,876.—A. W. GILLET, Sparta, Wis.—*Axle for Vehicles.*—January 1, 1867.—The bushings of brass are slipped on the spindle and confined by punching down the brass into countersinks in the spindle. The inner bushing carries a butting collar.

Claim.—The employment of the bands *B B'* in combination with the axle *A*, the said bands being constructed of soft metal and confined to the axle in the manner and for the purpose herein set forth.

60,877.—W. A. GOODHER, Burlington, N. J.—*Cooking Range.*—January 1, 1867.—The range has air casings surrounding certain parts intended to keep its outer jacket cool, and to supply warm air to the room in cold weather. The heated air may be turned directly up the chimney when desired.

Claim.—The ovens *e e'* and fire place *D*, in combination with the casings *A* and *B*, and pipes *G G* and *J'*, or their equivalents, the whole being constructed and arranged substantially as and for the purpose described.

60,878.—ISAAC GOODSPEED, Norwich, Conn.—*File Cutting Machine.*—January 1, 1867.—The pivoted hammer-block is raised by the catch lever. The cutter-head is raised by the sliding cam rod, and is drawn forward by a pin on the same to feed the blank by means of the cutter after each stroke.

Claim.—First, the swinging hammer *H* operated through the medium of the arm *E* and crank pulley *D*, in combination with the cutter-stock *I*, substantially as and for the purpose set forth.

Second, the arm *F* provided with the pins *O O'* and the upper curved edge *i*, in combination with the cutter-stock *I* provided with the springs *N N'*, the pin *o*, and slot *f*, to receive the shaft *L* on which the cutter-stock works, substantially as and for the purpose set forth.

Third, the taper screw *P*, in combination with the

slotted cutter-stock I, substantially as and for the purpose specified.

Fourth, the spring T attached to the sliding bed Q, in combination with the spring clamp or pressure plate R attached to the base A by the screws *q*, substantially as and for the purpose set forth.

60,879.—NICHOLAS GOTTON, Union Depot, Tenn.—*Cotton Cultivator*.—January 1, 1867.—The mold board is adjustable by vertical and horizontal slots in its supporting post.

Claim.—First, the frame A, provided with the slots *a*¹, being at right angles in combination with the scraper B, so that the scraper B may be adjusted and secured at different angles to the frame A, substantially as shown and described and for the purposes set forth.

Second, the peculiar construction of the frame A with the lower portion running upon the ground, so as to form a gauge for the scraper, substantially as shown and described.

60,880.—FRANCIS GRANGER, Homer, Ill.—*Machine for Raking and Cocking Hay*.—January 1, 1867.—The hay is gathered by a rake, carried up by an endless elevator, and received in a conical receiver which is inverted when filled, leaving the hay cock upon the ground.

Claim.—The elevator *l* carrying by its own gravity the hay up the rake teeth *g*, in combination with the rake *g*, the adjustable frame *m*, and the hinged receiver *d*, substantially as described.

60,881.—GEORGE F. GRAVES, Mount Upton, N. Y.—*Lifting Jack*.—January 1, 1867.—Explained by the claim and illustration.

Claim.—The thumb-piece *d*, of the toothed locking bar C, in combination with the lever B arranged with the standard A, substantially as described for the purpose specified.

60,882.—A. B. GREENWALT, Baltimore, Md.—*Tatting Shuttle*.—January 1, 1867.—A pin can be projected when required to pass a thread through a loop. The pin is projected by a thumb-piece and withdrawn by a spring.

Claim.—The tatting shuttle as an article of manufacture provided with a pin thumb knob and retracting spring, substantially as described.

60,883.—GEORGE HADFIELD, Cincinnati, Ohio.—*Medical Vacuum Apparatus*.—January 1, 1867.—A rigid framework is so arranged as to receive any part of the person, and covered where necessary with an air-tight envelope. The surface operated on is relieved from part of the pressure of the atmosphere for hygienic purposes.

Claim.—First, the medical vacuum chamber or receiver composed of several separable parts, A B and C, so as to be accessible from the ground level, in the described combination with an impervious and flexible envelope L N adapted to tightly invest the receiver and the head of the patient, substantially as set forth.

Second, the receiver proper, consisting of the circumferentially grooved base A, through which the exhaust tube passes, a side portion B fixed to said base, and a movable side portion C hinged to the fixed side as described.

Third, in the described combination, the circumferentially grooved base A and elastic band M, for securing the lower edge of the cloak or envelope, as set forth.

Fourth, the flexible air-tight envelope consisting of the cloak L, cap or hood N, and elastic band M, for the purpose explained.

60,884.—O. B. HALE, Chicopee, Mass.—*Converting Wheel Carriages into Sleighs*.—January 1, 1867.—The rim of the wheel enters gains in the pillars on the runner, and is attached by cams. The nose of the runner is attached to the carriage frame by a vertically adjustable arm.

Claim.—The runner A, when the same is attached to the wheel by means of the clamps H K, and to the frame of the carriage by means of the arrangement of the nut B, rod E, and clamp F G, combined and operating substantially as herein set forth.

60,885.—WILLIAM B. HALE, Northampton, Mass., assignor to Northampton Indelible Pencil Company.—*Indelible Pencil*.—January 1, 1867.—The case is made of impermeable material, and the pencil head forms the stopper.

Claim.—The combination by which the head of the pencil becomes the stopper or cap of the case, and thus serves as its own protector, doing away with the necessity which has heretofore existed, of inclosing the pencil in a glass vial with a cork stopper and protecting the vial by a wood, metal, or paper holder.

60,886.—CHARLES HAMILTON, New York, N. Y.—*Shoe Brush and Case combined*.—January 1, 1867.—The handle of the blacking brush slides into the body of the polishing part. Into a space between the bristles of these brushes the blacking box is placed. A lid covers the brush parts and comes in contact with the beveled wooden sides.

Claim.—The combination of a boot and shoe blacking brush, polishing brush, blacking box and case, constructed and arranged in the manner herein substantially set forth and described.

60,887.—BENJAMIN HANDFORTH, Chicago, Ill.—*Propeller*.—January 1, 1867.—The propeller is attached to the sleeve of a shaft with which it reciprocates. A folding propeller for backing is attached to the same sleeve, and the interior shaft carries the valve bottom of the main propeller and a zonal ring for folding the expansible propeller. This sliding movement of the inner shaft is caused by two reciprocal jointed stops which engage a pin on the shaft which projects through a slot in the sleeve.

Claim.—First, in combination with a reciprocating shaft A the buckets B and E, arranged and operating substantially as herein described and for the purposes set forth.

Second, in combination with the shaft A and buckets B E the arrangement of the slide C, valve D, and ring F, substantially as and for the purposes described.

Third, in combination with the above, the arrangement of the alternating stops L M, operating substantially as and for the purposes shown and described.

60,888.—JOHN HANLON, Bridgeport, Conn.—*Feeding Device for Sewing Machines*.—January 1, 1867.—The feed slide has vertical movement in a slot of the T-frame, which has horizontal movement in a groove of the bolt head. Both movements are caused by a lever pivoted to the T-frame, and operated by cam surfaces on a single head.

Claim.—First, the slotted T-frame or cross D D', so constructed and arranged as to contain within its vertical slot the feed-bar E, substantially as described.

Second, the use of the bolt head C, grooved substantially as shown, to receive the "cross" or slotted T-frame D D', substantially as described.

Third, the combination of the slotted T-frame or cross D D' with the feed-bar E when the body of the latter is contained within the former, substantially as described.

Fourth, hinging the lever K to the "cross" or slotted T-frame D D' substantially in the manner above described.

Fifth, combining the lever K, hinged to the slotted T-frame or "cross" as above shown, with the feed bar E, substantially as described.

Sixth, combining the "cross" D D', the feed bar E, and the lever K, which communicates motion to both the slotted T-frame or "cross" and the feed bar, substantially as described.

60,889.—B. S. HAVILAND, Fort Dodge, Iowa.—*Fence Post*.—January 1, 1867.—The part of the post beneath the ground is bent into the form of angle-iron. A brace piece slides on the post and is attached by a keeper.

Claim.—First, an improved cast or wrought iron fence post A, constructed as herein described, having a portion *a*¹ of the lower part which enters the ground bent over at right angles to the plane of the post, substantially as described and for the purpose set forth.

Second, the combination of the slide bar C, constructed as described, with the post A, substantially as described and for the purpose set forth.

Third, the combination of the key D with the post

A, substantially as described and for the purpose set forth.

60,890.—CHARLES W. HERMANCE, Albany, N. Y.—*Manufacture of Soap.*—January 1, 1867.—The ingredients and their proportions are as follows: Tallow, 100 pounds; rosin, 25 pounds; palm oil, 15 pounds; cocoa-nut oil, 10 pounds; borax, 15 pounds; and caustic-soda lye, of 20° B, 73 pounds.

Claim.—First, combining and saponifying the tallow, rosin, and oils, herein specified, by the process and in the proportions stated.

Second, the combination of borate of soda with the saponified tallow, rosin, and oils, in the proportions stated and in the manner set forth.

60,891.—HENRY HISE, Ottawa, Ill.—*Conductors' Ticket Box.*—January 1, 1867.—The tickets have duplicate ends partially separated. The conductor has free access to one-half of the tickets, but only partial access to the duplicate for the purpose of marking. After marking both ends alike the free end is separated from the other and handed to the passenger to be dropped into a box. The remaining half is thrust aside into another sealed division of the box.

Claim.—First, the box A, provided with the apartment F, spring *m*, lid C, and chamber D, arranged and combined and operating in the manner shown and described and for the purpose set forth.

Second, the secondary box E, when used in connection with the box A, and constructed of the two parts as described, box proper and lid, the latter (provided with a slot *l* and lip *f'*) as shown and described and for the purpose set forth.

Third, the tickets B having the slots *i j* and *j'*, for the purpose set forth.

Fourth, the combination of the tickets B with box A, constructed and arranged as described.

Fifth, as a complete method of detection or as a safety guard, the combination of box A, tickets B, and deposit box E, constructed, arranged, and operating substantially in the manner described and for the purpose set forth.

60,892.—J. C. HOFFEDITZ, Mercersburg, Pa.—*Cultivator.*—January 1, 1867.—The standards are laterally adjustable on their supporting bar, or removable from it. The plows are removable. The standards are pivoted and have a forward projection connecting with a spring allowing of backward oscillation. The handles are adjustable in height.

Claim.—The arrangement shown and described, consisting of the adjustable and pivoted spring standard C, removable shares I J, and adjustable handles E.

60,893.—J. C. HOFFEDITZ, Mercersburg, Pa.—*Attaching Cultivator Teeth.*—January 1, 1867.—The standard has an iron back pivot and a forward holding pin of wood. When a dangerous amount of strain is applied to the tooth the wooden pin relieves it by breaking, and a new pin is substituted.

Claim.—The arrangement of the cultivator standard C, hanger B, and wooden pin *c*, as described and represented.

60,894.—H. W. HOPKINS, Milford, N. H.—*Butter Mold.*—January 1, 1867.—The sections of stearite are polished and then attached together by a cement composed of glue, 4 oz.; Russia isinglass, 2 oz.; and boiled linseed oil, 2 oz.

Claim.—Constructing butter molds of stearite or soapstone, substantially as herein described.

60,895.—HENRY HUFENDECK, St. Louis, Mo., assignor to S. R. FOX, E. G. PRATT, and E. W. FOX, same place.—*Drill.*—January 1, 1867: antedated December 12, 1866.—The actuating shaft has upon it a larger and smaller bevel cog wheel, and its journal frame is shiftable so as to engage the larger wheel with a smaller pinion on the drill shaft, or its smaller wheel with the larger pinion upon the shaft. The table is adjustable vertically in side grooves.

Claim.—First, the combination of two or more sets of corresponding bevel gear wheels, arranged substantially as shown by C and D C' and D', with the changeable shaft support, when used as set forth.

Second, the combination of the feed screw B and its actuating hand wheel b', or their equivalents, with the

drill shaft B, all supported in the bearings *a a'* and *a''* of A, in combination with the several sets of corresponding bevel gear wheels C and D, C' and D', &c., the changeable shaft support G, and the work table H, as set forth.

60,896.—HENRY A. HUTSON, Newburgh, N. Y.—*Penman's Assistant.*—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, the rings 1 2 3 and 4, constructed and arranged in such peculiar manner as substantially described, for compelling the fingers to assume their respective positions, and to strengthen them in supporting the hand and forearm while writing.

Second, the stem B for preventing a cramped position of the hand, by affording a prop or support to the fingers, with screw H for adjusting to different-sized hands, and for dividing the assistant to secure it in a small case for the pocket.

Third, the stem C for projecting to form a rest at J for the pen-holder, and forming a base for the stem B in the hollow of the hand.

60,897.—ALBERT JOHNSON and SYDNEY E. ALLEN, Raleigh, N. C.—*Alarm Gun.*—January 1, 1867.—The spring carries a hammer which is sustained by a rod; the latter is tripped by the rotation of the gun upon its upright pivot, when the alarm cord is pulled.

Claim.—The base A, gun barrel D, spring hammer and trigger arm J, and arms P and Q attached to the barrel, when all are constructed and combined together substantially as and for the purpose described.

60,898.—JOHN JOHNSON, Saco, Me.—*Obtaining the Precious Metals from the Beds of Rivers.*—January 1, 1867.—The vessel has a circular aperture at its center through which a diving bell is lowered.

Claim.—The system herein set forth for obtaining gold from the beds of rivers, substantially as specified.

Also, the process by the means employed for the purpose intended, substantially as specified.

60,899.—JOHN JOHNSON, Saco, Me.—*Gathering and Treating Auriferous Sands from the Beds of Rivers.*—January 1, 1867.—The dredging machine upon which letters patent were granted to J. Johnson, August 7, 1866, has combined with it an amalgamator and concentrator to separate the gold from the sand.

Claim.—The process of raising and treating auriferous sands found at the bottom of rivers and lakes, substantially as described.

Also, the combination of the pumping apparatus with separators, concentrators, agitators, and amalgamators, when they are operated on board a floating barge, substantially as described.

60,900.—THOMAS J. JOLLY, Versailles, Ind.—*Machine for Making Wooden Pickets.*—January 1, 1867.—The machine saws the pickets and turns them upon edge, in which position they are forced to the planer that finishes their sides.

Claim.—First, the arrangement of the sliding gauge or pattern E, studs G, compound lever I, and fingers J and K, for upturning of the sawn palings, as set forth.

Second, in the described combination, the saw, upturning apparatus, and guides, the double-headed raking planer N N', adapted to operate as set forth.

Third, the arrangement of the segment roller R, checks S S', and planers N N', substantially as and for the purposes specified.

60,901.—I. W. JUDD, New Haven, Conn.—*Sash Fastener.*—January 1, 1867.—The fastener shaft has two projections, one to engage the sash and the other the operating lever on the jamb. The coil spring tends to throw out the catch.

Claim.—The shaft G, bolt F, spring I, and tail piece L, constructed and combined as herein described, in combination with the lever S, as set forth.

60,902.—OLIVER S. JUDD, New Britain, Conn.—*Snap Hook.*—January 1, 1867.—The double wire hook has a double coil spring and hook latch wound upon the pintle between the flanges of the strap loop.

Claim.—As a new article of manufacture, a snap hook, constructed substantially as and for the purpose described.

60,903.—CHARLES T. JULIUS, Philadelphia, Pa.—*Anchor.*—January 1, 1867.—In place of the usual stock-bar are two arms pivoted to the shank and having a limited rearward motion in the plane of their length, when fouled by the chain.

Claim.—The arms *a* and *a'* hinged to and otherwise combined with an anchor, substantially as and for the purpose described.

60,904.—JOHN A. W. IUSTI, Savannah, Ga.—*Truss.*—January 1, 1867.—Explained by the claim and illustration.

Claim.—Constructing a hernia truss with an elastic metal plate A formed by bending in three distinct arches, the two outside arches being twisted and curved, proportioned and arranged with reference to the pads *a a*, substantially as and for the purposes herein specified.

60,905.—GEORGE KAY and JOSEPH KAY, Esopus, N. Y.—*Pocket Knife.*—January 1, 1867; antedated December 20, 1866.—The spring is held between a transverse rivet in front and a back flange attached to one of the side plates.

Claim.—The arrangement of the bent spring B between the rivet *a* and flange *b*, in combination with the side plates A A, constructed and operating in the manner and for the purpose herein specified.

60,906.—MOSES T. KEHOE, Amsterdam, N. Y.—*Cattle Car.*—January 1, 1867.—Chains or cords are passed longitudinally through the cars beneath the cattle as a partial support; they are tightened by a windlass at one end.

Claim.—The attachment to and combination with a railroad car of chains or ropes, with a windlass for operating them in the manner described, and for the purposes set forth in this specification.

60,907.—JOHN B. KINNEY, Yellow Springs, Ohio.—*Washing Machine.*—January 1, 1867.—The roller frame may be inclined against the side of the tub as a washboard, or placed at the bottom to operate in combination with the oscillating rubber.

Claim.—The arrangement of the compound lever D F, vibrating rubber H, and shiftable bottom or washboard J, the whole being constructed and adapted to operate as set forth.

60,908.—A. H. KNAPP, Newton Center, Mass.—*Curtain Fixture.*—January 1, 1867.—The blind is balanced by a coiled spring, so that it may be easily raised or lowered by its stretch rod.

Claim.—The combination of the projecting knob or milled head D with the coiled spring B, cog-wheel and pinion E and F, and roller coupling *d*, substantially as and for the purpose herein specified.

Also, the square, angular, or equivalent form of recess G through the center of the roller, formed in connection with the wedge groove therein, for the purpose set forth.

60,909.—PATRICK W. LAMB, Albany, N. Y.—*Sprue for Molders.*—January 1, 1867.—Explained by the claim and illustration.

Claim.—The toothed sprue pattern C, constructed substantially as described, and applied so that the spaces molded by it communicate with the *hans* forms *e* at their center, over the handle shanks or rods *c*, essentially as and for the purpose or purposes herein set forth.

60,910.—THOMAS W. LANE, Boston, Mass., assignor to THE SPENCER REPEATING RIFLE COMPANY.—*Magazine Fire-arm.*—January 1, 1867.—The cartridges are placed in the body of the stock and forwarded by a spiral spring to the oscillating breech piece by which they are forced into the barrel. An oscillating spring catch plate in this breech piece ejects the shells over a drop bar, which covers the cartridge receptacle on the retraction of the breech piece.

Claim.—An oscillating retractor, working in the body of the rolling breech, and which is depressed during the backward rotation of the breech by a positive movement, and elevated by a spring when the breech is rolled forward into its locked position, as described.

Also, the combination and arrangement of the shaft

t, arm *h*, groove *w*, and pin *z*, in the manner and for the purpose set forth.

60,911.—ROBERT LEAMAN, Hillsborough, Ohio.—*Lounge for Invalids.*—January 1, 1867.—The side rails are jointed and a cord from the head is connected to a windlass to raise the rails along their whole or along half their length, vibrating them on their foot pivot or that at their mid-length respectively.

Claim.—First, the jointed rails *g g*, in combination with cleats P P and buttons *i i*, the whole arranged and operating as and for the purpose herein set forth.

Second, the employment of pulleys *m* and V, cord *a*, and frame R, when used in combination with jointed rails *g g*, the whole constructed and operating in the manner and for the purpose herein specified.

60,912.—J. F. LIGHT, Worcester, Mass.—*Shaft Coupling.*—A longitudinal key occupies seats in the shaft ends; an enveloping split sleeve embraces the rail ends and key; clamping nuts screw on each end of the sleeve.

Claim.—The combination with the ends of two shafts or rods of a friction coupling piece C, tightening nuts D, and spline or splines E, substantially as set forth.

60,913.—CHARLES P. LOESER, Hartford, Conn.—*Bed Bottom.*—January 1, 1867.—The bed frame has a transverse hook joint by which a portion of it may be bent up or removed. A hinged post works in combination with a rack to support this portion at any elevation.

Claim.—The hook and eye plates *d d'*, framework *a*, springs *b*, supporting cord *c*, with the supporter *g* and steps *i*, substantially as and for the purpose described.

60,914.—CHARLES LONG, Paris, Ill.—*Corn Planter.*—January 1, 1867.—The seed slide is operated by cam staples on a cog-wheel, when the latter is engaged to a cog-wheel on the axle.

Claim.—First, the arrangement of cog-wheel J, balanced on yoke I and engaging with pinion K upon the ground wheels axle, at the option of the husbandman, by means of the lever L, rod M, and catch N, substantially as and for the purposes set forth.

Second, the combination in a power corn planter of the frame A, wheels B B', engaging and releasing mechanism E F, the whole being combined with the elements of the preceding clause in the manner set forth.

60,915.—J. ALLEN, New York, N. Y., and S. P. TOWNSEND, New Providence, N. J.—*Finishing Fire-Arms so as to Prevent Oxidation and Corrosion.*—January 1, 1867.—Omitting the usual finishing by polishing, burnishing, &c., the metal portions of the arm are galvanized to prevent oxidation.

Claim.—First, the finishing of fire-arms of all descriptions by the mode and means hereinbefore described, and for the purpose of preserving them from damage by oxidation or corrosion as set forth.

Second, the restoration of damaged arms to good condition by the method and means above set forth.

60,916.—THEOPHILUS F. BERTRAND and PETER SAMES, Rockford, Ill.—*Cultivator.*—January 1, 1867.—The tongue runs back and furnishes a seat support. It is connected to the axle by diagonal bars. The plow beams are pivoted to the tongue, and the plows are vertically adjustable.

Claim.—First, the combination, substantially as described, of the tongue with the axle, arranged as set forth for the purpose specified.

Second, the combination with the tongue of the single cross-piece E, so arranged as that it shall serve as a brace for the segment and a fulcrum for the levers that control the auxiliary frame.

Third, the combination of two spring bolts with two supporting levers and two ratchets and with the axle, arranged and operating substantially as and for the purpose set forth.

Fourth, the combination of the rigid frame with the auxiliary frame, when the former is hinged to the latter, substantially in the manner and for the purpose described.

Fifth, the combination of the auxiliary frame with

the tongue, when the former is hinged to the latter, substantially as and for the purpose set forth.

Sixth, the combination of an adjustable support for the driver's feet with the auxiliary frame, substantially as and for the purpose set forth.

Seventh, the swivelled eye-bolt or double block constructed, arranged, and operating substantially as and for the purpose set forth.

Eighth, the combination of the eye-bolt and standard with the beam of the auxiliary frame, substantially as and for the purpose set forth.

60,917.—ANSON R. BROWN, Litchfield, Mich., assignor to himself and GARNER HERRICK, Albion, Mich.—*Instrument for Acupuncture.*—January 1, 1867.—The puncturers are associated in a cluster to carry the counter-irritant liquid from their enclosing chamber through the perforated block. They are actuated by the pressure of the hand upon their backwardly extending piston.

Claim.—The channeled puncturing point formed by two or more converging points substantially as described.

Also, the perforated block G, for retaining the medicine in the reservoir except at the needle holes, substantially as specified.

60,918.—SAMUEL MARDEN, Newton, Mass., assignor to himself and DUSTIN LANCEY, same place.—*Peat Machine.*—January 1, 1867.—The revolving mold-carrier has a series of followers sliding in radial grooves. The followers are operated by spiral springs and a cam. The peat is fed into the machine upon the apron, above which is arranged a tearing roller. From thence it passes into the hopper and upon the sieve, to which an intermittent motion is given by a cam. From this sieve it passes into the hopper and thence into the mold.

Claim.—First, the tearing apparatus composed of metallic plates, notched in the manner of saw-plates, set and arranged at different angles in the drum-beater B, in combination with the flexible apron A.

Second, the vibrating sieve operated upon by the cam *d*, as applied to or in combination with peat machines, substantially as described.

Third, the cam *d*, arranged and operating upon the sieve arm *e*, so as to sift the reduced peat substantially as described.

Fourth, the cam *l*, so constructed and arranged with respect to the sliding molds *m m*, &c., and the guard *n*, that the pressure on the guard by the sliding molds ceases for a space equal to the width of the sliding molds as they emerge from the guard.

Fifth, the circular mold carrier E revolving about the fixed cam *l*, as combined and arranged with the compressing guard *n*, it being also provided with a radial groove *i i*, &c., converging towards its center and supporting sliding molds *m m*, &c., operated upon by the cam *l* and the spiral springs *p p*, &c., which keep the sliding molds in proximity to the cam, all combined and arranged for the purpose of compressing peat, and as applied to peat machines substantially as described.

60,919.—REUBEN A. McCAULEY, Baltimore, Md.—*Pump.*—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, the pump A, with its side chambers E and F, piston chamber B, openings *o* and *r*, receiving and discharging ports *e f j* and *k*, arranged, constructed and operating in the manner substantially as shown and described, and for the purpose set forth.

Second, in combination with said pump, the pipe J, and the connecting guide-sleeves *n*, constructed, arranged, and operating in the manner substantially as shown and described, and for the purposes set forth.

60,920.—JAMES McLAUGHLIN, Duncannon, Pa.—*Car Coupling.*—January 1, 1867.—The pin is supported by a slide which is forced forward by a weighted lever. The link comes in contact with a depending pin of the slide and pushes it back, which allows the coupling pin to fall into its place within the link.

Claim.—The slide D, provided with the pendent pin *c*, and connected with the suspended weight F, in connection with the coupling pin B and link or shackle C, all arranged to operate substantially as and for the purpose herein set forth.

60,921.—ABNER MCOMBER, Schenectady, N. Y.—*Artificial Arm.*—January 1, 1867.—The hand is detachable at the wrist. The clasps issuing from the artificial stump have sliding motion to clamp any article placed between their claws. These clasps enter slots in the wrist plate of the hand. The thumb is adjustable in two positions by means of a spring and catch, the latter being freed by a trigger.

Claim.—First, the permanently attached clasps, *g g'* on the stump section of the arm in combination with the slotted plate *a e e* of the opposite section, substantially as and for the purpose set forth.

Second, the application to a spring thumb of an artificial hand, of a latch, or its equivalent, for holding said thumb open when desired, and means for releasing the thumb from the latch, substantially as described.

60,922.—ANDREWS T. MERRIMAN, Rutland, Vt.—*Machine for Squaring Tiles.*—January 1, 1867.—The tile is clamped on a vertically adjustable, horizontally oscillating frame, and its edge is ground by a horizontally rotating grinding disk.

Claim.—First, the vertical pin *e*, in combination with the plate *c* to which the tiles are clamped, substantially as herein described, so that the plate can rise and fall and sweep over the grinding disk in a circular or oscillating motion.

Second, the adjustable collar *g*, in combination with rising and falling swinging plate *e*, constructed and operating substantially as and for the purpose set forth.

Third, the clamp *i*, composed of a hinged lever with thumb screw and elastic pad, as and for the purpose described.

Fourth, the adjustable gauge *m*, in combination with the clamp *i* and plate *e*, constructed and operating substantially as and for the purpose set forth.

60,923.—F. H. MEYERS, Wilmington, Del.—*Car Coupling.*—January 1, 1867.—The coupling pin is sustained by a pivoted plate retained by a spring catch. The entrance of the coupling links throws back the catch and allows the coupling pin to drop into engagement.

Claim.—The combination of the lever H, spring catch G, the sliding rod C, and coiled spring D, with each other and with the bolt I and bumper A, substantially as herein shown and described.

60,924.—ELI MORRIS, Jr., New Haven, Conn.—*Handle for Saws.*—January 1, 1867.—The handle is made hollow; one portion is formed from a continuation of the shank or frame, and the other portion of counterpart form is riveted thereto.

Claim.—Constructing the handle of a saw frame of metal integral for the most part with the frame, and joined by riveting or otherwise to another separate piece, to complete the whole as set forth.

60,925.—GEORGE M. MORRIS, Cohoes, N. Y.—*Lubricating Device.*—January 1, 1867.—A pivoted disk in a cup below the lower journal box is revolved by contact with the under side of the shaft, and carries up oil to lubricate the latter.

Claim.—The within-described lubricating device, consisting of the slotted hanger A, slotted journal box C, disk M, spring *b*, oil cup D, and groove or channel *e e*, all combined and operating as and for the purpose set forth.

60,926.—GEORGE W. NICHOLS, River Falls, Wis.—*Logging Skid.*—January 1, 1867.—The sides of the skid frame have pivoted catches which allow the forward movement of the log but prevent a retrograde movement. Claw plates at the head of the skid prevent slipping.

Claim.—The application to a skid of the props D D, in combination with the ledge B, or its equivalent, the plate F, with its spur and bolt U, constructed substantially as and for the purposes specified.

60,927.—WILLIAM D. NICHOLS, Chicago, Ill.—*Wind Mill.*—January 1, 1867.—The sail shafts are turned in radial arms on the driving shaft to adjust their inclination to the power of the wind. This adjustment is caused by a horizontally rotating governor, or by balls upon sliding rods on the wheel shafts. The motion of these rods is caused by the

centrifugal force of the balls, which are impelled by the rotation of the sails.

Claim.—The combination of the sail cranks *p p* and sliding head *H*, constructed, arranged, and operating, as and for the purpose herein specified.

Also, the adjustment of the force of the counter spring or springs *O*, by means of the fixed pin or pins *q*, and the turning of the spring itself, or the equivalent thereof, substantially as and for the purpose herein set forth.

Also, the arrangement of the governor weights *S S*, attached to radial sliding rods on the sails themselves, and connected by means of the quadrant arms *R R* and connecting rods *v v*, or their equivalents, with the regulating sliding head *H*, substantially as herein described.

60,928.—NELSON PALMER, Hudson, N. Y., assignor to himself and T. G. PALMER, Schultsville, N. Y.—*Threshing Machine.*—January 1, 1867.—The concave is movable in its frame, and it and the cylinder have ridges with one smooth and one roughened side, so that one direction of rotation shall bring the rough sides of both in combination, and the opposite direction, the smooth sides.

Claim.—A concave, so connected with a threshing machine that it may be adjustably placed on one side or the other of the threshing cylinder, for varying the character of the work, substantially as set forth.

60,929.—NELSON PALMER, Hudson, N. Y., assignor to himself and T. G. PALMER, Schultsville, N. Y.—*Threshing Machine.*—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, a threshing cylinder when constructed with longitudinal ribs which are smooth upon one side and rough upon the other, substantially as and for the purpose set forth.

Second, in a threshing machine, the use of two ribbed concaves or rubbers, on one of which the ribs are smooth on their faces and on the other rough, substantially as and for the purpose set forth.

Third, so constructing the concaves of threshing machines that the straw may in the action of the machine be brought into contact with either smooth or roughened ribs or faces of the ribs as desired, substantially as and for the purpose set forth.

Fourth, a threshing cylinder when so connected with the motive power and related to the concave or concaves and other parts of the machine that it may be operated revolving in either direction, substantially as set forth.

Fifth, in combination with a threshing cylinder having ribs smooth upon one side and rough upon the other, a ribbed concave or ribbed concaves, so constructed and arranged as to present smooth faces to the smooth faces of the threshing cylinder when revolving in one direction, and roughened faces to the rough faces on the ribs of the threshing cylinder when revolving in the reverse direction, substantially as and for the purpose set forth.

60,930.—PHINEAS PARDEE, New Haven, Conn.—*Car Brake.*—January 1, 1867.—Inclined slide chutes are suspended from the car frame over the rails, and contain the shoes, which are held in their slides by chains which wind around a shaft. This shaft is kept from revolving by a lever catch, on the raising of which the shoes slide under the wheels to stop the car.

Claim.—The arrangement of the shoe *E*, in combination with a holder and the shaft *F* or its equivalent, when arranged in such relative positions to the wheels as to operate in the manner substantially as herein set forth.

60,931.—JESSE K. PARK, Marlborough, N. Y.—*Damping Brush.*—January 1, 1867.—Explained by the claim and illustration.

Claim.—The construction of a brush with the central part *A* of india-rubber or equivalent elastic material, and a covering of cloth, felt, or other absorbent material, substantially as herein set forth, for the purpose specified.

60,932.—SAMUEL J. PEET, New York, N. Y.—*Steam Engine Valve.*—January 1, 1867.—The valve plates are held in contact by steam pressure, and separated for the admission of steam by the conical end of the stem rod.

Claim.—The pair of valve plates *b b*, in combination with the conical wedge *h* on the screw *C*, or its equivalent, arranged and operating substantially as and for the purpose herein described.

60,933.—WARREN L. PEET, Maple Rapids, Mich.—*Horse Power.*—January 1, 1867.—The base frame of the sprocket wheel has slide arms in which are slide grooves for the adjustable frame of the sprocket pinion.

Claim.—The combination of the sliding frame *B*, wheel *Q*, endless chain *P*, and driving wheel *F*, constructed and arranged to operate in the manner as and for the purpose herein specified.

60,934.—CHARLES F. PIKE, Providence, R. I.—*Refrigerator.*—January 1, 1867.—The ice chamber connects at the bottom with a series of vertical and horizontal pipes. Smaller pipes pass through the ice chamber, cover and convey air through convolutions in the ice chamber and between the series of pipes, and discharge above a pan from whence the air flows into the room. From an aperture near the top of this room the air passes out through a U-shaped pipe. The water is discharged through a trap below.

Claim.—First, the horizontal tubes or pipes *I*, substantially in the manner and for the purposes hereinbefore specified.

Second, the horizontal tubes or pipes *I*, in combination with the ice box *H*, with or without the upright pipes or tubes *J*, and pan *R* and its appendages and appurtenances, substantially in the manner and for the purpose hereinbefore stated.

Third, the air pipe *K*, and also the air pipe *L*, or their equivalents, in combination with the ice box or receptacle *H*, the upright tubes or pipes *J*, or the horizontal tubes or pipes *I*, and also in combination either of them and with the pan *R* and its appurtenance, substantially in the manner and for the purposes hereinbefore stated.

60,935.—J. C. PRICE, New Philadelphia, Ohio.—*Hoisting Tackle.*—January 1, 1867.—A cam block holds the block to any point of its sustaining rope while the load is raised. A conical block on the hoisting rope engages the block to force its movement on the upper rope when the load is sufficiently elevated.

Claim.—The clamp *G*, in combination with the plates *A A*, wheels *B B'*, ropes *C D*, collar *E*, and ring *F*, all arranged to operate in the manner substantially as and for the purpose described.

60,936.—NATHAN PUCKETT, Terre Haute, Ind.—*Self-Centering Tool.*—January 1, 1867.—An ordinary scroll chuck has combined with it a drill and feeding sleeve by which the center hole may be drilled in the shaft.

Claim.—The sleeve screw *C* and the centre drill *D*, in combination with the scroll chuck *A*, constructed, arranged, and operating in connection therewith, substantially as and for the purpose herein specified.

60,937.—CHARLES H. REICHMANN, New York, N. Y.—*Lamp Chimney.*—January 1, 1867.—Explained by the claim and illustration.

Claim.—A glass chimney for lamps constructed of two sections, the adjoining parts of which are provided with flanges *a b* held together by a narrow metal band slipped over the upper part, and resting on its flange, and sprung over the flange of the lower part.

60,938.—FREEMAN F. REYNOLDS, Burke county, Ga.—*Plow.*—January 1, 1867.—The landside is adjustable on the standard. A brace bar from the standard foot to the beam heel is adjustable at either end.

Claim.—The adjustment of guide bar *J* to helve *G* by bolts *P P*, the advantage and object of which will be seen in above description, and as incidental to and necessary to the proper running of this stock; also, the adjustment of brace *H* to helve *G* by shoulder *S* and bolt *K*, and to beam *A B* by perpendicular bolt *N*, by virtue of which the plows are more easily adjusted to the stock, and less liability of choking, and strength added thereto, the several parts being in combination, as specified.

60,939.—LEVI RICHARDS, Providence, R. I., assignor to himself, THOMAS R. RATHBUN, and CHARLES

I. RICHARDS, same place.—*Machine for Making Eye-lets*.—January 1, 1867.—Of the two compound punches one cuts the disk and stamps it to cap form; the other opens the bottom and spreads out the flaring head. Cam grooves on the driving shaft actuate a pivoted lever to slide the die plate so as to transfer the blank from one punch to the other.

Claim.—First, the combination of the sliding rod M, punch N, tube O, flanged socket P, and spring Q, with the finishing die L, substantially as described, and for the purpose specified.

Second, the conveyor or carrier H, provided with the chamber *i**, and arranged to operate in connection with the female dies and tubes, substantially as and for the purpose specified.

60,940.—**ADOLPHE ROQUE**, Brive, France, assignor to **JACQUES GUEDIN**, New York, N. Y.—*Fiber from Pine Leaves for Hygienic and other Purposes*.—January 1, 1867.—Pine leaves or straw treated with a caustic alkaline solution and then washed in hot and cold water, are worked into a felt or cloth for hygienic purposes.

Claim.—The within-described process of producing a hygienic wool from pine leaves by treating them substantially as specified.

60,941.—**C. A. ROSE**, Columbus, Ga.—*Hand Hoe*.—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, making the eye A and blade B separate, and securing them to each other by bolts and nuts, substantially as herein shown and described.

Second, making the blade B of the hoe reversible and with two cutting edges, substantially as herein shown and described.

60,942.—**WILLIAM ROSS**, Day's Store, Pa.—*Preserving Butter, Meat, &c.*—January 1, 1867.—Composed of common salt, 12; saltpetre, 3; loaf sugar, 4; soda, 1, and water 137 parts.

Claim.—A chemical preparation for preserving butter and meats, composed of the ingredients and in about the proportions substantially as herein specified.

60,943.—**HAMILTON RUDDICK**, Boston, Mass.—*Steam Engine*.—January 1, 1867.—Two single acting pistons within one cylinder are connected rigidly by rods. The cylinder is enlarged in the center to receive the crank of the main shaft, which has a connecting rod to one piston.

Claim.—The arrangement of piston heads B B', rods *b b*, connecting rod D, and crank E, relatively to each other and the cylinder A, substantially as described.

60,944.—**JOHN P. SCHENCK, JR.**, Matteawan, N. Y.—*Composition for Lining Oil Barrels*.—January 1, 1867.—One pound of glue is dissolved in one pound of acetic acid; three pounds of water added, and then one pound of lime, and one pound carbonate of iron.

Claim.—An improved composition for lining and coating the interior of oil barrels, and other surfaces, formed of glued acetic acid, water, lime, and carbonate of iron, combined with each other in the proportions and in the manner herein specified and described.

60,945.—**H. S. SHEPARDSON**, Shelburne Falls, Mass.—*Carriage Jack*.—January 1, 1867.—The lift and the post have a diagonal line of junction, and the former slips vertically on the latter, when the lever is depressed.

Claim.—The standard B and lift C, in combination with lever F and toggle G G', constructed substantially as described.

60,946.—**R. W. SHRENER**, Woodland, Mich.—*Churn*.—January 1, 1867.—A wrist pin on the driving wheel traverses a horizontal groove in the frame to which the upper end of the dasher rod is pivoted, and causes vertical motion. A spiral spline on the dash rod traverses a groove in the frame to give rotary motion.

Claim.—The screw *g* and its combination with the nut *i*, side D and driving wheel C, constructed as shown, for the purpose of imparting the aforesaid motion to the dasher G.

60,947.—**JAMES E. SIMPSON**, Brooklyn, N. Y.—*Scaffolding for Dry Docks*.—January 1, 1867.—The arms are pivoted to the uprights in such manner that they may be folded against the same. The uprights can be slid along the stationary horizontal rail on which they are supported in a vertical position, or folded against the rail.

Claim.—The combination of the stationary guide and support rail *a*, the sliding shoe *b* and the hinged or folding upright *f*, arranged to operate substantially as described.

Also, in combination with the folding upright, the folding arms *i*, hinged to and folding up against the upright, and maintained in horizontal position when in use, substantially as set forth.

Also, in combination with the folding upright and its hinged arms the folding top piece *o*, applied and operated substantially as described.

60,948.—**AMOR SMITH**, Cincinnati, Ohio.—*Fertilizer*.—January 1, 1867.—The offal from which lard and glue have been extracted is pressed into blocks for preservation and subsequent preparation as a fertilizer.

Claim.—The hereinbefore described process for preserving the fleshy parts of boiled animal matter from decomposition by subjecting it to pressure, substantially as set forth.

60,949.—**A. P. SMITH**, Sterling, Ill.—*Mitten*.—January 1, 1867.—Explained by the claim and illustration.

Claim.—A mitten cut in sections, the thumb formed in part of the material taken from the thumb space, without being wholly detached in the cutting, all the parts united with the lining by a simple operation, substantially as described.

60,950.—**HENRY K. SMITH**, Norwich, Conn. assignor to himself and **CHARLES OSGOOD**, same place.—*Lathe Rest*.—January 1, 1867.—The screw spindle has conical portions to put in operation one of two friction clutches, which cause respectively a right or left motion of the slide-rest upon the shears. The rest has an upper section hinged to the base in front, and adjusted vertically by a screw in the rear.

Claim.—First, the combination of the friction clutch X, or its equivalent, with the worm gears A², connected together by pinion wheels B², slotted shaft C², and intermediate gear wheels W R N and E, with the latter engaging with the toothed or geared rack bar K of the lathe bed, when all combined and arranged together, so as to operate substantially in the manner and for the purpose described.

Second, in combination with the above, the friction clutch U, or its equivalent, connected through its loose gear wheel T with the pinion wheel P³ of a screw shaft M³, screwing into and through the lug N³ of the sliding lathe rest frame A³, substantially as described for the purpose specified.

Third, the combination of the divided nuts I³, L³, and thumb screw H³, with the two sections C³ and D³ of the tool rest frame A³, substantially as and for the purpose described.

60,951.—**JEREMIAH SMITH**, New Market, Ohio.—*Curculio Trap*.—January 1, 1867.—The annular groove is formed in two segments with rubber packing between the parts to allow of expansion by the growth of the tree.

Claim.—The impervious elastic joint D *a b*, connecting the two parts of the trough A B, so as to permit its expansion as set forth.

60,952.—**ZEALEGS SPERRY**.—Potter's Corners, Pa.—*Churn*.—January 1, 1867.—The dash rod has vertical movement by a slotted lever, and rotary movement by a spiral groove, traversed by a pin on the lid. The dasher has radial arms with upward wings thereon, and is attached to its rod by a thumb-screw.

Claim.—First, the lever E, slide D and guide C, combined in relation with each other, and with the spiral grooved dash rod B, substantially as herein set forth for the purpose specified.

Second, the arrangement of the pivoted stud or spur *i* and the pin *g'*, with reference to each other and with the spiral groove *h* of the dash rod B, whereby the said stud or spur may be removed from the groove

h, when desired, substantially as herein set forth for the purpose specified.

Third, the construction of the lower portion of the spirally grooved dash rod *B*, with a hinged or pivoted section *c*, arranged in relation with the slot or socket *e* thereof, substantially as herein set forth for the purpose specified.

60,953.—L. C. SPRINGER, Chicago, Ill.—*Magnetic Lock.*—January 1, 1867.—The bolt is locked automatically by spring catches in the safe frame, and unlocked by the completion of a galvanic circuit, which withdraws a plug between the ends of the double bolt, and allows its retracting spring to act. The circuit is broken before closing the door, by turning one or more of a series of notched wheels a certain extent. The wheels have each a separate galvanic connection, and can be moved to position for completing the circuit by galvanic shocks, each impulse moving them one notch.

Claim.—First, unlocking a safe or withdrawing the bolts thereof, by closing and opening an electro-magnetic circuit passing through a series of movable or adjustable points, substantially as and for the purposes set forth.

Second, operating upon and adjusting the said movable points in said electro-magnetic circuit by means of a corresponding series of auxiliary circuits, substantially as described.

60,954.—JAMES STEPHENSON, Canandaigua, N. Y.—*Door and Gate Spring.*—January 1, 1867.—The spring is attached to the door face, and its pintle has a lever which bears in the grooved face of the pulley on the door check to close the door.

Claim.—The spring *C* and pintle *D*, applied to the door or gate as described, in combination with the lever *F* and roller *G*, or other circular bearing fixed to the stationary frame, when said parts are arranged and operate in the manner and for the purposes herein specified.

60,955.—FRANK W. STERRY, Morrisania, N. Y.—*Compound for Sweetening, Coloring, and Flavoring Tobacco.*—January 1, 1867.—Powdered licorice root, two parts; powdered extract of licorice, one part; and powdered white sugar, two parts; are spread over the tobacco by means of a sieve.

Claim.—A compound for sweetening, flavoring, and coloring tobacco, which is made of the aforesaid ingredients in about the proportions herein set forth.

60,956.—SIMON STEVENS, New York, N. Y.—*Storing Petroleum and other Liquids, so as to Prevent Loss from Fire.*—January 1, 1867.—Vessels containing petroleum are immersed in a tank containing water.

Claim.—The mode herein described for the storing of petroleum or other similar inflammable liquids, so as to prevent accident by fire.

60,957.—RICHARD B. STEVENS, York Township, Ohio.—*Paste or Cement for Roofing.*—January 1, 1867.—Brickdust is combined with asphaltum or coal tar.

Claim.—The compounding of burnt brick or well burnt clay with asphaltum or coal tar, thereby forming a composition paste or cement.

60,958.—HENRY C. STEWART, Cincinnati, Ohio.—*Glue Pot.*—January 1, 1867.—The glue pot has across its top a box in which are the sliding arms. These arms may be drawn out so far as to suspend the pot over any convenient sized boiler.

Claim.—The parts *B c d' d'* and *g*, or their equivalents, constructed as above described and for the purpose set forth.

60,959.—WILLIAM STREVELL, Jersey City, N. J.—*Clamp.*—January 1, 1867.—The upper jaw is forced toward the lower by a bar having inclined portions which engage similar abutments above. It is intended for thin bodies having considerable latitude.

Claim.—The improved clamp herein described, the same consisting of two jaws *A B*, straps or clasps *D*, and wedge strip *E*, when all combined together, substantially in the manner and for the purpose described.

60,960.—P. SWISHER, Versailles, Ohio.—*Burglar Alarm Gun.*—January 1, 1867.—Three gun barrels are discharged simultaneously by means of a wire attached to a door or window. The barrels are capable of independent adjustment for the purpose of being aimed in different directions.

Claim.—First, in the construction of a burglar alarm gun, the combination of the fixed barrel *1* and the revolving barrels *2* and *3* with the breech pin *C*, for firing simultaneously in different directions, substantially as and for the purposes herein described.

Second, the breech pin *C*, having the central longitudinal hole *e*, the transverse hole *n*, and the annular grooves *e*, communicating with the vent of the upper barrel *1* and the bores of the revolving barrels *2* and *3*, all arranged and operated substantially as and for the purposes herein described.

Third, the outside powder pan *h* for lighting a candle or lamp when the gun is fired, in the manner herein specified.

60,961.—JOHN SYRCHER, Buffalo, N. Y.—*Wheel Toy.*—January 1, 1867.—The string is attached to the elastic spindle of the bandelore.

Claim.—Attaching the string *F* to the India-rubber or other elastic block *E*, in the manner and for the purpose described.

60,962.—GEORGE W. TAYLOR, Springfield, Vt.—*Blacking Box Holder.*—January 1, 1867.—The handle is attached to the frame by a spiral spring and slide grooves, and angular lugs upon the handle and frame engage the box by the contractile power of the spring.

Claim.—A blacking box holder composed of two parts *A* and *B* and a spiral spring *C*, fitted together and arranged substantially in the manner as herein shown and described.

60,963.—JAMES R. TAYLOR, New York, N. Y.—*Boat Detaching Tackle.*—January 1, 1867.—The rope is held by a serrated cam, or by a serrated lever operated by a cam.

Claim.—Connecting and detaching a boat from the end of a rope by the combined use of the bars and cam or eccentric lever and the end of the rope passed or reeved through or between them, substantially as described.

60,964.—JAMES R. TAYLOR, New York, N. Y.—*Boat Detaching Tackle.*—January 1, 1867.—The boat is attached to the davit blocks by the hooks of pivoted levers connected together so as to insure simultaneous release. The pivot supports of the hook levers have projections preventing release before the hooks are turned up.

Claim.—The combination of the hook and lever, or weight pivoted to the holding head, and the block hook and its roller with the lugs on the holding head for the purpose of closing the space between the point of the hook *C* and the holding head, and for opening said space by swinging back said hook *C*, substantially as described.

60,965.—JAMES R. TAYLOR, New York, N. Y.—*Boat Detaching Tackle.*—January 1, 1867.—The catch arm is pivoted to a stem rod attached to the boat, and the catch takes under a side projection of an upward extension of the stem rod. The davit blocks are released at both ends simultaneously by the rod connecting the catch levers.

Claim.—The combination of the two hinged pieces *A B* with their projecting portions *c d e f*, constructed, arranged, and operating together as and for the purpose set forth and described.

60,966.—JAMES R. TAYLOR, New York, N. Y.—*Boat Detaching Tackle.*—January 1, 1867.—Explained by the claims and illustration.

Claim.—First, in combination with a hook used in a boat-detaching apparatus, a reinforce, or secondary hook *e*, which catches under a solid portion of the head and thus relieves the pivot of the hook, or makes a safety connection should the pivot of the hook give way, substantially as described.

Second, in combination with the hook and its reinforce, an eccentrically formed tripping lever, that is aided in being tripped or removed by the pressure of the hook upon its curved edge, substantially as described.

60,967.—E. S. TORREY, New York, N. Y.—*Attaching Elastic Tips to Legs of Furniture.*—January 1, 1867.—The upper part of the rubber tip has a circumferential groove to engage the incurred edge of the holding nut by which it is attached to the table leg.

Claim.—The combination of the socket B and conical leg *a* with the tip *f*, substantially as and for the purposes herein set forth.

60,968.—GEORGE UPTON, South Danvers, Mass.—*Manufacture of Glue.*—January 1, 1867.—The steam is introduced from above into the body of the stock through a pipe. The liquid is drawn off from beneath a perforated diaphragm.

Claim.—In the manufacture of glue, the process of subjecting the gelatinous matters to the action of steam, substantially as set forth.

60,969.—HUNNEVILLE VINCENT, New York, N. Y., assignor to himself and HUGH B. BROWN.—*Hoop Skirt.*—January 1, 1867.—Each wire passes two or more times around and returns for junction to the point of departure, so that the ascending shall cross the descending part; tape connections are made as usual.

Claim.—The arranging of the wires or hoops in such a manner that each hoop crosses or intersects itself once or more in its passage around the skirt, substantially as and for the purposes herein set forth.

60,970.—RUDOLPH VOLLSCHWITZ, New York, N. Y., assignor to himself and J. J. SCHLAEFFER, same place.—*Door Lock.*—January 1, 1867.—The key has cam projections upon it, which place a series of spring tumblers in a position to allow the retraction of the bolt.

Claim.—The mortises *g* in the tumblers D, to operate in combination with the flat notched bit of the key, nuts E, and bolts C, substantially as and for the purpose described.

60,971.—JAMES WALSH, Valley Town, Ill.—*Granary.*—January 1, 1867.—The frame is mortised together and the sides and divisions supported by engaging in slide grooves of the sides and of intermediate, doubly-grooved posts. The sections of the granary may be made of such size as to form measures.

Claim.—The granary and measurer, constructed of removable parts, substantially as described and represented.

60,972.—JOSEPH WARD, New York, N. Y.—*Hollow Auger.*—January 1, 1867.—The cutters are adjustable, and are combined with a central boring bit.

Claim.—First, the arrangement within the case A of the cutter stocks B, constructed with discharge throats C, and adapted for adjustment by means of the cam E and guides *a*, as and for the purpose specified.

Second, the within-described tool, adapted for cutting tenons and boring holes simultaneously, constructed and operating in the manner and for the purpose specified.

60,973.—HERVEY WATERS, Northbridge, Mass.—*Mechanism for Operating Dies.*—January 1, 1867.—The punch slide is connected to its motive arm by a hook, insuring its invariable return after a stroke, and the hook stirrup of the arm may be engaged with the inner recess of the hook to cause a downward stroke. The mechanism is such that a second blow will not be given without the lever is allowed to rise and is again depressed.

Claim.—The combination with an eccentric hammer, crank press, or other similarly operating machine or machines, of a means or system of mechanism by which the action of the machine or machines may be controlled substantially as set forth, when such system of mechanism is so connected with the machine or machines as not to enter into the active operating structure thereof.

60,974.—HORATIO B. WEAVER, Hartford, Conn.—*Lock and Key.*—January 1, 1867.—The inner knob acts directly upon the bolt to retract it, but the outer knob acts upon it by the sliding of another bolt, which is

only freed by the introduction of a key into the shank of this knob.

Claim.—First, the combination of the two spindles D and D', the bolt B, plate C, and the tumblers F, or their equivalents, the whole being constructed, arranged for joint operation, and applied to a lock case, substantially as and for the purpose herein set forth.

Second, the combination of the above and the fence *k'*, the whole being constructed, arranged, and operating as described.

Third, the bell-crank tumbler-levers F, hung to the spindle D' and arranged in respect to the recess *k* of the plate C, substantially as described.

Fourth, the tumblers F, arranged in respect to the slot *l*, in the stem of the handle E', as described.

Fifth, the slot in the tubular stem of the handle E', in combination with notches *p* in the edges of the key.

60,975.—A. WERNÉ, New York, N. Y.—*Rectifier for Stills.*—January 1, 1867.—A cylindrical vessel of wood has a metal coil about half way up, and another coil at the top for cold water. The spirituous vapor from the still enters the vessel by pipe near the bottom, and the watery portions are condensed by contact with the coils. The rectified vapors pass by a pipe to the condensing worm.

Claim.—First, the spiral channels formed in the covering-plate C and in the box B by the spiral flanges *d* and *g*, respectively, substantially as and for the purpose herein shown and described.

Second, the annular plate *b*, made substantially as and for the purpose herein shown and described.

Third, the combination of the plate *b*, box B, and cooling-cover C with the rectifier A, substantially as and for the purpose herein shown and described.

60,976.—ELIAS A. WIGHTMAN and WILLIAM C. WILLIAMS, Livingstonville, N. Y.—*Cultivating Hops.*—January 1, 1867.—The poles have staples to receive wire rods for sustaining the vines. The rods are withdrawn when the crop is gathered.

Claim.—The sliding rod B, arranged with the poles A, as shown, adapted to be drawn therefrom when desired, substantially as represented and described.

60,977.—JAMES F. WINCHELL, Springfield, Ohio, assignor to himself and GEORGE C. STEELE.—*Corn Husker.*—January 1, 1867.—A metal plate, turned up into a claw at one end and a hook at the other, is attached to a leather strap which has holes for engagement to the hook.

Claim.—The corn husker, consisting of the metal plate A and the strap B, made adjustable in size, when constructed and arranged as herein shown and described.

60,978.—G. C. WINCHESTER and M. V. B. HOWE, Ashburnham, Mass., assignors to C. and G. C. WINCHESTER, same place.—*Chair.*—January 1, 1867.—The seat is supported on socket joints and has a spring connecting it to the stand. The fore end of the spring engages a ratchet, which has a retaining cam.

Claim.—Combining the seat *a* with the stationary stool or base *b* by means of ball-and-socket joints, arranged not only to act as hinges but otherwise, substantially as described.

Also, combining with such arrangement or construction the spring *i*, fixed to the bar and bearing against the rear part of the seat, substantially as shown and described.

Also, the combining of the ratchet bar, pawl plate, shaft, and cam, when arranged to lock the seat in horizontal or inclined position, substantially as set forth.

Also, forming each side rail *f* and its leg *p* from a single strip of wood bent into shape, substantially as shown and described.

60,979.—W. E. WOODBRIDGE, Little Falls, N. Y.—*Construction of Ordnance.*—January 1, 1867.—The re-enforcing wire is wound in spiral coils around the barrel, the contiguous coats being coiled in opposite directions. The interstices are filled in with molten metal.

Claim.—First, the employment, in the structure of cannon, of helices of wire of reversed obliquity, applied one over another, and brought into union by the intervention of a more fusible metal, employed as a solder.

Second, in general terms, the construction of cannon substantially as herein described, modifying the selection and use of materials as herein set forth.

Third, the application of the mode of construction herein described to tubes other than cannon, when the mechanical requirements are similar.

60,980.—L. D. WOODMANSEE, Mad River township, Ohio.—*Bridle Bit.*—January 1, 1867.—Explained by the claim and illustration.

Claim.—The combination of the rigid bars A and B, jointed directly to the mouthpiece of a bridle bit, and operating in the manner substantially as and for the purpose described.

60,981.—CHARLES J. WOOLSON, Cleveland, Ohio.—*Grate.*—January 1, 1867.—The bars are pivoted in a tipping frame and connected together by a strip, by which the spaces between them can be closed. The ashes may be dumped by tipping the frame.

Claim.—The tipping frame A, provided with journals and bearings B, in combination with the shackle or grate bar D, arms E, and link O, and duplicate bearings S.

60,982.—SAMUEL A. WRAY, Greenfield, Ind.—*Cultivator Plow.*—January 1, 1867.—The beams are attached together by a flexible plate, and have a slotted adjustment plate near the rear end.

Claim.—The combination of the beams B and B', elastic plate D, and hinge joint E, with a device for retaining the beams in position, substantially in the manner set forth.

60,983.—ANTHONY WREALSH and WM. BURNS, Springfield, Ohio.—*Water Wheel.*—January 1, 1867.—An improvement on the Jouval turbine wheel. The water is received at top and discharged at bottom. The wheel shaft is supported on converging, upwardly extending arms from the upper casing. Each of the buckets is formed in two radial planes with concentric connection between them. The water gates are opened and closed by the oscillation of a perforated annular plate having a segmental rack engaged by a spur wheel.

Claim.—First, the buckets D, when constructed with two or more faces *d d'*, upon different radial planes, substantially as set forth.

Second, constructing the inner set of concentric buckets, or faces of the same bucket *d* and *d'*, shorter than the outer set, substantially as and for the purpose set forth.

Third, the combination of the guide wheel E, intermediate plate F, and gate ring H, when constructed and arranged substantially as set forth.

Fourth, the raised crown of the intermediate plate F, as arranged in relation to and serving as a bearing for the guide ring H, substantially as set forth.

Fifth, the plate F, when constructed and arranged between the guide wheel E and gate H, substantially as and for the purpose set forth.

Sixth, the elevated bush G, supported upon braces resting upon the crown of the intermediate plate F, and within the guide ring H, substantially as and for the purpose set forth.

60,984.—HENRY WURTZ, New York, N. Y.—*Composition of Glue or Gelatine and other Materials, called Durogel.*—January 1, 1867.—Five parts of bichromate of potash are added to 250 parts of glue in boiling solution. This compound is poured out upon slabs and allowed to cool, after which it is exposed to the action of light, which renders it insoluble. Colors may be combined with the solution of glue.

Claim.—The combination of bichromate of potash with ordinary glue or gelatine, in the manner and for the purpose substantially as described in the foregoing specification.

60,985.—EMANUEL YOUNG, Amanda, Ohio.—*Hollow Auger.*—January 1, 1867.—The auger cuts a tapering tenon and a shoulder upon the spoke simultaneously.

Claim.—As an article of manufacture, the herein-before-described tool, formed with the knives C and E attached to the hollow tapering body B, formed with the shank A, for attaching the tool to a brace, substantially as described.

60,986.—MARTIN ZIGLER, Mulhouse, France.—*Imponderable Fluid and Mode of Generating the Same.*—January 1, 1867.—The fluid may be collected and transmitted in currents like electricity. It is generated by bringing an azotic body into contact with a carbonized body. A battery to generate this fluid may be formed by filling a bladder with caustic ammonia and placing it in a vessel filled with molasses, a conducting thread of silk being attached to the bladder, and another to the vessel containing molasses.

Claim.—First, producing a new imponderable fluid in the manner and by the means herein set forth and described.

Second, the combination of two substances, the one containing azote and the other containing carbon, in the manner substantially as herein described, so as to generate an imponderable fluid, and to excite or produce a current of the same, as and for the purposes set forth.

60,987.—DAVID M. AYER, Lewiston, Me.—*Boot and Shoe.*—January 8, 1867.—Air cells are formed between the outer and inner soles of boots by corrugating the inner sole, and so arranged as to form an air passage between said sole and the upper of the boot, for the introduction or escape of air.

Claim.—First, forming air cells or spaces between the outer and inner soles of boots and shoes by means of corrugated or fluted sole leather, substantially as described.

Second, in combination with air cells or spaces between the outer and inner soles of boots-and shoes, formed by corrugated or fluted sole leather, as described, air ducts or passages communicating with the outer air, substantially as described.

60,988.—ELI BANKS, Millport, N. Y.—*Paddle Wheel.*—January 8, 1867.—The paddles are convex before and flat or concave behind, and are attached to surfaces of the arms at an inclination to the radius of the wheel.

Claim.—The combination of the spoke A and paddle B, when made as described and used for the purpose set forth.

60,989.—BERNARD BATTLE, Pittsburgh, Pa., assignor to DANIEL COYLE, Soho, Pa.—*Composition for Lubricating Journals.*—January 8, 1867.—For use on journals necessarily hot, as rolls of rolling mills: one barrel animal grease or residuum; two pounds each of plumbago, sulphur, and steatite; one pound each of carbonate of magnesia, glue, and rosin; and four gallons of slaked lime, to be mixed while hot. To this one-half gallon of molasses may be added when cold.

Claim.—The preparation of a lubricating compound composed of the above-named ingredients, viz., animal grease or "residuum," plumbago, sulphur, steatite, carbonate of magnesia, glue, rosin, and hydrate of lime, with or without molasses, substantially as above set forth, and in the proportions and for the purposes above designated.

60,990.—DANIEL BEST, Lancaster, Pa.—*Furnace for Steam Boilers.*—January 8, 1867.—A vertical, longitudinal partition in the boiler separates the tubes into two series, and the caloric current, after passing beneath the boiler, traverses the tubes on one side of this partition to a combustion chamber over the furnace, and then passes through those of the other side to the exit flue.

Claim.—The prolongation of the outer cylinder B of the boiler beyond the flues when closed with a partial head N O and doors D D, so as to form a chamber C directly over the front part of the furnace or fire box F, constructed in the manner and for the purpose specified.

Also, the vertical partitions P in boilers in combination with a partition or chamber I M, for conveying the heat first under, then through, a series of flues E' on one side of the water level, and returning it on the same plane on the other side of said partition P through the flues E'' to the rear of the boiler, substantially in the manner specified.

60,991.—WILLIAM BRANAGAN, Burlington, Iowa.—*Steam Generator.*—January 8, 1867.—The side flues are carried by a revolvable jacket so that

they can be presented to any of the horizontal tubes traversing the water space from the fire box to the chamber within the jacket.

Claim.—Applying a jacket D to a boiler which is constructed substantially as described, so that this jacket can revolve around the boiler, substantially as specified.

60,992.—E. W. BRANCH, East Henrietta, N. Y.—*Cider Mill.*—January 8, 1867.—The hand wheels for communicating pressure may be turned by single handles parallel with their shafts by series of radial handles from their periphery, or by levers oscillating on the shafts and engaging ratchet projections on the inner face of the rim. Inverted troughs with notches in their lower edges are placed on the bottom board of the press to assist drainage.

Claim.—The windlass wheel K, having three separate functions of operation, composed, first, of the side pin *h* and rod M, for rapidly turning up the screw wheel H; second, the hand pieces *f* for imparting the initial pressure; third, the ratchets *g* and lever L for producing the final pressure, arranged and operating conjointly with the screw wheels H H and follower D, substantially as set forth; fourth, the employment of a series of inverted troughs or tiles P P, closed on their upper sides, but provided with apertures *k k* on a level with the face of the bed, to receive and conduct away the expressed juice, substantially as set forth.

60,993.—FRANKLIN BRUA, Gordonville, Pa.—*Harvester Rake.*—January 8, 1867.—The rakes are carried on arms upon a bevel gear wheel, and are vertically oscillated by a horizontal cam to bring them down upon the platform at the proper time.

Claim.—The peculiar construction of the horizontal wheel O, with its stops or lugs P, centrally-elevated radiating arms M with slots *m*, in combination with the elbowed heel K L of the rake shaft T, the whole being arranged and operated in the manner and for the purpose herein set forth.

Also, the arrangement of the double head B, center pin or shaft I, bracket D, pinion F, and slotted cog wheel O, when constructed and operated in the manner and for the purpose set forth.

60,994.—WALTER S. BUCK, Philadelphia, Pa.—*Machine for making Tin Cans.*—January 8, 1867.—The body of the can is placed on the expanding cylinder and held by an adjustable blade which is depressed by a treadle. The seam is then soldered. The cylinder is expanded by set screws at the ends which screw into one side and have circumferential grooves in the heads which are engaged by pins.

Claim.—First, the cast-iron base plate A, with its recesses B and G, in combination with the steady pin L, for the purpose substantially as described.

Second, the expanding metallic cylinder S, when constructed and adjusted substantially as described.

Third, the combination of the slotted blade H with the slotted and vibrating arm C and set screws O, arranged and operating as described.

Fourth, the sliding guides *y* in combination with the cylinder S, substantially as described.

Fifth, the combination of the pressure arm C, base-plate A, and expanding cylinder S, when arranged and operating for the purpose substantially as described.

60,995.—W. BUTTERFIELD, Madison, Wis.—*Rotary Pump.*—January 8, 1867.—The revolving piston is placed eccentrically in the cylinder and has buckets whose edges are kept in contact with the inner surface of the cylinder by concentric cam rings upon the cylinder heads. The water is received below and discharged above. A circumferential passage within the cylinder extends beyond the place of exit for the escape of water.

Claim.—First, a rotary pump having a circular cylinder and the chamber E in the casing, so arranged that the valves in passing under the chamber shall force the water out in the opposite direction, as described.

Second, constructing the end plates H with the concentric rings *n*, forming a bearing for the springs *a*, substantially as set forth.

Third, the combination of the cylinder C, provided with the buckets or valves D, and set eccentrically in the case A, in combination with the chamber E, and

the side plates H, provided with the rings *n*, when arranged and operating as set forth.

60,996.—NELSON CARL, Cincinnati, Ohio.—*Extension Table.*—January 8, 1867.—Both parts of the table draw equally away from the slide or middle portion. The main frame of each of the principal parts performs the functions of a slide, and the middle portion serves to hold the extra leaves.

Claim.—The combination of the central-boxed slide E and legs G with the ends A B of the table, forming the outer slides, the whole constructed and arranged to operate as and for the purposes described.

60,997.—HECTOR CARLOS, New York, N. Y., assignor to self and HENRY C. WATSON, same place.—*Button.*—January 8, 1867.—The shank is jointed and its end is pointed for insertion and capable of being oscillated 90° to act as a retainer.

Claim.—As a new article of manufacture the novel button herein described, composed of the body A, shank B, confining pivot C, and pointed hinged part D D', combined and arranged substantially in the manner, and so as to be applied to the garment and secured thereon, substantially in the manner and for the purpose herein set forth.

60,998.—M. J. and H. M. CHAMBERLIN, Springfield, Mass.—*Breech Loading Fire Arm.*—January 8, 1867.—When the recoil block is down the trigger is held by it in the sear of the hammer. When the block is up the trigger, as it is pulled from the sear, locks the block in closed position.

Claim.—First, using the trigger as a brace to support the recoil block, substantially in the manner herein set forth.

Second, so combining and arranging recoil block, hammer, and trigger, that when the recoil block is raised up against the rear end of the barrel and the trigger pulled for the purpose of firing, the recoil block is supported by the trigger acting as a brace and kept in place by the hammer, and when the recoil block is down and the trigger in the notch of the hammer, it (the trigger) is kept from being pulled out from under the hammer by the recoil block, substantially as herein set forth.

Third, the projection M, when constructed and arranged in the manner and for the purpose set forth.

60,999.—W. S. COLWELL and F. VEAZIE, Pittsburg, Pa.—*Stave Machine.*—January 8, 1867.—Staves are sawn to a thin circular form by two saws in form of segments of circles, actuated reciprocally by cranks which are connected to their sectoral frames. The block is clamped to a sliding bed by points actuated by a worm gear.

Claim.—First, the arrangement of the saws A and B, arms 1 and 2, shaft 3, connecting rods 5 and 6, and crank 4, when said arrangement is used for sawing out the concave and convex sides of a stave at one operation as herein described.

Second, the arrangement of the guides D and D', clamps *e f g* and *h*, provided with arms J and K, rack *m*, lever *l*, endless screw *i*, and wheels 12 and 13, when said parts are arranged and operating as herein described and for the purpose set forth.

Third, the arrangement of the racks *w*, wheels 30, shaft P, lever *u*, provided with the pawl *t*, when said parts are used in connection with the clamps *e f g* and *h*, as herein described and for the purpose set forth.

61,000.—ALICE A CONDIT, Muncie, Ind.—*Feathered Cloth.*—January 8, 1867.—The plumes are trimmed square at both ends and made of equal length, so as to make the quill form one side. It is then sewed to the fabric, the stitches passing over the quill, each quill being concealed by the feathers of the next.

Claim.—An article of manufacture formed by trimming, folding back, and sewing upon cloth or other material the feathers of geese, birds, or fowls, as herein shown and described.

61,001.—EDWARD S. CROSS, Lime Rock, Conn.—*Bed Bottom and Seat.*—January 8, 1867.—The coils at each end of the spring engage behind a helical projection on the casting by which it is connected to the bedstead or slat.

Claim.—First, the spiral spring E attached to the end of the slat B or of the bedstead A, by means of an attachment inserted into the end of the spring, and having one or more spurs standing in the helical spaces in the spring so as to allow of being turned, substantially as and for the purpose herein specified.

Second, in combination with the above the within described arrangement of the castings C and D and axis *c* and *d* adapted to turn in the vertical plane, substantially as and for the purpose herein specified.

61,002.—JAMES H. FLAGG, Perkinsville, Vt.—*Hanging Paint Pots to the Sides of Buildings.*—January 8, 1867; antedated December 22, 1866.—The pot is hung to a horizontal bar whose inner end has studs to engage the lower side of a weather board. The bar has pivoted to it a divaricated lever whose lower pointed ends engage the wall.

Claim.—The lever A and forked brace B in combination with each other in such manner as to provide a device, substantially such as and for the purpose herein shown and described.

61,003.—A. M. FREEMAN and A. M. STONER, Springfield, Ohio.—*Car Coupling.*—January 8, 1867.—The pin head is connected by a chain to a rock-bar bent into the form of a crank. When the car is uncoupled the pin rests on a pivoted plate having a perpendicular perforation through which the pin passes when the plate is raised by the entering link.

Claim.—The combination of the shaft C, bolt *c*, and latch *m*, when said parts are arranged to operate in connection with each other, substantially as and for the purpose herein set forth.

61,004.—CHARLES N. GILBERT, JOHN F. BARKER, and E. N. IVES, Springfield, Mass., assignors to NEW ENGLAND PORTABLE GAS WORKS COMPANY, same place.—*Apparatus for Carburetting Air.*—January 8, 1867.—An improvement on carburetters made on what is known as the gravity principle. Explained by the claims and illustration.

Claim.—First, in a gas apparatus, constructed on the principle before mentioned, arranging the generator in a fire-proof and gas-tight chamber, substantially as set forth.

Second, arranging a tank for holding the fluid in a separate and detached building, and connecting the same with the generator by means of a force pump and pipes, substantially as set forth.

Third, arranging the pipes connecting the generator with the tank and pump in such a manner that the syphons can be filled and the generator emptied from the tank house.

Fourth, the arrangement of the gas-pipes in such a manner that the condensed vapor, together with the gas in the generator and pipes, can be withdrawn from without the building, substantially as described.

Fifth, heating the generator by means of the radiating box or pipe passing through the chamber outside of the generator, substantially as described.

Sixth, the use of gauges for the purpose of indicating the presence of fluid in the generator or pipes, instead of petio cocks.

Seventh, the use of metallic flanges for the purpose of securing the pipes to the generator and tank, constructed substantially as described.

Eighth, the improved form of generator, in which the reservoir chamber *h* is added to the evaporating pans *o o*, both enclosed in one case, substantially as described.

Ninth, the attachment of the metallic box B, arranged substantially as and for the purpose shown.

Tenth, the improved can for filling, with the union and hose attachment, arranged substantially as shown.

Eleventh, the arrangement of the pipes *q* and *v*, with the cock *p* and the cock *s* communicating with the syphon tubes and the gauge P in such a manner that the syphons may be operated and fluid withdrawn from the pans by the naphtha let down from the reservoir *h*, in the manner substantially as described and shown.

Twelfth, the syphon cups E E E, arranged substantially in the manner and for the purpose specified.

Thirteenth, the general arrangement of the gas-tight chamber, with the enclosed closet, having the glass front and metallic door, into which closet the various pipes enter, together with the damper rod, arranged in such a manner that the generator can be

inspected and operated without necessitating an entrance to its chamber, substantially as described.

Fourteenth, the general arrangement of the air-tight chamber, with pipes for venting the generator and chamber, having the damper *u* and man-hole *w*, substantially as described.

61,005.—GEORGE K. GLUYAS, San Francisco, Cal.—*Bearing for Shafts of Steamships.*—January 8, 1867.—The pillow-block of the shaft is supported by rubber-springs resting on a block, which is adjustable vertically in the slide frame by screws beneath. This device is intended for the middle bearing of paddle shafts.

Claim.—The arrangement of the frame A enclosing the adjustable blocks B, guided by the slides C and the blocks D, and combined with the rubber springs E and adjustable screws F, substantially as set forth for the purpose specified.

61,006.—GEORGE GRAY, Temperanceville, Pa.—*Artificial Fuel.*—January 8, 1867.—To 1 ton of coal dust add 8 or 10 pounds of melted pitch and 1 pound of resin. Moid into blocks.

Claim.—The artificial fuel composed of the ingredients, prepared in the manner and proportions substantially as set forth.

61,007.—HENRY HAMMOND, Hartford, Conn.—*Back Sight for Fire-arms.*—January 8, 1867.—The perforated sight disk has lips which take over the edges of the jointed standards, or over the edges of a central vertical slot. A scale upon the standard indicates the elevation of the disk.

Claim.—First, the combined action of the oscillating disk *i* with the clasp *f*, relative to the standard *d*, substantially as and for the purpose described.

Second, the oscillating disk *i*, with its fastening screw *k* and sight *n*, with the standard *d*, substantially as described.

Third, the employment of the screw *h*, with the oscillating disk *i* and standard *d*, substantially as and for the purpose described.

61,008.—IRA HOLMES, Moscow, N. Y.—*Inhaler.*—January 8, 1867.—A chamber in the cap has valves which allow the vapor to pass from the vessel to the mouth, and from the mouth through the inhaling tube to the outer atmosphere.

Claim.—The cap C, with its chamber E, valves *c* *t*, and tubes D F, when arranged in the manner and for the purpose set forth.

61,009.—E. S. HUNT, Philadelphia, Pa.—*Stone Dresser.*—January 8, 1867.—The frame is carried on wheels with rubber tires, and may be moved by a hand crank, which is connected to either the moving or dressing devices. The cutters are clamped at the lower end of a rod, which has adjustable springs to limit its action, and is raised by radial revolving arms which engage a lever that comes in contact with its tappet.

Claim.—First, the hammer H R and its cutter *c*, constructed and combined with lever M O, lifter L F, and springs S P and S' P', regulating nut M A, so as to obtain the intended and herein described effect.

Second, the lever L, pinions P and P', with gearing and unengearing movement plate N S, with notches and lug N S—N S, when combined and constructed in the manner and for the purpose above described and set forth.

Third, wheels R A and R' A', provided with a rim made of India-rubber, gutta-percha, leather, or any equivalent substance, when combined and constructed in the manner and for the purpose above described and set forth.

61,010.—BARTON H. JENKS, Bridesburg, Pa.—*Self-Lubricating Bolster and Step for Spinning Frames.*—January 8, 1867.—The removable bearings are of soft metal to decrease the wear of the spindle, around which they form sleeves within the hard-metal bolster.

Claim.—First, the hard-metal bolster *a*, with oil chamber *e* and separated removable bearings *c* *c'*, substantially in the manner and for the purpose described.

Second, the spindle step *g h m*, constructed in the manner and for the purpose described.

Third, the combination of the bolster *a* *c* *c'*, step

g h m, and spindle B, substantially in the manner and for the purpose described.

61,011.—JOHN L. KENDALL, New York, N. Y., assignor to ELLEN A. VAIL, Southold, N. Y.—*Skirt Supporter*.—January 8, 1867; antedated December 23, 1866.—The tapes on the inside of the skirt have eyelets to be engaged by hooks near their lower ends, and thus loop up the skirt to the extent desired.

Claim.—A skirt supporter, composed of a tape or strip of fabric furnished with a hook and eyelets, and adapted for attachment to the skirt as and for the purpose described.

61,012.—J. W. LATCHER, Albany, N. Y., and JOHN YOUNG, Amsterdam, N. Y., assignors to JOHN YOUNG, Amsterdam, N. Y.—*Wringing Machine*.—January 8, 1867.—The roller shafts have transverse pins which engage gains in the hubs of bevel wheels, whose conical sockets are traversed by shafts. The outer ends of the hubs of these wheels have bearings in the frame, which allow them an oscillating movement when the distance between the rollers is varied.

Claim.—First, the employment or use of conically-bored wheels F F, applied to shafts of clothes wringers, for the purpose shown and described.

Second, in combination with the gears F F, the variable bearing-plate E, all constructed and arranged to operate substantially as set forth.

Third, in combination with the wheels F F and bearing-plate E, the elastic cushion k, for the purposes set forth.

Fourth, in combination with the conically-bored gear wheels F F and cushion k, the relay spring l, for the purpose described.

61,013.—WILLIAM J. LUDLOW, Chardon, Ohio.—*Torch and Match Safe*.—January 8, 1867.—The tube screws into the handle, which forms a receptacle for oil, and contains also a match recess. A ring is provided by which to hang up the torch.

Claim.—The described invention as a new article of manufacture.

61,014.—A. C. MARTIN and J. WOODROUGH, Hamilton, Ohio.—*Saw*.—January 8, 1867.—The teeth are secured in the plate by their dovetailed bases. They are moved laterally into their recesses and then tightened by forcing outwardly by a key-piece inserted beneath; the key is fastened by a pin.

Claim.—Inserting the saw tooth in its seat by moving it toward the periphery or edge of the saw and securing it in place by the means substantially as specified.

61,015.—ALEXANDER, JOHN, and THOMAS McKENNA.—Pittsburg, Pa.—*Barreling Cock*.—January 8, 1867.—The passage in the cock for the escape of air has a whistle, which sounds while the barrel is filling; the rise of liquid covering the inner end of the passage indicates when the barrel is filled.

Claim.—Combining with a barreling cock a whistle or other contrivance that will indicate by sound the flow of liquid while filling, and so constructed as that when the liquid reaches the nozzle the sound will cease, whereby the person in charge may know that the barrel is full.

61,016.—JACOB P. MEYER, Waukesha, Wis.—*Protecting Horses' Necks*.—January 8, 1867.—A lengthened rest for the collar top, having bearing before and behind a spot galled by an ordinary collar.

Claim.—The pad composed of the slats A, flexibly united, and having a middle space which spans the sore and ends which rest upon the neck or withers, with or without the cushions, substantially as described and represented.

61,017.—ALEXANDER G. NYE, Weymouth, Mass.—*Separating Hard Rubber from Porcelain Teeth*.—January 8, 1867.—The plate is immersed for five minutes in oil raised to 300° Fahrenheit.

Claim.—The employment of a bath of heated or boiling fat or oil, in connection with one or more teeth and a mass of vulcanite, in manner and for the purpose as specified.

61,018.—S. W. J. F. and N. PALMER, Auburn, N. Y., assignors to themselves and DAVID LYMAN,

Middlefield, Conn.—*Mangle*.—January 8, 1867.—Explained by the claims and illustration.

Claim.—First, the application to the rollers of mangles of hard rubber or vulcanite, substantially in the manner and for the purposes described.

Second, combining and connecting the lever frames in which the stationary and movable rollers are hung by a system of links and levers, arranged substantially as described so that the same may be actuated by hand, weights or otherwise, substantially as and for the purposes herein shown and described.

Third, in combination with the movable roller, when hung in the short arms of angular levers for the purpose of adjustment with reference to the stationary roller, the internal and external gear wheels and intermediate pinion under the arrangement shown and described, so that the said gear wheels, while at variable distances from each other, shall bear fixed and invariable relations to the said pinion, substantially as and for the purposes set forth.

Fourth, the method of gearing the rolls of mangles, or other like machines, when arranged so as to move with equal or different velocities, but at variable distances from each other, by mounting upon the said rolls respectively internal and external gear wheels, which mesh with an intermediate pinion, stationary with relation to said rolls, substantially as shown and set forth.

Fifth, in a mangling machine, marking and ornamenting the material passing between the mangle rolls, by means of letters or other devices or designs cut or formed in intaglio in one or both of said rolls, substantially as herein shown and described.

61,019.—WILLIAM P. PARROTT and JOHN J. BORDMAN, Boston, Mass.—*Ore Crusher*.—January 8, 1867.—The faces of the cylinders are constructed in segments. The cylinders have a reciprocating motion endwise, each in respect to its fellow of the same pair. A reciprocating motion may be given to the hoppers.

Claim.—The mode hereinbefore described of making either or each of such crushing rollers of a series of peripheral segments or sections e', a body d' d' d', and clamp rings f' f', formed and applied together, substantially as specified.

Also, the mechanism as described, for imparting reciprocating endwise movements to the rollers of either or each pair of crushing rollers, as described.

Also, the combination of a movable hopper, a pair of crushing rollers, and mechanism for moving the hopper laterally in reference to such rollers, in manner as set forth, while they may be in revolution, as specified.

Also, the construction of each hopper, viz: with two or more receiving and discharging apartments arranged in it, substantially as and for the purpose specified.

61,020.—CHARLES M. RAYNALE, Birmingham, Mich.—*Propeller for Vessels*.—January 8, 1867.—The water is driven to the rear for the propulsion of the vessel by the action of the valve plungers, operated by a motor on board the vessel.

Claim.—A vessel, constructed with pipes B B opening directly astern, and bent at right angles upward, in combination with reciprocating plungers C open above, and working vertically in each, said plungers being constructed with outward-opening valves C', and arranged to operate substantially as and for the purpose set forth.

61,021.—DANIEL T. ROBINSON, Boston, Mass.—*Horse Railway Car*.—January 8, 1867.—The tapering end of the tongue enters a socket in the whiffletree frame, and may be withdrawn therefrom when required.

Claim.—So applying the pole of a horse car to its connection or draw bar as to be enabled to disconnect it therefrom instantaneously by itself, or without the whiffletree, essentially in manner and to operate as hereinbefore described.

61,022.—DANIEL T. ROBINSON, Boston, Mass., assignor to PAUL P. TODD, same place.—*Coffee Pot*.—January 8, 1867.—The ground coffee is contained in a foraminous cup, whose sides are enclosed within a shell ending above in a funnel. The top of the latter fits tightly in the pot top, and receives the bottom of a condensing vessel which may contain milk. The

vapor from the decoction passes through the funnel sides, condenses, and falls into the cup containing the ground coffee.

Claim.—In combination with the pan B and foraminous cup C, the shield or tube D, essentially in manner and for the purpose as described.

61,023.—ANDREW V. RYDER, Germano, Ohio.—*Horse Rake.*—January 8, 1867.—The rake teeth are raised simultaneously by a treadle lever and depressed by separate spiral springs.

Claim.—The above-described construction and arrangement of the levers A and F, in combination with the links D, for operating the rake by treadle action, substantially as set forth.

61,024.—T. SCHOLZE, Steuben county, Ind., and J. BICKEL, Elkhart county, Ind.—*Water Elevator.*—January 8, 1867.—The crank is adapted to release the check pawl and to serve as a brake for controlling the descent of the buckets.

Claim.—The crank C, as constructed with an arm and hook *d*, in combination with the pawl catch *g* and perforated plate A, substantially in the manner and for the purpose as herein set forth.

61,025.—ANTHONY M. SMITH, Brooklyn, N. Y.—*Spring Lock.*—January 8, 1867.—The tube containing the pin by which the key operates is extensible by a set screw to suit doors of any thickness.

Claim.—The combination of the extension tube A and nut *s*, the elongated catch *d* and arm *e*, operating in recess *o* by means of the set screw *u*, substantially as described.

61,026.—HARLOW C. SMITH, Champaign City, Ill.—*Flour Sifter.*—January 8, 1867.—The sieve is pivoted at its lower and smaller end, and discharges the refuse through the side of the box at that place. It is agitated by a cam wheel and spring, and has a wire passing through the exit of the hopper to prevent clogging.

Claim.—The combination of wire E E, pivot N, aperture H, rod L, rod I, and hooks O, as described and for the purpose specified.

61,027.—SIDNEY SQUIRES, Boston, Mass.—*Wringing Machine.*—January 8, 1867.—The clamping device is so pivoted to the wringer frame that it may be reversed, and each roller has a place of attachment for the hand crank.

Claim.—Pivoting the portions H to the frame A, so that their position can be reversed, for the purpose described.

Also, in combination with the above, projecting one end of both shafts C D of a wringing machine beyond its frame, so that when the portions H are reversed, and the position of the rolls thereby changed, the crank may be applied to the lower shaft, as and for the purpose set forth.

61,028.—R. N. STEWART, Philadelphia, Pa.—*Paper Box.*—January 8, 1867; antedated December 30, 1866.—The edges of the pasteboard are embraced by sheet metal, and these strips soldered together. The strips furnish places of attachment for metal loops by which to fasten or hang the box.

Claim.—Securing the edges of the pasteboard of which the said paper boxes are made permanently together by means of the double clamps A of thin sheet metal, constructed and applied substantially as and for the purposes as described.

Also, the combination with the said double clamps A, the small metallic loops *a*², substantially as and for the purpose described.

61,029.—GEORGE STORER, New Britain, and GEORGE W. STORER, Portland, Conn.—*Attachment for Center Boards of Vessels.*—January 8, 1867.—The center board is pivoted by a pin, which traverses a bushing in the board and enters metal sockets screwed into the trunk on each side.

Claim.—The screw socket *e* receiving the center pin *d* of the center board, and forming a water-tight connection with the trunk *a*, substantially as specified.

61,030.—ELI THAYER, New York, N. Y.—*Decoction Apparatus for Tea and Coffee.*—January 8, 1867.—The lower portion contains the material for the in-

fusion, and being partially separated from the water above, is capable of attaining a boiling heat before the main body of water, which condenses the steam and volatile oil arising from the infusion below.

Claim.—A decocting apparatus wherein the main body of water is separated from that portion which saturates the material from which the decoction is made, by some non-conducting material which partially intercepts the heat and circulation, whereby ebullition may be produced in the latter portion of the water, and its vapor condensed by the former and cooler portion, substantially as is herein set forth.

61,031.—ELI THAYER, New York, N. Y.—*Steam Generator.*—January 8, 1867.—The upper water chamber has downwardly extending ducts which communicate together through pipes which extend into the furnace space. The smaller pipes open at one end into the inner duct, and at the other discharge at the blind end of the larger and enveloping pipes. The larger pipes discharge into the outer duct, which is nearer to the furnace.

Claim.—First, the discharge chamber *e*, in combination with a tubular steam generator, substantially as set forth.

Second, the arrangement of the several doors *n n w w* for feeding the fuel among the pipes constituting the upper grate, and for clearing them of cinders or other obstructions, substantially as set forth.

Third, the feeding chamber *m m*, substantially as set forth.

Fourth, the upper grate, substantially as set forth.

61,032.—SYLVANUS WALKER, New York, N. Y.—*Pliers.*—January 8, 1867.—The jaws are plain at the ends, have opposing grooves for holding a bolt longitudinally, and serrated transverse hollows for use as a wrench.

Claim.—Pliers constructed and arranged substantially as and for the purposes herein set forth.

61,033.—C. M. WILLIAMS, New York, N. Y.—assignor to HENRI L. STUART, same place.—*Carbureting Gas.*—January 8, 1867.—The hydrocarbon is distributed by a rose into the upper part of the gas-holder, from a raised tank; the emission is regulated by a cock.

Claim.—Carbureting illuminating gas by mixing or combining with it the vapors of volatile hydrocarbons before it is introduced into the service mains for distribution, substantially as described.

Also, the devices herein shown and described for carbureting gas in the holder before its distribution to the service mains.

61,034.—W. DEWEES WOOD, McKeesport, Pa.—*Treating Cleaned or Scaled Iron.*—January 8, 1868.—After removing from the alkaline bath, and washing as usual in hot water, the plate is allowed to dry, and heated in an oven to a degree below redness. It is then taken out and dipped in a bath of oil and turpentine.

Claim.—The process hereinbefore described of subjecting the iron immediately after it has been washed in water to remove the remains of acid or alkali, to a hot-air bath in a suitable oven or chamber, heated to a low temperature, sufficient to evaporate all fluids from the pores of the metal, and then, while the iron is yet hot, immersing it in or coating it with a mixture of oil and turpentine, or other similar fluid or mixture, which will leave a very slight film or coating on its surface, for the purpose hereinbefore described.

61,035.—MAX ADLER and LOUIS KNELL, Buffalo, N. Y.—*Sash and Blind Fastener.*—January 8, 1867.—The bent end of a pin operated by a knob inside the window frame enters between two projections on the shutter hinge plate to keep it either open or shut.

Claim.—In a sash and blind fastener combined, the points or beaks *d d*, beveled concave *e*, bent lever *f*, knob *g*, and the part *a* of the hinge, in combination with the ratchet wheel *h* and dog *k*, substantially as set forth.

61,036.—CHILTON B. ALLEN, Chicago, Ill.—*Composition for Roofing.*—January 8, 1867.—Pulverized slate and gypsum are mixed in equal proportions, and oil paint or tar added.

Claim.—The use of pulverized plaster, (and or boiled,) in combination with slate flour and other ingredients for roofing, covering the sides of buildings, boat decks, &c., substantially as herein described and set forth.

61,037.—L. V. BADGER, Chicago, Ill.—*Nutmeg Grater.*—January 8, 1867.—The nutmeg is dropped into the oscillating cylinder, and pressed against the curved grater by the plunger, which forms a handle for oscillation.

Claim.—The sector-shaped case B, having hollow cylinder H hung in and between its sides, plates D, in combination with the plunger I of said cylinder, substantially as and for the purpose described.

61,038.—JOSEPH W. BANCROFT, Philadelphia, Pa.—*Dumping Car.*—January 8, 1867.—This car is for transporting coal up steep grades, and automatically discharging it above. On reaching the level at the summit the trigger catch of the front door is tripped by a protuberance on the track, coincidentally with the forward inclination of the car, incident to the variation in the size of the wheels, and the car being on the level.

Claim.—A mining car, supported by large wheels B behind, and small wheels B' in front, in combination with a swinging door C, latch b, and yoke D, all constructed and operating as and for the purposes set forth.

61,039.—JOHN H. BARRINGER, Hillsboro', Ill.—*Cultivator and Sulky Plow.*—January 8, 1867.—The plow and cultivator drag bars are of metal, and are connected by a link to the frame, so that either can be removed, and the other substituted. The tongue is pivoted to the frame, and may be turned sidewise by a lever.

Claim.—First, the arrangements herein described of a combined cultivator and sulky plow connected, and operating separately when the parts are shifted, substantially as herein described.

Second, the arrangement of a shifting plow E, connected with the beam a by the adjustable plates u u, and suspended in the front by the joint b and the bar c, and in the rear by the hook e to the arm f, and the vibrating bar g, substantially as and for the purposes herein described.

Third, the arrangement of the shifting cultivators n n attached out of line with each other to the bent iron beams p, and suspended in front by the jointed connections r, and behind by the hooks t to the arms f¹ f² on the vibrating bar g, substantially as and for the purposes herein described.

Fourth, the arrangement of a guide rod or lever k, connected with the draught pole D, substantially as and for the purpose herein specified.

61,040.—HENRY BARSALOW, Saint Anne, Ill.—*Cultivator.*—January 8, 1867.—The plow beams are connected at their front ends to the frame by a universal joint, and are suspended from the frames of pulleys having movement on a lateral bar. The beams have stirrups for the feet by which they may be moved laterally.

Claim.—First, the beams G attached to the front of the frame A by an adjustable universal joint connection, and suspended by chains near their rear ends to travelling rollers i on the raised cross bar t of frame A, substantially as and for the purpose set forth.

Second, the combination of the mounted frame A, plow or shear beams G G, and detachable seat E, stirrups and foot piece E', all arranged substantially as and for the purpose specified.

61,041.—HENRY BARSALOW, Saint Anne, Ill.—*Seedling Machine.*—January 8, 1867.—The hounds run backward and upward over the axle, and a lever connected to the axle frame operates through these backward projections of the hounds to raise or depress the seed runners. The seed slides are operated by gears from the ground wheels, but may be disconnected and operated by hand.

Claim.—First, the curved extension of the hounds E E beyond the rear of the bar C of the front part of the machine, in combination with the lever J, provided with the cross bar L for the rear parts of the hounds to rest upon, and the segment rack K and

catch L, or their equivalents, all arranged substantially as and for the purpose set forth.

Second, the operating of the seed slide M automatically from the wheel I, by means of the gear l, adjustable gears i k, rod Q and the bent lever P', all arranged substantially as and for the purpose specified.

Third, the combination of the hinged or jointed rear part or frame G of the machine, with the extended hounds E E, lever J, with cross bar L attached, substantially as and for the purpose set forth.

61,042.—J. L. BEERS, McAlisterville, Pa.—*Saw Mill.*—January 8, 1867.—The feed motion of the carriage is controlled by a hand lever working in a long slot having notches to hold it in position. This lever is connected to the pitman that works the feeding knee, in which there is a long slot, so that by operating the lever the pitman head is moved to or from the center upon which the knee oscillates, thus regulating the feed.

Claim.—Controlling the feed motion by means of the lever L, rod K, pitman F, pin b, notched plate M, T-shaped slotted arm G, and pawls H H, arranged and operating substantially as described for the purpose specified.

61,043.—VIRGIL W. BLANCHARD, Bridport, Vt.—*Hot Air Furnace.*—January 8, 1867.—The air passes into a pipe which traverses the fire chamber, and is forced around the ends of diaphragms within lateral blind pipes projecting therefrom. It then enters a combustion chamber in a reverse direction to the calorific current from the consumption of the fuel. Water or oil is supplied immediately below this place of entrance to increase the heat. The calorific current passes through an upper chamber into which project blind pipes with smaller pipes conducting cooler air almost to their extremities.

Claim.—First, the air heater N, fitted within the fire chamber A and arranged or provided with one or more tubes k k communicating with the tubular axis j, and having partitions l for the purpose of conveying or transmitting a current of fresh heated air to the combustion chamber E, and directly in contact with the products of combustion from the fire chamber so that the inflammable gases contained in said products may be consumed within the combustion chamber, substantially as set forth.

Second, the tubes n o placed at the inner end of the air heater and arranged as shown, or in an equivalent way, for the purpose of ensuring a proper mingling of the fresh heated air with the products of combustion from the fire chamber, within the combustion chamber as described.

Third, the perforations r at the end of the space g, between the tubes n o, in combination with the perforated disk or valve s, the apertures t of which are inclined or beveled at their ends to deflect the products of combustion from the fire chamber, through the current of fresh heated air issuing from tube u, as set forth.

Fourth, the tubes e' d' applied to the inner end of the air heater in combination with the tubes n o u, the perforated rotary disk or valve s, and the perforations r in the end of the space g, all arranged substantially as and for the purpose specified.

Fifth, the combustion chamber E in combination with the air heater N, fire chamber A, and the tube M', the latter forming a communication between the combustion chamber and a reservoir of oil, water, or other substance which may be decomposed and consumed within the combustion chamber, all arranged substantially as and for the purpose set forth.

Sixth, the arranging of the disk or damper s with the tube u and rod v attached, the latter extending through the tube j of the air heater N, whereby the disk or damper may be turned at will, and the passage of the products of combustion into the combustion chamber regulated as desired.

Seventh, the slide a' in the outer end of the tube j of the air heater in combination with the disk or valve s and draught passage g at the inner end of the tube j of the air heater, for the purpose of regulating the proportion of fresh heated air, and the products of combustion passing into the combustion chamber, as set forth.

Eighth, the sliding damper F at the rear of the fire chamber, in combination with the air heater N and

combustion chamber E, substantially as and for the purpose specified.

Ninth, the ratchet O and pawl P, or their equivalents, for the purpose of regulating the position of the air heater within the fire chamber, as set forth.

Tenth, the arrangement of the pipes K in the compartment G in the case D above the fire chamber, in combination with the tubes L fitted within the pipes K, and the compartments H I, cold air spaces *d d*, and tubes M, provided with necessary valves, all arranged to operate in connection with the fire chamber of the furnace, substantially as and for the purpose specified.

61,044.—JOSEPH T. BRENEMAN, Springfield, Ohio.—*Hay Stacker*.—January 8, 1867.—The frame is erected over the stack and wagon stand. A knot upon the hoisting rope raises the pulley block and frees it from the catch, when it passes along the slide beam to a point above the stack. An enlargement of the rope prevents the descent of the fork except at the recess in the slide beam over the load.

Claim.—The construction and arrangement of the rollers D, sheaves E, block C, catch F, arm H, links I, and rope L, substantially as and for the purpose set forth.

61,045.—W. S. BRIGHT and J. G. MOREY, New Orleans, La.—*Medicated Plaster*.—January 8, 1867.—A sheet of muslin is coated with a composition of gum ammoniac, 2 oz.; isinglass, 4 oz.; and dilute acetic acid 1 qt., and attached to a piece of perforated buckskin.

Claim.—A medicated plaster made and coated with a medicated compound formed of the ingredients mixed together in and about the proportions named, substantially as and for the purpose described.

61,046.—ALBERT BUELL, West Leyden, N. Y.—*Head Block for Saw Mills*.—January 8, 1867.—The side cleats to which the log is clamped have adjustable inclination to saw the boards beveled.

Claim.—Placing the log in a position to be sawed in bevells by means of movable cleats *b*, screws *f*, and adjusting screw *e*, held by the holding screw *a*, arranged and operating substantially as described for the purpose specified.

61,047.—C. C. CADY, West Union, Iowa.—*Car Coupling*.—January 8, 1867.—A hook is rigidly attached to the drawhead for the link to engage on. A divaricated spring bar partially surrounding the hook is operated by a lever to throw off the link. The running of a car off the track lowers the engaging hook so as to cast off the link and uncouple the car.

Claim.—The fixed hooks B, in combination with the link raisers D connected to levers E, the springs F, and the links C, all arranged and applied to drawheads A A, to operate in the manner substantially as and for the purpose set forth.

61,048.—J. T. CARMAN, Springfield, Ohio, assignor to himself, JOHN W. FULTON, and LEE W. FULTON, same place.—*Brick Machine*.—January 8, 1867.—The clay is drawn through the interstices of an oscillating screen by claws on a revolving shaft, and is elevated by an endless carrier for deposit in the hopper. From this it is discharged by a slide bottom which reciprocates on the fixed bottom and forces the clay into the mold, where it is pressed by a vertically reciprocating follower, first into and then from the mold on to a receiving plate.

Claim.—First, the sliding box A', provided with the plate C', in combination with the fixed molds D' and the plungers R, all arranged to operate in the manner substantially as and for the purpose set forth.

Second, the sliding bottom K, operated substantially as shown in combination with the fixed molds D', plungers R, and the plate C' on the sliding box A', substantially as and for the purpose specified.

Third, the adjusting of the bottom K to regulate the supply of clay to the molds through the medium of the rod *m*, pinions *l k*, screw rod L, and nut *j*, substantially as set forth.

Fourth, the pulverizing or reducing of the clay by means of the oscillating screen C and the teeth *c* on the rotary shaft F, substantially as shown and described.

61,049.—ROBERT CHAMBERS, Detroit, Mich.—*Center Board for Vessels*.—January 8, 1867.—Two reciprocating boards, set at an angle to each other, are pivoted so as to descend into the water vertically when the vessel is careened by the sails. A ratchet upon the edge of the boards rings a bell on the movement of the boards as the vessel goes on the other tack.

Claim.—First, the keel box A, having fixed keel *a'* and piece *a* forming passages for the center boards B *b* pivoted thereto, having ratchet edges *f*, in combination with the striking device *g* of the bell D, substantially as and for the purpose specified.

Second, the center boards B *b* operating in combination with the alarm bell D, for the purpose described, substantially as specified.

61,050.—NATHAN CHAPMAN, Hopedale, Mass.—*Roller Temple for Looms*.—January 8, 1867.—The edge of the cloth is held between two rollers pressed together by a spring lever. An adjustable plate prevents the reed from striking the temple. The object is to adapt the temple to weaving goods of different descriptions and thicknesses.

Claim.—The use of two ribbed or grooved rollers, or one ribbed or grooved roller and one plain roller, arranged in separate frames and pressed toward each other or the cloth by a spring, and allowed to turn freely as the cloth is drawn through between them.

61,051.—J. S. CLARK, Auburn, Mass.—*Butter Tongs*.—January 8, 1867.—The blades are attached to shanks which unite in a spring coil.

Claim.—The combination of the blades or plates A A with the wire coiled and bent, substantially in the manner and for the purposes herein shown and described.

61,052.—EBEN S. COFFIN, Boston, Mass.—*Steering Apparatus*.—January 8, 1867.—The barrel shaft has a screw journal bearing giving a longitudinal motion to the barrel as the wheel is turned, to keep the rope perpendicular to the shaft.

Claim.—First, the combination and arrangement of the screw shaft E, barrel G, ropes F, quarter blocks H, tiller C, and rudder post B, in the manner as and for the purpose specified.

Second, giving a longitudinal movement to the barrel G and shaft E, so that the said barrel may move forward or aft at each turn of the wheel D a distance equal to the diameter of the wheel rope F, substantially as herein shown and described and for the purpose set forth.

61,053.—WILLIAM COVER, Jenner's Crossroads, Pa.—*Paint Brush*.—January 8, 1867.—A fountain paint brush with a receptacle at the end of the handle and a supply tube through the latter, which has a cock for regulation.

Claim.—First, a brush provided with a tubular handle B, and having the reservoir C attached thereto, substantially as shown and described.

Second, the combination of the brush A, tubular handle B, reservoir C, and the compressing device E *b*, arranged to operate substantially as set forth.

61,054.—B. F. COWAN, New York, N. Y., assignor to himself, J. D. SHEWELL, and JOHN SUMNER, same place.—*Coal Scuttle*.—January 8, 1867.—A vibrating register screen in the bottom of the coal scuttle.

Claim.—Making the bottoms of coal scuttles of plates having slots or openings and solid parts intermediate, and so arranged that the slots are opened and closed by the oscillation of one of the plates, substantially as above described.

61,055.—LEWIS P. DECKER, Williamsburg, N. Y.—*Lock*.—January 8, 1867.—The body of the lock is cast solid, except a passage for the bolt and key. The bolt is retracted by the rotation of a screw-threaded sleeve to which it engages. The shoulders of the tongue are recessed, and have rubber packing to prevent inflow of water.

Claim.—First, the combination of the pivoted bolt D, male screw E, and female screw F with each other and with the body A of the lock, substantially as herein shown and described.

Second, the combination of the rubber packing C

with the beveled or hollowed shoulders *b*¹ of the link B, substantially as shown and described.

61,056.—BERNARD DOUD, Cortland, N. Y., assignor to himself and A. HOLMES, same place.—*Cement Composition for Pavement, Floors, Walks, &c.*—January 8, 1867.—A composition of gravel, broken stones, and coal tar is spread upon the ground or a roof and covered with a composition of charcoal and salt. When limestone is not used quicklime is added. For a top dressing: sand, 65; coal ashes, 20; iron scales or filings, 5; plaster of Paris, 4; water lime, 2; hydraulic cement, 1 part—mixed with hot coal tar.

Claim.—The composition cement for the construction of cellar and stable floors, vaults, walks, drives, and pavements, and roofing for buildings, &c., composed and applied in the manner substantially as set forth in the foregoing specification.

61,057.—PHILIP S. DUSENBURY, Boscobel, Wis.—*Portable Fence.*—January 8, 1867.—Stakes rise from the foundation block and are tied by a yoke. The rails cross each other obliquely between the stakes, and are mortised together at their points of contact.

Claim.—The arrangement and combination of the foot block D, yoke B, stake C, and notched and interlocking rails A, as and for the purposes specified.

61,058.—WILLIAM H. ELLIOT, New York, N. Y.—*Potato Digger.*—January 8, 1867.—A series of bent tines are mounted on a handle which has a pivoted flural support.

Claim.—First, the support *h*, in combination with shaft *a* and tines *f*, substantially as and for the purpose described.

Second, handle *l*, with one or more auxiliary handles in combination with a support *h*, or their equivalents, for the purpose set forth.

Third, joint *i*, in combination with two or more handles, substantially as herein shown.

Fourth, a joint *j*, in combination with an elongated foot *k*, substantially as and for the purpose specified.

61,059.—W. H. ELMER, Fair Water, Wis.—*Water Wheel.*—January 8, 1867.—The water falls vertically on central chutes, and is deflected outward and forward against the buckets, from which it has a side discharge.

Claim.—A horizontal water wheel provided with buckets G, composed of radial and segmental portions *b c*, as shown, in combination with a central case E and chutes F, all arranged to operate substantially in the manner as set forth.

61,060.—ROBERT FARIES, Maroa, Ill.—*Steam Generator.*—January 8, 1867.—A series of nearly vertical pipes are formed in sections of two, connected by perforated cross pipes and elbow pipes, for supplying water and taking off the steam. A horizontal diaphragm directs the caloric current from the burning fuel across the vertical pipes.

Claim.—The combination of the parallel pipes C C, perforated cross pipes D, elbow pipes G, secured as described, and plate H, substantially as and for the purpose specified.

61,061.—B. G. FITZUGH, Baltimore, Md.—*Burglar Alarm for Safes, &c.*—January 8, 1867.—The hammer is set by closing the door, and released by the opening of the same.

Claim.—In combination with a fire-arm lock on the inside of such safe, or other apartment or receptacle, a lever or arm connected with the door thereof and controlled by suitable guides, so that the act of closing the door from the outside shall connect the lever or arm with the dog or sear lever of the lock, and the opening of said door trip the hammer and let it fly upon the cap or fire a charge of powder, substantially as described.

61,062.—THOMAS FLEETWOOD, Carleton, N. B.—*Steam Engine Lubricating Cup.*—January 8, 1867.—Unrendered tallow is placed in the cup, is gradually rendered by the heat of the steam, and is supplied to the piston through a pipe furnished with a cock.

Claim.—A self-rendering tallow cup for lubricating steam engines, constructed and operated substantially in the manner herein described.

61,063.—JOHN GREGORY, Marion, Ohio.—*Medical Compound.*—January 8, 1867.—Composed of petroleum, one ounce; extract of dandelion, two drops; solution of borax, two drops; and four drops of Dr. Sanford's liver invigorator, for the cure of consumption, &c.

Claim.—First, the application of petroleum oil produced directly from the pipes of the well, with its natural gases, as and for the purposes specified.

Second, the use of the above-described chemicals, in the manner substantially as and for the purposes set forth.

61,064.—WILLIAM JOHN HAY, Southsea, England.—*Composition for Coating Ships' Bottoms.*—January 8, 1867.—Black or the protoxide of copper is boiled in linseed oil until it is reduced to a sub-oxide. A paint or varnish is formed, which may be thinned by turpentine, naphtha, or other similar material.

Claim.—First, protecting iron and wooden ships, caissons, dams, and other wooden or iron structures from decay and from fouling, by coating or covering the same with the materials and in the manner hereinbefore described.

Second, preparing the materials for the purposes aforesaid, in the manner hereinbefore described.

61,065.—WILLIAM HELFFRICHT, Philadelphia, Pa.—*Passenger Register.*—January 8, 1867.—The tickets are printed on a continuous strip, which is rolled upon a spindle and fed between rollers to the opening at which the tickets are torn off.

Claim.—First, a box capable of being opened at pleasure, and containing a roll of paper on which is printed a continuous series of tickets, the paper passing through a slit or opening against the edge of which it can be torn off, all substantially as and for the purpose set forth.

Second, the combination of the pulley B, containing the roll of paper and the rollers D and E, in combination with the casing or box A A', having a slit or opening in front for the passage of the paper, the whole being constructed and arranged substantially as described.

61,066.—JASON HEMENWAY, Deerfield, Mich.—*Water Wheel.*—January 8, 1867.—The inner sides of the pivoted buckets have connecting rods to a ring having a segment of gearing. A central sliding rod of the wheel shaft operates, by a bell crank and rack gear, to turn the said ring and expand or contract the water spaces between the buckets. The wheel may have central or horizontal discharge.

Claim.—The pivoted buckets C C', connected with the ring E, on the wheel shaft F, by rods D, in combination with the bent lever G, rod H, and screw J, all arranged to operate in the manner substantially as and for the purpose herein set forth.

61,067.—JOHN S. HITTELL, San Francisco, Cal.—*Washing Machine.*—January 8, 1867.—The vertical shaft is supported by the cross-bar and reciprocated by the handles, and the paddles act upon the clothes in the suds box.

Claim.—The combination of the wheel (made of the axle C, the paddles E E E, and handle D) with the cross-board A, and a pivot or socket at the base of the axle to keep it in place.

61,068.—WM. W. HORNBERGER, Chicago, Ill.—*Apparatus for Forming Boilers.*—January 8, 1867.—The bowed springs are connected by pivoted arms to bars, and have longitudinal adjustment by turning the reversely-screw-threaded connecting bolt, and lateral adjustment by nuts upon the ends of this bolt. This frame is put within a stove boiler when forming the lower seam.

Claim.—First, the springs A, arranged to operate in connection with the arms C, pivoted to the bar B, in combination with the bars D, operated by the bolt E, and nuts *c*, substantially as described.

Second, the frames F F', united by the screw bolt E, when arranged to operate as and for the purpose set forth.

61,069.—RICHARD HUGHES, Virginia City, Nevada.—*Punch.*—January 8, 1867.—The punching face consists of needles so clamped in the holder that any injured one can be removed without displacing the

others. It is intended for perforating sheet metal to form screens.

Claim.—The holder A, having spring arms or jaws C C, socket E, to receive needles *b*, and separating plates *c*, substantially as and for the purpose described.

61,070.—LIVERAS HULL, Charlestown, Mass.—*Whip Stock.*—January 8, 1867.—Each of the rattan strips has its face of attachment to the central stock continued on one side past the strip preceding it, and has a rectangular face lapped over in like manner by the succeeding strip.

Claim.—The improved whip stock made substantially as described, viz: with each of its rattan strips *b*, having its joint with the next strip arranged in the plane of that face of the heart piece to which the former strip may be applied, the strips and heart piece being glued together, and subsequently turned into shape, as set forth.

61,071.—MARSHAL J. HUNT, Rising Sun, Md.—*Combined Corn Planter and Cultivator.*—January 8, 1867.—The devices are explained by the claims and illustration. A detachable seed and fertilizer distributing device is attached to the frame.

Claim.—First, hinging the rear of the cultivator frame to the axle and to a lever in close proximity to the driver's seat, and supporting its front by a tongue and the necks of the team, so that it may be self-raising to pass over any obstruction, and be raised by the driver when desirable to do so, and held up by a catch, substantially as herein described.

Second, in combination with the standards or down hangers *b*, a cast or other iron socket or stock L, with wings *o* for holding the cultivators and allowing them to be adjusted, removed or replaced, substantially as described.

Third, a removable and replaceable bed or frame M for carrying a seeding mechanism, substantially such as described, so that the machine may be used for laying off the ground, planting corn, and cultivating it in rows, as herein described and represented.

61,072.—WILLIAM JAMES, Richmond, Va.—*Attachment for Stills to Test the Proof of Spirits.*—January 8, 1867.—A glass tube containing a hydrometer rises from the junction between the worm pipe and the low and high wine pipes. The high wine pipe has an upward bend to drive the liquor to a certain height in the hydrometer tube, which has connection at top to the worm pipe to prevent the production of vacuum in it. It has also a discharge pipe to free it from liquor when required.

Claim.—The combination of the indicator tube with the bend or depression in the pipe through which the spirits is conveyed, whereby to be enabled continuously to test the strength or proof of the spirits passing through said pipe, substantially in the manner and for the purpose described.

Also, the arrangement of the valves or vent pipes, in combination with the still or worm pipe, and the indicator tube for preventing the formation of a vacuum, and equalizing the pressure, substantially as described.

Also, the employment of the vent or discharge pipe at or near the base of the indicator tube, substantially as described.

61,073.—E. K. JOSSELYN, Cambridge, Mass.—*Eye-glass.*—January 8, 1867.—The horns fit the nasal protuberance being adapted to its peculiar conformation.

Claim.—The extensions *c c*, either as part of the frames *a' a'*, or fastened to the same by any suitable fastening, substantially as described and for the purpose set forth.

61,074.—JOHN L. KENDALL, New York, N. Y., assignor to himself and R. H. TRESTED, same place.—*Electrotype Dies for Making Imitation Straw Goods, &c.*—January 8, 1867.—The straw goods or fabric to be imitated is stiffened with a backing and laid upon a metallic form, which gives it the required shape. After dipping in an acidulated solution and drying, it receives a coating of black lead, and a copper negative is obtained of the straw by the usual process of electrotyping. The shell is formed into a die, and a counter die produced therefrom, between which, pre-

pared fabric is pressed into an imitation of the original straw goods.

Claim.—The within-described process of preparing a die and counter die for pressing textile and other fabrics in imitation of straw, as set forth.

61,075.—JOHN W. LEWIS, Fetterman, West Va.—*Plove.*—January 8, 1867.—A reversible share and a wrought cutter, sole and point are attached to a cast-iron sheth, mold-board, and landside.

Claim.—The combination with the casting A B C forming the sheth, mold-board, and landside of the separate reversible share, and the wrought portion E G F, forming the cutter point and sole, the whole substantially as described and represented.

60,076.—WILLIAM C. LEWMAN, Kansas, Ohio.—*Hand Corn Planter.*—January 8, 1867.—The two outer blades are pivoted at bottom, and are connected to the middle blade by three flexible partitions, so as to form four seed passages, and allow of a lateral movement in the outer blades. This movement of the blades works hoppers on the seed slide, and opens and closes the dibble points.

Claim.—A hand corn planter, which is composed of the blades A B and C of the flexible partition or walls F G and H, and the four seed slides *b b* and *c c*, which slide in the seed boxes D and E, all made and operating substantially as and for the purpose herein shown and described.

61,077.—ROBERT O. LOWREY, Tabor, Iowa, assignor to himself and E. N. KELLOGG.—*Wind Mill.*—January 8, 1867.—The described devices are for holding the sails in a suitable position with reference to the force of the wind, while at the same time they are allowed to feather properly as they move against the wind.

Claim.—First, the application of the stops *h* to hinged arms *e e'*, which are connected together in pairs, and acted upon by a loaded sliding ring G upon the shaft B, substantially as described.

Second, the combination of the stops *h*, arms *e e'*, and wings D, in such a manner that the stops when tripped will again assume vertical positions, substantially as described.

Third, providing adjustable stops *h* on each side of the radial arms to which the wings D are pivoted for supporting the latter in the two positions which they assume in each revolution, substantially as described.

Fourth, providing for allowing the stop arms *e e'* of the upper and lower series to separate vertically when forced outward, employing the curved rods *f f'* for effecting this object, substantially as described.

61,078.—GEORGE MACDONALD, Aston, England.—*Machine for Cleaning and Ginning Cotton.*—January 8, 1867.—The surface of the buffs are of radial fibers, such as those of hemp or jute, impregnated with resinous substance or composition. It is clamped upon the arbor by annular pieces of metal.

Claim.—Making the acting surfaces of cylindrical buffs to be substituted for the rollers ordinarily employed in machinery or apparatus for cleaning or ginning cotton and other fibrous substances of compressed fiber, substantially as hereinbefore described and illustrated in the accompanying drawing.

61,079.—I. M. MARSTON and H. R. HULING, Roxbury, Mass.—*Saving Machine.*—January 8, 1867.—The arbor of one of the system of cog-wheels between the motor and the saw shaft is upon a bent arm, which has a concentric slot for adjustment to suit a change of the said cog-wheel for one of different diameter.

Claim.—The slotted curved support K attached to the lower feed roller M and screw E, for the purpose of allowing different-sized gear wheels to be placed upon the spindle A of the support K, so as to regulate the speed of the machine, when all are constructed and arranged as herein shown and described.

61,080.—WILLIAM C. MCGILL, Cincinnati, Ohio.—*Cork-screw.*—January 8, 1867.—The handle of the cork-screw is furnished with a knife and fulcrum piece for wire cutting and opening cans.

Claim.—First, as a new article of manufacture, the parts A B C D E and G, constituting an instrument for drawing corks, cutting wire, and opening cans.

Second, the arrangement of parts A B and G, constituting a combined cork-screw and can opener.

Third, the can opening instrument, consisting of the handle A, blade B, shearing bar C, and foot D, arranged and operating as set forth.

Fourth, the arrangement of parts A B and C D E, constituting a combined can opener and wire cutter.

Fifth, the described arrangement and combination of the right and left hand screw on one stem F G, with the rest or foot I and handle A, as and for the purposes set forth.

61,081.—J. A. MCKINNEY, Griggsville, Ill.—*Evaporator.*—January 8, 1867.—To the pan is attached a frame supporting a sliding carriage carrying a skimmer. The gates which close the apertures through the partitions dividing the pan into compartments are opened and closed by means of levers, provided with pins, which slide in slots in said gates.

Claim.—First, the skimmer T and carriage W, constructed and arranged as herein described in combination with each other, with the pan M and with the supporting frame X, substantially as herein described, and for the purpose set forth.

Second, operating the slide gates J with levers K, constructed and arranged substantially as herein described, and for the purpose set forth.

61,082.—ISAAC M. MILBANK, Greenfield Hill, Conn.—*Breech-loading Fire-arm.*—January 8, 1867.—The oscillating breech block is traversed by a locking pin, which has vertical reciprocation by an inclined groove, when turned in its socket.

Claim.—The spirally grooved locking bolt D, operating in combination with the fixed screw h and pivoted breech block e on the rear of the breech receiver, substantially as and for the purpose set forth.

61,083.—J. and E. P. MILES, Bloomingdale, Ind.—*Plow.*—January 8, 1867.—A plate is projected by a lever in a forwardly curved direction beneath the beam and immediately before the post to dislodge the weeds therefrom. It is retracted by a spring.

Claim.—The arrangement of the curved sliding plate e connected with the elbow lever arm m by the rod n, and operated by the arm m', in combination with the spring p or its equivalent, for clearing a plow of grass and weeds, substantially as herein described.

61,084.—ALEXANDER MILLAR, Roxbury, Mass., assignor to himself and E. A. G. ROULSTONE, same place.—*Drinking Cup.*—January 8, 1867.—The cup is in concentric sections arranged telescopically for vertical extension. When extended the lower part of each conical frustum catches against the upper portion of the section within and forms a joint therewith.

Claim.—The construction or formation of the cup with a base composed of a "stepped" flange on the bottom piece, substantially as described.

61,085.—JOSEPH A. MILLER, New York, N. Y.—*Steam Generator.*—January 8, 1867.—Sections of arched pipes span the furnace and are connected together at bottom by horizontal pipes and stay bolts. Curved diaphragms within the vertical pipes divide them into passages for circulation of the water.

Claim.—The sectional boiler, constructed substantially as shown and described, and made up of the pipes A' with their diaphragms S', constituting steam generating spaces d' and return water passages e', arranged in relation to the steam space and fire grate of the boiler in combination with cross pipes situated below the latter, the whole being bolted or united together essentially as specified.

61,086.—JOSEPH A. MILLER, New York, N. Y.—*Steam Generator.*—January 8, 1867.—The vertical pipes connecting the lower and upper water space have smaller removable pipes inserted into them from the upper side, whose office is to collect sediment. These smaller pipes have a funnel-shaped top and an inverted conical bottom, and have radial projections to hold them concentrically within the outer pipes and allow an annular water passage between them.

Claim.—The sediment collector, constructed substantially as herein represented and described, for use

in connection with vertical water tubes of a steam boiler, essentially as herein set forth.

61,087.—FRANCIS MUNSON, Cincinnati, Ohio, assignor to himself and J. W. LAYMAN.—*Return Grace Hoop.*—January 8, 1867.—The hoop is connected by elastic cords to the rods by which it is alternately projected and received.

Claim.—The combination of the grace hoop A with the elastic thongs B C, for the purpose herein described and set forth.

61,088.—CÆSAR NEUMANN, New York, N. Y.—*Hoop Skirt.*—January 8, 1867.—The bustle hoops are formed in one or two clusters, none of the hoops of which are connected in front except the upper and lower hoop of each cluster, which extend beyond the others, and overlapping at opposite ends are secured by clasps.

Claim.—First, a hoop skirt with its upper wires closed by means of a spring clasp, substantially as described and represented.

Second, a hoop skirt with its upper opening wires arranged in sections and provided with spring catches, for the purpose described.

61,089.—JOSEPH OLMSTED, Knoxville, Ill.—*Magnetic Brake for Cars.*—January 8, 1867.—The completion of the circuit operates an armature on each car which acts upon a shaft to clutch it to an otherwise free cog wheel, upon it which is rotated by the truck wheels. By this means the brake mechanism is actuated. Disconnecting the circuit frees the brakes.

Claim.—First, the arrangement of the magnet D, armature E, lever F, with the shaft G, clutches H J, and gear wheel I, operating substantially as and for the purposes described.

Second, the combination and arrangement of the shaft G, clutches H J, gear wheel I, and spur wheel K, with the axle substantially as shown and described.

61,090.—SOLOMON OPPENHEIMER, Peru, Ind.—*Constructing Latch Bolts.*—January 8, 1867.—This bolt is made of two separate parts, and the latch end may be raised from the other and reversed upon it so as to present the oblique face of the bolt in either direction.

Claim.—The peculiar manner and means by which the two several parts are connected and held together, namely, the additional prongs A A and the raised flanges c c on the same, forming clamps for holding the shank firm and steady.

Also, affixing side flanges a' a' and beads or projections b b to the shank, for the purpose as stated, also the grooves in the clamps for the said beads or projections to fit into.

61,091.—R. B. PARKS and J. R. PARKS, Neponset, Ill.—*Cultivator.*—January 8, 1867.—The plows are adjustable by the driver by means of levers. The plow irons are pivoted to the standards and are adjustable in their vertical inclination by set screws.

Claim.—First, the angular bars H pivoted to bar I, and connected with the treadles J by links e, in combination with the beams D, and operating substantially as described, for the purpose specified.

Second, the pivoted bars L, in combination with the plows K, and standards E E', and set screw g, substantially as described for the purpose specified.

61,092.—RICHARD PATTIN, Marietta, Ohio.—*Lamp Chimney Cleaner.*—January 8, 1867.—The elastic strips are attached at their respective ends to a rod and a sleeve piece, by which they are expanded to fit the inside of a globe or bulbous glass.

Claim.—First, forming the rings or eyes by which the two wires are connected out of the body of the wires instead of additional pieces, in the manner set forth.

Second, the wires H and K, arranged to move freely one upon the other, in combination with the elastic metallic strips G, substantially as described.

61,093.—W. W. PAXSON, Point Pleasant, Pa.—*Damper.*—January 8, 1867.—The lower end of the aperture in the pipe is turned inward to deflect the caloric current from the opening, which is regulated in size by the sliding plate.

Claim.—The new article of manufacture herein described, being a section of stove pipe with swaged deflector *a*, cleats *b*, and slide *B*, as and for the purpose set forth.

61,094.—THOMAS J. PLATT, Newark, N. J.—*Artificial Tripoli for Polishing.*—January 8, 1867.—A composition of loam 2, plaster of Paris 1, and yellow ochre 1 part.

Claim.—A polishing material composed of the substances herein named and described, substantially as and for the purposes set forth.

61,095.—ORIN I. PORTER, Hudson, Ohio.—*Grain Bin.*—January 8, 1867.—The grain bin has rollers on which it may be drawn forward, and pivots on which it is tilted forward from its case to afford access to its contents.

Claim.—The rib *C*, groove *D*, rollers *E*, and bin *B*, in combination with the counter or its equivalent, for the purpose and in the manner as set forth.

61,096.—HENRY H. POTTER, Carthage, N. Y.—*Fly Trap.*—January 8, 1867.—The faces of the bait pans are brought together by spiral springs on the removal of the detent pin. On separating the pans for resetting the flies drop into the receiver beneath.

Claim.—First, the vessel *C*, in combination with the two pans *A A*, for receiving the remains of the entrapped flies when the pans are opened, substantially as herein shown and described.

Second, the bent wires *a a*, their upper arms supporting the pans *A A*, and their lower ends interlocking and holding the pans open until released by the detent *f*, as and for the purpose specified.

61,097.—THOMAS PRATT, Valparaiso, Ind.—*Wrench.*—January 8, 1867.—Explained by the claim and illustration.

Claim.—A wrench in which the jaw *A* is formed by a solid extension of the handle, and the movable jaw *B* is connected therewith by the stem *C* passing through a mortice at the base of the jaw *A*, being retained in place by the pressure of the spring *D* upon the side thereof, substantially as set forth.

61,098.—LYMAN PRAY, Charlestown, Mass.—*Distilling Apparatus.*—January 8, 1867.—The still is surrounded by annular fire chambers, each of which communicates with the smoke stack by a pipe with a damper. The chambers have intercommunication by openings in the horizontal division plates, which are alternately on opposite sides of the still. The object is to lower the heating medium around the still as the surface of the liquid falls.

Claim.—The arrangement of one or more shelves *d e* in the fire chamber *B* of a still, to operate in combination with the still *A*, flues *f g h*, and dampers *j' g' h'*, substantially as and for the purpose set forth.

61,099.—JAMES PRENTICE, New York, N. Y.—*Eye Glass.*—January 8, 1867.—Explained by the claim and illustration.

Claim.—The nose pieces *a a* on the eye glasses *A A*, extending from a point below the center of the glass to a point above said center, with gradually increasing width, in order to conform to the anatomy of the nose, as herein shown and described and for the purpose specified.

61,100.—GEORGE W. RAY, Springfield, Mass., assignor to RAY and TAYLOR, same place.—*Paper Collar.*—January 8, 1867.—Explained by the claim.

Claim.—Paper, whether plain or enameled, embossed, either before or after its conversion into articles of wearing apparel by means of a woven fabric applied under pressure, substantially as herein described and for the purposes set forth.

61,101.—GEORGE REHFUSS, Philadelphia, Pa., assignor to the American Button Hole, Cording, Braiding, and Embroidering Machine Company, New York.—*Sewing Machine.*—January 8, 1867.—This machine is for sewing heavy goods, like sails, carpets, &c., which are held by pins on the carriage. The feeding devices are of the usual kind, and the cloth as fed pulls the carriage; the rails are inclined gently to facilitate the feeding.

Claim.—The combination of a stationary sewing

machine and two or more inclined rails, which are traversed by a truck or carrier adapted for the reception and retention of a fabric to be sewed, when the required traversing motion is imparted to the said truck by the operation of the feed device of the machine, substantially as described.

61,102.—GEORGE REHFUSS, Philadelphia, Pa., assignor to the American Button Hole, Cording, Braiding, and Embroidering Machine Company, New York.—*Sewing Machine.*—January 8, 1867.—A single thread is used, and the edges of fabrics may be sewn over at option by changing the looper and adjusting the parts. The curved needle has a backward curve near its point the better to insure the seizure of its loop, allowing the machine to be made on a smaller scale.

Claim.—First, a hook *y*, in combination with a reciprocating eye-pointed needle bent near its lower end, and with the within-described operating devices or their equivalents, the whole being constructed and arranged for joint operation, substantially as set forth.

Second, the lever *I*, constructed for the retention, removal, and replacement of the loop-carrying bars *J* or *J'*, substantially as described.

Third, the said lever *I* and its loop-carrying bar *J* or *J'*, in combination with the within-described devices or their equivalent, whereby the said bar can be readily adjusted to act in conjunction with the needle for forming the edge binding or for making the ordinary loop stitch.

61,103.—GEORGE REHFUSS, Philadelphia, Pa., assignor to the American Button Hole, Cording, Braiding, and Embroidering Machine Company, New York.—*Sewing Machine.*—January 8, 1867.—For use on carpets. Adjustable jaws hold and guide the edges; the sharp teeth of the feed-dog penetrate and carry along the two layers of carpet, and an inclined plate lying between the layers assists in guiding them toward the jaws and the needle.

Claim.—First, the adjustable jaws *k k'*, with their ribs or flanges *s t*, constructed and adapted for attachment to a sewing machine, substantially as and for the purpose described.

Second, the pins *i i* applied to a feeding device and combined with a slotted presser foot into the slot in which the pins project when above the work plate, substantially as and for the purpose described.

Third, the adjustable plate *K*, with its inclined projection *r*, constructed and adapted for attachment to a sewing machine, substantially as and for the purpose set forth.

61,104.—JOHN RICH, Worcester, Mass., assignor to himself, D. RUGGLES, J. E. BACON, same place, and A. DANIELS, Franklin.—*Spinning Machine.*—January 8, 1867.—An improvement on his patent of February 28, 1865, No. 46,588. The spring fingers are automatically closed to nip the thread by means of their entering mortises in the rising and falling bar; when relieved they open of themselves. The roving delivering plate is self-adapting to the varying diameter of the roving on the spool. When the required length of roving has been given out, the plate is automatically thrown back out of contact with the roving that the clamps may continue to rise and draw the rovings. The plate is again automatically brought into contact with the spool.

Claim.—Opening and closing the fingers on the twisting tubes by the motion of the bar or the equivalent thereof, substantially as and for the purpose specified.

Also, delivering the roving by the rolling of the periphery of the roll of roving on the spool against the surface of the delivery plate, operated substantially as and for the purpose described.

61,105.—W. B. ROBINSON, Detroit, Mich.—*Steam Engine Slide Valve.*—January 8, 1867.—An improvement on his patent of September 15, 1863. The steam is admitted beneath the packing rings to the steam-chest cap.

Claim.—First, making packing rings or packing strips of differential surfaces and with the recess *o*, substantially as described.

Second, the holes *p* through the flange *g*, in combination with the packing rings or strips, substantially as set forth.

61,106.—CHARLES ROSE, Allentown, Pa.—*Current Fixture*.—January 8, 1867.—The blind is retained in its elevated position by a spring pawl and ratchet, and is released by drawing a cord connected to a pawl. The unwinding of the blind winds up a weighted cord upon the roller, and by drawing this cord the blind is rewound.

Claim.—The arrangement of the toothed nut H, the lever I, and spring L, with the disk F, shaft D, and roller A, the several parts being constructed and used as and for the purpose herein specified.

61,107.—J. S. ROSS, Hiram, Ohio.—*Fruit and Ice House Combined*.—January 8, 1867.—The ice is formed in the house in upwardly flaring molds, which are held together by hook end-rods, so that when one cake is formed the mold may be taken apart and put together upon the last formed cake for the formation of another. The floor in the first case and the ice in the others form the mold bottom. Around this ice chamber is erected a preserving house.

Claim.—First, the special arrangement of the fruit and ice rooms, when constructed and combined with a suitable building, as and for the purpose described.

Second, the mold or frame F, with adjustable tapering sides or ends, in combination with the pan or vat H, substantially as and for the purpose described.

61,108.—WILLIAM A. SHEPARD, New York, N. Y., assignor to himself and JOHN M. MOOREHEAD, same place.—*Brick Machine*.—January 8, 1867.—The clay passes from the hopper through the action of a spiral screw, into the molds of an intermittently revolving wheel. The bricks are pressed from beneath by plungers actuated by toggle levers, and ejected from the molds by the same means.

Claim.—First, the combination of the hopper F, rollers G and H, and screw E, with each other and with the revolving horizontal wheel V, substantially as herein shown and described.

Second, the combination of the pitman R, arm S, hub T, and pawl I, with each other and with the ratchet wheel H of the wheel V, for the purpose of revolving the said wheel intermittently, substantially as herein shown and described.

Third, operating the plungers for the double purpose of pressing the brick and delivering them from the molds by toggle bars, when constructed as herein shown and described.

Fourth, the combination of one or more sets of toggle bars Z and sliding blocks X with each other and with the plungers W and wheel V, substantially as herein shown and described.

Fifth, the combination of the pitman A' and arm B' with the toggle bars Z and E' and with the hub T, substantially as herein shown and described.

Sixth, the combination of the plate L' and arm K' with the pitman R, arm S, and wheel V, substantially as herein shown and described and for the purpose set forth.

Seventh, the sliding bar D', in combination with the toggle bar acting upon the follower.

61,109.—NELSON S. SNEDEKER, Philadelphia, Pa.—*Lubricating Journals*.—January 8, 1867.—The pad to cover the open journal is formed of a combined push and wire work, and has a metallic backing.

Claim.—A lubricator composed of woollen plush interwoven with a wire warp and united to a metallic back with rivets or their equivalents.

61,110.—DAVID STAUFFER, Spring Hills, Ohio.—*Stump Extractor*.—January 8, 1867.—The raising chain is pivoted to the lever between its two fulcrums, which are used alternately by the insertion of pins in the two upwardly inclined series of holes in an arm of the frame.

Claim.—The inverted frame BB and C C, set upon runners A A, combined with the levers D D working in C C, and operated by moving the fulcrum bolts b b in the holes a a', and alternately lifting and depressing the levers, for the gradual extraction of stumps, constructed and arranged to work substantially as herein described.

61,111.—J. STEVER and J. A. WAY, Bristol, Conn., assignors to JOHN H. SESSIONS, same place.—*Wood Lathe for Turning Knobs*.—January 8, 1867.—The cylinder carries a series of arbors upon which the

blank knobs are revolved; it has a periodical movement, and carries the knobs in contact with the tools that shape, finish, and detach them from the arbors.

Claim.—First, the cylinder C, in combination with the notch wheel Q, ratchet bar R, lock bar R², bolt S, and actuating pin cam T, for the purpose of giving a periodical movement to said cylinder C, substantially as described.

Second, the tool stocks T²³⁴⁵⁶⁷, in combination with the cams J, arranged upon the plate K, lever U², with its connecting arms actuated by the cam T⁴, substantially as and for the purpose described.

Third, the clearer clutch M, in combination with the lever O and cam P, vibrating spindle N, substantially as and for the purpose described.

Fourth, organizing in one machine the above-enumerated successive operations for turning, finishing, and clearing the knobs from the machine, as described, when arranged substantially as set forth.

61,112.—JOSEPH J. STOUT, Greensburg, Ind.—*Evaporator*.—January 8, 1867.—The juice passes down from each compartment to that below, alternately at the opposite ends of the pan. The ports of communication have slide valves worked by a screw rod, by which their size is adjusted. A series of grate bars on each side of the fire is inclined upward and inward, to prevent contact of the fuel beneath the compartments having the thicker sirup.

Claim.—First, constructing the pan of an evaporator with inclined longitudinal partitions forming compartments arranged one higher than the other, and with alternately disposed openings, so that the juice shall flow from the central and highest part through the length of all the partitions, substantially as and for the purpose set forth.

Second, the rod F and bars E E, in combination with the set screws I and valves D, substantially as and for the purpose set forth.

Third, constructing the bottoms of evaporators with corrugations or other irregularities of surface, substantially as and for the purpose set forth.

Fourth, the arrangement of the grate bars B and grated guards B', substantially as and for the purpose set forth.

61,113.—A. W. STREETER, Shelburne Falls, Mass.—*Bit Stock*.—January 8, 1867.—A rotating sleeve around the socket has cams by which the spring gripping jaws are actuated to clasp the shank of the bit.

Claim.—The combination of two gripping jaws, an undivided socket to control the end of the shank of a tool, and a locking ring turning concentrically around the socket to close and unclose the gripping jaws upon the tool, all being and acting in combination, substantially as specified.

61,114.—GEORGE SULLIVAN, West Liberty, Ohio.—*Ditching Machine*.—January 8, 1867.—The spades are supported and guided by adjustable side frames and forced into the ground by levers. They are raised and swung around by a crane to deposit the contents.

Claim.—A ditching machine constructed, arranged, and operating as herein shown and described.

Also, the windlass and crane in combination with the inclined guide frames, substantially as described.

61,115.—W. W. SUTLIFF, Town Line, Pa.—*Gate*.—January 8, 1867.—A weighted lever on the hinge post has various eyes for the engagement of a hook upon the gate to regulate the amount of force exerted to close it.

Claim.—The lever C, the weight D, and the rod d, constructed and arranged substantially as herein shown and described, in combination with a gate or door, as and for the purposes set forth.

61,116.—EDWARD DE LOSS SWEET, Chicago, Ill.—*Tariff Indicator for Telegraphs*.—January 8, 1867.—Explained by the claim and illustration.

Claim.—In combination with a map M, the arrangement of a tape or its equivalent, divided into spaces or divisions numbered as shown, said spaces being so proportioned as to indicate upon said map the variable tariffs adapted for varying distances, substantially as herein described and shown.

61,117.—THOMAS TAYLOR, Washington, D. C.—*Alloy for Sabots of Projectiles*.—January 8, 1867.—

From 30 to 78 pounds of tin to 120 pounds lead, the proportions of tin varying according to the strength of the charge; the tin is increased for heavy charges, and a small proportion of copper may be added for maximum sizes.

Claim.—An alloy for a composition for metallic sabots for projectiles, within the limits or proportions described, and for the purpose set forth.

61,118.—ELI THAYER, New York, N. Y.—*Belt Coupling.*—January 8, 1867.—The ends of the belt are passed through the clasp and bound by a wedge, which is driven between those portions of them embraced by the clasp.

Claim.—The key as shown in Fig. 2, in combination with the clasp and belt, as shown in Figs. 1 and 3.

61,119.—ELI THAYER, New York, N. Y.—*Boot and Shoe.*—January 8, 1867.—Explained by the claim and illustration.

Claim.—The making the tap soles of boots and shoes in several transverse sections of leather, substantially as set forth.

61,120.—ALEXIS THIRULT, New York, N. Y.—*Distilling Petroleum.*—January 8, 1867.—Three boilers are connected with separate condensing worms, and also with each other. The benzine is driven off from the first boiler and the clear oil from the second. The colored oil is passed into the third boiler. A tar cock in the bottom of the second boiler has a traversing rod to break the residuum shell and keep the bottom clear.

Claim.—First, the apparatus constructed as above described, the object of which is to secure a continuous distillation by one single operation, being a combination of boilers A B C and the tar cock F with the hot-air chamber U, and all the pipes and other parts composing the said apparatus.

Second, the still, composed of boilers A B C, as to their form and combination, for the use and purpose above described.

Third, the tar cock F, as to its construction, the object being to clear the still of all residuum without retarding the distillation.

61,121.—NATHAN THOMPSON, St. John's Wood, England.—*Boring Tool.*—January 8, 1867.—A series of concentric thin cylinders of steel are divided by metal cylinders and attached to a shaft by a diametric pin. The thin steel divides the wood into thin cylinders without loss of stock by making dust or chips.

Claim.—First, the construction of a tool of a thin cylinder and axis, for cutting a hollow cylinder out of wood, substantially as herein shown and described.

Second, the employment of thin steel cylinders *a* and short tubes or cylinders *c* for cutting a series of hollow cylinders out of wood, in the manner and for the purpose substantially as herein shown and described.

61,122.—HOWARD TILDEN, Boston, Mass.—*Coffee Pot.*—January 8, 1867.—The inner chamber serves to receive steam when boiling, which elevates the liquid through the ground coffee, and when the pot is removed from the fire the condensation in this chamber draws the decoction below the grounds.

Claim.—The use of the strainer E, in form as shown, when provided with the rim F, and the air chamber D, in combination with the cylinder C, the tube *g*, and the body of the pot A and B, the whole constructed substantially as described and for the purposes set forth.

61,123.—DANIEL UNTHANK, Spiceland, Ind.—*Portable Fence.*—January 8, 1867.—Explained by the claims and illustration.

Claim.—First, a portable fence having its posts formed of two upright bars or posts A A, connected by pins B B', in combination with the braces C E, either or both, and the notched bars D D' fitted on the pins B B', substantially as and for the purpose set forth.

Second, the bars D' in connection with the blocks or supports F between the bars D' and the bars D below them, substantially as and for the purpose set forth.

Third, the supplemental vertical strips *a** attached to the bars D of the end panel at the angle of the

fence, in combination with the notched bars D* of the panel which forms the other side of the angle, substantially as and for the purpose set forth.

61,124.—RICHARD UREN, Houghton, Mich.—*Apparatus for Washing Ores.*—January 8, 1867.—The box has at the top an endless band travelling on rollers. The pulp is let on at one side and the light particles are carried across the belt into the trough, while the heavy particles are carried forward by the belt and emptied into the boxes.

Claim.—Washing ores or minerals by causing the same to flow across a revolving belt, substantially as and for the purposes described.

61,125.—P. H. VANDER WEYDE, Philadelphia, Pa.—*Refining Petroleum and Lubricating Oils.*—January 8, 1867.—The oil is passed in a small stream through a coil within a steam boiler heated to 320° Fahrenheit, and its volatile parts removed and condensed. The oil residue is passed through a series of vertical filters. The filtering material is drained in a centrifugal machine and revived in a retort.

Claim.—First, the heating of the heavy petroleum in a steam coil in the manner described, thus preparing it for the filter, and in the same time saving and condensing the vapors arising, namely, gasoline, naphtha, and benzine.

Second, the combination of this continuous heating apparatus with a percolator or filter, substantially as described.

Third, the rapid draining, cleaning, and partial drying of the exhausted filtering or percolated material, by placing it in the elongated boxes described, and submitting it to the action of a centrifugal machine.

Fourth, the manner of reviving, by distillation in a retort, the filtering material, producing in the same time a quantity of kerosene for illuminating purposes.

61,126.—JAMES B. WALLACE, Franklin, Ohio, assignor to himself, R. WALLING, and JOSEPH CROOK, same place.—*Invalid Chair.*—January 8, 1867.—The chair bottom may be rotated on the stand, and the upper frame is so hinged and pivoted as to form a chair or couch.

Claim.—First, the leg support E, hinged to the arm rests F, and pivoted to the bottom C below its juncture with the arm rests by the plate H, in the manner described and for the purpose specified.

Second, the bottom C, in combination with the standard B, cyma reversed springs *a a a a*, and legs A, substantially as herein set forth and for the purpose specified.

61,127.—BENJAMIN J. WARNER, Brooklyn, N. Y.—*Watch Case.*—January 8, 1867.—An arrangement for the insertion of photographs into a watch case.

Claim.—The hinged ring *e*, applied between the lid *c* and body *a*, and fitted for the reception of pictures, and provided with catches, substantially as and for the purposes set forth.

Also, the ring *o*, snapping outside of the flange of the opening, receiving the glass or crystal and securing the same in place, as shown.

61,128.—AMOS WILDER, Calais, Maine.—*Blackening Box Holder.*—January 8, 1867.—A single wire is bent into form for holding the box and to answer the purpose of a handle. The jaws are opened by sliding the ferrule or by springing in the sides of the handle.

Claim.—As a new article of manufacture the holder, consisting of the bent wire A B, formed of one piece, as herein described, and having a ferrule D, as herein set forth and for the purpose specified.

61,129.—JAMES F. WINCHELL, Springfield, Ohio, assignor to himself and GEORGE C. STEELE, same place.—*Fruit Step Ladder.*—January 8, 1867.—The supplementary section may constitute a brace support or an extension of the other portion.

Claim.—First, the combination of the ladders A and B, when constructed and arranged to operate substantially as shown and described.

Second, the circular brace C, when arranged as shown for locking the part B in position.

Third, pivoting the ladder B, by means of the hinge D, made to embrace the bars A, as shown and described.

61,130.—JAMES F. WINCHELL, Springfield, Ohio, assignor to himself and GEORGE C. STEELE.—*Fruit-drying House.*—January 8, 1867.—The air is heated in an air-chamber around a furnace at the bottom of the drying chamber, and ascends through the open-bottomed drawers. The flue has a valve by which the caloric current may be passed around a horizontal flue in the drying chamber.

Claim.—First, a dry-house constructed substantially as described, and having the pipe H, with its valve *n*, and the return flue E, combined and arranged for joint operation, as herein described.

Second, the removable bottoms *p*, constructed of wire gauze or its equivalent, arranged to be used in connection with the drawers D, substantially as herein set forth.

Third, providing the drawers D with the guide pieces *t*, as shown and described.

61,131.—A. J. WORKS, Fair Haven, Conn.—*Burning Hydrocarbon Liquids as Fuel.*—January 8, 1867.—Explained by the claims and illustration.

Claim.—First, the combustion of naphtha, crude petroleum, or any other liquid hydrocarbon, on an open surface or receiver, connected or surrounded with air channels in connection with ignited hydrogen gas, the flames of both uniting while in a state of combustion, substantially as and for the purpose set forth.

Second, the arrangement of a series of receivers, two or more, in combination with each other, and with a suitable supply pipe, constructed and operating substantially as and for the purpose described.

Third, the secondary receiver B, in combination with the main receiver A, substantially as and for the purposes described.

Fourth, the central air channel *c*, and annular air channel *d*, in combination with the receiver A, constructed and operating substantially as and for the purpose described.

Fifth, the decomposer F, provided with jet openings *f*, near its bottom, in combination with the jacket E, receivers A B, and air channels *c d*, all constructed and operating substantially as and for the purposes set forth.

Sixth, the hood G, in combination with the jacket E, decomposer F, receivers A B, and air channels *c d*, all constructed and operating substantially as set forth.

61,132.—JOSIAH YEAGER, Berrysburg, Pa.—*Machine for Rounding Leather.*—January 8, 1867.—The guide eyes and hollow cutters are various in size, and the drum may be turned to bring the required cutter into the upper position.

Claim.—The employment of the tubular cutter, arranged and operating substantially as and for the purpose described.

Also, the arrangement of the guide or perforation in relation to the tubular cutter, substantially as and for the purpose described.

Also, the employment of a series of cutters and guides, mounted upon the drum C, or its equivalent, substantially as and for the purpose described.

Also, making the cutter adjustable upon the drum or cylinder by means of the wedge and set screw, or equivalent devices, substantially as described.

Also, the drum or cylinder, mounted in the uprights or standards in such manner as to be free to turn in bearings therein, in combination with a means for setting or holding the said drum, together with the cutters, in any desired or convenient working position, substantially as described.

61,133.—JOHN ALLEN, New York, N. Y., and GASTON D. SMITH, Washington, D. C.—*Finishing Tools, Implements, Machinery, and other articles.*—January 15, 1867.—The articles are coated with fusible metal by the galvanizing process, instead of finishing by the ordinary methods of polishing or painting.

Claim.—First, the finishing devices of machinery, engines, sewing machines, tools, instruments of all descriptions, by the mode and means hereinbefore described, and for the purpose of preserving them from damage by oxidation or corrosion, as set forth.

Second, the restoration of damaged tools and machinery to good condition by the method and means set forth.

61,134.—LEONARD ANDREWS, Biddeford, Me.—*Drill.*—January 15, 1867.—The socket is forced to the bottom of an ordinary blasting hole, and the cutters driven out by blows upon the wedge-ended rod. The cutters are drawn back by springs, which serve, also, to guide the wedge rod. When chambered to the proper size, a bifurcate drill is introduced and the chamber deepened sufficiently. For insertion or withdrawal the bifurcations of the drill are sprung in by an embracing socket.

Claim.—First, the combination of the tube *a*, rod *b*, ring and springs *e f f*, horizontal cutters *g g*, as and for the purposes set forth.

Second, the combination of the double drill, Fig. 5, constructed as described, with the tube *r*, as and for the purposes specified.

61,135.—FRANTZ A. AMBRUSTER, New York, N. Y.—*Turning Lathe.*—January 15, 1867; antedated January 3, 1867.—The pipe bowl is placed on a longitudinally-sliding mandrel and turned by a cutter upon a shaft, actuated by a chain engaging a sprocket wheel on the said shaft. The ends of this chain are connected to two cranks which are adjustable in length, to regulate the oscillation of the cutter head.

Claim.—First, the oscillating spindle E, in combination with the chuck I, carrying one or more tools, and with the longitudinally-sliding back center F, constructed and operating substantially as and for the purpose described.

Second, controlling the oscillation of the spindle E by means of the chain *c* and adjustable cranks *e*, substantially as and for the purpose described.

Third, giving the oscillating motion to the cutter head by means of two shafts *i i'* carrying the cranks *e* and chain *c*, substantially as and for the purpose set forth.

61,136.—LEWIS J. ATWOOD, Waterbury, Conn.—*Apparatus for Bundling Scrap Metal.*—January 15, 1867.—The scrap cylinder is driven up by a hydraulic ram against a plunger attached to the head of the machine. The cylinders may be upon a revoluble disk or arms, so as to be brought under the plunger alternately.

Claim.—The bundling or consolidation of scraps of sheet metal, by the means and substantially as set forth.

61,137.—W. E. BARCOCK, East Pembroke, N. Y.—*Water Elevator.*—January 15, 1867.—A forward movement of the crank puts the friction clutches in operation and elevates the bucket. A slight backward turn frees the clutches sufficiently to allow the bucket to descend.

Claim.—The drum A, shaft B, the head C, the ratchet cone *e'*, and the spiral spring *o*, when arranged and combined substantially as described for the purposes herein set forth.

61,138.—CYRUS M. BAKER, Bingham, Me.—*Cattle Tie for Stalls.*—January 15, 1867.—The chain and rod surround the animal's neck, and the rings have vertical play on the upright standard.

Claim.—The tie-chain herein described, the same consisting of the bar B, chains D and E, and rings G G, when all connected together, so as to be used for the fastening or hitching of cattle and other animals, substantially as described.

61,139.—THOMAS BARBOUR, Boston, Mass.—*Photographic Camera.*—January 15, 1867.—The box is pivoted and hinged so as to allow of vertical oscillation or rotation, and has a longitudinal sliding adjustment. An adjustable plate has openings through which impressions are taken on a plate behind.

Claim.—First, the arrangement of the plate *f f*, racks *g g*, pinions *h h*, rod *i i*, wheel *k k*, and adjustable arm *p p*, as described, and for the purpose specified.

Second, arranging a case upon a pivot so as to turn thereon, in combination with suitable stops, as herein described and for the purpose specified.

Third, the use of the lever *e e* for elevating and depressing the case, as described.

Fourth, the use of the movable plate or frame *f f*, operating as described and for the purpose specified.

61,140.—E. L. BARRETT, Springfield, Ohio.—*Apparatus for Making Envelopes.*—January 15, 1867.—The envelopes are so folded over a combination of plates as to admit of a thick rectangular stuffer, whose form they assume.

Claim.—First, the plates *e, f,* and *g,* in combination with the slides *a, a',* substantially as and for the purpose set forth.

Second, the stop *e,* gauge *d,* in combination with the slide *a,* and plate *f,* substantially as and for the purpose specified.

Third, pivoting or hinging the plate *g e f* to the slides *a, a',* substantially as and for the purpose described.

Fourth, the stuffer *M,* Fig. 7, constructed and operating as and for the purpose substantially as set forth in the herein described process of making envelopes.

61,141.—LOUIS D. BARTLETT, Fitchburg, Mass., assignor to the PUTNAM MACHINE COMPANY, same place.—*Valve of Steam Engines.*—January 15, 1867.—An improvement on the patent of Brown and Burleigh, January 15, 1856. The puppet valves governing the supply and exhaust of steam to the cylinder are actuated by cams on a revolving shaft. The valve stems are guided above in sockets in the top plates of the valve chests, and by removing these plates the valves may be reached or removed.

Claim.—The arrangement of the casings, steam passages, and valves, within the steam chest, in relation to each other, and operating substantially as described.

61,142.—ALONZO BENEDICT, Jonesville, N. Y.—*Neck Yoke.*—January 15, 1867.—The clevis has clips around the yoke, and has a lining—strips of leather—which rests against the under side of the tongue.

Claim.—The curved or U-shaped metallic bars *D D,* attached to the neck yoke by means of clips *C C,* and grooved at their inner parts to receive and clamp the chafing leather *E,* substantially as herein shown and described.

61,143.—MAYEUL BERNABÉ, Toulon, France.—*Protecting Armor Plates.*—January 15, 1867.—After shaping and piercing the plates they are cleaned in an acid bath and then electro-plated with copper in the ordinary manner.

Claim.—The herein described method or process of covering the steel, iron, or cast-iron plates with an insulating and protective coating of copper for neutralizing the electric currents and rendering the plates inoxidizable.

61,144.—SEALY JAMES BEST and JAMES JOHN HOLDEN, London, England.—*Apparatus for Charging and Drawing Gas Retorts, and other like purposes.*—January 15, 1867.—The charging scoops are carried on a frame which is supported on rail wheels. These scoops are in position for insertion into the retorts, where they are inverted to deposit the coal. The ends of the scoops are hinged to the bottom, and are raised for withdrawal. The scoop frame is moved upon rails, and for charging the scoops is run beneath a series of reversible troughs, each having beneath a spout for conveying the coal to one of the scoops. The retorts are discharged by rakes in a frame somewhat similar to the charging device.

Claim.—The apparatus and machinery, substantially as herein described.

61,145.—CARL BEU, Dessau, Anhalt-Dessau.—*Wool Dryer.*—January 15, 1867; antedated January 2, 1867.—A drying chamber is placed vertically between a heater and a blower. Within the chamber is a vertical series of boxes having perforated bottoms. These boxes are supported and delivered one at a time by cams in connection with the lower one. The matters to be dried are placed in the upper box, and gradually descend while drying, as stated.

Claim.—First, the arrangement of a series of drying boxes, placed one above the other, in a suitable case *A,* in combination with a suitable mechanism, whereby an automatic downward motion is imparted to said boxes, substantially as and for the purpose described.

Second, the recesses *t* in the drying boxes *f g h,* &c., in combination with the cams *q,* constructed and operating substantially as and for the purpose set forth.

Third, the stop motion *a' b' c',* in combination with the drying boxes *f g h,* &c., constructed and operating substantially as and for the purpose described.

61,146.—DANA BICKFORD, Boston, Mass.—*Sprinkler for Clothes and Flowers.*—January 15, 1867.—An elastic bulbous reservoir in connection with a pipe and a rose, acting on the principle of a syringe.

Claim.—The combination of the elastic bulb *A,* the valve *B,* the perforated nozzle *c,* all constructed as and for the purpose specified.

61,147.—JOSEPH N. BITTING, sr., Camden, N. J.—*Rudder Bearing.*—January 15, 1867.—A projection on the stem of a rudder engages a recessed inclined edge on a plate which forms its bearing.

Claim.—The projection *e* on the rudder post, in combination with the plate *D* and its inclined recess on the edge, when the latter and the said projection are formed in relation to each other, as described.

61,148.—FELIX BIZARD and PIERRE LABARRE, Marseilles, France.—*Apparatus for Storing Petroleum and other Inflammable Liquids.*—January 15, 1867.—The oil is stored in a submerged tank, being introduced and discharged by pipes. The induction and overflow of the water is also conducted by pipes. The surface level of the oil is shown by a transparent gauge and a try-cock.

Claim.—First, an oil tank of ordinary or suitable construction, provided at the top thereof with a pipe through which said tank is supplied with or discharged of oil, in combination with a pipe, also passing through the top, into and down to near the bottom of said tank, said pipe being branched and provided with cocks and level indicator for regulating the flow of water to and from the tank, in the manner and for the purpose set forth.

Second, the combination, in an oil tank or reservoir, of an elevated man-hole and pipes connected therewith, for supplying or drawing off the oil to or from the tank at a point higher than the top or dome of said tank, as herein shown and described.

Third, in combination with the arrangement claimed in the last preceding clause, the level indicator, when constructed to operate in the manner substantially as described.

Fourth, the channel or depression formed in the bottom of the reservoir, for receiving and collecting the sediment and facilitating the entrance to the dome, substantially as specified.

61,149.—GEORGE C. BOVEY, Cincinnati, Ohio.—*Brick Kiln.*—January 15, 1867.—Partially balanced covers overspread all or a portion of the top during the latter part of the operation of burning.

Claim.—A brick kiln entirely open at top and provided with folding covers, substantially as and for the purposes set forth.

61,150.—C. D. BROWN, Sterling, Ill.—*Planting Hedges.*—January 15, 1867.—The plants are clamped and supported at their proper relative distance between adjustable bars which engage perforated plates in the posts.

Claim.—First, the employment of clamping beams *A A* and posts *B B* in the operation of planting hedges, substantially as described.

Second, providing for adjusting the beams or clamps *A A* vertically as well as horizontally, substantially as described.

61,151.—GEORGE BURKET and SAMUEL M. GASKELL, Bluffton, Ohio.—*Sulky Plow.*—January 15, 1867.—The forward end of the plow beam is hung to the tongue and the rear end to a roller on the frame. The handle may be raised and by throwing forward a slotted hinged plate, retained in that position.

Claim.—First, the attaching of the rear part of the plow beam by a chain or rope *b* to a pulley *d,* on a shaft *H,* on the hounds *a a* of the draft pole, said shaft *H* having a lever *I* attached, and all arranged substantially as and for the purpose specified.

Second, the slotted plate *K* attached to the platform *D,* in such a manner that it may be turned forward to embrace the plow handle and serve as a bearing or fulcrum for it, and be turned backward free from the plow handle when it is necessary to liberate the latter, substantially as set forth.

61,152.—FRANCIS BURROWS, Peoria, Ill.—*Lamp*.—January 15, 1867.—The metallic connection between the burner and reservoir is reduced to a minimum; a water chamber beneath the burner and the heaters in the wick-tube diminish the conduction of heat.

Claim.—First, the chamber C, formed in the manner herein described, and adapted for the reception of water to prevent the heating of the reservoir, as and for the purpose explained.

Second, the combination and arrangement of the reservoir A, two-part wick tube D D', and casing C C' C'', with their several adjuncts, applied and operating in the manner and for the purpose explained.

61,153.—JOHN W. BUTTRICK.—Farmington, Wis.—*Seed Planter*.—January 15, 1867.—The seeding mechanism is driven by a ratchet cam upon the inside of one of the supporting wheels, and it is thrown out of gear by a lever. This driving wheel is prevented from rotating when desired by the transverse movement of a slide bar so as to engage one of a series of pins upon it.

Claim.—First, the cam Z, when constructed and used substantially in the manner and for the purpose set forth.

Second, the combination and arrangement of the cam Z, feed bar Q, spring P, and part M, substantially as and for the purpose set forth.

Third, the combination and arrangement of the cam Z, feed bar Q, and shut off lever K, substantially as and for the purpose set forth.

Fourth, the combination of the wheel A' constructed with the cam Z, and pins c, and the brake G', and operating lever I, when constructed and used substantially as and for the purpose set forth.

Fifth, the combination and arrangement of the shovels U and operating bars or levers R and M, substantially as and for the purpose set forth.

61,154.—A. G. BUZBY, Philadelphia, Pa.—*Case for Pen and Ink*.—January 15, 1867.—The case has two pockets adapted for the pen and ink bottle respectively.

Claim.—First, the pen B, with its flange and collar a, and button c, and the case A, with its cover A', and opening for the reception of the pen, the whole being constructed as described.

Second, the cover A', with its cap d, and recess for the reception of the bottle D, in combination with the case A, and its pen B, as set forth.

61,155.—ADAM S. CAMERON, New York, N. Y.—*Pump Valve*.—January 15, 1867.—Explained by the claims and illustration.

Claim.—First, a valve composed of a metallic case A, in which India-rubber or other suitable material B is confined so as to form faces a b to operate in combination with the seat C, substantially as and for the purpose described.

Second, a valve formed by putting the rubber into the case or recess in a plastic state and vulcanizing it therein, substantially as and for the purpose specified.

61,156.—R. M. and D. CAMERON, Edinburgh, Scotland.—*Pen*.—January 15, 1867.—The tips are slightly upturned to enable the passage over the asperities of coarse paper.

Claim.—The construction of pens possessing the improved qualities in the manner substantially as hereinbefore described and shown in the accompanying drawings.

61,157.—LAZARE CANTEL, New York, N. Y.—*Trunk*.—January 15, 1867.—An improvement on his patent of December 20, 1853. A rubber pipe is partially inserted in the contiguous edges of the top and body of the trunk to render it water-tight when closed.

Claim.—The grooved wooden frames c d, secured to the edge of the trunk, or similar article, by the bands e and f, and hinge h, and suitable nails, in combination with the elastic strip or pipe i, as and for the purposes specified.

61,158.—ROBERT CHAMBERS, Cincinnati, Ohio.—*Railroad Rail*.—January 15, 1867.—Explained by the claims and illustration.

Claim.—First, the compound railroad rail A a e A' a' e' B b, secured or locked together by the same spike

or spikes which fasten the rail to the sleeper or cross-tie, substantially as set forth.

Second, in combination with the aforesaid compound rail, the single-lipped chair E e.

61,159.—NATHAN CLAPMAN, Milford, Mass.—*Cotton and Hay Press*.—January 15, 1867.—The follower has radial projections from its corners which traverse vertical grooves in the frame, and it is actuated by reciprocating ratchet rods, which are operated by a lever rock bar. The ratchets act on the projections of the plunger by pawl wedges which gravitate into inclined recesses to engage the ratchets.

Claim.—Traversing and holding the ratchet rods which work the follower by the stationary locking boxes P P, provided with ratchet wedges or pawls, and connected by vibrating links and crank rock shafts to traversing locking boxes N N, provided with ratchet wedges or pawls to work the press by levers inserted in the holes in the rock shafts and vibrated.

Second, the four arms on the follower, extending through the press box and fastened to the ratchet rods working at the corners of the press.

Third, the use of four rods, or one at each corner of the follower, to move it even and keep it from tipping.

61,160.—JAMES M. CHRITTON, Joliet, Ill.—*Churn*.—January 15, 1867.—The box has side pockets for the reception of heated water. The stops of the dashers are removable. Pipes pass through the lid for the conduction of air through the cream.

Claim.—The water pockets e, in combination with the movable box d, the movable pinion and shaft b and the air tubes f and g, when constructed and operating substantially as described.

61,161.—S. O. CHURCH, West Meriden, Conn., assignor to himself and S. S. Wilcox, same place.—*Can Opener*.—January 15, 1867.—The pivoted catch is brought in contact with the under side of the lid by means of the thumb piece at its upper end.

Claim.—The lever A, provided with a fulcrum a, in combination with a hook C and the handle B, constructed and arranged so as to operate in the manner described.

61,162.—MIRTLLOW R. CLAPP, New York, N. Y., assignor to himself and E. P. JONES, same place.—*Steam Generator*.—January 15, 1867.—The vertical tubes within the fire space contain three plates of such a size as to give mutual support. Downwardly-inclined openings in the plates allow the passage of water.

Claim.—First, the water and steam generating tubes G, exposed to the action of the fire or heated gases, as specified, and provided with diaphragms g, having openings s in them inclining downwardly, substantially as and for the purpose or purposes herein set forth.

Second, the construction of the diaphragms g, within the tube G, whereby they support or retain each other in place, as described.

61,163.—ARTHUR CLARK and THOMAS REECE, Philadelphia, Pa.—*Cracker Crusher*.—January 15, 1867.—An annular piece with inward radial cutters is hinged to a disk with similar cutters placed intermediately. The two parts are brought together upon a cracker by pressure on the handles.

Claim.—The arrangement of section B, with its perforated or bottomless cup C and ribs a, or their equivalents, and section A, with its flange D and ribs b, or their equivalents, both of said sections having suitable handles, and hinged together in either of the modes herein described, and operating substantially as and for the purposes set forth.

61,164.—ORSON COLVIN, Belvidere, Ill.—*Beehive*.—January 15, 1867.—Explained by the claims and illustration.

Claim.—First, the inner case B, provided with inclined sides a a and a perforated top piece e, in combination with an outer box A to receive B; with an air space allowed between, and the ventilating openings j m in the box A, substantially as and for the purpose set forth.

Second, the spare box C, with perforated bottom, registering with the perforated partition plate e and with perforated top piece C, in combination with the

case B, with perforated sides registering with the perforated spare boxes D, whereby air will be admitted into all parts of the hive, in the manner described for the purpose specified.

61,165.—DAVID CONNOR, Fulton, Ill.—*Milking Stool.*—January 15, 1867.—The seat is adjustable upon a bench, which also has a basket rack for the reception of the bucket.

Claim.—The circular frame F, bench H, and seat A when constructed, arranged, and operating substantially as and for the purpose set forth.

61,166.—T. J. CURRIER and A. M. BLACK, Worcester, Mass.—*Tool Rest for Lathes.*—January 15, 1867.—The segmental rest is oscillated in the poppet block to incline the tool by a screw, which engages its intaglio screw rack.

Claim.—The combination with the poppet block A of the tool rest D, shaft H, and screw G, substantially as set forth.

61,167.—J. P. F. DATICHY, West Hoboken, N. J., assignor to himself and JOHN H. BONN, same place.—*Jet Condenser.*—January 15, 1867.—An improvement on his patent of August 30, 1864. The steam is exhausted into the central compartment, and condensed in the upper one, to which the air pump is connected. The water of condensation is conducted from the upper to the lower compartment, from which it is pumped into the boiler.

Claim.—A condenser composed of three compartments A B F, valves a M, rose C, and connecting pipes E G I, all constructed and operating substantially as and for the purpose described.

61,168.—HERBERT DAVIS, Troy, N. Y.—*Fagot for Railroad Rails.*—January 15, 1867.—The pile is composed of steel and of two qualities of iron bars, so disposed as to make a steel face, and with the superior quality of iron in the positions for exerting its durable and tenacious qualities.

Claim.—First, the rolling or making of rails for railroads of a pile composed of a series of iron bars A, provided with a steel cap B, formed or rolled with a pendent flange at each side, and with longitudinal grooves and projections e b at its under surface, and the upper iron bars of the pile rolled or formed with corresponding grooves and projections a d to admit of the steel cap and upper iron bars being locked together, substantially as shown and described.

Second, forming the iron portion of the pile of bars A A' of superior and inferior iron, arranged or disposed substantially in the manner and for the purpose set forth.

61,169.—THOMAS B. DE FORREST, Birmingham, Conn.—*Hoop-skirt.*—January 15, 1867.—Explained by the claim and illustration.

Claim.—Protecting the attachment of the lower hoop to the tapes by extending the tapes below the bottom hoop, and covering this extension with metal, substantially in the manner and for the purpose specified.

61,170.—THOMAS B. DE FORREST, Birmingham, Conn.—*Hoop-skirt.*—January 15, 1867.—By placing the cord on the outside it is retained on the edge of the wire, and being attached to the lower hoop takes the wear from the covering of the latter.

Claim.—Attaching a cord to skirt wire outside the covering which encloses the wire, substantially as herein set forth.

61,171.—THOMAS B. DE FORREST, Birmingham, Conn.—*Binding for Skirts.*—January 15, 1867.—Dress binding whose salient points are capped with metal.

Claim.—A binding having one edge protected, substantially as described, as a new article of manufacture.

61,172.—THOMAS B. DE FORREST, Birmingham, Conn.—*Binding for Skirts.*—January 15, 1867.—A binding of rubber to the edge of a skirt to receive the wear.

Claim.—A binding presenting an india-rubber or similar flexible edge, substantially as herein described, as a new article of manufacture.

61,173.—GEORGE POMEROY DODGE, London, England, assignor to NATHANIEL SHATTOWELL DODGE, Washington, D. C.—*Manufacture of Rubber Belting.*—January 15, 1867.—A strip of woven material is placed upon a sheet of rubber of such a size as to cover the strip. The sheets are then passed into a mold, which folds the rubber around the strip of woven material, after which they are passed between rollers.

Claim.—The mode of manufacturing bands or belts composed of fabrics and gum or sticky substances, substantially as herein described.

61,174.—LEVI W. DOWLIN, Sherbrooke, Canada East.—*Vulcanizing Flask for Dentists.*—January 15, 1867.—The flask is formed in three parts. The teeth are set in the central part, and the others contain the dies for pressing the rubber into shape. The parts are attached together by bolts.

Claim.—The employment of the middle part B of the flask, substantially as and for the purpose herein specified.

Also, the separate union of the parts B and C, before the rubber is packed in by means of screw bolts h h, or their equivalent, substantially as and for the purpose herein set forth.

Also, the combination and arrangement of the counter die part A, with the parts B and C, substantially as herein specified.

61,175.—GEORGE DOYLE, Worcester, Mass.—*Steam Pump Valve Gear.*—January 15, 1867.—The piston-rod of the direct acting steam pump has a spring projecting from an adjustable collar, which engages tension lugs and adjustable tappets to operate the slide valve.

Claim.—First, the arrangement of the spring h, the dogs j j, and the lugs i i, on the valve stem, substantially as and for the purpose specified.

Second, the arrangement of the dogs j j, for putting tension on the spring by restraining it during the stroke or part of the stroke of the piston, substantially as and for the purpose specified.

61,176.—JEHEL C. DRIGGS, New York, N. Y., assignor to MATTHEW T. HIGGINS.—*Sewing Machine.*—January 15, 1867.—The needle operates from below, and the looping device is located above, the table.

Claim.—First, the combination in needle-feeding machines of the horizontally-slotted arm G, operated by a crank or eccentric pin D, and carrying the needle vertically-slotted arm H, with its adjustable branch and spring J, and rotating cam F, for giving to the needle its two-fold motion, substantially as specified.

Second, the combination with a needle working from below up through the table, of a looper L, above the table, acted upon by a spring g, and guide p, and pivoted to a rod or arm o, radiating from a rocking shaft M, essentially as herein set forth, and for the production of a single thread or chain stitch.

61,177.—GEORGE W. DUDDERAR, Unionville, Md.—*Device for Protecting Trees from the Borer.*—January 15, 1867.—About half the perforated metal portion is inserted in the earth, which is packed closely about it. Above the metal portion and attached to it is a water-proof covering to be closely tied to the trunk of the tree.

Claim.—The application of an adjustable appliance to the trunk of fruit trees to protect them, as herein described, using for that purpose the aforesaid cylinder and oil-cloth top or addition, or any other substantially the same, and which will produce the intended effect.

61,178.—J. W. AND W. EBERT, Zanesville, Ohio.—*Head Blocks for Saw Mills.*—January 15, 1867.—The knee of the head block is made to advance by means of a rack and ratchet bar operated by means of two bars, one of which causes the ratchet to move the rack forward, the other bar holds the rack in place.

Claim.—First, providing for adjusting knees upon head blocks by means of rectilinear reciprocating pawls, which are allowed to vibrate vertically, in combination with a lever H, which will admit of said

pawls being engaged with or disengaged from their knees at pleasure, substantially as described.

Second, the locking plates J J, applied so as to take into the racks of adjustable knees of head blocks, substantially as and for the purpose described.

Third, the construction of the bar H, substantially as and for the purpose described.

Fourth, the combination of the locking plates J J, or their equivalents, with rack D, upon the knees C C, and with the bar H, which raises and depresses the pawls b b, substantially as and for the purpose described.

Fifth, the combination of the pawls b b, arms b' b', and angular lever c c, with the reciprocating bar E, and a lever, whose movements are regulated by adjustable stops f f, substantially as and for the purposes described.

61,179.—AUGUSTUS ECKERT, Trenton, Ohio.—*Converting Motion.*—January 15, 1867.—An escape motion. Explained by the claim and illustration.

Claim.—The lever C, with its nose, c, pivoted at one end to the link i, and to the other end to the pendulum D, connected by the rod h to the elbow lever e f, having its fulcrum on the stationary hanger, operating in combination with the escape wheel B, with pins b, in the manner described for the purpose specified.

61,180.—ALBERT E. ELMER, Greenfield, Mass.—*Railway Car Axle.*—January 25, 1867.—The radial abutting surfaces of the compound axle are concave and convex to give a firmer bearing and allow of tightening after wear by further insertion of the stem into the sleeve.

Claim.—Improved railway-carriage axle, made as described, viz: with the concave and convex shoulders d e, arranged and combined with the tubular and cylindrical parts a b, and with respect to the wheels, substantially as described.

61,181.—JOHN R. FISH and H. C. HARTMAN, Fort Wayne, Ind.—*Steam Generator.*—January 15, 1867.—The water is forced through a heater which is within the fire-box.

Claim.—First, the heater B, when placed inside the fire-box of a tubular or fine boiler, in such manner as to be exposed to the direct action of the fire before the heat passes through the flues of the boiler, in combination with the pipe C, and the check valve C', and pipe D, arranged substantially as set forth.

Second, in combination with the heater B, the blow-off pipe E, arranged substantially as and for the purpose set forth.

61,182.—EDWARD FITZ HENRY and ISAAC BALL, Portland, Oregon.—*Machine for Finishing Leather.*—January 15, 1867.—Explained by the claims and illustration.

Claim.—First, the set screws D¹, and rod D, with the springs E, substantially as and for the purpose set forth.

Second, the plate B, pivoted to the plates A, so as to communicate motion to the rubber centrally, and without pressing upon the springs attached to the slickers.

Third, in combination with the plate B, the rods G, and pins G¹, for the purpose of raising the slickers and brushes when not in action, substantially as set forth.

Fourth, the jaws F and I, hinged substantially as set forth, in combination with the hair spring I, substantially as and for the purpose set forth.

Fifth, in combination with the jaws F, the springs K¹, and brushes K, substantially as set forth.

Sixth, the cleaner S, in combination with the slickers F¹, operating substantially as and for the purpose set forth.

Seventh, the lever L, and notched plates O, or their equivalent, in combination with the rods G, attached to the jaw F, substantially as and for the purpose set forth.

Eighth, the arrangement of the points M¹, so as to permit the raising of one or all of the rubbers, substantially in the manner and for the purpose set forth.

61,183.—JOHN G. FLAGG, Philadelphia, Pa.—*Device for Forming Hassocks or Stools.*—January 15, 1867; antedated January 10, 1867.—The carpet is

placed in a mold of the preferred form, and after the filling is inserted, the top piece is pressed over it and confined there for sewing.

Claim.—An apparatus for making hassocks, consisting of the screw D, disk E, mold F, and a suitable frame, all arranged and operating substantially as herein specified.

61,184.—LORENZO D. FORD, Canaan, N. Y.—*Attaching Roofing to Buildings.*—January 15, 1867.—The edges are connected together by a single return fold, which is traversed by the holding nail.

Claim.—The connecting of the edges of the sheets or strips of plastic roofing by means of a lock joint, formed by bending the edges or selvages of the fabric, substantially as shown and described.

61,185.—BENJ. E. FOWLER, Hartford, Conn., assignor to BENJ. F. ELLIS, same place.—*Door Bolt.*—January 15, 1867.—The spindle has a tooth gear which engages a rack on the bolt to move the same. By a longitudinal movement of the spindle a pin enters a notch therein to lock the bolt.

Claim.—The rack bolt b, in combination with the pinion e, spindle d, pin and groove h g, substantially as and for the purpose described.

61,186.—JAMES H. FREY and WILLIAM HECKER, Sharon, Pa., assignors to themselves and E. A. WHEELER.—*Printing Press.*—January 15, 1867.—The platen is supported on four pins which traverse a slot so curved that it shall move as stated in the claim. The inking surface has an inner circular and an outer annular plate, which revolve in opposite directions.

Claim.—First, so constructing and operating the platen B that it shall move bodily in a right line up to and from the form bed C, and also assume an inclined position when at the termination of its outward stroke, the said platen performing these movements without revolving, substantially as described.

Second, supporting and guiding the platen B by means of four bearings a a¹ a¹, which move in slots a², substantially as described.

Third, communicating motion in opposite directions to the plates of the inking table, and also a separate and independent motion to either of the plates e e¹, at will, all by means substantially as described.

Fourth, communicating motion to the rock shaft of the inking roller arms c c' by means of segments b b, which are on a crank E¹ that is connected to the shaft D³, substantially as herein described.

Fifth, providing for giving a rapid and slow motion to the platen and its appendages by the employment of two cranks, in conjunction with the treadle and its rod, either one of which cranks will communicate motion to the shaft of the crank wheels D¹ D², substantially as described.

61,187.—EDWARD P. FURLONG, Portland, Me., assignor to himself and HENRY INMAN.—*Paper Pantalot.*—January 15, 1867.—A removable paper edging for pantalots.

Claim.—A paper pantalot constructed and applied to drawers, substantially as described.

61,188.—P. TENNY GATES, Plattsburg, N. Y.—*Carriage Boot.*—January 15, 1867.—The apron is combined with a dash cover and has an upward ridge to cast off the water. It has perforations for the whip handle and reins.

Claim.—First, the boot A, constructed substantially as described, and used as and for the purposes herein set forth.

Second, the dash cover, provided with its flaps D and straps d, when constructed as set forth and used as specified.

Third, the combination of the dash cover C and boot A, when formed as herein fully described, and used with the dash of a vehicle either stationary or adjustable, in the manner and for the objects described.

61,189.—BURTON GIFFORD, Pelee, Iowa.—*Hog Pen.*—January 15, 1867.—The feeding trough is attached to the side of the pen, and has graduated holes of communication to prevent the larger hogs from crowding the smaller from their portion.

Claim.—First, attaching the trough to the outside of the pen, with graduated openings leading into it

from the inside of said pen, substantially as herein shown and described.

Second, the combination of the hinged cover G, chains or cords H, and sliding board J, with the trough E, and with the perforated side of the pen, substantially as herein shown and described.

Third, forming a portion of the bottom or floor B of the pen of slats or with slots, substantially as herein shown and described and for the purpose set forth.

Fourth, the combination of a removable box D with the slotted portion of the floor B, substantially as herein shown and described, and for the purpose set forth.

61,190.—BURTON GIFFORD, Pedee, Iowa.—*Sheep Pen.*—January 15, 1867.—A hay rack and grain trough in the side of the pen communicate with a box projecting from the pen for convenience in feeding.

Claim.—First, forming a feed box D upon or attaching it to, the outside of the sheep pen A, substantially as herein shown and described.

Second, the combination of the sliding board H and G and levers L, with the feed box D, substantially as herein shown and described.

Third, the combination of the adjustable board J with the sliding boards H and G, and with the feed box D, substantially as herein shown and described.

Fourth, connecting the feeding trough B with the feed box D by the spout or channel F, substantially as herein shown and described.

61,191.—H. C. HATTEN and J. P. ANGLEBERGER, New Carlisle, Ohio.—*Machine for Soldering Eave Troughs.*—January 15, 1867.—The trough is clamped to a series of convex blocks on an extended frame. Buttons and curved bars confine the trough while it is soldered between the blocks.

Claim.—A reversible frame for soldering eave troughs, constructed and arranged for use substantially as set forth.

61,192.—J. B. HAWLEY, New Haven, Conn.—*Buckle.*—January 15, 1867.—Formed of one piece of wire; the two ends are coiled near the center of the rear, and then extending to the front form two tongues. A link passing through these loops serves to connect the buckle with any other object and to hold the looped parts together.

Claim.—A buckle constructed substantially in the manner herein described, combined with a hook or eye, substantially as herein fully set forth.

61,193.—WM. W. HENDRICKS, Philadelphia, Pa., assignor to the COOPER FIRE-ARM MANUFACTORY, same place.—*Skate.*—January 15, 1867.—Four levers are pivoted to the foot plate in pairs, and a lug projects upward from each lever to gripe the sole or heel of the boot when the moving ends of the levers are drawn inward.

Claim.—The combination and arrangement of the plate A, the lever jaws D D' E and E', with their lugs d e, and the straps F and F', or equivalent devices for operating the said levers beneath the plate A, the whole being constructed and operating as and for the purpose described.

61,194.—H. R. HILDRETH and W. H. SMITH, Dutch Flat, Cal., assignors to H. R. HILDRETH, GEO. B. HOBBS, and JOHN DIBBLEE, same place.—*Material for Stuffing Mattresses, and for other purposes.*—January 15, 1867.—The fiber is first separated by means of a picker, then boiled in a solution of potash, washed, dried, and curled as hair is curled by twisting into ropes.

Claim.—First, as a new article of manufacture, and as a substitute for the ordinary curled hair, the fiber of the soap plant, when properly treated and manipulated therefor.

Second, treating the fiber of the soap plant substantially as herein described and for the purpose specified.

61,195.—JOHN HINDMARSH, Henry, Ill.—*Corn Plow.*—January 15, 1867.—The plows are adjustable vertically, and may be raised and lowered and moved laterally by a single lever.

Claim.—First, the lever N, in combination with the standard O*, for sustaining the plow in an elevated position when required.

Second, the rods O O, plow beams G G, cross bar P, and screw Q, combined and operating as described.

Third, the combination of the plow beams G G, standards L L, lever N, and brace rods j, all arranged and applied to a mounted frame A, to operate in the manner substantially as and for the purpose specified.

61,196.—HENRY W. HOLLY and SIDNEY L. GEER, Norwich, Conn.—*Manufacture of Artificial Slate.*—January 15, 1867.—Wood, paper, &c., is coated with a material composed of liquid quartz mixed with equal parts of lampblack or other coloring matter and emery or other gritty material.

Claim.—First, the use of liquid siliceous matter or binding material in liquid slating.

Second, liquid slating composed of the ingredients specified, in or about the proportions set forth.

61,197.—JOHN HOLMES, New York, N. Y.—*Smoking Stand.*—January 15, 1867.—An ornamental stand containing separate receptacles for tobacco in its various forms, also its concomitants of pipes and matches.

Claim.—A smoking stand constructed as herein shown and described.

61,198.—PHINEAS B. HOOD, Milford, N. H.—*Sad Iron.*—January 15, 1867.—A metal face and handle attached together through a block of soapstone.

Claim.—A sad iron composed of a metallic face and with a body of soapstone, when constructed and arranged substantially as herein shown and described.

61,199.—WM. D. HOOKER, San Francisco, Cal., assignor to himself and VOLNEY CUSHING.—*Pump Valve.*—January 15, 1867.—The valve has radial arms whose upwardly turned ends have rectangular faces playing in corners of its chamber to keep it to simple vertical reciprocation.

Claim.—The valve A constructed with guides b b b b upon its sides, arranged substantially as described and for the purpose herein set forth.

61,200.—JAMES R. HOPKINS, Dayton, Ohio, assignor to himself and JACOB O. JOYCE, same place.—*Filtering, Evaporating, and Granulating Saccharine Liquids.*—January 15, 1867.—The juice is passed down through a filter with clay and straw in layers, up through another filled with straw, and down through a third filled with marble chips, from which it passes to the evaporating pan. The whole of this pan is covered except a strip along its flaring side, which is left open for the collection and removal of scum. When the sirup reaches 40° Baumé one pint of cold water is added to each eight gallons of sirup, and after stirring from one to three minutes it is drawn off into the granulator.

Claim.—First, the evaporator lid or cover A, as described and for the purposes set forth.

Second, the mode herein described for filtering and purifying the juice, in combination with the granulating process, substantially as and for the purposes set forth.

Third, the mode herein set forth for producing granulation, in combination with the evaporator lid A and the filtering process, substantially as described.

61,201.—BENJ. F. HORTON, Ithaca, N. Y.—*Seed-ling Machine.*—January 15, 1867.—Explained by the claims and illustration.

Claim.—First, the combination and use of the stationary bar C with the two movable bars or slides B B, when made as described, and the use therewith of one or more series of studs in the opening between the bars, or immediately connected with the said opening.

Second, the bars B B, when held in constant parallelism with each other by means of the rods H H H, thus securing a uniform and adjustable opening between the bars and the even sowing of the seed; and the set clamp I and its set screw J, for the purpose of adjusting the opening for the sowing of various seeds or articles.

Third, the arrangement of the studs G, one series on the fixed bar C, and at least one on the vibrating bars B B.

Fourth, the combination of the wheeled carriage, the can E, seed box, vibrating bars, stationary bars,

gear lever, when made as described, the same constituting one whole or machine.

Fifth, the making of the zigzag cam adjustable by set screws, so that it can be applied to the wheels of the horse rakes, and the use of the machine in combination with the wheels and carriages of horse rakes, as shown and described.

61,202.—WILLIAM W. HUGHES and JAMES C. ADAMS, Philadelphia, Pa.—*Flooring for Malt Kilns.*—January 15, 1867.—The upturned flanges of the perforated plates are stiffened by and bolted to continuous strips, which are connected together by transverse bars.

Claim.—First, constructing malt kiln floors of perforated flanged plates, extending over two or more joists stiffened by the side bars or slips G H and the transverse bars or strips J K, the flanges of said plates being also secured together by pins, bolts or rivets passing through the contiguous flanges.

Second, securing the flanged plates, constructed as above described, to the iron joists below by means of clips *m m* and wires or their equivalents.

61,203.—WILLIAM S. HUNTINGTON, Byron, Mich., assignor to himself and C. P. DEVEREAUX, North Newburg, Mich.—*Plow.*—January 15, 1867.—The elbowed lever is oscillated by a draw-bar to clear weeds from the breast of the plow.

Claim.—The iron elbow scraper *a* suspended to the beam A of a plow, in combination with the drawing rod *b*, arranged and operating substantially as and for the purpose herein described.

61,204.—J. LITTLE HYDE, New York, N. Y.—*Regulator for Watches.*—January 15, 1867.—The scale marks are inclined from a radial direction to accomplish the object stated in the claim.

Claim.—So constructing the index and scale of the regulator that the edge of the index shall form such an angle with the lines of the scale that one of the said lines shall always be but partially covered by the index, substantially as herein described for the purpose specified.

61,205.—ALLEN S. JIMMERSON, Greenpoint, N. Y.—*Sweeping Machine.*—January 15, 1867.—A transverse brush and a pair of inclined brushes are rotated by the supporting wheels of the truck. The bristles are clamped between metallic plates which are adjustable on the radial arms of their frames.

Claim.—First, the combination of the transverse rotary brush D with the two oblique rotary brushes C, arranged and operating substantially as herein set forth for the purpose specified.

Second, the construction of the sections F with the brushing splints *i*, clamped between the two metallic strips or plates *h*, substantially as herein set forth for the purpose specified.

61,206.—H. P. JONES, Davenport, Iowa.—*Dough Kneader.*—January 15, 1867.—The kneading board has rotary motion from a hand crank and simultaneous longitudinal movement by the engagement of cog gears on side racks, by which it may be made to travel in either direction.

Claim.—First, the employment of a traversing rotating blade, of a hexagonal form, in conjunction with a box A having flaring sides and ends, substantially as described and for the purposes set forth.

Second, the construction of the blade C with toothed gudgeons *g g* on its ends, in combination with the sliding keepers *c c* and shouldered rack plates B B, substantially as and for the purposes described.

61,207.—JULES JURGENSEN, Locle, Switzerland.—*Stem Setting Watch.*—January 15, 1867.—The bending over of the pendent ring into the space occupied by the guard cap when closed engages the con- trate gear wheel of the spindle with the system of gear wheels connecting with the minute hand.

Claim.—First, in combination with mechanism for setting the hands of the watch, the pendent bow C, constructed and arranged so that by its movement said mechanism is thrown in or out of gear, substantially as specified.

Second, the combination of the cap or guard E with the pendent bow C and hand-setting mechanism, whereby the said cap while closed is made to prevent

the bow from throwing the hand-setting mechanism in gear, essentially as specified.

Third, the combination of the spindle D, pendent bow C, with its eccentric pin *m*, sliding rod *h*, spring *i*, clutch lever *k*, clutch *b*, con- trate wheel *e*, and pinion *d* in gear with the cannon pinion of the watch, substantially as shown and described.

61,208.—A. C. KASSON, Milwaukee, Wis., assignor to himself and N. C. GRIDLEY.—*Auger.*—January 15, 1867.—Explained by the claims and illustration.

Claim.—First, an auger having a twist whose front or working faces are concave, and whose rear surfaces are convex, substantially as represented in Fig. 2 of the drawings.

Second, an auger constructed substantially as herein shown and described, which permits the formation of cutting lips at any point in its length by simply sharpening the edges.

61,209.—WILLIAM S. KELLY, Schenectady, N. Y.—*Pump.*—January 15, 1867.—The piston rod has a valve below a loose piston bucket, the lower end of which forms its seat. The piston has a limited motion upon the rod. The packing is expanded by the sliding upon each other of the two beveled annular plates beneath it; the outer one of these is expandible.

Claim.—First, the construction of the piston B C, with outlets *a a*, and with a valve seat formed in its lower end for receiving a valve D, which is applied on the lower end of the piston rod, substantially as described.

Second, the combination of the flanged tapering collars F G' and packing *e*, or their equivalents, with piston B C *a*, and valve D on the piston rod E, substantially as and for the purpose described.

Third, the construction of the packing expanders F G', substantially in the manner and for the purpose described.

Fourth, the employment of a tapering flanged collar and a split flanged collar under, over and back of the packing, in such manner that the column of fluid above the piston valve will expand the packing as the piston is raised, substantially as described.

Fifth, the pump constructed substantially as herein shown and described, so that the packing *c* is expanded laterally by the column of water being lifted, and the valve D opened and closed by a direct force or pull upon the piston, substantially in the manner described.

61,210.—MARTIN C. KILGORE, Washington, Iowa.—*Steam Generator.*—January 15, 1867.—The boiler is made in two portions with an outwardly projecting connecting flange. Steam pockets occupy a portion of the spaces left between the square sides of the flue space and the outer shell of the boiler. A superheater is placed vertically over the furnace, and within the chimney. The superheater has pipes of connection from its upper parts to the pockets, and from its lower part to the upper part of the steam space within the boiler. Stop cocks carry the water of condensation from the steam pockets outside the boiler.

Claim.—First, the pockets H, constructed substantially as and for the purpose specified.

Second, the dome K, in combination with the tubes L and M, constructed and operating substantially as set forth.

Third, a steam boiler having sections A and B, flanges C and D, flue box E and dome, and tubes and pockets as described, constructed, combined and arranged substantially as herein specified.

61,211.—W. P. KIRKLAND, San Francisco, Cal.—*Marine Motor.*—January 15, 1867.—The passage of the vessel forces water through a longitudinal pipe and water wheel at the bottom of the hold. The wheel works the pumps or supplies a hose for extinguishing fires, &c.

Claim. the pipe A having stop-cocks B B, water wheel D and water pipe G, in combination with any suitable device connected with the said water wheel for transmitting its power, when arranged together substantially in the manner and for the purpose specified.

61,212.—CHRISTIAN F. KNAUER, Pittsburg, Pa.—*Curtain Fixture.*—January 15, 1867.—The left-hand socket is the full size of the roller, and the right-hand socket is open above, and has a toothed segmental rack,

which by reciprocal revolution of the roller cuts a groove in the same to let it down to its bearing at that end. This groove prevents side movement. The tape is wound on the roller, counter to the blind, and passes beneath a spring brake, which may be drawn out by the taper end.

Claim.—The combination of the guard D and stud *m*, and toothed rim *d* on the bearing of a window shade fixture, substantially as specified and for the purpose set forth.

61,213.—EDWARD H. KNIGHT, Washington, D. C.—*Safety Chamber for Oil Tanks, &c.*—January 15, 1867.—The safety chamber is introduced to afford a space into which the oil may expand, and from which it returns when contracting. It is an improvement on his former patent in respect of being detachable and capable of introduction into the tank or barrel at the ordinary opening for filling.

Claim.—The safety chamber operating substantially as described, and so arranged as to be attached to and removed from the tank or barrel as required.

61,214.—WILLIAM KOPLIN, New Castle, Pa.—*Spike Machine.*—January 15, 1867.—The relative adjustment of the moving die knife, and the descending pointer, are such that the motion of the pointer follows the cutting movement of the knife, lengthening the point into a recess of the knife-shaft, the point being withdrawn before the knife is retracted.

Claim.—The arrangement of the moving die *g*, and knife *h*, with the descending pointer *K*, actuated by the cam so as to cause the pointer to follow the cutting movement of the knife and precede the withdrawal of the latter for the purpose described.

61,215.—S. A. KROMER, Doylestown, Pa.—*Gate.*—January 15, 1867.—The gate runs upon two rollers, and its extended braced arm runs between two rollers which preserve the horizontal position of the gate.

Claim.—First, the combination of the arm *J* and the brace *K*, with the rear end of the gate, substantially as herein shown and described, and for the purpose set forth.

Second, the combination of the horizontal track bars *H* and *I* with the gate and with the friction pulleys or rollers *D E F G*, substantially as herein shown and described and for the purpose set forth.

Third, in the arrangement of the pulleys, or rollers *D E F G*, in connection with the posts *B C*, and track rails *H I* substantially as herein shown and described and for the purpose set forth.

61,216.—L. L. LANSTROTH, Oxford, Ohio, and S. WAGNER, Washington, D. C.—*Apparatus for Extracting Honey from the Comb.*—January 15, 1867.—After the "cap" has been cut off the comb it is placed in a wire gauze basket which is rapidly rotated. The honey is thrown out by centrifugal force. The drained combs are returned to the hives to be again filled with honey.

Claim.—First, the frame *T*, with the adjustable arms *b*, and the support or post *D* for supporting and operating the revolving frame *B*, substantially as set forth.

Second, the frame *B*, suspended by a shaft *C* from the frame *T*, and arranged to hold the comb while being rotated, substantially as herein described.

Third, providing the comb holder or frame *B* with adjustable post *l*, or their equivalents, for adjusting it to receive and hold frames or combs of various sizes.

Fourth, in combination with the stationary posts *m*, and the adjustable post *l*, the wire gauze *B'*, or its equivalent, arranged to support the comb and at the same time permit the escape of the honey, substantially as described.

61,217.—R. G. LATTING, New Orleans, La.—*Cotton Bale Tie.*—January 15, 1867.—The central arched rib is bent down into an arched form for strength, and serrated to increase its bite on the hoop. A notch in the open eye prevents the accidental side movement and escape of the hoop.

Claim.—First, the toothed ridge *G g*, as and for the purpose described.

Second, the shoulder *h* in the bar of the loop *C*, as and for the purpose described.

Third, the arched central bar *G*, substantially as described and represented.

61,218.—J. N. LEAVENWORTH, Hamden, Conn., assignor to himself and BELA A. MANE, same place.—*Let-off Mechanism for Narrow-ware Looms.*—January 15, 1867.—The weighted friction brake bears directly on the disk of the bobbin. The consumption of the warp threads causes the weights thereon to rise, and so to lift the levers, release the brake, and cause a delivery when wanted.

Claim.—The let-off mechanism constructed and arranged to operate as described, the same consisting of the weight *I*, suspended by the warp, the weighted lever *E*, and its shoe *f*, bearing on the warp spool.

61,219.—R. W. LEWIS, Beacon Falls, Conn.—*Self-feed for Carding Engines.*—January 15, 1867.—This machine differs from that described in McQuirk and Cole's patent, No. 59,919, in that the waste roving is taken directly from the main cylinder and returned to the second breaker.

First, the doffer ring *d*, arranged in combination with the main cylinder *A*, so as to take therefrom the outside or waste roving.

Second, the combination of the creeper *E*, with the doffer rings *d*, and the main cylinder of second breaker, substantially in the manner described, so as to receive the waste roving directly from the main cylinder and transfer it to the second breaker, substantially as set forth.

61,220.—JAMES W. MALOY, Boston, Mass., assignor to THE AMERICAN MARBLE-CUTTING COMPANY, same place.—*Stone Cutting Machine.*—January 15, 1867.—Improvement on his patent of April 11, 1866. As the cutter revolves its shaft has a vertical reciprocation imparted by the contact of its ratchet wheel and the stud on the stand, and thus the cutter is caused to strike continuously upon the stone.

Claim.—First, the combination with the revolving cutting tool *D* of the toothed wheel *H*, and projection *p*, or their equivalents, for imparting a reciprocating motion to the said cutting tool, as set forth.

Second, the combination of the vibrating shaft *F* with the movable bearing *l* and spring *S*, as and for the purpose set forth.

61,221.—SYLVESTER MARSH, Littleton, N. H.—*Cog Rail for Railroads.*—January 15, 1867.—Parallel bars of angle iron, at suitable intervals, afford bearings for the rollers, which form cogs in the rack, or cog rail, with which the gear of the car truck engages in ascending heavy grades.

Claim.—First, a ratchet or cog rail composed of cylindrical cogs, free to revolve upon their axes or trunnions, substantially as herein shown and described.

Second, a ratchet or cog rail constructed as described, forming the uprights which support the cogs or rollers of angle iron, substantially as herein shown and for the purposes set forth.

61,222.—HENRY MARTIN, Chicago, Ill., assignor to himself, A. N. TOWNE, and A. J. AMBLER.—*Metallic Safety Seal for Railroad Cars.*—January 15, 1867.—The metallic strip is to be attached to the fastenings of a car door in such a manner that the door cannot be opened without breaking the device.

Claim.—A metallic seal consisting of a tapering strip of metal, which is constructed for receiving an eyelet and having its ends secured together thereby, substantially as described.

61,223.—PETER MARTIN, Cincinnati, Ohio.—*Hot Air Furnace.*—January 15, 1867.—The construction of the stove and course of the calorific current may be understood by reference to the claims and illustration.

Claim.—First, the arrangement of the fire chamber *A*, the ash pit *F*, the series of descending flues *J J J* leading from the top of the fire chamber to the ash pit and the ascending flue *O*, leading directly into the discharge flue *O'*, all as herein described and for the purposes set forth.

Second, the combination of the elbows *K L*, collars *M* and flanges *N*, with the fireplace *A*, ash pit *F*, and flues *J* and *O*, as and for the purposes explained.

Third, the combination of the supporting crank *H*, lever *I*, and divided grate *G G'*, all constructed and arranged to operate as described.

Fourth, surmounting the fire chamber of a hot-air furnace with an arched and corrugated sheet-metal crown plate B b, as herein set forth.

Fifth, in combination with the elements of the first claim, the door Q and its accessories, when located as described and operating for the purpose set forth.

Sixth, the sliding shutter Y Z Z', constructed and employed as and for the purposes set forth.

61,224.—FRANZ O. MATTHIESSEN, Jersey City, N. J.—*Manufacture of Sugar.*—January 15, 1867.—The reticulated cylinder of the centrifugal machine discharges into a chamber which is connected by a swivel nozzle with either of two troughs, which receive the liquids discharged from the rotary cylinder.

Claim.—First, the process, substantially as herein described, of separating the products as discharged from the centrifugal machine by first running off the green syrup, and afterward the cleansing liquid or liquoring into distinct vessels or reservoirs for separate treatment or use, substantially as specified.

Second, the combination with the discharge spout D of the centrifugal machine of a swiveling spout E, or spouts controlled by a valve or valves, substantially as and for the purpose or purposes herein set forth.

61,225.—EDWARD MAYNARD, Tarrytown, N. Y.—*Priming Metallic Cartridges.*—January 15, 1867; antedated December 5, 1866.—A thin and shallow metallic cap covers the base of the metallic cartridge, and confines the fulminate at a single point therein, so that cartridges may be safely transported unprimed, and have the primed caps applied when desired.

Claim.—A primed metallic cap for the base of a cartridge when the fulminate is secured at a single point on the inner side of said cap and the priming point or receptacle does not project externally therefrom beyond its base, all substantially in the manner and for the purpose herein set forth.

61,226.—ALBERT MCALPINE, Pittston, Pa.—*Machine for Dressing Barrel Hoops.*—January 15, 1867.—The hoops are dressed to a thickness by means of a revolving cutter wheel, in connection with a guide block and pressure and feed roller.

Claim.—Dressing barrel hoops their entire length to a thickness by the cutter wheel B, when arranged to operate with the guide or head block H, pressure roller U, and feed roller L, all constructed substantially as described.

61,227.—JAMES R. MCCLINTOCK and JOHN K. SCOTT, New Orleans, La.—*Dredging Machine.*—January 15, 1867.—The apparatus has a stirrer for loosening the mud, &c., and a pump for introducing a stream of water to disperse it, for the purpose of deepening a river channel or removing a bar.

Claim.—First, the adjustable frame work or guide C for adjusting and holding in proper position the lower ends of the pipes or hose B, and for supporting the stirrer D, when the same is used as described for the purpose set forth.

Second, the combination of the adjustable guide C, with the pipes or hose B and forcing pumps A, as described for the purpose set forth.

Third, the combination of the forcing pumps A, pipes or hose B, adjustable guide C, with the stirrer D, or its mechanical equivalent, substantially as described for the purpose set forth.

61,228.—LEANDER J. McCORMICK and LAMBERT ERPELDING, Chicago, Ill., assignors to LEANDER J. McCORMICK.—*Harvester.*—January 15, 1867.—In this hinge-joint harvester the tongue is rigidly secured to the main frame, which is mounted upon two driving wheels. One end of the finger beam is hinged to the rear end of the supplementary frame, which is hinged to the forward part of the main frame. The cutting apparatus has a vertical and axial movement independent of the main frame. The motions are obtained by a lifting and locking lever and a rocking lever.

Claim.—First, the combination, as set forth, of the main frame, supplementary frame, and hinged and pivoted finger beam, all constructed and arranged as described.

Second, the combination of the supplementary frame, the hinged finger beam, and the coupling arm

with the rocking lever, when arranged for joint operation, as described.

Third, the combination of the shoe O, locking piece r, and crescent cam s, with the lever S, all arranged as described for the purposes both of locking the finger beam and lifting it horizontally.

Fourth, the combination with the main and supplementary frames of the hinged finger beam, the locking lever, the coupling bar Q, and the rocking lever, all arranged and operating as described.

Fifth, the combination of the cross piece N and coupling bar Q, with the shoe O, constructed and arranged as described.

61,229.—ROYAL B. MILLIKIN, Springfield, Vt.—*Pocket Knife.*—January 15, 1867; antedated January 5, 1867.—One part of the handle swings upon the blade pivot and exposes the photograph.

Claim.—A knife handle in two parts, connected one to the other and to the blade, and otherwise constructed substantially as described.

61,230.—SIMEON MILLS, Madison, Wis.—*Thill Coupling.*—January 15, 1867.—The socket to which the thill is attached is solid with the exception of the slot which admits the pivot. The socket may be attached to the draw bar or to the clip. The slide which closes the slot through which the pivot enters is fastened in position by the end flanges of the thill irons.

Claim.—First, the socket D formed solid with the exception of the slot for the pivot, substantially as described, whether fastened to the draw bar or clip, or an axle band.

Second, the combination of the solid socket D, slide F, and flanges b b, on the thill iron.

61,231.—THOMAS S. MINNISS, Meadville, Pa.—*Locomotive for Plowing, &c.*—January 15, 1867.—The traction engine has an endless track hinged outwardly, with vertical flanges for supporting the wheels or trucks. The clutches are separately operable by levers pivoted on the axles, and act to engage or release the driving wheels. The platform has a cam lever for raising and a caster wheel for guiding.

Claim.—First, an endless chain or track composed of plates B, hinged as described, with vertical flanges E and truck C, in combination with the frame track A and wheel D, as and for the purpose set forth.

Second, the clutch M, operated by lever N, in described combination with wheel D and endless chain or track, for the purpose specified.

Third, the platform O with guide wheel H, arm J, and cam-headed lever I, as and for the purpose set forth.

61,232.—STEPHEN MOULTON, Hartford, Conn.—*Sewing Machine Shuttle.*—January 15, 1867.—Explained by the claims and illustration.

Claim.—First, a shuttle for sewing machines in which the removable bobbin C and adjustable tension spring D are arranged in the manner shown upon a plate A, which is pivoted to case B in such a manner as to cover and protect the parts named, and the thread, when in use, and also that the parts named may be readily exposed for renewal of the threads or adjustment of the tension spring by means of the screw H, substantially as shown.

Second, the manner of arranging the tension spring D, so as to form a bearing for the spring z, which holds the bobbin in place, said spring being inserted in a hole drilled directly through one end of the bobbin support A.

61,233.—JEREMIAH MYERS, Dorchester, Mass.—*Glassware Press.*—January 15, 1867.—The plunger of this press, for forming hollow glassware, is operated by eccentric segment gears which give a rapid motion to the plunger at the earlier portion of the stroke, and a slower but more powerful effect at and near the conclusion of the stroke.

Claim.—The arrangement and combination of the eccentric segment gears n and r, with the platen or plunger c, connecting rods l, and lever s, the whole being connected to operate together substantially as set forth.

61,234.—MYER MYERS, MAURICE MYERS, and WILLIAM HILL, Birmingham, England.—*Apparatus for the use of Smokers.*—January 15, 1867.—The cutter is intended for removing the tip end of the cigar, and the stiletto to act as a probe in making a draft opening, or in connection with an elastic cord as a cigar holder.

Claim.—The sliding, cutting edges, defined as *d* and *g*, and the connecting of the same with a stiletto and means for expanding and holding the parts in position, substantially in the manner and for the purpose set forth.

61,235.—PETER MYERS, Newton, Ill.—*Thill Coupling.*—January 15, 1867.—The thill is hooked to the clips when the forward ends are depressed below their working position, and plates on the ends of the thill iron are thrust forward by springs to prevent rattling.

Claim.—The construction and arrangement of the coupling iron *J*, spring *E*, follower *F*, thill iron *G*, safety button or spring *C*, and grooves *P P*, all for the purposes as above set forth.

61,236.—A. F. NATHAN, New Haven, Conn.—*Skirt Elevator.*—January 15, 1867.—A three-barred slide is placed at a fixed point upon the skirt, and a tape attached to a lower point upon the skirt is passed through the slide and held at the required adjustment.

Claim.—The arrangement of the slide *A* upon the loop *B*, in the manner described, in combination with the tape *C*, substantially as herein set forth.

61,237.—CHARLES NEER, Brooklyn, N. Y.—*Dynamometer.*—January 15, 1867.—The apparatus is designed to ascertain the strain or power exerted in a revolving mechanism where the extent of movement or distance traveled becomes an element in the calculation. The peripheral power scale is combined with a steelyard or other measure of actual force, and the power exerted can be determined by inspection and calculation based upon the number of revolutions.

Claim.—First, the peripheral power scale *e*, in combination with the chain *i* and a steelyard or other measure of actual force, the parts being constructed and combined substantially as and for the purposes set forth.

Second, constructing the steelyard carrier *f* in two parts so as to apply the dynamometer to a shaft without removing it from its bearings, substantially as set forth.

Third, the ring *2* and columns *1*, in combination with the peripheral power scale *e*, for connecting the same to the coupling *c*, as set forth.

Fourth, the power indicator *n* and fork *6*, combined with steelyard head *h*, for the purposes as set forth.

Fifth, the dial *q*, applied to indicate the proportion of speed in combination with the indicator *n*, so as to determine the actual power consumed, substantially as set forth.

Sixth, the friction tester, consisting of the cylinder *r*, the boxes *s t*, in combination with the dynamometer, substantially as and for the purposes set forth.

61,238.—ANTHONY NULSEN, E. HAUZEISEN, and ALBERT WAGNER, Cincinnati, Ohio, assignors to A. NULSEN & Co., same place.—*Brick Machine.*—January 15, 1867.—The clay from the hopper is passed out at the throat by the traveling bottom, and thence between rollers and counterpart traveling bands which form a spout to deliver it into the molds on the endless traveling apron beneath. The latter is operated by claws on an oscillating side frame.

Claim.—First, in the described combination, the hopper *B*, traveling bottom *E*, rollers *C D* and *F*, throat *II*, and shaver or knife *G*, for the purpose set forth.

Second, the compressing rollers *N N'*, when combined with the trunk composed of the two endless aprons *Q Q'*, rollers *R R'*, and back boards *S S'*.

Third, the combination of trunk *Q Q'*, *R R' S S'*, and conducting and separating throat *T U U'*.

Fourth, the described combination of separating throat *T U u*, reciprocating knife *9*, and removable molds *3*.

Fifth, the endless carrier *Y Y' Z z 1*, when combined with the reciprocating hooks or claws *5*, substantially as described.

61,239.—ENOCH OSGOOD, Boston, Mass.—*Cotton Gin and Picker.*—January 15, 1867.—The cylinder is composed of alternate disks of cloth and rubber secured firmly upon a shaft. The cotton is drawn in by the revolution of the cylinder between it and a stationary blade. The seeds are separated by the action of two vibrating toothed clearers.

Claim.—First, the elastic roller *B*, made of rubber and cloth, the latter running edgewise from the center or core to or toward the outer circumference with the flanged metallic rings between the several compound rings as described, the same constructed and operating in the manner as shown and described, and for the purpose set forth.

Second, the elastic roller *B*, made of rubber and cloth wound around its shaft or core spirally, with strips in the manner described and for the purpose set forth.

Third, the combination of elastic roller *B* with the concave bar *C*.

Fourth, the combination of elastic rollers *B B* with the double concave or angular bar *L*, and clearer *M*, as described.

Fifth, the combination of elastic roller *B*, corrugated clearers *D D*, and concave bar *C*, as described.

Sixth, the combination of elastic roller *B*, revolving clearer *E*, and concave *C*, as described.

Seventh, the combination of picking cylinder *P'*, cylinders *v v* and *w*, belts *L L'*, rack *K*, elastic roller *B*, and revolving clearer *E*, constructed, arranged, and operating in the manner substantially as described and for the purpose set forth.

Eighth, in combination with the clearers *D D* the pitman *e*, constructed and operating in the manner shown and described, and for the purpose set forth.

Ninth, the combination of the elastic roller *B* with the revolving doffer *Z*, constructed, arranged, and operating in the manner substantially as shown and described, and for the purpose set forth.

61,240.—B. OWEN and B. PICKERING, Dayton, Ohio.—*Combined Tongs, Lid Lifter, Hook, &c.*—January 15, 1867.—One portion has a divaricated end, and the jaw on the other portion acts against one prong of the former.

Claim.—The above described lid lifter as a new article of manufacture, the same being constructed and used substantially in the manner and for the purposes set forth.

61,241.—ISAAC T. PACKARD, Chicago, Ill.—*Reed and Pipe Musical Instrument.*—January 15, 1867.—The lever and tracker, in the action work of reed and pipe musical instruments, are connected by an elastic band secured around the respective pieces by notches or pins.

Claim.—The use of an elastic band, or its equivalent, for the purpose herein described and set forth.

61,242.—H. H. PALMER, Rockford, Ill.—*Bed Bottom.*—January 15, 1867.—The series of slats are connected by flexible strips which are attached to springs coiled around the side rails.

Claim.—A spring bed bottom composed of a series of parallel wooden slats *D*, connected near their ends by strips *b*, of leather or other suitable flexible material, with wire springs *C* attached to the head and foot pieces *a a* of the frame *A*, and connected to the strips *b* centrally between the slats *D*, substantially as set forth.

61,243.—SIDNEY PARKER, Chicago, Ill.—*Railroad Frog.*—January 15, 1867.—The steel rails are imbedded in and riveted to a block which rests on the bed plate.

Claim.—A railroad frog consisting of the bed plate *B*, plate *A*, and the steel rails *x y* and *z*, combined and constructed as herein shown and described.

61,244.—EDUARDO JUANES Y PATRULLO, New York, N. Y.—*Machine for Preparing the Fiber of Plants.*—January 15, 1867.—Improvement on his patents of March 5, 1861; April 23, 1861; and April 23, 1863. The machine is intended for operating upon tropical plants. The devices are for adjusting the pressure of the apron against the fibrous material when operated upon by the beaters of the drum.

Claim.—The combination of the apron *C* with the sliding frame *D*, operated by the lever *E*, and ar-

ranged substantially as and for the purpose herein described.

61,245.—R. R. PATTISON, Chicago, Ill.—*Knife Cleaner*.—January 15, 1867.—The knife handles are clamped and protected in a box, the blades are exposed in a row to the action of the reciprocating rubber above.

Claim.—First, the bed or cushion J, or its equivalent, upon which the knives, &c., are laid to be acted upon by the scourer, in combination with the cleaning material box or reservoir L, when the two are combined substantially as and for the purpose specified.

Second, the holder M, for the handles of the knives or forks, &c., made in a box form and provided with a cover, plate, or board Q, so hung thereto as to accommodate itself to handles of varying thicknesses, substantially as described.

61,246.—JAMES B. PELTON, Sandusky, N. Y., assignor to D. H. WOOD, same place.—*Carriage Brace*.—January 15, 1867.—Explained by the claim and illustration.

Claim.—The combination and arrangement of the braces G with the ordinary elliptic springs C and the body A, in the manner shown and described, that is to say, the braces forming simple bars attaching to the body and connecting with the upper half of the elliptic springs, so that while both the body and spring are united and braced against rocking and swaying, the springs are unnumbered and allowed their natural, free, and unimpeded elastic action, and the bars hidden from sight, as herein set forth.

61,247.—GEORGE G. PERCIVAL, Brooklyn, N. Y.—*Lighting Gas by Electricity*.—January 15, 1867.—Explained by the claim.

Claim.—The attachment to a gas burner of any kind, or the fixtures thereof, of a secondary pile, which may be charged, as it were, with voltaic electricity, by being properly connected with any suitable source of electricity, and which will retain the charge until given off from time to time, as may be required for the purpose of lighting the gas, the whole substantially as herein described.

61,248.—RUSSELL PHILLIPS, Gardiner, Me.—*Carpenters' Gauge*.—January 15, 1867.—Two gauge heads are secured upon the gauge rod, and slide thereon; they are so arranged that one head will slide past the other.

Claim.—The combination of the stock having the grooves and rails and the two slides on its opposite sides, the slides having the recesses, the lips, the projections and thumb screws, as and for the purposes herein set forth.

61,249.—D'ARCY PORTER, Cleveland, Ohio, assignor to G. S. NEWCOMB & Co.—*Scissors Sharpener*.—January 15, 1867.—The cutter is adjustably attached to an oblique face on the arm of the stock; the gauge is regulated by points, and a set screw on its slotted shank.

Claim.—The adjustable knife C, arm B and stand A, in combination with the gauge D, points a, and screw E, arranged in the manner and for the purpose set forth.

61,250.—IRA W. PRAY and EDWARD FITZHENRY, Portland, Oregon.—*Machine for Scouring Leather*.—January 15, 1867.—Dually arranged sets of articulated rubbers or scrapers are alternately brought into action by the reciprocating motion of a crank.

Claim.—First, a mechanism by which dually arranged sets of rubbers or scrapers L, in a machine for finishing leather, may alternately be brought into action by the reciprocating motion of a crank, substantially in the manner set forth.

Second, in combination with the crank N' and pitman N, the frame A, pivoted substantially in the manner and for the purpose set forth.

Third, in combination with the hinged arms H, with or without the arms I, with the springs K, the parts being constructed and arranged for use substantially as set forth.

Fourth, the springs K, pivoted cross-pieces K' and levers O, in combination with the hinged arms H and I, substantially as and for the purpose set forth.

Fifth, in combination with the table G, we claim the roller E, adjustably suspended by the rods E' and cross bar F, substantially as and for the purpose set forth.

61,251.—THOMAS REECE and ARTHUR CLANKE, Philadelphia, Pa.—*Lemon Squeezer*.—January 15, 1867.—The bulb has flanges which shut upon the rim of the cup, and confine the lemon, whose juice exudes through the slots in the cup.

Claim.—The combination of the two handles C and D, hinged together as shown with the two cups A and B, one provided with a slotted recess, and the other with a flange d, the several parts being constructed and used as and for the purpose herein set forth.

61,252.—H. N. RELYEA, Warsaw, N. Y., assignor to himself and MILLS L. RICE.—*Mill Pick*.—January 15, 1867.—The head is made of malleable iron, and of a truncated diamond form; each end has a wedging socket to receive the shank of a steel blade, which can be detached by a flat-sided wedging key, inserted in a hole through the head, coinciding with the joint between the socket and blade.

Claim.—The diamond-shaped truncated head A, formed of malleable metal, and provided with sockets a a and transverse holes b b, in combination with the hardened blades B B and key c, constructed and arranged substantially and for the purposes set forth.

61,253.—WILLIAM JONES RHEES, Washington, D. C.—*Frame for Artificial Slates*.—January 15, 1867.—The hollow in the frame forms a receptacle for pencils, &c., and the sliding lid is marked to form a scale. The slate frame is also graduated.

Claim.—First, the combination of a hollow in a slate frame, to be used as a receptacle for pencils, sharpeners, and other utensils, with a suitable covering constituting a ruler and gauge, substantially as described.

Second, marking upon said ruler, so arranged, measures of length, substantially as shown and described.

Third, marking upon the frame of a slate measures of length, substantially as described.

61,254.—WILLIAM J. RHEES, Washington, D. C.—*Frame for Slates*.—January 15, 1867.—The frame of the slate is made of boxes, which form receptacles for pencils, &c.; upon the hinged lids are inscribed measures, copies, &c.

Claim.—First, making the frame to a slate of a box or boxes, as and for the purpose substantially as described.

Second, using the box frame of a slate as a receptacle for pencils, rulers, sponge, or any other utensils or other articles, substantially as described.

Third, dividing the box frame of a slate into compartments, as and for the purposes described.

Fourth, making letters, drawings, and measures of length on the box frame of a slate, either outside or inside.

61,255.—WILLIAM RHEINER and L. H. WOLFF, Detroit, Mich.—*Apparatus for Inserting Corks*.—January 15, 1867.—The base piece has at one end a standard, which serves as a bearing for the end of the lever, and at the other end a tube extending through the base piece. A plunger is attached to the lever by a curved rod, and serves to push the cork into the mouth of the bottle.

Claim.—First, the combination and arrangement of the base B, cone A, standard a, holder C, lever D, and plunger b b', in the manner and for the purpose described.

Second, hinging the top F to the part E, and fitting the plunger to said hinged part F, all in the manner shown and described.

61,256.—GILBERT RICHARDS, Cummington, Mass.—*Dish Washing Machine*.—January 15, 1867.—The dishes rest against the inclined screen, and the water is dashed against them by the revolving paddle.

Claim.—The combination and arrangement of the wire screen G, extending longitudinally of the cylindrical vessel A, from one end to the other thereof, the horizontal winged shaft E, and gear wheels C and D with each other, and with the cylindrical vessel A, as herein described and for the purpose specified.

61,257.—GEORGE S. RICHARDSON, Stow, Ohio.—*Fruit Picker.*—January 15, 1867.—The wire basket is mounted upon a pole with guards of unequal length, which are caused to embrace the stem of the fruit, separate it from the branch, and guide it into the pocket.

Claim.—The guards B of unequal lengths, and single curved fingers B, connected with the hoops or bands A, in combination with the socket rings F, bag D, and staff or handle, arranged in relation to each other as and for the purpose specified.

61,258.—JOHN W. RICHARDSON, Sligo, Ohio.—*Harrow.*—January 15, 1867.—The blades present a salient curved edge to divide the clods, are capable of horizontal rotation in their sockets, and of elevation in a gang by the rotation of their common shaft, for the purpose of clearing them of collected trash, or of raising them into a position for transportation clear of the ground.

Claim.—First, the provision in a harrow of the cimeter-shaped blades J, adapted to revolve on their shanks or axes, boxed within the frame, when employed with the chambered metallic boxes H, constructed as represented in figure 2, for the purpose explained.

Second, the arrangement in a mounted or wheel-supported harrow, of one or more shafts K K', journaled transversely of the frame, and armed with teeth or blades L, in combination with the notched rod Q, projection Q, lever N, and treadle R, as and for the purpose set forth.

Third, in combination with the elements of the clause immediately preceding, the handle S, on the rear part of the rod O, for the several objects stated.

61,259.—S. RICHARDSON, Jericho, and J. S. ADAMS, Burlington, Vt.—*Potato Digger.*—January 15, 1867.—The share passes under the hill of potatoes, and throws the dirt and potatoes into a rodded cylinder through which the dirt is sifted. The cylinder is revolved by one of the two wheels which carry the apparatus.

Claim.—The combination of the digger B, cylinder gauge wheels D D' and supporting wheels E E', arranged and operating substantially as described.

61,260.—J. B. RIPPON, Kendall, N. Y.—*Whiffletree Attachment to Plovs.*—January 15, 1867.—The wheels on the ends of the whiffletree enable it to pass the trunks of fruit trees without injuring the bark.

Claim.—The application of the wheel A projecting beyond the end of the whiffletree, as shown in figure 1.

Also, the brace B and pivot a, for the purpose of securing the wheel to the whiffletree, substantially as herein described.

Also, in combination with the wheel A, the long staple C, for the purpose herein set forth.

Also, the special arrangement and combination of the whole thing as herein set forth.

61,261.—WILLIAM H. RODGERS, Brooklyn, N. Y.—*Machine for Covering Wire with Fine Wire.*—January 15, 1867.—The head for the wire is independent from, but in line with, the axis of the revolving head, which carries spools of fine wire to be wound around the wire which is fed along the axis of revolution. The tension is obtained by passing the wire around grooved rollers.

Claim.—The hollow fixed head I, separated from the hollow axis b, in combination with the revolving head, carrying the spools or bobbins of fine wire, and revolved around the axis b, as and for the purposes set forth.

Also, the grooved rollers g, in combination with the revolving head and spools around which rollers g the fine covering wire is wound, to give the required tension from the friction, as set forth.

61,262.—D. E. ROSE, Cincinnati, Ohio.—*Amalgamator.*—January 15, 1867.—The vessel is suspended in a furnace through which extends an inclined tube, which discharges its contents near the bottom. The tube has a propelling screw having a shoulder and elastic collar at its bearing, and a grinding plate at its lower end, which works against a grinding surface attached to the lower end of the tube. Above the

mouth of the vessel is a wheel which removes the waste ore as it rises to the surface of the molten lead.

Claim.—First, the combination of the spring bearing H and inclined sectional shaft B, provided with spiral flange, revolving in the case X, which enters the kettle E near the bottom, substantially as described.

Second, combination of the inclined casing X, provided at its lower end with stationary grinding flange D, and the shaft B, provided with a grinding disk C, introduced through the side of the kettle and operating near its bottom, substantially as described.

Third, in combination with the kettle, arranged as described, the revolving paddle G, as described and represented.

61,263.—A. P. ROUTH, Liberty Mills, Va.—*Draining Machine.*—January 15, 1867.—Explained by the claim and illustration.

Claim.—The adjustable flaring wings G G, applied to the double mold board D in the manner described, and operating to clear away the dirt from the edges of the ditch, as and for the purpose set forth.

61,264.—GILBERT J. RUGG, Worcester, Mass.—*Planing Machine.*—January 15, 1867.—From the feed roller of the planing machine weighted levers are suspended by stirrups, which permit the rollers to be regulated by a crank, or raised or lowered by the inequalities of the board, while preserving the uniform power of the weight upon the roller.

Claim.—The combination of the lever F with roll D, cross-piece G, and rods b and c, when constructed and operating substantially as shown and set forth.

61,265.—WILLIAM G. RULE, New York, N. Y.—*Legging.*—January 15, 1867.—The elastic metal frame has a covering of any suitable material, and, being flexible, is opened and clasped around the leg which it embraces.

Claim.—The combination of the elastic metal frame, substantially as described, with the covering of the same, whether made of leather or other material, for the purpose of making spatterdashes as set forth.

61,266.—ROBERT SANDERSON, Cleveland, Ohio.—*Steam Governor.*—January 15, 1867.—By means of the arrangement of an auxiliary lever and yoke and connected devices, the steam is cut off when, by an accident to or breakage of the governor, a full head of steam is inopportunistly admitted.

Claim.—The auxiliary lever O, yoke N, and pivot joint b', extending through the lever M, in combination with the lever J, pawls K K', lifting toes H, bail P, and yoke L, as and for the purpose set forth.

61,267.—A. T. SCHMIDT, Pittsburg, Pa.—*Manufacture of Paper and Treatment of Paper Pulp.*—January 15, 1867.—The pulp, paper, or cloth is treated with a composition of glycerine, 1; oil of vitriol, 1; and water 9 parts, to strengthen it and to enable it to resist the action of water, acids, and alkalis.

Claim.—The process hereinbefore described of treating paper, paper pulp, and textile fabrics of vegetable fiber with a mixture of glycerine, oil of vitriol, and water, and subsequently with an alkaline bath, or the equivalent of such process, substantially as and for the purposes hereinbefore described.

61,268.—THOMAS D. SHAW, Westfield, Ohio.—*Churn.*—January 15, 1867.—The dashers are provided with tubes inclining from each other, and are revolved, one within the other, in opposite directions, by separate pinions actuated by a common spur wheel.

Claim.—The dashers I and J, provided with tubes L M, in combination with the sleeve N, shaft K, and operating conjointly by the gearings O P and G, as and for the purpose set forth.

61,269.—CHARLES C. SHORT, Osgood, Ind.—*Automatic Fly Brush and Fan.*—January 15, 1867.—The extension arms are hooked on to the hub on the end of the vertical axis, which is revolved by gearing and a spring.

Claim.—The combination and arrangement of the shaft H, automatically actuated by clockwork, and the cross-head H', screw-head I, and the extension arms K K', attached adjustably to the cross-head by hooks K'', substantially as and for the purpose set forth.

61,270.—ISAAC M. SINGER, Yonkers, N. Y.—*Sewing Machine.*—January 15, 1867.—Improvement on Singer's patent of December 11, 1866. A central delivery oscillating shuttle is used. A round needle bar and round presser bar are so connected that each prevents the other from turning. The shuttle, while entering the loop, is relieved of the rubbing action of its guide. The shuttle point is in a plane with one of its sides. The thread extends from the shuttle throat in a line diverging from the track of the needle point. An ear projecting from the butt of the shuttle gives it a broader wearing surface. The bobbin is held in the shuttle by a removable spring-ring, fitting in an annular groove; a branch of the same ring gives tension. Paper, cloth, &c., are interposed between the bobbin and the shuttle. The height to which the feed surface may be raised is made variable. The extent of feed in opposite directions is made determinable.

Claim.—First, the combination of a round needle bar and a round presser foot stem, by means of sliding brackets, substantially as set forth.

Second, the combination of a reciprocating spring shuttle holder with a shuttle guide in such manner that the former, while moving with the shuttle, is caused, during a part of its movement, to press strongly against the shuttle, by the action of the shuttle guide, substantially as set forth.

Third, the combination of a shuttle constructed to oscillate in a sewing machine, with a projecting thread guide for the delivery of thread, substantially as set forth.

Fourth, the construction in a sewing machine of the lateral support for the oscillating shuttle, with a central opening, substantially as set forth.

Fifth, the shuttle constructed with an ear, projecting at its butt, beyond the bobbin socket, substantially as set forth.

Sixth, the combination of the shuttle with a spring-ring so arranged as to hold the bobbin in its socket in the shuttle, substantially as set forth.

Seventh, the combination of the shuttle with a spring-ring provided with a branch to make pressure upon the bobbin, substantially as set forth.

Eighth, the combination of the shuttle with a lining in the bottom of its bobbin socket, substantially as set forth.

Ninth, the combination of the shuttle with a hoop lining in its bobbin socket, substantially as set forth.

Tenth, the combination of several sections of a sectional thread tension, with one movable stock, substantially as set forth.

Eleventh, the combination of the arm of the thread take-up with its stock by means of an adjustable connection, substantially as set forth.

Twelfth, the combination of the regulating lever of a reversible feed mechanism, with a stock carried by said lever, substantially as set forth.

Thirteenth, the combination of the turning regulating plate and feeding instrument of a sewing machine, by means of a bent reciprocating bar, substantially as set forth.

61,271.—HENRY SLATTER, Covington, Ky.—*Composition Fuel.*—January 15, 1867.—Composed of mineral tar diluted with quicklime and water and mixed with fine coal dust, charcoal dust, sawdust, chaff, and 10 per cent. of coarse sand. Mold into blocks.

Claim.—The composition fuel composed and compounded as set forth.

61,272.—ANDREW J. SMITH, New York, N. Y.—*Grain Binder.*—January 15, 1867.—A foot lever is provided at the opening of the gathering frame, the same having notched arms extending in front, upon which the gavel is raked and by which it is carried up within reach of the gathering arm. The twisting device is attached to a block which slides in a slot in the bottom of the frame, and it is provided with gear-wheels which are rotated by a rack at the side of the slots, as the block is carried backward by the gathering arm.

Claim.—First, the lever F, provided with the notched forks E, when arranged and used as and for the purpose herein set forth.

Second, the sliding gear block K, constructed, arranged, and operating substantially as and for the purpose herein specified.

61,273.—ELLIS F. SMITH, Orangeville, Ill.—*Corn Planter.*—January 15, 1867.—One wheel has marking studs on its rim, and on its inner face has a bevel wheel which gears into a pinion connected to the seed slide. A certain proportion is maintained in the construction of the parts, so that the seed drops while a marker is on the ground.

Claim.—The traction wheel A', provided with the markers c c c, in combination with the gear wheels C and D, so constructed that a hill will be planted when the marker is on the ground, for the purposes and substantially as described.

61,274.—SYRANUS STANDISH, Pacheco, Cal.—*Amalgamator.*—January 15, 1867.—The muller arms are formed with curved flanges, and have shoes attached by means of pins which are secured in slots in the muller arms by means of heads. The edge of each shoe is formed with a curved peripheral flange.

Claim.—First, the spiral-shaped flanges or lips M of the rotating muller arms L, substantially as and for the purposes specified.

Second, the shoes M² hung to the muller arms L, so as to be susceptible of a lateral play upon such arms, substantially as and for the purpose described.

Third, the shoes M², having spiral-shaped flanges or lips O upon their outer ends, as and for the purpose set forth.

61,275.—A. F. STAYMAN, Baltimore, Md., assignor to self, J. W. HODGES, and P. DE MURGUIONDO.—*Utilizing Tobacco Dust.*—January 15, 1867.—The tobacco dust is moistened, aggregated, and granulated or pressed into sheets or cakes. The cakes are broken into grains of proper size for smoking, or the aggregated particles may be pressed into cakes of proper size to fit into a pipe.

Claim.—First, the utilizing of tobacco dust, substantially as herein described.

Second, the process herein described of preparing tobacco dust for use.

Third, a material for smoking composed of tobacco dust, prepared in any of the methods herein described, or in any equivalent manner.

Fourth, a granulated smoking tobacco composed of tobacco dust, treated substantially as herein set forth.

Fifth, as a new article of manufacture, the smoking tobacco, composed principally of tobacco dust, and prepared substantially as herein described, whether the same be used in a granular or solid form.

61,276.—O. F. STEDMAN, Ravenna, Ohio.—*Watch Case.*—January 15, 1867.—Inserted into the case of a watch is a broad circular spring which prevents the entrance of dust into the works.

Claim.—The spring L, as arranged in combination with the watch case, in the manner and for the purpose as herein set forth.

61,277.—ELI STUBBS, West Elkton, Ohio.—*Machine for Filing Saws.*—January 15, 1867.—A frame is clamped to the saw plate, and has hinged arms that can be adjusted to the bevel to act as guides in filing the teeth of the saw, whose back rests against the set screws in the clamp.

Claim.—The adjustable clamp A, in combination with the hinged adjustable guides B B, constructed and arranged as described, as a new article of manufacture, applied and used in the manner specified.

61,278.—JAMES H. STURDY, Attleboro', Mass.—*Steam Generator.*—January 15, 1867.—The generator has helical ascending and descending flues arranged to extend around its surface, and communicating at their upper ends, so that the products of combustion which ascend through one flue shall descend through the adjoining one. A cap placed on the upper end of the flue has central passages for the purpose of changing the direction of the gases.

Claim.—A boiler constructed with helical ascending and descending grooves or flues, arranged to extend around it, and made to communicate at or near their upper extremities, substantially as set forth.

Also, the cap B, as made with the central passage g, and one or more chambers e f, the same being arranged in it, substantially in the manner and for the purpose as specified.

Also, the combination of the cap B, or its equivalent, with the boiler formed with two or any other

greater number of helical flues arranged in it, substantially as described.

61,279.—JAMES R. TAYLOR, New York, N. Y.—*Boat Detaching Tackle.*—January 15, 1867.—The eyes of the davit fall blocks are engaged by pivoted hooks at the stem and stern respectively of the boat. The hooks are detained by links, which are simultaneously withdrawn by lever connection with a rotating shaft amidships.

Claim.—Combining with the central windlass or shaft C, and the hooks or bolts *i i'* at the ends of the boat, the rods, levers, and links *b b' d d' f f'* and *g g'* for connecting and detaching boats, substantially as herein described and represented.

61,280.—JAMES R. TAYLOR, New York, N. Y.—*Boat Detaching Tackle.*—January 15, 1867.—The ring-bolt which depends from the fall block is secured to the seat by a latch, which passes through its slotted shank. Anti-friction rollers in a boxing beneath the seat, and in the shank of the bolt, assist the operation of withdrawing the latch.

Claim.—In a boat connecting and detaching apparatus the combination of the slotted ring bolt key and friction rollers arranged to operate together, substantially as herein described and for the purpose set forth.

61,281.—JAMES R. TAYLOR, New York, N. Y.—*Boat Detaching Tackle.*—January 15, 1867.—The hook of the davit fall block engages the ring-bolt on the seat of the boat, and has an extended lever by which it is forcibly rotated to disengage itself from the said ring. A prong on the hook limits its motion in the other direction.

Claim.—In connection with the hook in the davit block, and the ring in the boat, the lever A, with its foot piece *c*, the whole constructed, arranged, and operating in connection therewith, substantially as described.

61,282.—E. S. TORREY, New York, N. Y.—*Elastic Tip for Legs of Furniture.*—January 15, 1867.—The elastic shoe is embraced by the flanges on the divided socket, whose shank enters the vertical axial hole in the leg of the piece of furniture.

Claim.—The combination of soft elastic tips and divided sockets, substantially as herein set forth, for connecting said elastic tips with furniture as above described.

61,283.—JAMES W. TRUMAN, Macon, Ga.—*Tobacco Pipe.*—January 15, 1867.—The flange of the metallic tube holds the conical rubber packing, which forms an extension of the stem, and enters the socket of the bowl.

Claim.—The combination of the flanged tube *b* and rubber packing A, with the pipe stem B, substantially as and for the purpose herein shown and described.

61,284.—PHILO B. TYLER and WILLIAM M. CHANDLER, Springfield, Mass., and L. F. STANDISH, Chicopee, Mass., assignors to REPEATING LIGHT COMPANY, Springfield, Mass.—*Apparatus for Lighting Lamps, Gas Burners, &c.*—January 15, 1867.—For the purpose of lighting without removal of the chimney or globe, a continuous or repeating match is fed by a wheel to the igniter device, which consists of a vibrating arm or roughened surface against which the match impinges.

Claim.—The tube and its appendages for holding and controlling a continuous or repeating match, substantially as herein described, in combination with the wick tube or equivalent gas burner and an igniter, substantially as described and for the purpose specified.

61,285.—SAMUEL S. UTTER, New York, N. Y.—*Cooking Stove.*—January 15, 1867.—Air passes in through holes in the rear plates, and by pipes to the lower part of the oven; traversing the latter it enters a chamber behind the fire box, and thence passes into the fire, being heated in its passage, and forming the medium of removing the fumes from the oven.

Claim.—The air channels *g g*, arranged within the smoke channel *l l*, and employed in connection with the main chamber *e* and additional chamber *d*, as and for the purpose specified.

61,286.—T. VARNEY and A. RIX, San Francisco, Cal.—*Quartz Crusher.*—January 15, 1867.—The reciprocating jaw of the quartz crusher is operated by a toggle connected to the crank of a revolving shaft, the outward pressure being received upon the binder.

Claim.—Combined use of the wrought iron binder K, the toggle bar M and jaws B and E, constructed and arranged substantially in the manner and for the purposes set forth.

61,287.—GEORGE WAGNER, Washington, D. C.—*Boot and Shoe.*—January 15, 1867.—The front two-thirds of one side and the entire opposite side are formed of one piece of leather, and the other third of a side of another piece, leaving an opening on one side, covered by a flap, so that there will be no seams at places where they can rub the foot.

Claim.—The combination of the piece *a b c*, and the piece C, leaving the opening on the side covered by flap D, in the manner described for the purpose specified.

61,288.—W. W. WAKEMAN, Jr., New York, N. Y., and R. ROSS, Brooklyn, N. Y.—*Paint Burner.*—January 15, 1867.—The flame is projected obliquely upward upon the paint through the opening, one side of which is bounded by the edge of the hinged cover.

Claim.—First, the within described apparatus adapted for projecting flame obliquely in a central stream upon painted surfaces, and allowing of being moved about and tilted, substantially as and for the purpose herein set forth.

Second, the cover K *k*, in combination with the disk, formed and provided as above represented, and adapted to receive sufficient quantities of air at the sides, and to expose only a small area of the upper surface of the vessel through which the jet of flame may issue, substantially as and for the purpose herein specified.

61,289.—EDWIN WANT, New Haven, Conn.—*Eye Glass.*—January 15, 1867.—Explained by the claims and illustration.

Claim.—First, attaching the handle D and the arm E, each to their respective bows, and the spring F to the two bows in position relatively to the said handle and arm, so that when closed the two points at which the spring is attached and the two glasses correspond in position, the one with the other, in the manner herein described.

Second, attaching the spring to the bows by means of the square shoulder described, and the nut *t*, substantially as and for the purpose specified.

Third, the handle D and catch pin *d*, when formed in one and the same piece, as and for the purpose specified.

61,290.—WILLIAM WEAVER, Phoenixville, Pa.—*Vegetable Cutter.*—January 15, 1867.—The pinion engages the outer circular rack of the hopper, and the roots or fruit contained therein are thrust by the spiral flanges against the edges of the knives, which are attached to the bed plate.

Claim.—The cylindrical revolving hopper B, its spiral vanes *m*, the plate A and rounded knives *n n*, in combination with the annular rack *d* and pinion *e*, the whole being arranged and operating as set forth.

61,291.—WILLIAM C. WELLS, Parkersburg, West Va.—*Still for Petroleum.*—January 15, 1867.—The fire sheets are secured to the bottom of the still by means of a frame, which may be permanent while the plates are detached, and new ones substituted and secured by internal riveting. The calorific current in the furnace has a reverting action, and passes in contact with the whole bottom of the still.

Claim.—First, the framework B for the bottom of the still and to receive the fire sheets or plate, substantially as described and for the purpose specified.

Second, in combination with the bottom framework B of the still, the return flues G of the furnace, corresponding with the fire sheets C, substantially as and for the purpose described.

61,292.—GEORGE A. WHITE, Boston, Mass.—*Paint and Varnish Brush.*—January 15, 1867.—The binder holds the bristles in place, while the new brush is being "broken in," and forms a continuation of the ferrule. A collar of pasteboard is wrapped

with a binding cord, and the latter secured by the fender wires.

Claim.—Combining with the ferrule *a* the fender wires *c* and binder cord *d*, substantially as described; also in combination with such binder and the paper cylinder *e*, or its equivalent, substantially as set forth.

61,293.—JAMES M. WHITING, Providence, R. I.—*Carriage Hub.*—January 15, 1867.—Tapering collars of rubber are interposed between the tubular portions of the bronzed central portion and the sleeves which form the axle box and caps.

Claim.—First, a carriage hub, made with its central part for receiving the spokes and elastic cylinders of bronze, combined with the conical sleeves of iron, forming in two pieces the axle box and nut for comprising the elastic cylinders, and the external covering for these, and forming the two ends of the hub.

Second, the conical-shaped elastic cylinders or packing.

Third, the ventilated air space between the axle box and the packing.

Fourth, the lips and slots for preventing the turning of the sleeve in screwing and unscrewing, with the holes giving access to the external air, all made and operating substantially as described or their mechanical equivalents.

61,294.—SILAS M. WHITNEY, Galesburg, Ill.—*Cultivator.*—January 15, 1867.—The standards are secured by eyebolts and sockets to the beams, and are braced by eyebolts to angle pieces, fastened to advance points on the beam. The plow is steered by a caster wheel at the rear.

Claim.—First, the securing of the standard *D* to the beam *A* through the medium of the sockets *B* and screw bolts *C*, provided with eyes *a*, all constructed and arranged substantially in the manner as and for the purpose set forth.

Second, the braces *E*, applied to the beam and standards, substantially in the manner as and for the purpose specified.

Third, the caster or gauge wheel *H*, applied substantially in the manner as and for the purpose set forth.

61,295.—D. WIGHT, New London, Conn.—*Coal Scuttle.*—January 15, 1867.—The discharge spout is at the side near the base, and has a cover which is temporarily held up by a catch while coal is being discharged.

Claim.—A coal hod or scuttle, provided with a discharge opening or spout at or near its lower or bottom plate, for the removal of the coal therefrom, substantially as described.

61,296.—J. T. WILSON, East Liberty, and T. J. LOUIS, Port Perry, Pa.—*Car Coupling.*—January 15, 1867.—The pin is temporarily supported on the hook of a pivoted and counter-weighted latch, and by the contact with the latter of the entering link, the pin is freed, and becomes automatically engaged with the link.

Claim.—In combination with the draw bolt *d*, and the flanged or beveled face plate *b*, the coupling lever *e*, when hung from the upper bar of the coupling frame, so as to leave a free space for the reception of an extra link *o* and allow the connecting link *c* to slide back into the coupling frame when necessary, the parts being constructed and arranged substantially as and for the purpose above described.

61,297.—JAMES F. WINCHELL, Springfield, Ohio, assignor to himself, GEORGE C. STEEL, and L. A. SIMONS.—*Alarm for Money Drawers.*—January 15, 1867.—A cleat on the lower rear portion of the drawer engages a latch, and rings the bell, when the drawer is opened or closed. A treadle withdraws the latch to avoid the noise. A spring wire locks the drawer, and is unlocked by the motion of the knob.

Claim.—First, the combination of the drawer *B*, lever *D* and sliding block *F*, and spring *n*, with the bell *G*, all arranged and operating substantially as described.

Second, in combination with the above-named parts, the treadle *E*, for the purpose of enabling the drawer to be closed without sounding the alarm, as set forth.

Third, the locking device, consisting of the knob *C* and spring *b*, arranged to operate as set forth.

61,298.—ROBERT WOLFF, New York, N. Y., assignor to himself and JOHN H. THIELING.—*Brick Machine.*—January 15, 1867.—The tempered clay from the pug mill is admitted into pockets of given capacity, which are then closed. Plungers in said pockets press the clay therein, and on withdrawal of the covers discharge the bricks, which are transferred to endless aprons and removed.

Claim.—First, in connection with the mud box *A* and grinding shaft *B b*, the molding pocket *D*, sliding cover *k*, throat slide *H*, plunger *E*, levers *G I*, and cams *P R S*, all constructed, arranged, and operating substantially as and for the purpose herein described.

Second, a duplication of the above, in connection with a single mud box *a* and grinding device *B b b*, substantially in the manner and for the purpose hereinbefore described.

61,299.—ALBERT A. WOOD, Manlius, N. Y.—*Water Wheel.*—January 15, 1867.—The lips project down between the guide boards of the scroll, and are parallel with the surfaces of the guide board. The sides of the chute are parallel, and deliver the water in an unbroken stream.

Claim.—The adjustable chute-board or lip *b*, extending down between the guide curves, and parallel therewith to conduct the water in an unbroken stream, and always in the same direction upon the wheel, substantially as and for the purpose set forth.

61,300.—ALONZO WOOD, East Henrietta, N. Y.—*Fastener for Shirt Collar.*—January 15, 1866.—Pivoted spring jaws clamp the ends of the collar, and present a stud to the rear for the neck band of the collar, and one to the front for the attachment of the neck-tie.

Claim.—First, the combination of the spring clamping device *a b*, with the stud *l*, operating as described and for the purpose set forth.

Second, in combination with the spring clamping device *a b*, and the holding stud *l*, the stud or catch *n*, as and for the purpose specified.

61,301.—A. A. YEATMAN and J. M. MASON, Washington, D. C.—*Coal Hod.*—January 15, 1867.—A lifting device in the front part of the scuttle allows the dust to fall through into a receptacle at the lower part of the hod.

Claim.—First, placing a sieve *B* of suitable construction with the mouth of a coal bucket, so that the lump of coal may be passed over said sieve, and the dust thereof fall through it, as herein specified.

Second, the combination of the bucket *A*, with chamber *C*, forming shoulder *X* at its top and sieve *B*, when constructed and used substantially as herein specified.

61,302.—EDMUND YEISER and J. S. SHERTZ, Sheridan, Pa.—*Horse Hay Fork.*—January 15, 1867; antedated January 5, 1867.—To the upper end of the sliding bar are pivoted two arms, one extending beyond the case and forming a hand lever, and the other having a projection over which is forced a spring catch, when the sliding bar is thrust down to force out the prongs, thus locking the prongs in elevating position. One of the prongs is made longer than the other, and has a shoulder, within which the other shuts to prevent the hay from clogging.

Claim.—First, the metallic body *A*, provided with a sliding bar *B*, lever *E*, catch *F*, and boot *D*, arranged and operating substantially as herein specified.

Second, the spears *a* and *a'*, connected as described, spear *a'* being slightly longer than spear *a*, spear *a* shutting within a shoulder on the end of spear *a'* to form a perfect joint, the whole arranged and operating as and for the purposes set forth.

61,303.—JAMES YOCUM, JR., Philadelphia, Pa.—*Molding Flask.*—January 15, 1867; antedated January 5, 1867.—By the combination described the core may be formed at the same time as the mold, and retained in its proper position within the latter, avoiding the making of separate cores and of special supports therefor.

Claim.—The detachable bars *G*, with their arms or enlargements *g*, in combination with a molding flask, the whole being constructed and operating substantially as and for the purpose described.

61,304.—HENRY AEUER, Muscatine, Iowa.—*Cabbage Cutter.*—January 22, 1867.—The knives are attached to a horizontally rotating disk, and their curved edges lap so as to make two knives cut on any radial line. The hinged legs of the table may fold beneath the bed.

Claim.—First, the manner substantially as herein described and shown of arranging a series of scroll knives on a rotary bed, and beneath a stationary hopper, so that two or more knives are made to cut at the same time, under the same hoppers, as shown.

Second, the arrangement with a cabbage center bed, such as described, of the frame A B, with box E, hinged legs G G, guard board F, and bracket extension, substantially as described, and for the purposes set forth.

61,305.—CHARLES AUSTIN, Concord, N. H.—*Melodeon.*—January 22, 1867.—A supplementary lever beneath is operated by the depression of the ordinary upper lever and opens the valve keys of additional reeds to add their volume of sound to that of the main reeds.

Claim.—The arrangement as well as the combination, substantially as above specified, of a lever E and one or more additional reeds *i i*, and the operative apparatus thereof, as explained, with the exhaust chamber D and a main reed key A or B thereof, the same being so that on pressing down the said key for the purpose of opening the main reed valve thereof, the lever E shall be moved so as to put in operation each additional reed operative apparatus, whereby its reed or reeds may be sounded simultaneously with the main reed.

61,306.—EDWIN C. AUSTIN, Monroe Village, Wis.—*Tool for Cutting Moldings.*—January 22, 1867.—Side flanges on the cutting tool rest upon the wood and act as pressers to prevent the tearing of the wood while being cut.

Claim.—First, the knives C constructed with the projections or bearings *c* pressing upon the surface of the wood in advance of the cutting edge, substantially as and for the purposes specified.

Second, the tool herein described for cutting rope or screw molding, constructed and operating substantially as described.

61,307.—J. BAILIE and J. GERVERS, Cincinnati, Ohio.—*Dough Mixer and Roller.*—January 22, 1867.—The dough is mixed in the chamber by the revolution of the spiral shaft and by it discharged through a spout to the rolls, which slab and then deliver it to the discharge apron.

Claim.—First, the combination of the rolls D D' with the worm or screw dough mixer A, in the manner and for the purpose set forth.

Second, the combination of the carrying band or belt I and slabbing rolls D D' with a worm or screw dough mixer, in the manner and for the purpose substantially as specified.

Third, the combination and arrangement of the spur and worm gear as shown for regulating the speed and giving a positive motion to the screw A, stabbing rolls D D', and carrying band I', for the purpose and in the manner substantially as described.

61,308.—A. BASSFORD, New York, N. Y.—*Billiard Cushion.*—January 22, 1867.—Explained by the claims and illustration.

Claim.—First, in a billiard cushion the use of metallic ribbon or other hard and elastic strip interposed between two pieces of vulcanized india-rubber of different degrees of elasticity, or within a rubber cushion, substantially as herein set forth.

Second, in billiard cushions constructed substantially as set forth, the arrangement herein described and represented, whereby one block of india-rubber is backed and supported by the other.

Third, the two blocks or strips of vulcanized rubber, of unequal degrees of elasticity as described, in combination with the spring steel ribbon and rubber packing, arranged substantially as and for the purposes herein set forth.

61,309.—JOHN F. BOYNTON, Syracuse, N. Y.—*Apparatus for Carburetting Gas and Air.*—January 22, 1867.—A tight box is placed at some point in the gas pipe between the gas holder and burner and con-

tains a series of tubes extending from the bottom to near the top, filled with fibrous material which conveys the hydro-carbon liquid by capillary attraction to the upper part of the box. Over the upper ends of the tubes is a flat disk which causes the gas or air to flow over the ends of the wicking in a thin stratum, and to become charged with hydro-carbon vapor.

Claim.—First, in a carburetting box or vessel a tube or tubes, whether flat, cylindrical, or of other form, filled with fibrous or capillary material, and so arranged with openings at the bottom that the carbonizing fluid will be constantly drawn by capillary action from the lower and heavier strata, and subjected to evaporation in the upper portion of the vessel, substantially as described.

Second, in a carburetting box or vessel constructed and operating as herein described, so arranging the capillary tubes that the gas in its passage through the vessel will move slowly in a thin stratum over the ends of the wicks containing the carbonizing fluid, substantially as described.

Third, dividing the carburetting vessel into two or more compartments, by soldering one of the plates forming each of the double partitions or wick tubes to the bottom and sides of the vessel, so that two or more different carbonizing fluids may be used in the same vessel, without mixing previous to evaporation.

61,310.—JOHN F. BRIDGET, Washington, D. C.—*Thill Coupling.*—January 22, 1867.—The set screw beneath the socket plate and elastic pad raises the thill iron against its pivotal pin and prevents rattling.

Claim.—The combination of the set screw G and socket plate H and spring K, operating to raise the end of the thill in its bearings, substantially as and for the purpose described.

61,311.—ERASMUS D. BROWN, Buffalo, N. Y.—*Basket Attachment for Pistons of Deep Well Pumps.*—January 22, 1867.—The basket attached above the piston is placed there to catch any rivet or other matter which may fall into the well and impede the motion or dog the piston fast in the barrel.

Claim.—The slotted flaring basket A, for the purposes and substantially as described.

61,312.—SAMUEL BROWN, New York, N. Y., assignor to the BROWN AND LEVEL LIFE SAVING TACKLE COMPANY, same place.—*Boat Detaching Tackle.*—January 22, 1867.—The ring of the davit fall block is engaged by a hook secured by a chain to a casting-off device. An eye on the hook is chained to the ring-bolt on the seat of the boat, and when the hook is cast off the chain acts as a detent, rotates the hook and disengages it from the fall block.

Claim.—A boat-connecting apparatus, composed of the ring *a*, hook *c*, and chain *b g*, and which is disconnected from the block by slacking the chain *g* in the boat to be launched, substantially in the manner and for the purpose described.

61,313.—D. JAY BROWNE, Cambridge, Mass., and STEUBEN T. BACON, Boston, Mass.—*Manufacture of Brandy.*—January 22, 1867; antedated January 14, 1867.—The spirit is obtained by the distillation of a mixture of sorghum brandy and fermented grape skins.

Claim.—First, the blending of brandy or spirits distilled from sorghum sirup, with brandy distilled from fermented grape juice, water, and sorghum sirup, or glucose, substantially as herein set forth.

Second, in the production of brandy from the combination of the above-named materials, the mode or fermenting in close casks or vats, furnished with tubes or coils within, for regulating the temperature of the liquids while fermenting, substantially as herein specified.

Third, in the production of brandy from the above-named ingredients, as necessary to secure success, the process of distilling in vacuo, substantially as and for the purposes herein described.

61,314.—DUNCAN BRUCE, Rossville, N. Y.—*Making Sugar.*—January 22, 1867; antedated January 17, 1867.—The crude juice is placed in a tank and thence run into a vacuum pan exhausted of air, communicating with a vacuum apparatus. After partial evaporation the juice is forced up into a vessel where it is filtered, and thence flows through two other ves-

sels where it is further filtered, and into a second pan where the evaporation is continued. A condenser communicates with the vacuum vessels.

Claim.—First, the combination of the vacuum chamber and condensing chamber, with one or more evaporating chambers, having steam or hot water heaters applied to them, substantially as described.

Second, the combination of one or more filtering air-tight vessels with one or more air-tight evaporators and a condensing chamber D, which communicates with a vacuum chamber E, substantially as described.

61,315.—DUNCAN BRUCE, Rossville, N. Y.—*Apparatus for Decomposing Animal and Vegetable Substances, for Curing Meat, Tanning, &c.*—January 22, 1867; antedated January 17, 1867.—The vacuum chamber has an air-exhausting and air-forcing device. The material to be treated is placed in a vessel in which it is heated and treated by exhausting the air or forcing in moist air. In extracting fats, juices, &c., they are drawn off through a series of filtering vessels. To cure meat the air is first exhausted, brine admitted from a tank and afterward drawn off, the meat dried and cured by means of air and smoke from suitable vessels. Tanning may be effected by a similar treatment of hides.

Claim.—First, an apparatus consisting of a series of air-tight vessels communicating with a condensing vessel, and also with a vacuum reservoir, having a forcing and exhausting engine applied to it, the whole to be used substantially as described in the treatment of vegetable and animal matters.

Second, curing meat by the means and in the manner substantially as herein described.

Third, the process, substantially as described, of obtaining grease from fatty substances, by subjecting these substances to the action of moist heat in a vacuum.

61,316.—S. JOHN CARROLL, Baltimore, Md.—*Preserving Green Corn.*—January 22, 1867.—The unhusked ears of green corn are covered with brine in casks or cans.

Claim.—Preserving green corn in the manner substantially as herein set forth and described.

Also, the new article of manufacture and commerce, green corn preserved substantially as herein set forth and described.

61,317.—Canceled.

61,318.—JOHN B. COLLEN, Philadelphia, Pa.—*Machine for Pressing Fuel into Blocks or Bricks.*—January 22, 1867.—Two hoppers are situated at opposite sides of the frame and communicate with two series of molds. The plungers are operated by a yoke and cams, and enter alternately the molds on each side, first pressing the peat into the molds, and then, by a further pressure, discharging the blocks when the gates are raised.

Claim.—A machine constructed, arranged, and operated substantially as herein described and represented, for the purpose of pressing artificial or natural fuel in a fine or granular state into blocks or bricks for transportation and for burning, as set forth.

61,319.—H. COMSTOCK, Seneca Falls, N. Y.—*Pump.*—January 22, 1867.—Applied within the usual leather-cup packing is a cup of rubber, which, by its elasticity, presses the leather closely to the sides of the barrel.

Claim.—First, the combination of the rubber cup or flange *f* with the leather packing *c*, operating substantially in the manner and for the purpose specified.

Second, the groove *g* in the bottom of the cylinder in combination with the valve yoke *C*, operating substantially as and for the purpose set forth.

61,320.—JOHN G. COOK, Lewiston, Me.—*Dentifrice.*—January 22, 1867.—Composed of chlorate potassa, 7 lbs; prepared chalk, 28 lbs; powdered myrrh, 14 oz; Peruvian bark, 28 oz; sugar, 14 lbs; oil of wintergreen, 8 oz, incorporated, pulverized, and screened.

Claim.—As a dentifrice, a chlorate compound, made up of ingredients substantially as described.

61,321.—L. M. CRANE, Ballston, N. Y.—*Safety Paper.*—January 22, 1867.—Explained by the claims.

Claim.—The inserting or incorporating of one or more threads or strips of gutta percha, or a material possessing like properties, into the pulp or fiber of paper during the manufacture of the same, and in such a manner that said threads or strips will be softened and firmly united to the fiber under the heat of the drying cylinders, substantially as set forth.

Also, as an improved article of manufacture, a safety record paper, made substantially as herein shown and described.

61,322.—W. and F. W. CRIGHTON, Manchester, England.—*Machine for Preparing Cotton, &c.*—January 22, 1867.—Patented in England April 3, 1861.—The spiral beaters are attached to disks upon the upright shaft, which revolves in a case of a conical frustal form. The cotton is introduced into the lower part or bottom of the machine, and is carried out at or near the top; the dirt is either left in the dust box or thrown out between the bars of the grid.

Claim.—First, the arrangement hereinbefore described, consisting of placing the beaters or openers on a vertical axis, and forming the place or opening for the delivery of the cotton at the top of said case, or at a point higher than that at which the cotton is fed into the machine, said machine being also constructed and its parts so arranged that a considerable portion of the dirt will be delivered either at the bottom of the beater case or cone, or through openings at a lower point than that at which the prepared cotton is delivered, substantially as hereinbefore set forth.

Second, the combination with a beater case and beaters, or other similar apparatus for cleaning cotton, of the carrier or series of dirt boxes *d*, substantially as hereinabove set forth.

61,323.—FELIX A. DE BEAUREGARD, Paris, France.—*Blast for Iron and other Furnaces.*—January 22, 1867.—A furnace blast is produced by injecting a current of steam into the pipes leading from the upper part of the furnace. The steam, in passing out of the said pipes, exhausts the air from the furnace, and its place is supplied by fresh air which enters apertures at the lower part. The steam is generated in a boiler surrounding the furnace.

Claim.—Surrounding the furnace by a tank, the water within which is converted into steam by the heat of said furnace and then discharged through suitable pipes or conduits, arranged substantially as herein described, so that the discharge of the said steam shall induce a blast within and through the furnace, as set forth.

61,324.—JULES DELERY, St. Bernard parish, La.—*Steam Generator.*—January 22, 1867.—A valve is placed in the stand or water-supply pipe upon which the boiler rests, and a rod is passed therefrom up through the generator and connected with a lever, a screw-threaded rod and a band wheel, so that by turning the latter the valve can be raised to any required height from its seat to give the attendant the means of controlling the flow of water into any one of the series of generators when a series are used.

Claim.—The isolating check valve *b*, connecting rods *E* and *E*, and lever *J*, in combination with the generator and water-communication pipe, substantially in the manner shown and described.

61,325.—A. J. B. DE MORAT, Philadelphia, Pa.—*Telegraphic Cable.*—January 22, 1867.—The cable is constructed with one or more unbroken continuous tubes or cylinders, made by helically-wound metallic strips insulated internally and externally; the object being to permit stretching without impairing their conductive power.

Claim.—The construction of telegraphic cable by means of insulated tubes or continuous cylinder or cylinders, formed of helically-wound strips in such manner as to preserve uninterrupted linear conduction in case of stretching, as herein set forth, or any other substantially the same, and which will produce these intended effects.

61,326.—GEORGE W. DOOLITTLE, Lincoln, Ill.—*Wheat Drill.*—January 22, 1867.—The series of V-shaped wheels are attached to a hinged frame to

follow in line with the seed sown to force the seed below the surface of the soil, leaving the drills open to be filled with earth or snow for the protection of the plants.

Claim.—First, the jointed frame A C, to which the compressing wheels D E are attached, in combination with the funnels L L, depositing tubes K, angular bars I I, cutter blades H H, substantially as arranged for the purposes herein set forth.

Second, the arrangement of the standard P, lever *m*, easter *n*, for controlling the depth of the drills K or lifting them out of the earth, in combination with the drills or delivery tubes and the mechanism for regulating the quantity of seed, substantially as herein described for the purposes specified.

61,327.—GEORGE H. DOW, Freeport, Ill.—*Washing Machine.*—January 22, 1867.—The rubber is shod with rollers and reciprocates upon a concave bed of rollers. The rubber is attached by toggle arms to the box, and has an end board which acts against a concave at the end of the box.

Claim.—The arms E E', roller upper board C', and pressure board F, in combination with the concave washboard H, lower roller board C, and springs D, arranged as and for the purpose set forth.

61,328.—MAHLON S. DRAKE, Newark, N. J.—*Barrel Bung.*—January 22, 1867.—The bung is made of metal in two portions, and after insertion in the bunghole is expanded by means of a right-and-left screw, which draws the portions together. Elastic rubber is placed between the two portions.

Claim.—As a new article of manufacture, a bung for barrels, casks, or cases, constructed substantially as specified.

61,329.—JOSEPH O. FARRELL, Chicago, Ill.—*Tail-board for Wagons.*—January 22, 1867.—Explained by the claim and illustration.

Claim.—Providing the tail-boards with a double latch, constructed substantially as described, that is to say, consisting of a rod and two rack bars rigidly connected and vibrating in journals in or on the tail-board under the impulse of the hand, or of the spring, so that they shall traverse the openings in the braces I as the tail-board is moved, and when abandoned to the influence of the spring shall afford support to the tail-board by the engagement of the notches, substantially as described.

61,330.—JOHN H. FITZSIMMONS, Sasquehanna Depot, Pa.—*Safety Valve.*—January 22, 1867.—The two puppet valves are placed upon one stem and operate in separate chests; the conducting pipes convey the steam from the lower valve chamber to the upper one. The steam presses upward upon the lower valve, which is of larger area than the upper one, upon which the steam exerts a downward pressure. The difference is compensated for by weights placed upon the valve stem.

Claim.—The combined valves F and E, with valve seats A and C, the steam pipes G G, together with the releasing screw X, as herein described and for the purpose set forth.

61,331.—F. G. and E. A. FLOYD, Macomb, Ill.—*Cherry Stoner.*—January 22, 1867.—The cherries fall from the hopper and are thence pushed in a gang by a plunger provided with a series of faces separated by plates and acting upon the cherries individually. Each stone is detained by a cruciform plate, whose single post traverses a slot in the annular face of the plunger, which expels the fleshy portion.

Claim.—First, the knife or stone retainer *o*, when constructed in the manner shown, and supported on the single arm to permit it to operate in connection with the reciprocating bar *c*, substantially as herein set forth.

Second, the reciprocating bar *c*, having the plates *n* attached and provided with the holes *e*, when used in combination with the knives *o*, substantially as shown and described.

Third, the hopper B, reciprocating bar *c*, knives *o*, and bed piece *e*, all arranged and operating as described.

61,332.—E. G. FORD and H. WEBLE, Delphos, Ohio, assignors to E. G. and J. G. FORD.—*Clamp for*

raising Timber Frames.—January 22, 1867.—The adjustable, jointed metallic clamp is to be attached to the post and the timber on which it rests, and thus hold the foot of the post while being raised.

Claim.—The hinged bars C D, constructed and arranged to operate substantially as and for the purpose set forth.

61,333.—DAVID FROST, Dupage, Ill.—*Shaker Attachment for Threshing Machines.*—January 22, 1867.—By the adjustment described the length of the arms of the shaker is regulated. The shaker arms are arranged in pairs and vibrate between the upper and lower portions of the endless belt to produce a vertical vibration, which shakes the grain out of the straw.

Claim.—The application of the slotted lapping plates, confined together by a thumb screw, to the pitman and vibrating knockers or shakers of a straw-carrier belt, all in the manner and for the purpose described.

61,334.—W. J. GORDON, Philadelphia, Pa.—*Machine for Riveting Buttons to Fabrics.*—January 22, 1867.—The plunger is pointed, rotates as it descends and spreads the end of the rivet. A sleeve on the plunger fits the hollow in the face of the button, and the flanged head of the rivet is bent over toward the fabric, which is thereby clamped against the convexity of the button.

Claim.—First, the lever H, in combination with the spindle D, having a pointed projection *i*, when the lever is provided with a beveled eccentric projection *w*, or its equivalent, and when the spindle is so constructed and arranged, in respect to the lever, that on operating the latter the spindle will turn around as it descends, for the purpose specified.

Second, the combination of the above with the sleeve E, having a projection adapted to the cavity in the button, and with the springs *h* and *n*, the whole being arranged for joint action, as and for the purpose described.

Third, the concavity so formed in the base A, in respect to the head of the rivet, and to the devices for spreading the latter, that on forcing the rivet into the said concavity, the edges of the said head will be turned up, as and for the purpose described.

61,335.—ELLEN M. GRISWOLD, Hagerstown, Md.—*Support for Window Sash.*—January 22, 1867.—A slot made of hinged sections occupies the space between the beading and supports the sash. To support the window partly open one or more of the sections is bent over and the sash is thereby provided with a shorter support.

Claim.—The application to window frames of a sash support composed of the adjustable pieces C C' C'', connected by hinges, substantially as and for the purpose set forth.

61,336.—INCREASE S. HILL, Boston, Mass., and ANDREW BURNHAM, Chelsea, Mass., assignors to LOUIS OSBORNE, Boston, Mass.—*Apparatus for Detaching Boats.*—January 22, 1867.—Curved rods pass round inside of the gunwale of the boat and engage the links on the ends of the fall ropes, locking them to staples at the stem and stern. The rods are connected to a shifter amidships to cast the fall ropes loose simultaneously.

Claim.—First, the arrangement of curved disengaging rods in guides along by the gunwale of a boat, substantially as herein described, when the same are connected with a pivoted lever through the operation of which the disengaging rods are simultaneously retracted, liberating the links by which the boat is suspended.

Second, a graduating coupling in the disengaging rods by means of which the lengths thereof may be so adjusted as to secure simultaneous disengagement of the suspending links, as and for the purpose described.

61,337.—WM. A. HOPKINS, New York, N. Y.—*Can for Paint, &c.*—January 22, 1867.—The can has ears soldered to it which serve as sockets for the handle and as hooks under which the edges of the clamps engage and secure the top to the can.

Claim.—The combination of the can, cover, ears and clamps when the same are combined, constructed,

and operated substantially as shown for the purpose specified.

61,338.—JOSEPH E. HOVER, Philadelphia, Pa.—*Writing Paper.*—January 22, 1867.—The surface of writing paper is coated with pulverized chalk, magnesia, or other substances to neutralize the acid in ink; the chalk may be mixed with a solution of alum before applying it to the paper.

Claim.—Writing paper, the surface of which is coated with chalk or other material which will neutralize the acids in writing inks or fluids.

61,339.—WM. HUSTON, Wilmington, Del., assignor to himself and H. N. WICKERSHAM, same place.—*Apparatus for Obtaining and Applying Motive Power.*—January 22, 1867; antedated January 19, 1867.—The eccentric disks are each connected to a shaft, and each has a recess in which fits a portion of a block or piston, so arranged that steam or other fluid admitted into the said recesses shall so act upon the piston as to impart a continuous rotary motion to the disks and their shafts.

Claim.—First, the combination of the disk F and its chamber X, and the disk F' and its chamber X' with the piston G, the whole being arranged for joint action, substantially as and for the purpose herein set forth.

Second, in combination with the above, the heads B and B', with their recesses and openings arranged substantially as described.

Third, the combination of said disks, piston, and heads, with a casing A.

61,340.—JOEL C. JACKSON, Rochester, N. Y.—*Wrench.*—January 22, 1867; antedated January 17, 1867.—The stop lever and pawl are formed of one piece of metal, and the wrench barrel has ratchet teeth cut in the bottom of a peripheral recess.

Claim.—The peripheral recesses or groove *o*, in the wrench barrel *c*, formed with ratchet teeth in its bottom surface, in combination with the stop lever pawl *d*, within the stock *b*, as and for the purposes set forth.

61,341.—A. F. JOHNSON, Boston, Mass., and M. P. GRIFFIN, Medford, Mass.—*File-Cutting Machine.*—January 22, 1867.—The chisel and the adjuster are arranged face to face in a stock which may be rotated in a horizontal plane, and the stock is enclosed in a head swiveled to the end of the helve so as to be rotated in a vertical plane.

Claim.—First, the combination of a swiveling head with a rotary stock, substantially as described.

Second, the combination of a chisel and adjuster with a rotary stock, in the manner substantially as described.

Third, placing the chisel and adjuster together in the same stock, when constructed and arranged as described.

Fourth, the lever Q, in combination with the tool stock.

Fifth, the adjustable screw jaws T U, in combination with the ratchet *f*, the screw S, and bed B.

Sixth, inserting rubber blocks at the ends and between the bows of the elliptic springs I P, in a file-cutting machine, constructed substantially as described.

61,342.—DAVID JUNE, Fremont, Ohio.—*Cast-iron Chimney.*—January 22, 1867.—The sections of the cast-iron chimney are coupled together, have enlargements above the throats of the grates, and holes at intervals for the reception of stove pipes or ventilators at the successive stories.

Claim.—The section B in two parts C C', with cavities E E, in combination with section B' in two parts, constructed and arranged together as and for the purpose herein described.

61,343.—C. H. KNOX, Mount Pleasant, Iowa.—*Washing Machine.*—January 22, 1867.—By the mode of clamping the gearing together the warping of the lid, when hot and cold water are used alternately, is prevented from affecting the engagement of the gears by which the rubber is rotated.

Claim.—The bolt R, in combination with the clamp T, friction roller L, plates K and F, as set forth.

61,344.—JESSE S. LAKE, Smith's Landing, N. J.—*Self Track-laying Car.*—January 22, 1867.—The team is hitched to the runners, which traverse on wheels having their bearings in transverse sleepers which are attached to an endless band, by which they are consecutively taken up at the rear and laid down in advance of the runners. In turning the unequal draft on the two sides lays the sleepers a little obliquely with the course of the car, and thereby deflects its direction of motion.

Claim.—First, the combination with a truck, car or vehicle of the within-described revolving track consisting of an endless series of trucks or floats I P Q L, connected together by flexible chains, cords or straps K, and operating in the manner and for the purpose specified.

Second, the combination with the runners or ways H H, cylinder G, and crutch M, of the flanges B B' B', the latter B' being hinged or pivoted to admit of lateral adjustment in order to vary the course of the car or vehicle, substantially as described.

61,345.—M. C. LEONARD, Washington, D. C.—*Cartridge Box.*—January 22, 1867.—The wool lining forms a cushion for the metallic fulminate cartridges, and prevents their explosion when subjected to shaking or to blows upon the box.

Claim.—A cartridge box lined with sheepskin or other equivalent material, and for the purpose set forth.

61,346.—T. J. MARINUS, Independence, Iowa.—*Window Shade Supporter.*—January 22, 1867.—The tape is fastened at each end to the window casing, in front and rear of the shade, which rests in the bight of the tape. A fold of the tape is passed through a lever clamp, and by pulling the tape through the latter the shade is raised.

Claim.—In a window shade, the combination of the clamps composed of the lever H, the hollow frame F, and spring I, with the cord for raising the shade, all constructed in the manner and for the purpose herein set forth.

61,347.—CARLISLE MASON, Chicago, Ill.—*Quartz Crusher.*—January 22, 1867.—Two conical, fluted or corrugated crushing rollers run together to crush the stone; the frame is supported by means of tension rods and spring beams.

Claim.—First, the conical crushing disks *m*, having their faces corrugated, substantially as shown, and arranged to operate in connection with each other as set forth.

Second, The tension frame, consisting of the rods *x* and the keys or wedges *a*, arranged to operate in connection with the crushing disks *m*, as shown and described.

Third, in combination with the tension frame as above described, the spring beams *v*, and the set screws *e*, arranged and operating as and for the purpose set forth.

61,348.—JAMES E. MCBETH, New Orleans, La., assignor to himself and J. W. CHAMBERLAIN.—*Eung for Beer Barrels.*—January 22, 1867.—The rubber ring is clamped between the flanges of the socket and caps, and embraces the stem of the faucet.

Claim.—First, the rubber ring D, substantially in the manner and for the purposes described.

Second, the combination of the parts B and C, substantially in the manner and for the purposes described.

Third, the combination of the parts B C and D, substantially in the manner and for the purposes described.

61,349.—HERRMANN MENDEL, Philadelphia, Pa.—*Instrument for Guiding Tailors in Cutting out Coats and Vests.*—January 22, 1867.—The device is shown in the illustration. Its application cannot be briefly described. The parts slip upon each other to assume the required form and proportions.

Claim.—A plate A and adjustable strip E, in combination with an adjustable plate B, adjustable strip C, and strip D, or its equivalent, the whole being constructed, graduated, and arranged substantially as and for the purpose described.

61,350.—ISAAC L. MILES, Charlestown, Mass.—*Printing on Glass.*—January 22, 1867.—The ways are

covered with material which prevents the slipping of the glass, and they correspond in position and form with the rounded surface of the type from which the impression is taken.

Claim.—Transferring an impression from a form of elastic type, having a rounded or curved surface, to a flat plate or sheet of glass, by rolling the latter over and in contact with ways arranged adjacent to and having a curvature corresponding with that of the face of the form of type, as described.

61,351.—D. P. NICKERSON, Cleveland, Ohio.—*Center Board and Box for Vessels.*—January 22, 1867.—The parallel plates of the center board are strengthened by intervening brace plates and edge stays, and it is pivoted in a box planted in the keel and braced by exterior angle irons and stay plates.

Claim.—First, the arrangement of a metallic center board constructed with the two sides G G', the braces I, and stay bolts H, in combination with the metallic box B, for the purpose and in the manner set forth.

Second, the portable metallic center board box constructed with braces C, and angle irons D, as and for the purpose set forth.

61,352.—GEORGE PALMER, Littlestown, Pa.—*Washing Machine.*—January 22, 1867.—The clothes are placed in company with loose balls in a revolving cylinder whose periphery is formed of rollers, and which is rotated in the suds box by gearing and hand cranks.

Claim.—The washing cylinder D D, as constructed with the revolving bars or rollers F F, into which cylinder the clothes are placed and secured to be washed with the balls I I I, constructed as shown and described, the washing apparatus being arranged and combined with the gear wheels *d* and *e*, and the crank handle E, operating substantially in the manner herein described for the purposes specified.

61,353.—GEORGE PALMER, Littlestown, Pa.—*Clothes Wringer.*—January 22, 1867.—The ribs of metal on the wooden core prevent the torsion of the elastic covering. The pressure on the upper roller is derived from a pad beneath a lever, whose detent is a rack on the frame of the wringer.

Claim.—First, placing ribs of metal longitudinally in hard wood rollers for clothes wringer, when covered with elastic substances, substantially as herein set forth.

Second, in combination with clothes wringer rollers as described, the pressure lever Q, ball V, or other equivalent spring and rock bar Y, operating as and for the purposes herein specified.

61,354.—HENRY PAYNE, Sr., Mount Vernon, Ohio.—*Device for Preventing Collision of Locomotives.*—January 22, 1867.—One or more tubes are placed under the cylindrical portion of the boiler of a locomotive and are connected therewith by a steam pipe, so as to propel forward the piston rods, to whose outer ends are attached a cross bar which acts as a buffer against the opposing engine.

Claim.—The affixing to locomotive boilers one or more tubes in such manner as herein described, as that by letting steam into them from the boiler, a shaft will be driven or forced forward from each tube to meet any opposing object, and thus prevent collision of the locomotive with the object opposing, or much diminish its force.

61,355.—JOHN L. PEAKE, New York, N. Y., assignor to himself and LOUIS GUILLANDEU, same place.—*Wrench.*—January 22, 1867; antedated January 6, 1867.—The face of one jaw has a graduated recess whose projecting points bite against the pipe in concert with the tooth on a movable jaw, which is actuated by the engagement of the rack on its back with the segment rack on the end of the lever.

Claim.—The recessed face *a*, on the jaw A, in combination with the tooth *b* on the jaw B, adapted to traverse backward and forward by means of the rack N, segment M, and lever C, all arranged for joint operation, so as to act on cylindrical bodies or pipes of different diameters all in lines at uniform distances from their centers, substantially as herein set forth.

61,356.—JOHN PFEIFER, Philadelphia, Pa.—*Coal Shuttle.*—January 22, 1867.—A concavo-convex bead is run around the lower edge of the hod, lapping closely against a similar surface on the stamped-up base.

Claim.—Producing a close joint between the body A and the bottom B of the said coal hod, by means of the concavo-convex bead *a' b'*, substantially as and for the purpose described.

61,357.—J. C. POLAND, Jr., Auburn, Me., and B. R. COTTON, Lewiston, Me.—*Shuttle Binder for Looms.*—January 22, 1867.—Explained by the claims and illustration.

Claim.—A shuttle binder made as a lever, pivoted at or near its center when arranged with adjusting screws *d d'*, by which the angle of the binder can be changed, and the binder can be fixed in position, substantially as described.

Also, in the arrangement claimed above, mounting the pivot of the binder on a screw, by which the distance of the whole binder is adjusted with reference to the opposite side of the shuttle box.

61,358.—M. M. PREBLE, Kokomo, Ind.—*Fly Trap.*—January 22, 1867.—The flies enter a tube at the dark end of the box, and approaching the light end, pass to the box above. They are killed by a slide piece containing a cup of burning sulphur which is introduced beneath the upper box.

Claim.—The combination of the boxes A and E, and slides G and F, the said parts being constructed and arranged substantially in the manner and for the purpose set forth.

61,359.—DE WITT S. RAWSON, Peru, Ill.—*Stereoscope.*—January 22, 1867.—The box in which the stereoscopic views are packed is so arranged that one side opens out into a bracketed shelf for holding a number of views in position for being viewed successively; the hinged cover with the lenses attached beneath is vibrated into a position vertical to the plane of the pictures and the lenses focally adjusted.

Claim.—The picture box H, the swinging front D, and shelves or brackets E E, substantially as herein described.

61,360.—JOHN E. ROBINSON, Boston, Mass.—*Ice Cream Freezer.*—January 22, 1867.—Several cans are revolved simultaneously from one shaft and gearing placed underneath. Connected with each can is a stationary scraper around which the can revolves. Each can is separately removable from the screw shaft inserted at the bottom.

Claim.—In combination with a freezing vessel *a*, the arrangement of a series of cream cylinders *b*, to be simultaneously rotated within the same, when each cylinder is so mounted as to be capable of disconnection from the driving mechanism and removed from the freezing vessel without disturbing the other cream cylinders, substantially as set forth.

Also, in combination with such an arrangement and method of operation of the cylinders, the stationary scrapers held in place during the rotation of the cylinders, substantially as described.

Also, mounting each cylinder on a screw shaft, and so as to be removable therefrom, substantially as and for the purpose described.

61,361.—E. A. G. ROULSTONE, Roxbury, Mass.—*Trunk Lock.*—January 22, 1867.—The hasp swings on its pin in the plane of the locking mechanism, and is pressed into locking position, displacing the tumbler in the case, whose spur then engages and retains it. When the catch is withdrawn by the key the spring opens the hasp. A shoulder on the hasp catches beneath a flange on the case to relieve the working mechanism when strain is applied to open the lid.

Claim.—The combination of the spring bolt *l*, and tumblers *e*, or locking mechanism when constructed and arranged to lock and unlock, substantially as set forth.

Also, combining with the projection *o* of the bolt, the flange *r* with its pin *p*, for receiving the strain of the bolt, substantially as described.

61,362.—ABRAM ROWE, Macomb, Ill., assignor to himself, LORENZO F. WHITMAN, and REASON A. BOWIE.—*Portable Water Power.*—January 22, 1867.—

Arranged in a suitable case at the bottom of a boat is a spiral current wheel provided with guide channel and gates, and adapted for driving machinery when the boat is at anchor.

Claim.—First, a portable hydraulic motor for operating machinery, consisting of the propeller or screw wheel B, enclosed in a case E, and located in the central bottom portion of a boat A, as herein shown and described.

Second, in combination with the wheel E, arranged as shown, the sluice C in the front end of the boat having its sides converging as represented.

61,363.—JESSE RUSSELL, Bath, Me.—*Abrasive Powder.*—January 22, 1867.—Composed of the graded products of pulverized manganesian garnets and native iron, with the addition of quartz, black mica and actinolite. The peculiar efficiency arises from the persistent angularity of the particles of the garnets, however much reduced.

Claim.—Abrasive powders, made by reducing and grading the material above described.

61,364.—GEORGE E. SELLERS, Sellers' Landing, Ill.—*Utilizing Waste Extracts of Fibrous Plants.*—January 22, 1867.—The waste solutions obtained in the manufacture of paper by treating wood, straw, &c., with boiling water, are evaporated until said solutions attain a sirupy consistency. The extract thus obtained is used to prevent incrustation in steam boilers.

Claim.—First, the vegetable extract of fibrous plants, when obtained in the process of preparing fiber for paper stock, in the manner and for the purpose substantially as described.

Second, the utilization of the vegetable extract of cane (*arundinaria macrosperma*) and other fibrous plants, when obtained from them in the process of preparing their fiber for paper stock without other chemical agencies than water or heat, as a new article of commerce.

61,365.—CHARLES J. SHEPARD, Brooklyn, N. Y.—*Base Burning Stove.*—January 22, 1867.—A chamber filled with non-combustible material intervenes between the fire chamber and the coal reservoir to moderate the heat of the latter. The air passes through this chamber to the fire in company with the results of the water admitted into the chamber from the reservoir above. The position of the door increases its value as a radiating surface.

Claim.—First, the use or employment of the chamber B, constructed and operating substantially as described, for the purpose set forth.

Second, in a stove with the upper or reservoir chamber constructed substantially as shown, a door placed in position relatively to the grate as shown for the purposes herein fully indicated.

Third, the use or employment of water, substantially as shown, for the purposes set forth.

61,366.—JOSEPH NOTTINGHAM SMITH, Jersey City, N. J.—*Hydrant.*—January 22, 1867.—As the discharge tube is depressed, the water between the cups rises toward the outlet, and a further depression sinks the valve and allows the flow from the main through the filter toward the outlet. Raising the tube allows the pressure of the water to close the valve against the seat, which is an inverted cup sustained by an axial bolt from beneath.

Claim.—The tubular flanged valve F, operating substantially as herein specified.

Also, the inverted cup-shaped valve seat D, in combination with the valve F, substantially as herein described.

Also, the filter Ly, arranged in the hydrant as herein set forth.

Also, the combination of the filter tube L, with the valve F, substantially as and for the purpose herein set forth.

Also, the flexible packing Q, in combination with the cups P and T, substantially in the manner and for the purpose herein specified.

61,367.—F. U. STOKES, Cincinnati, Ohio.—*Window Screen for Railroad Cars.*—January 22, 1867; antedated January 6, 1867. Either the glass or the gauze portion of the sash is exposed to the window opening to suit the comfort of the passengers.

Claim.—A sash frame for a railway car window, constructed in such a manner that the upper half may be set with glass, and the lower with wire gauze or analogous material, the whole being combined together in the manner and for the purpose herein set forth.

61,368.—JOSEPH WILSON SWAN, Newcastle-upon-Tyne, England.—*Printing Photographs.*—January 22, 1867.—This refers to carbon printing, in which carbon is fixed by the action of light transmitted by a photographic negative, and received on a surface of gelatine colored with carbon, and made sensitive. The protected portions of the colored and gelatinous surface are afterward washed away by water, leaving the parts made insoluble by the light to form a print. This invention provides a tissue of colored gelatinous matter which allows access of light, and subsequently of water, to remove non-affected portions of the colored matter from the back, as well as the front surface. Further manipulations are cited in the claims.

Claim.—First, the preparation and use of colored gelatinous tissues, substantially in the manner and for the purpose set forth.

Second, the mounting of undeveloped prints, obtained by the use of colored gelatinous tissues, in the manner and for the purpose set forth.

Third, the retransfer of developed prints, produced as above described, from a temporary to a permanent basis.

61,369.—J. P. TIRRELL, North Bridgewater, Mass.—*Manufacture of Shoe Lacings.*—January 22, 1867.—The strip is rounded by being drawn between reciprocating friction surfaces, which intermit and open the traction devices, returning to repeat the action upon another strip.

Claim.—Combining with friction surfaces having a relative reciprocation a co-operating mechanism which shall draw or feed the strip between these surfaces, substantially as and for the purpose set forth.

Also, in combination with such an arrangement or organization, mechanism for releasing the strip from the nippers, mechanism for separating the abrading surfaces, and mechanism for returning the parts to normal position, substantially as set forth.

61,370.—THOMAS WELCH, Churchville, N. Y.—*Hanger Box for Crank Shafts.*—January 22, 1867.—The shaft revolves within boxes which have a capacity for rocking when the line of the shaft varies. The bearing edge at the back of one of the boxes is capable of adjustment by wedge and set-screw toward the shaft, to compensate for wear. The cap forms one side of the casing enclosing the boxes.

Claim.—First, providing the hanger journal of the crank shaft, or other journals of harvesters, with self-adjusting or self-lining bearings, or boxes, substantially as and for the purposes shown and described.

Second, the application of the wedge E with or without a set-screw, when used in combination with the box in which the journal revolves, for the purpose of compensating for the slack that might otherwise occur by the wearing away of the parts.

Third, the set-screw S, in combination with the self-adjusting or self-lining boxes of harvesters, substantially as and for the purposes set forth.

Fourth, in combination with the self-lining or adjusting boxes and journals, the oil reservoir, substantially as shown and for the purposes described.

Fifth, in combination with a set-screw and self-lining or self-adjusting boxes in harvesters, the cap I, or its equivalent, for the purposes described.

61,371.—NORMAN J. WELLS, Huntington, Mass.—*Purifying and Cleansing Sizing for Paper, &c.*—January 22, 1867.—The animal scraps are bleached by means of nitric, sulphuric, or hydrochloric acid, and chloride of lime, after which they are boiled with water to extract the gelatine, alum being added during the process. The rising impurities are skimmed off and the mixture allowed to simmer for a few hours, and subsequently strained through alum.

Claim.—The use of alum, or other equivalent mentioned, in the process of preparing sizing, when used and applied in the manner substantially as herein described and for the purpose set forth.

61,372.—AMOS WESTCOTT, Syracuse, N. Y.—*Cheese Vat.*—January 22, 1867.—The leg is pivoted to a flanged lug on the end of the box, and is made adjustable so as to give any inclination to the bottom of the box, or to level it.

Claim.—The method above described of constructing, attaching, and rendering adjustable the leg D, substantially as and for the purposes set forth.

61,373.—WILLIAM D. WHITMORE, Boston, Mass.—*Piston for Steam Engines.*—January 22, 1867.—A case is attached to the flange plate of the piston head, and is held in position by screws, but is so arranged that it may be removed from the cylinder without removing the piston and its rod. The sectional packing rings, with the springs which keep them in contact with the cylinder, are located within said case, and are easily assembled after removal for repairs.

Claim.—The improved ring section and wedge piston as made, not only with its ring sections and their wedges wholly within and supported by a case C separate from and to be attached to the cap B by screws, but as having the cap B applied to the piston rod A, the whole being substantially as and for the purpose hereinbefore set forth.

61,374.—NEWIEL J. WILLIS, Waltham, Mass., assignor to himself and AMMI BROWN, Boston, Mass.—*Bed Bottom.*—January 22, 1867.—The slat is stiffened by a wire which lies closely against its under surface, and has coil springs at each end which are attached to the slat.

Claim.—The improved construction of the slat lifter B, and arrangement of it and its springs relatively to the slat A, the whole being as described, the part c of such lifter under such arrangement being made throughout its length to bear against the underside of the slat and the springs to extend wholly below the part c and the slat, as explained.

61,375.—JOHN P. ZELLER, Bourbon, Ind.—*Seed Drill and Cultivator combined.*—January 22, 1867.—The machine is adapted to be used as a planter, seeder, or cultivator. The respective wheels have projections to operate the seed slides. The occasional cogs on the rear wheel are for the intermittent motion of the planter slides, and the more numerous cogs on the off wheel are for the rapid reciprocation of the seeder slides. The gang of cultivator teeth is attached when required.

Claim.—First, the frame A, constructed as described, with the hinges d, loop g g, studs h h, loops f f, studs 5 5, and tongue D, in the manner and for the purposes herein fully set forth.

Second, the wheels B and B', with corrugations upon their inner faces and connected to the frame by the short axle cog bars P and metal slides, in the manner and for the purposes specified.

Third, the arrangement of the shaft C with cog segments O O, which mesh into the cog bars P P, and used for elevating or depressing the frame A, in the manner as set forth.

Fourth, the drag L, with shoe M, and roller, constructed as set forth, and used with the frame A, as specified.

Fifth, the arrangement of the detachable drilling device G, constructed as specified, and used in combination with the frame as specified.

Sixth, the corn cultivator attachment H, when used with the frame A, as set forth.

61,376.—ANTON ZSCHILLE GROSSENHAHN, Saxony, assignor to L. T. DOWNES.—*Machine for Raising the Nap upon Cloth.*—January 22, 1867.—This cross-gig machine is designated to be used independently or in connection with an ordinary or suitable finishing gig. The figure shows it in connection with a double cylinder gig, and in connection with the claims sufficiently indicates the novel features.

Claim.—First, A gig or machine for raising the nap upon cloth, composed of the following elements: 1. A mechanism for moving the cloth through the machine so as to present plane surfaces to the action of the teasles. 2. One, two, or more pairs of plane-surfaced, independent teazel plates, with mechanism for moving the same while maintaining their parallelism with the cloth, in arcs of a circle or otherwise, so that each plate shall continuously move toward the cloth, sweep transversely and in contact with the

cloth from the center toward the sides thereof, and then recede and return toward the center.

Second, the means herein described for engaging or disengaging the cloth with or from the teazel plates, and regulating their pressure of contact, substantially as shown and set forth.

Third, the method of teazing cloth by machinery, substantially as herein shown and described, that is to say by imparting to the teazing surfaces the following motions, viz., to and from the cloth and also at right angles to the run thereof, so that the nap shall be raised crosswise from the center, or thereabouts, to the sides, as described.

61,377.—W. A. ALEXANDER, Mobile, Ala.—*Saw Set.*—January 22, 1867.—The blade of the saw is inserted between the cheeks of the block, and the teeth are set by means of a cam upon a pivoted lever.

Claim.—The combination of the lever B, pivoted in the block A', with the recess b and the set-screw c in the block A, forming an adjustable saw set, constructed and operating substantially as herein described.

61,378.—DEXTER B. ANDREWS, Fort Wayne, Ind.—*Composition for Kindling Fires.*—January 22, 1867.—Composed of rosin, 2 lbs; tallow, 4 oz; pine or other sawdust, 4 qts; mix and press into blocks.

Claim.—A composition for kindling fires, compounded from the materials, and substantially as set forth.

61,379.—ROBERT ANDREWS, Milwaukee, Wis.—*Composition for the Manufacture and Preserving of Leather.*—January 22, 1867.—Composed of linseed oil, 1 gall.; neat's-foot oil, 1 gall.; oil of tar, 4 lb; tallow, 10 lbs; beeswax, 1 lb.

Claim.—Making the composition out of the materials named, in the manner named, and applying it to leather in the process of manufacture, or after it is manufactured, and to all articles made of leather, disclaiming everything but the composition.

61,380.—WILLIAM BACHELLER, West Newbury, Mass.—*Corset and Skirt Supporter combined.*—January 22, 1867.—The skirt supporter is made of metal conformed to the shape, and is secured to the corset so as to form an adjunct thereto.

Claim.—In combination with an ordinary corset the skirt supporter, for which letters patent were granted me May 29, 1866, adapted to be worn and secured together in the manner as and for the purpose specified.

61,381.—WILLIAM BAHEME, New Media, Pa.—*Governor.*—January 22, 1867.—On the mill shaft is a pivoted governor ball and arm, which, on a certain increment of speed, comes in contact with and actuates a detaching apparatus to drop the water-gate lever and arrest the motion of the machinery. It is particularly intended for stopping the mill when the grist has all run out of the hopper.

Claim.—The arrangement upon the mill shaft of a pivoted governor ball and arm to actuate a detaching apparatus for the water-gate levers, substantially as described.

61,382.—GEORGE A. BALL, San Francisco, Cal.—*Paper Ruling Machine.*—January 22, 1867.—The surface of the cylinder is divided into sections between which are rods with laterally adjustable nippers. These are automatically operated. Adjustable blocks are inserted between the sections and between the nippers to preserve the contour of the cylinder. Other devices are described in the claims.

Claim.—First, the division of the cylinder into any number of sections, with nippers working between each section, and the introducing of the movable blocks *i i* between each nipper to preserve the circular form of the cylinder in combination with the nippers, substantially as described.

Second, covering the cylinder with india-rubber cloth z, and placing upon the edge of each section where the nippers strike a strip of gutta percha z', as described and for the purposes set forth.

Third, the gauge j, rods l l, and lock nuts m m, affixed to the feed board, in combination with the feed board R.

61,383.—**ABNER BASSETT**, Virginia City, Nev.—*Apparatus for Amalgamating Ores.*—January 22, 1867.—The ore pulp is placed in a cylinder which is traversed through by an axial steam pipe and surrounded by a steam jacket.

Claim.—First, the barrel *e*, or its equivalent, having a hollow shaft *o* passing through it, by which heat is introduced by exhaust steam or otherwise, substantially as described and for the purpose set forth.

Second, the hot-air shell or bath *g*, for the purpose of applying heat by exhaust steam or otherwise to the outside of the vessel containing the pulp, whereby obdurate ores are made to amalgamate more freely, substantially as described and for the purpose specified.

Third, the application of steam or heat to the ore or pulp, both through and around it, without coming in direct contact with it, the said ore or pulp being confined in some suitable vessel, said vessel being enclosed in a shell or bath, for the purpose herein set forth.

61,384.—**WILLIAM BAYHOUSE**, Portland, Oregon.—*Edge Plane for Boots and Shoes.*—January 22, 1867.—The peculiar shaped handle of the tool permits it to be used by both hands. This handle is notched underneath for a slotted plate or gauge, in which is placed the knife or cutter.

Claim.—First, an edge plane having a cutter *D* with straight and concave edges, and the adjustable slotted guard *F*, placed over the said cutter, substantially as described and for the purpose set forth.

Second, the gauge *B*, with slots *b* and *b'*, and the screw *L*, for elevating the cutter, in combination with the screw *G*, and thumb-nut *H*, substantially as described and for the purposes set forth.

61,385.—**AMOS BEAN**, Canaanville, Ohio.—*Sorghum Stripper.*—January 22, 1867.—The spring knives are rooted to the cast-iron box and present curved ends to embrace the stalk which is passed between them. The levers affect the proximity of the knives to adapt them to varying sizes of stalks.

Claim.—First, an improved cane stripper, formed by the combination of the adjustable spring knives *B*, and cast-iron box or frame *A*, said parts being constructed and arranged substantially as herein shown and described.

Second, the combination of the levers *C*, with the spring knives *B*, and box or frame *A*, substantially as herein shown and described, and for the purpose set forth.

61,386.—**JACOB BEESLEY**, Philadelphia, Pa.—*Ash Sifting Device for Grates.*—January 22, 1867.—The sifting device described is placed beneath the grate of a stove or heater so that the ashes discharged therefrom may be sifted without removal or handling.

Claim.—First, a grate *d*, for receiving the ashes and cinders, in combination with the sliding frame *C* and its projections *e e*, the whole being constructed and operating beneath the fire grate of a stove heater or furnace, substantially as and for the purpose herein set forth.

Second, the ribs *c e*, with their recesses *x x*, in combination with a grate *d*, and with the sliding frame *C* and its lugs *e e*, the whole being arranged substantially as described.

Third, the combination of the detachable box *B*, grate *d*, and sliding frame *C*, the whole being constructed and operating substantially as specified.

61,387.—**W. F. G. BEEUWKES**, Holland, Mich.—*Cowl.*—January 22, 1867.—The chimney passes through enveloping casings which isolate it from the roof and prevent conduction of heat to a dangerous extent.

Claim.—The arrangement of the guard pipes or casings *C F*, plate *H*, and short cylinder *J*, for protecting the roof from the heat of the chimney, substantially as herein shown and described.

61,388.—**JEAN GUSTAVE BEQUET**, Paris, France, assignor to **MORITZ PINNER** and **GUSTAVE BEQUET**, New York, N. Y.—*Apparatus and Processes for Rectifying Alcohol and other Spirits.*—January 22, 1867.—The spirits are rectified while in a state of vapor; the devices are described in the claims and illustration.

Claim.—First, introducing chemicals into a recti-

fying or distilling column for the purpose of analyzing or purifying, in whole or in part, the contents of such column.

Second, introducing such chemicals at option either in their natural state or mixed with water or other suitable liquids.

Third, introducing water into a rectifying or distilling column in such a manner as to cause the mixing of such water with all or part of the contents of such column, for the purposes herein set forth.

Fourth, introducing such chemicals, pure or mixed, or such water, into such column, substantially by the means or in the manner herein described.

Fifth, constructing a rectifying or distilling apparatus, in such a manner that one boiler or still can supply and keep at work two columns, or at option more, at a time.

Sixth, constructing a rectifying or distilling apparatus, in which two columns, or at option more, are connected with each other in such a manner that thereby the contents of one column can, in whole or in part, be passed into another column without interrupting the process of rectification, distillation, analysis, or condensation.

Seventh, constructing an analyzer of a series of tubes or cylinders, substantially like the upper compartment of the analyzing condenser *G*³ herein described.

Eighth, constructing a condenser of a series of tubes or cylinders, substantially like the lower compartment of the analyzing condenser *G*⁴ herein described.

Ninth, constructing the analyzing condenser *G*⁴ of a series of tubes or cylinders, and dividing the same into compartments, substantially as described and for the purposes named.

Tenth, providing a rectifying or distilling apparatus with a vessel *V*²⁸ for the reception or distribution of chemicals, substantially as described and for the purposes set forth.

Eleventh, providing a rectifying or distilling apparatus with one or more tubes or vessels *T*²⁹ for the mixing of chemicals with liquids, substantially as described and for the purposes set forth.

Twelfth, supplying each or all of such tubes *T*²⁹ with a float or self-acting stop-cock *50*, for the purpose of regulating the quantity of liquid required in each tub.

Thirteenth, the three-way stop-cocks *75 76 77 78*, or any desirable number of the kind, constructed substantially as herein set forth and used as described.

Fourteenth, connecting such three-way stop-cocks with steam chambers or pipes, substantially in the manner or for the purposes herein set forth and described.

Fifteenth, the pipes *15a* and *15b*, in connection with pipes *16a 16b 16c* and *16d*, and stop-cocks *90 10* and *9*, the whole substantially arranged in such a way as to enable the condensed impurities of any given column to be returned or directed into any given still, substantially as described and for the purposes set forth.

Sixteenth, regulating by means of valves *27a* and *27b* the quantity of vapors required in any given column for rectifying or distilling purposes, all substantially as described.

61,389.—**JEHIAL BORST**, East Cobblekill, N. Y.—*Churn.*—January 22, 1867.—Explained by the claim and illustration.

Claim.—The arrangement of the two dashers, the outer revolving faster than the inner, and both being operated by means of shaft *S*, toothed plate *n*, idle wheel *o*, and gear-wheel *m'*, with its shaft *m*, the several parts being constructed and used for the purposes specified.

61,390.—**JOHN F. BOYNTON**, Syracuse, N. Y.—*Compound for Telegraph Insulators and for other Purposes.*—January 22, 1867.—The compound of hydrocarbons, sulphur, sulphurets, silicious and calcareous substances, forms a non-conducting material for making telegraph insulators, or application to bricks, tiles, wood, &c., to prevent absorption of water.

Claim.—First, as a composition for an electric insulator, a combination of hydrocarbons with silicic acid and silicate of alumina.

Second, the combination of sulphur with the silicate of alumina and silicic acid, for the purpose set forth.

Third, the combination of sulphur, hydrocarbons,

silicic acid, and silicate of alumina, as and for the purpose herein set forth.

Fourth, any combination of silicates with sulphur or hydrocarbons, so arranged or combined that when formed into an electric insulator it will be black or dark-colored, for the purpose herein specified.

Fifth, saturating earthenware, brick, tiles, drain pipes, porous stone, wood, cast iron, and other hard, porous substances, with the compounds herein described, after subjecting said substances to a sufficient degree of heat to expel the air and moisture therefrom, substantially as and for the purposes described.

61,391.—GEORGE W. BRIGHT, Philadelphia, Pa.—*Steam Blower.*—January 22, 1867.—Steam is emitted from the edges of the spiral wings of the blower, causing them to revolve, and generating a blast of air. Steam is admitted through the trunnion and passes through the hub to the hollow wings, the shaft being secured by a collar and nut and the hub closed by a plug.

Claim.—The arrangement of the shaft A, the hub B, the wings C, the screw b, and the nut c, with the jets e, substantially as herein described for the purposes set forth.

61,392.—R. H. BURKE, Greenpoint, N. Y.—*Tool for Cutting off Boiler Tubes.*—January 22, 1867.—A tube which forms the stock of the tool carries a head with inclined grooves, to which the inner ends of the cutters are secured; the movement of the head in one direction by means of a screw forces them out, and in the other draws them in. Supplementary tubes are used to fasten the stock in the tube to be cut when the latter is of larger size than the stock.

Claim.—First, the cutter head G, with feed screw F and tubular nut E, in combination with the cutters H and pipe A, constructed and operating substantially as and for the purpose described.

Second, the supplementary sleeves I, in combination with the pipe A and head G, carrying the cutters H, substantially as and for the purpose set forth.

61,393.—J. BURNS, New York, N. Y.—*Cooler for Coffee, &c.*—January 22, 1867.—The coffee from the roaster is laid on a screen and cooled by a downward column of air induced by a draft fan.

Claim.—First, as an article of manufacture, the portable cooler herein described, the same consisting of the open mounted pan A, with perforated false bottom B and connecting tube D, as and for the purpose specified.

Second, the arrangement of the stationary suction blower E on the floor, with the pipe b below it, in combination with the removable mounted cooler A B C, supported by its tube D, as and for the purpose specified.

61,394.—CALEB CADWELL, Waukegan, Ill.—*Harvester Cutter.*—January 22, 1867.—The teeth project in rear of the link plates, so that the projections upon the driving blocks over which the cutter passes shall engage directly with the blades both before and in rear of the link plates. The cutter passes between suitable guides and underneath a spring roller at the inner end, and is driven by suitable gearing.

Claim.—First, the rotary cutter, consisting of the teeth I and links H, in combination with the blocks G G' g, when constructed and arranged in the manner and for the purpose specified.

Second, the arrangement of the cutter H I, blocks G G', guides M M', roller L, spring L', gearing D E, shaft B, and bevel pinions C C, as herein described and represented.

61,395.—L. B. CARPENTER, Milwaukee, Wis.—*Seafold.*—January 22, 1867.—The four upright posts are secured to a base, within which slides a horizontal platform or frame. This platform is elevated or lowered by means of windlasses and ropes.

Claim.—The combination and arrangement of the posts A, the horizontal sliding timbers E, arms F, crank shafts H, cranks I, ropes J, and pulleys K with each other, substantially as herein described and for the purposes set forth.

61,396.—DEXTER H. CHAMBERLAIN, West Roxbury, Mass.—*Hand Stamp.*—January 22, 1867.—In this canceling stamp the three wheels have respect-

ively facets corresponding to the number of days and months and a given series of years; are mounted on separate axes, and a double thickness of ribbon is passed beneath their type faces.

Claim.—First, the type wheels a b c, of different diameters, mounted upon separate and independent axes, as and for the purpose set forth.

Second, the combination of the inking ribbon with two reels and a stud, in such a manner as to form a double fold of the ribbon underneath the type wheels or die block, substantially as and for the purposes specified.

61,397.—OCTAVE CHANUTE, Chicago, Ill.—*Repairing Railroad Rails.*—January 22, 1867.—A billet or pile for a railroad rail is formed of an old rail, nearly of full length, and a single cap and foot piece previously rolled to the required shape. This is intended to save the expense of cutting into short pieces and working it up from a short pile, as is usual.

Claim.—A pile for forming a railway bar, composed of an old or worn rail and a new bar of iron or steel for the head and foot, or either, substantially as herein shown and described.

61,398.—W. B. CLEVES, Binghamton, N. Y.—*Measuring Funnel.*—January 22, 1867.—The funnel is fixed in place beneath the cock of a cask, and a cock is located beneath it. A glass tube communicating with the bottom of the funnel ascends to the top, exterior to the funnel, and has the scale inscribed upon it.

Claim.—The peculiar construction of the measure A, in combination with the gauge tube B communicating with the inside of the measure above the faucet C, with the single scale to indicate the quantity in the vessel, and the stand D, with the adjustable clamp to hold the measure in its upright position, substantially as described and for the purposes set forth.

61,399.—WILLIAM B. COATES, Philadelphia, Pa.—*Car Coupling.*—January 22, 1867.—The hollow coupling pin has a rod moving in its longitudinal perforation and connected above to the cap and ring of the pin, and below to a slotted catch, in such a manner that when the bolt is dropped in place the slotted catch shall fall across the pin and prevent it from being jolted out; the said catch being drawn perpendicularly by the act of removing the pin.

Claim.—The coupling pin, constructed in the manner and for the purpose described in this specification.

61,400.—CHARLES C. COLE, Northfield, Vt.—*Filtering Tube for Wells.*—January 22, 1867.—Cup-shaped strainers are placed in the tube, whose interior has countersunk strainers protected by hinged or stationary plates.

Claim.—First, protecting the countersunk strainers A by hinged plates D, or stationary plates B, substantially as represented and described.

Second, the combination of the cone or cup-shaped strainers G with the tubing, substantially as herein shown and described.

61,401.—EDWARD S. COLLINS, United States Navy.—*Furnace Shield.*—January 22, 1867.—The frame on which the shield is pivoted is capable of adjustment in a vertical plane, and is secured in the required position to the cheeks of the fender.

Claim.—First, the shield B, so hung or arranged upon a frame C H and G that it can be adjusted to the required angle with regard to the furnace door, substantially as and for the purpose specified.

Second, the combination with the door shield B of the fender A, when arranged together and so as to operate substantially as and for the purposes described.

61,402.—HENRY S. COOK, Boston, Mass.—*Wheel and Axle Connection.*—January 22, 1867.—The wheel is attached to the axle by a coupling. A plate revolving on the axle hub and retained by a collar has catches which engage in holes in the hub plate, and the latter being partially rotated is then locked by a pawl. The plates revolve together around the collar which holds the wheel upon the axle.

Claim.—The improved carriage wheel and axle connection, consisting of the plates a and e, with their

studs *c c c* and openings *f f f*, operating in combination with the collar *h*, as described.

Also, in combination with the above-described arrangement of parts, the pawl *i*, or its equivalent, substantially in the manner and for the purpose as set forth.

61,403.—EDWIN COPLESTON, Wrentham, Mass.—*Head Covering.*—January 22, 1867.—The foundation of the hat or cap is made of cloth, buckram, muslin, &c., stamped into shape, the several pieces being stuck together by glue or cement. It is treated with a composition of starch and oil, and after pressing to the desired form is varnished and flocked.

Claim.—A head covering, produced as herein described, as a new article of manufacture.

61,404.—RENÉ CUPPER, New York, N. Y.—*Extracting Iodine from Sea Water.*—January 22, 1867.—Sea water is decomposed by means of a composition of 1 lb. sulphate of copper, 2 lbs. sulphate of iron, 5 oz. tartaric acid, and 2 ounces of tartrate of ammonia. The water is decanted from the precipitate, which is strained and boiled in a solution of caustic potash. The solution is then separated from the insoluble portion, and upon cooling deposits crystals of iodide of potassium which are removed from the mother liquor.

Claim.—The process substantially as herein described for the purpose specified.

61,405.—CHARLES DANIEL, Lamonte, Mo.—*Washing Machine.*—January 22, 1867.—The slatted cylinder is pivoted in and vertically adjustable in the sides of the tub, and operates in connection with a slatted adjustable frame also pivoted in the tub and adapted to hold the clothes up to the rotating cylinder. A clamp on the frame holds the clothes when a portion requires an extra rubbing.

Claim.—First, the combination of the adjustable slatted cylinder C and the adjustable slatted concave frame G with each other and with the box or tub A, when said cylinder and frame are constructed and operated substantially as herein shown and described.

Second, the clamping device formed by the combination of the movable jointed frame J with the concave frame G, substantially as herein shown and described and for the purpose set forth.

61,406.—WILLIAM A. DEVON, Port Richmond, N. Y.—*Boat Detaching Tackle.*—January 22, 1867.—The rings of the davit fall-blocks are engaged by locking clasps at the stem and stern respectively of the boat. These are simultaneously opened by separate chains connected to a ring amidships, the tension of which operates cam-faced levers and sets free distending springs in each clasp.

Claim.—The combination of the jaws A and B of the pivoted locking clasp C, with its cam-shaped lever *h* and cheek or face piece *i*, for operation on the jaws, substantially as specified.

61,407.—JUSTUS DOERING, Philadelphia, Pa.—*Filter.*—January 22, 1867.—The respective chambers for filtered and unfiltered water are provided with pipes extending nearly to their concave or conical bottoms; these pipes are used as outlets when the apparatus is to be cleaned, which may be done by opening these outlets without otherwise disturbing the filter.

Claim.—First, the perforated vessel B and its pipes *c* and *d*, in combination with the casing A and its pipes *f* and *g*, the whole being constructed and arranged substantially as specified.

Second, an inclined discharge pipe, arranged in respect to the concave bottom of a filter, substantially as and for the purpose described.

Third, the pipe *d*, with its openings *z*, in combination with a filter, substantially as and for the purpose set forth.

61,408.—J. H. DOUTHIT, Albany, Oregon.—*Gang Plow.*—January 22, 1867.—The plow beams are connected and are pivoted to a horizontal bar on the wheeled carriage. They are raised and lowered, or kept on the ground by chains and windlasses operated by a hand lever and crank under the control of the rider.

Claim.—First, the attaching of the plow beams F

F to slides H H, fitted between suitable guides *c c*, at the inner sides of the bars A A, in connection with the foot lever I attached to one of the slides H, and the pin K, passing through any of a series of holes in the other slide H, substantially as and for the purpose set forth.

Second, the windlass L, having the cords or chains M M' attached, and the latter connected to the plow beams F F, to operate in the manner substantially as and for the purpose specified.

Third, the windlass R having a cord or chain A* attached, which is connected to the plow beams F F, one of the bearings of the windlass being fitted in a slide S, and having a pulley U on one end, around which and a pulley W, on wheel D, a belt *h* passes in combination with the lever T, attached to slide S, all being arranged to operate in the manner substantially as and for the purpose set forth.

61,409.—ROBERT E. ELLERBECK, Washington, D. C.—*Skate.*—January 22, 1867.—The sole is grasped between the diagonal clips which are laterally adjustable on the tread plate, and the grasp is tightened by bringing the sole in line with the blade. A projection rises from the front of the heel support, and interlocks with a plate in the front of the boot heel.

Claim.—First, the laterally adjustable clips *a*, attached to the skate on a line diagonal to the longitudinal plane of the blade A, for the purpose of grasping and securely holding the boot or shoe when applied thereto, substantially as shown and described.

Second, the projection *o* having a groove formed therein and arranged to operate in connection with the plate *n*, and secured by the catch *e*, or its equivalent, substantially as set forth.

Third, in combination with the clips *a*, arranged as described, the grooved projection *o* and plate *n*, spring *f*, and catch *e*, arranged to operate as and for the purpose set forth.

61,410.—ALFRED B. ELY, Newton, Mass.—*Machine for Cutting Files.*—January 22, 1867.—The tool stock is lined with rubber, through which passes the shank of the chisel. The tool is separate from the hammer and the chisel slips up and down in the stock. A pin through the shank above the rubber keeps the chisel in place. The arm of the tool stock has a ball at its end, which is socketed in hollows on the inner sides of two legs of metal on the rear of the tool stock.

Claim.—First, lining the socket and grasping the tool in the stock or head with rubber when the parts are arranged and constructed and operate, substantially as and for the purposes described.

Second, connecting the tool holder or head with the arm or shaft, substantially as described.

Third, the spring arm D, in combination with the rubber-lined head, substantially as described.

Fourth, the arrangement of the bars G, with the head and arm, substantially as and for the purposes described.

Fifth, regulating the angle of the cutting edge of the tool to the arm or shaft by means of bars and clamps, substantially as described.

Sixth, the combination of the rubber-lined socket with the vertically swiveling head, substantially as described.

Seventh, the combination of the rubber-lined socket with the vertically swiveling and horizontally turning head, substantially as described.

61,411.—SAMUEL FAY, Lowell, Mass.—*Machine for Opening and Cleaning Cotton.*—January 22, 1867.—The beaters are arranged one within the other and revolve with different velocities and in opposite directions, being attached to a face plate revolving in a vertical plane. The lower portion of the enclosing cylinder is perforated to allow the dust to escape, and the cotton admitted near the axis escapes at a spout arranged tangentially near the lower portion of the casing.

Claim.—The combination of the beaters G H and I J, arranged the one within the other, and revolved with the same or different velocities, and in the same or opposite directions, substantially as herein shown and described.

61,412.—THOMAS F. FIELD, Saugerties, N. Y.—*Changing Water in Steam Generators.*—January 22, 1867.—A short pipe or nozzle is secured by a flange

to the generator, and has a valve upon its inner end which opens inward, and upon its outer end has a screw thread for the attachment of a water supply hose; the pressure of the water being in excess of that of the steam in the generator.

Claim.—The valve D applied to and in combination with the change water-feed nozzle of steam boilers, and operating in connection with a feed pipe or hose under pressure, substantially as and for the purposes herein set forth.

61,413.—LEVI W. FIFIELD, Melrose, Mass.—*Knitting Machine Needle.*—January 22, 1867.—The forked latch is pivoted in the shank of the needle, and has shoulders which rest upon the cheeks of its slot to limit its vibration. The prolongation of the pivot hole in the latch gives it a limited capacity for longitudinal adjustment.

Claim.—The closer or latch, as made furcated, and with one or more shoulders *d*, arranged with respect to the forks, as and for the purpose set forth.

Also, the pivoted closer or latch, as made with the slot *f*, to enable it not only to turn upon but slide on its pin *e*, as set forth.

61,414.—C. L. FRANK, Rockville, Conn.—*Globe Valve.*—January 22, 1867.—Explained by the claim and illustration.

Claim.—The attachment of the disk H to the stem B, by means of the pin which is fast in the stem and working in a groove in the disk, as herein shown and described.

61,415.—STEPHEN M. GOLDEN, Marceline, Ill.—*Churn.*—January 22, 1867.—The dasher rod is attached to a lever which is vibrated vertically by a wrist on the face of the driving wheel. The wrist traverses a slot in the lever.

Claim.—First, the arm D, as operating on the wrist G, shaft B, and adjustable bolt F, as herein described and for the purposes set forth.

Second, the construction of the frame C, with its toothed wheels K and L, fly-wheel H, and adjustable piston D, in combination with the shaft B, and churn A, when arranged and operated as herein described and for the purposes set forth.

61,416.—WILLIAM F. GOODWIN, Washington, D. C.—*Automatic Toy.*—January 22, 1867.—The legs are flexed and extended by the motion of the compound systems of levers operated by a spring and trains of gearing; the articulations and consecution of the motions imitate the natural and cause the automaton to progress.

Claim.—First, constructing the legs of toys or hobby horses with bars or pieces joining them together, making hinged or vibrating joints at the several points where the legs are required to bend, so that when attached or pivoted on the studs S or their equivalents on the shoulders and hips, and acted upon by the rotating of the cranks B', the legs are made to move, bending all the joints, raising and turning the foot, stepping, walking, and trotting with both the fore and hind legs and feet, in imitation of the movements of the horse or animal which the toy is made to represent, in the manner and for the purpose substantially as described.

Second, the cranks B', or their equivalents, operated in any manner or by any means whereby they can be made to rotate, the rotating of which imparts to the legs their vibrating and reciprocating motions, arranged to operate in the manner and for the purpose substantially as described.

61,417.—W. G. GRANT, Wakeman, Ohio.—*Director for Uterine Supports.*—January 22, 1867.—The instrument is used for inserting a pessary which is contracted in the tube till it reaches the required spot; the tube then opens longitudinally and the pessary is ejected by the plunger.

Claim.—The director A, made in two parts or sections B, and connected together substantially as and for the purpose specified.

Also, the pusher E in combination with the director A, substantially as described for the purpose set forth.

61,418.—STEPHEN B. GREACEN, Norwich, Conn.—*Peat Machine.*—January 22, 1867.—Within the cylindrical casing is a cylinder eccentrically journaled and carrying a series of sliding plates operated by a

cam. A hopper above the casing feeds the peat to the pockets on the periphery of the revolving cylinder; these gradually decrease in size radially, and thus condense their contents. The blocks are discharged at an opening in the lower part of the casing.

Claim.—First, the combination with the eccentric outer cylinder B, and irregular cam E, of the revolving inner cylinder D, with its separately operating radial slides *b*, forming sides to the molds, the whole being constructed and arranged for operation together, substantially as and for the purpose herein set forth.

Second, the combination with the revolving cylinder D, slides *b*, and cam E of the knife or scraper *f*, arranged for operation in relation thereto, as shown and described.

61,419.—ALBERT HALL, New York, N. Y.—*Toy Gun.*—January 22, 1867.—The barrel forms a sleeve around the lower portion of the stock and the interior devices are exposed by opening the stock at its longitudinal suture when the barrel is removed. The cylindrical spring uniting the plunger and discharge cup is elongated by retraction rearward till the button engages the sear of the trigger.

Claim.—First, the construction of the stock of a spring toy gun in two longitudinal halves or sections *a b*, secured together by the barrel *c*, substantially as herein set forth.

Second, the cylindrical India-rubber spring *g*, arranged in relation with the piston *f*, barrel *c*, and trigger *k*, substantially as herein set forth for the purpose specified.

61,420.—CHARLES HALL, New York, N. Y.—*Tool Holder for Planing Machines.*—January 22, 1867.—The tool rest has two projecting cheeks, between which the stock is suspended by pins, three on each side, projecting from it and passing through curved slots in the cheeks. The two series of pins are directly opposite one to the other, and of either series two are arranged some distance apart, but in a horizontal plane, near the upper end of the tool stock, and the other near the lower end of the stock, but on a vertical line intermediate between the two upper pins.

Claim.—The combination of the tool stock of a planer, with its support or rest, by means substantially as above set forth, so that the tool stock can move a limited distance in two directions, in the line of cutting, whereby two opposite cutting edges may be alternately brought into operation and held there.

61,421.—WILLIAM HANCOCK, Saco, Me.—*Reversible Butt Hinge.*—January 22, 1867; antedated January 14, 1867.—The plates have tubular portions on each edge, and the pintle being removable they may be associated so as to form a right or left hand hinge.

Claim.—First, the hinge, in combination with the washer, for the purpose specified.

Second, a double round edge hinge, as specified, in combination with a movable pin or pintle, whereby I am enabled to obtain a "right or left hand" hinge movement from one and the same hinge.

61,422.—JOHN HARRINGTON, Menomonee, Wis.—*Machine for Pulling Flax.*—January 22, 1867.—The cams on the faces of the reel heads operate pivoted plates, which as the reel rotates are vibrated and clamped against the radial plates on the reel arms and seize the flax as the machine passes over it. At a subsequent point in the revolution of the reel the pivoted jaw plates open and drop the flax on the platform in the rear of the reel.

Claim.—First, the rotating reel provided with fixed radial plates *c*, and movable plates J, arranged so as to operate as clamps, and as the machine is drawn along pull the standing flax and deposit it on the platform, substantially as set forth.

Second, the cam-shaped grooves L, at the inner sides of the plates M, and the pivoted arms K, to which the plates J are attached, in connection with the rollers *e*, at the inner ends of the arms working in the grooves L, for the purpose of operating the plates J, substantially as set forth.

Third, the shafts *j*, at the outer ends of the plates *c*, in connection with the yielding bars *k*, at the outer ends of the plates J, substantially as and for the purpose specified.

Fourth, the combination of the main frame and plat-

form, with the reel arranged with clamps to operate as set forth.

61,423.—GEORGE HAVEL, Newark, N.J.—*Traveling-bag Frame.*—January 22, 1867.—A double strip of metal is bent into a frame for a traveling bag, making the overlapping lips of two thicknesses, and at the same time leaving a groove between their edges in which to confine the material of which the bag is made.

Claim.—As an article of manufacture the within-described frame for traveling bags, when constructed and used as and for the purpose specified.

61,424.—JAMES L. HAVEN, Cincinnati, Ohio.—*Meat Cutter.*—January 22, 1867.—The cylindrical case has slots through which the knives are introduced, the latter being secured by the projecting ribs on exterior plates; the ribs press the bases of the knives against the sides of their slots, and a single tightening screw at the end of the plate clamps the gang of knives.

Claim.—First, the mode of securing an entire series of meat cutting or mincing knives G, by means of a single set screw L, ribbed plate F, and slotted case A B, substantially as set forth.

Second, the provisions of ribs f, on the side of a meat cutter, whether cast on the case or separately, in combination with a correspondingly ribbed loose part, when arranged so that one lateral movement will firmly hold all the knives, substantially as set forth.

Third, the mode of securing a series of meat cutting or mincing knives G, by means of the lateral movement of a ribbed plate F, against corresponding ribs on the slotted case A B, substantially as set forth.

61,425.—SAMUEL K. HAWKINS, Lansingburg, N. Y.—*Apparatus for Automatically Weighing Spirits and other Liquors.*—January 22, 1867.—The machine receives the liquor as it runs from the still, weighs it, passes it off to the cisterns or tanks, and registers the weight of the liquor manufactured, all by automatic motions. The devices are cited in the claims.

Claim.—First, the automatic weighing machine, constructed and operating substantially as and for the purpose herein described.

Second, in combination with the levers D and C, and the clutch hooks p p, the drop weight E, so arranged that the clutch hooks will alternately lift and drop the weight, substantially as and for the purpose described.

Third, the combination of the balance levers D and C, with the mechanism for operating the valves a and b b, substantially as described.

Fourth, the combination of the balance lever D, the gripping bars G G, the clutch hooks p p, the weight E, and the V-shaped slot V, constructed and operating substantially as described.

Fifth, the dial plate M, in combination with the index m, the ratchet wheel N', the pawl n, and the arm O, operated by a rock shaft, substantially as and for the purpose described.

Sixth, in combination with the balance lever D and its attachments, the sliding weight D', substantially as and for the purpose described.

Seventh, in combination with the lower lever C, and the drop weight E, the elastic platform E', substantially as and for the purpose described.

Eighth, in combination with the lower lever C, the connecting bars H' and h, the lever k' and the valve a, the inclines J and J', constructed and operating substantially as and for the purpose described.

61,426.—T. D. and W. A. HEDGER, Meadow Lake, Cal.—*Revolving Sluice for Saving Metals.*—January 22, 1867.—The endless apron is made of fabric sufficiently coarse to retain the heavier particles which it receives from the feed spout, beneath which issues the stream of water. A scraper at the end removes the refuse, and the entangled metallic particles pass into and are collected in the tank.

Claim.—First, a sluice with revolving belt D, so constructed that the sides will form flexible joints b b in passing around the drums, closing up and forming close joints while passing up and down the incline, forming a sufficient channel between them for the purpose described, substantially as set forth.

Second, the mouthpiece or opening G beneath the platform, so that the sand or pulp which is fed to the

machine may enter a sufficient distance below to give action and force to the water introduced through the opening G to sweep down the incline and carry with it the sand and debris, substantially as described for the purpose set forth.

Third, separating the ore, by passing the valuable portions up the incline, and the debris down to the foot, as waste matter, as described.

61,427.—CYRUS HILL, Dover, Me.—*Composition for Roofing.*—January 22, 1867.—Composed of coal tar, three gallons; linseed oil, one quart; and clay, plaster, and pulverized slate in sufficient quantity to give the mixture proper consistency to spread easily.

Claim.—The composition for covering roofs and for similar purposes, consisting of the ingredients herein named, and united in the proportions substantially as set forth.

61,428.—J. HINDMAN, Olathe, Kansas.—*Corn Husker.*—January 22, 1867.—Improvement on patent of Shaw, November 10, 1857, in respect of the position of the hook, which is curved backward so as to be utilized by the retraction of the arm and hand instead of the radio-ular rotation of the forearm.

Claim.—A corn husker having the tang B turned back and pointing toward the wrist, as herein shown and described.

61,429.—JOHN S. HOAR, West Acton, Mass.—*Bench Vise.*—January 22, 1867.—Combined with the ordinary movable jaw of a bench vise is a supplementary, adjustable, obtuse-angled, triangular jaw secured by a backwardly projecting flange to the jaw, the obtuse angle being against the face of the jaw.

Claim.—First, the adjustable jaw B made as described, also its combination and arrangement with the vise jaw.

Second, the arrangement and combination of the slotted hook C, and its set screw b, with the vise jaw A, and with the adjustable jaw B, made as described.

61,430.—CHARLES HOLLWEDE and JULIUS BRZEZINSKY, New York, N. Y.—*Muff.*—January 22, 1867.—The skin is stretched and formed on a block, the edges being drawn over the ends to the required extent so as to expose the fur to the edge of the lining of the pocket.

Claim.—A fur muff, having its ends turned and set upon a former, by means substantially as shown and described.

61,431.—D. S. HOLMAN, Conneautville, Pa.—*Seed Planter.*—January 22, 1867.—The devices described constitute means for opening the furrows in the ground, regulating the discharge of seed, and covering the seed after being dropped.

Claim.—First, the two seed slides H H', placed one above the other at the upper part of the tubes G, and having springs d bearing against them, in combination with the wheels I and projections e, having pins f g in their peripheries, all arranged to operate substantially in the manner as and for the purpose set forth.

Second, the regulating slides J, in combination with the seed slides H H', arranged substantially as and for the purpose specified.

Third, the combination of the metallic tubes L and covering shares O, all arranged and applied so as to be capable of operating and being adjusted substantially as shown and described.

61,432.—R. L. HOWELL, Baltimore, Md., assignor to himself, E. M. WILKINS, and W. S. BROWNING, same place.—*Burner for Vapor Stoves.*—January 22, 1867.—The flow of oil to the retort is controlled by a valve with a screw stem, and as it issues from the vertical vent tube is deflected by a cone which prevents the hissing of the vapor as it escapes. A chamber in the supply pipe forms a trap for arresting foreign matters on the oil.

Claim.—First, the residuum chamber N N, and the pipe B, arranged substantially as described, in combination with a vapor stove.

Second, the conical headed pin H, within the aperture J of the retort, operated by the screw plug E, substantially as and for the purpose specified.

Third, the retort F having stands L and partition K cast solid therewith, the latter having vent J ex-

tending through it, and valve seat I on its side, as and for the purpose specified.

61,433.—ANTHONY ISKE, Lancaster, Pa.—*Window Sash and Fastener.*—January 22, 1867.—The device provides a ready means for removing the sash from its traversing grooves for the purpose of cleaning or reglazing. The side strips are made removable and are locked in place by the turn button.

Claim.—The tongue and groove connection of the strip B with the sides A of the sash, in combination with the turning button, for either locking both parts A B together, so as to move up and down jointly, or for locking both to the casing, the whole arranged and operating in the manner and for the purpose specified.

61,434.—PATRICK KENNY, New York, N. Y.—*Steamboat Signal Apparatus.*—January 22, 1867.—The movement of a lever by the pilot actuates an indicator traversing the face of a marked dial coincidentally with the sounding of a bell. The levers projecting through a plate having slots extending in different directions, are caused by means of wires to move a lever connected to the shaft of the index by cord attached at different points on its periphery; thus a greater or less extent of movement on the levers will move the index through a proportionate arc.

Claim.—First, the combination of the signal handles with each other in the manner described, so that each signal handle will have a different line of movement, as and for the purpose set forth.

Second, attaching the connecting cords to the index shaft at intervals proportioned and corresponding to the intervals between the signal marks upon the dial, substantially as described.

Third, the combination of one or more levers G, or their equivalents, with the index shaft, substantially as described.

61,435.—DANIEL KIDDER, Franklin, N. H.—*Apparatus for Tethering Animals.*—January 22, 1867.—By the introduction of the spring under the pole the end of it is kept up to prevent the animal from getting entangled in the bridle rein or tether rope.

Claim.—The spring E applied to the pole D, in combination with the stake A, substantially as and for the purpose described.

61,436.—NORMAN S. KINYON, Chenango Forks, N. Y.—*Churn.*—January 22, 1867.—The spiral horizontal blade and the concentric bowed blades are revolved in different directions by their pinions, which engage with a common master wheel.

Claim.—The combination, construction, and arrangement of the dasher blades or floats with the angular blades *s s* on the lower end of the shaft B, substantially as described and for the purpose set forth.

61,437.—GEORGE T. LAPE and JEPHAN LEATHE, New York, N. Y.—*Railroad Switch.*—January 22, 1867.—The switch piece has a lug which rests against the rail, retains it against side pressure, and has a central groove which receives the flange of the wheel and leads it up till it crosses the rail, when it descends into its proper position.

Claim.—The street car replacer, consisting of the side pieces B B, groove A, lug *a*, when constructed and operating as herein set forth for the purpose specified.

61,438.—DAVID P. LEWIS, Huntsville, Ala.—*Cotton Chopper and Thinner.*—January 22, 1867.—A cutter with edges on both sides is arranged in a frame capable of vertical adjustment to regulate the depth of cut. The motion of the cutter is imparted from a wheel driven by bevel gears from the axle of the supporting wheels.

Claim.—A machine for cutting and thinning cotton and for other purposes, constructed, arranged, and combined substantially as herein shown and described.

61,439.—ALPHONSE JULIEN LOISEAU, New York, N. Y.—*Stop Motion for Looms.*—January 22, 1867.—To each warp thread is hung a weight which descends as the thread breaks, and is then pushed by a constantly oscillating plate against a cross bar, which brings into action the proper levers and catches to

check the lay, arrest the movement of the driving shaft, and also slip the belt.

Claim.—The oscillating plate F and cross bar E in combination with weights or rods *a*, dog *e*, catch bar N, and stop K, constructed and operating substantially as and for the purpose described.

61,440.—EMILE LOISEAU, New York, N. Y.—*A Attachment for Holding Skirts together.*—January 22, 1867.—The lower hoop is attached to the skirt by a loop, which encloses the hoop and buttons to the skirt.

Claim.—A strap A whereby a lady's hoop skirt is attached to a petticoat, said strap being made substantially as herein shown and described.

61,441.—ISAAC V. LYNN and GEORGE T. SNOWDEN, Pittsburg, Pa.—*Balance Slide Valve.*—January 22, 1867.—The conical packing ring is interposed between the conical seat on the inside of the cylinder on the back of the valve, and the cylinder which depends from the inside of the chest cover. The object is to obtain a balancing pressure on the respective sides of the valve.

Claim.—The packing ring D, or its equivalent, when used in combination with the cylinders *f* and C, plate B, and valve A, constructed, arranged, and operating substantially as herein described and for the purpose set forth.

61,442.—JOHN McMICHAEL, Philadelphia, Pa., assignor to JOSEPH WRIGHT, same place.—*Wood Turning Lathe.*—January 22, 1867.—The lathe has two revolving disks with cutting edges on their peripheries, and an oscillating frame carrying revolving spindles upon which the handle is fixed. The means for oscillating the handle in contact with either side are described in the claims.

Claim.—First, the rocking frame H arranged with the cutters G and G' and the standing frame A, substantially as hereinbefore described, and for the purposes specified.

Second, combining the cam V with the rocking shaft T and rocking frame H, for giving a reciprocating motion to the latter, substantially as and for the purpose above described.

Third, the combination of the cam lever O with the center J' and lever P, the latter being operated by the lever Q, or its equivalent, substantially as and for the purpose set forth.

Fourth, arranging the sliding handle Y and spring X with the upright W, for the double purpose of giving a rocking motion to the frame H by means of the cam V, and actuating the cam lever O through the intermediate levers P Q, substantially as described and for the purposes specified.

61,443.—BENJAMIN F. MILLER, New York, N. Y.—*Caloric Radiator for Stove Pipes.*—January 22, 1867.—The diaphragm is sustained by angular radial plates parallel to the axis of the radiator. A radial extension of the case at this point preserves the sectional area of flue space.

Claim.—First, the septa or plates *f*, in combination with the diaphragm *e* and radiating case *d*, substantially as and for the purposes set forth.

Second, arranging the diaphragm *e* and case *c* in the manner shown in Figs. 1 and 3, so that the space through which the heated gases or products of combustion pass shall be nearly of equal area to the pipe *a*, for the purposes and as set forth.

61,444.—CHARLES B. MOSELEY and LUCIUS L. WOOLLEY, Medford, Mass.—*Copy Holder.*—January 22, 1867.—The clamp holds the "copy" for a compositor or copyist, and is revolved as the matter is composed to expose a fresh portion to view. The pawl holds the cylinder to its adjustment and the edge of the lid may constitute a line indicator.

Claim.—The cylinder D, or its equivalent, having a spring jaw F, when hung in a suitable frame, substantially as and for the purpose described.

Also, in combination with the above, the swinging lid II, arranged substantially as described and for the purpose specified.

Also, the notched head of the cylinder D, or its equivalent, in combination with the pawl or catch N, for the purpose described.

Also, the iron frame on which the working portion

of the machine rests, and which holds the same in position, substantially as specified.

61,445.—MICHAEL C. MURRAY, West Acton, Mass.—*Railway Chair*.—January 22, 1867.—The base plate has an upward flange which fits into the hollow on one side of the rail and receives a jaw which fits into the hollow on the other side. Rabbits secure the relative longitudinal position of the parts. The notches in the adjacent edges of the rails receive a locking piece, and the nuts of the transverse bolt are secured by a longitudinal locking bar.

Claim.—The improved chair as constructed with the base plate A, separate from and to extend under and support the jaw C, and as having the rabbit a and as provided with the projections c c' and the shoulders b b, arranged with respect to the base plate A and the jaws B C, and so as to extend into and under the rails as specified.

Also, the rails as made with the notches d d arranged in them at their joints or ends, as specified, and to be used with the chair made as explained.

Also, the nut holder D as made with the nut recesses i i and the flange k, or their equivalents.

61,446.—HENRY E. NEWTON, Manchester, N. H., assignor to himself and W. A. NEWTON, same place.—*Broom*.—January 22, 1867.—The spring connection of the handle to the broom gives a flexibility additional to that of the bristles.

Claim.—One or more springs B which connect the handle C with the broom head A, substantially in the manner and for the purpose herein shown and described.

61,447.—JOHN NICHOLSON, Alleghany City, Pa.—*Pump*.—January 22, 1867.—The upper end of the valve chamber or working barrel has a lock furnished with catches and springs, the catches taking hold under the shoulder of a coupling and being held there by means of said springs until released by a collar on the pump rod; the valve chamber and its lock are combined with a yielding seat piece in the tubing.

Claim.—Providing the upper end of the valve chamber or working barrel h of a pump with a lock f f', furnished with catches g and springs e, said lock being used in connection with a coupling A, case C, seat J, nuts K 8 and 9, spiral spring r, and collar l' on the pump rod D, the whole being constructed, arranged and operating substantially as herein described and for the purpose set forth.

61,448.—L. R. NORMAN and W. F. DIETERICHS, jr., St. Louis, Mo.—*Brick Kiln*.—January 22, 1867.—A space for the escape of steam is provided between the two arches which form the roof of the chamber where the articles are burnt. The smoke flues on the top and ends of the air chambers are connected by short transverse flues which terminate in chimneys on the sides of the structure whose inarched walls resist internal pressure.

Claim.—First, the construction and arrangement of the smoke flues D d D' as described and set forth.

Second, the cold air or supply chambers C, and the distribution of the air to the furnaces through a series of orifices c, as described and set forth.

Third, the construction of the vertical walls of the kiln with concave sides so as to resist the interior pressure from the expansive force of the heat and steam.

61,449.—L. R. NORMAN and W. F. DIETERICHS, St. Louis, Mo.—*Brick Kiln*.—January 22, 1867.—Explained by the claims and illustration.

Claim.—First, constructing the sides of our improved brick kiln of double walls to enclose a hot-air chamber when the outer wall is inwardly curved or arched, the inner wall being straight, all substantially in the manner herein described and for the purposes set forth.

Second, the arrangement of a hot-air chamber D over the cold air supply chamber B, between the fire spaces of our improved kiln, constructed and operating substantially in the manner and for the purpose herein specified.

Third, the combination and arrangement of the outer chimneys F, the valves F', and the air chambers A² and D enclosing the kiln, all substantially in the manner and for the purpose herein set forth.

Fourth, the arrangement of the fire boxes with

grate bars extending entirely across our improved kiln, substantially as herein set forth.

61,450.—C. P. NORTON, Roseville, Ill.—*Cultivator*.—January 22, 1867.—The draft pole is supported by an arch upon the axles, and the beams connected to a braced vertical rod depending from the draft pole, the coupling being adjustable vertically. The double shovel plows are managed by the usual handles.

Claim.—First, the pole B, arch C, and supporting wheels D D, constructed and arranged substantially as and for the purpose herein set forth.

Second, the pole B b, fig. 1, sliding box f, loop F, and set screw k, in connection with the plow beam A, all arranged and operated as and for the purpose described.

61,451.—JULIUS A. PEASE, New York, N. Y.—*Hat Body*.—January 22, 1867.—The hat body is made of rawhide split, damped, and stretched on a block with a ring next to the brim, and is thus dried; or it may be tanned on the block. It is then colored, floored, or covered with plush or other material.

Claim.—A hat or hat body made from raw hide or untanned hide, substantially as before described.

61,452.—EDWARD L. PERRY, New York, N. Y.—*Cot or Covering for Rolls for Spinning, &c.*—January 22, 1867.—The three or more layers which form a cot or covering for the roll are united by cement.

Claim.—A cot or covering for rolls of spinning or other machines, when made or composed of three or more separate layers or thicknesses joined together, of which the outer layers a and b consist of leather, and the intermediate layer c of fibrous or elastic material, substantially as described.

61,453.—H. PIERCE and J. B. BUTTON, Cleveland, Ohio.—*Oil Tank*.—January 22, 1867.—The tank is formed on sills whose intervening keys are arranged so as to form a circular base. The two floors are at right angles to each other, and each at an angle of 45° with the sills. A circular groove in the sills receives a brace against which the planks of the first floor abut. The second floor is above the lower edge of the tank.

Claim.—First, the arrangement of the sills B, keys C, abutment braces F, in combination with the foundation floor G, for the purpose set forth.

Second, the construction and arrangement of the bottom G', placed within the tank, the inlayer d' in combination with the tank H, angle irons b and floor G, for the purpose and in the manner set forth.

61,454.—LUKE A. PLUMB, Biddeford, Me.—*Combined Lamp, Coffee Pot, and Boiler*.—January 22, 1867.—The device has the functions cited, the coffee-pot and boiler having a central flue which forms a chimney for the lamp upon which they are imposed when adapted for associated use.

Claim.—First, the tube D, attached to a cone C, of the burner of the lamp when used in connection with a vessel provided with a central draft tube to fit over said tube D, substantially as and for the purpose herein set forth.

Second, the employment or use in a vessel provided with a central draft tube for a lamp of a vessel E, provided with two or more removable chambers J, substantially as and for the purpose specified.

Third, the combination with a lamp of two or more vessels E H, provided with central draft tubes arranged so that the draft tube of one vessel will extend above its top to admit of the lower end of the tube of the other vessel being fitted upon it, substantially as and for the purpose set forth.

61,455.—OSCAR T. POTTER, Scott, N. Y.—*Carriage Jack*.—January 22, 1867.—The jointed arm is pivoted to the post and extended by the depression of its attached lever.

Claim.—The arrangement of the arm b with its fork d and crooked lever m, in combination with the standard a, when used as and for the purposes set forth.

61,456.—TIMOTHY J. POWERS, New York, N. Y., assignor to FITCH and VAN VECHTEN, same place.—*Cartridge Filling Machine*.—January 22,

1867.—Automatic devices feed the cartridge shells to the machine; feed the gunpowder into the shells, the bullets to the machine and to the loaded shells, where they are rammed upon the charge. Other automatic devices crimp and close the mouths of the shells around the bullets. Automatic contrivances carry the shells from the shell-feeding to the powder-feeding device, thence to the bullet-feeding and inserting devices, thence to the crimper, and finally to the discharge.

Claim.—First, the spring or contractible crimping die or device for closing the mouths of the shells on to or in the bullet, constructed to operate substantially as described.

Second, said contractible crimping die, or its equivalent, in combination with an intermittent shell carrier for operation together, essentially as herein set forth.

Third, the combination of an automatic bullet-feeder with an automatic shell-carrier, substantially as specified.

Fourth, the combination of an automatic shell-feeder, shell-carrier, and bullet-feeder, for action together, as herein set forth.

Fifth, the combination with an automatic bullet-feeder, of a bullet take-up or slide, to deposit the bullet over the shell.

Sixth, in combination with an automatic bullet-feeder a divided or opening and closing conducting die, to guide the bullet to its place in or over the shell, and to hold it while the charge is being rammed, substantially as specified.

Seventh, providing the bottom of the powder hopper, or space intervening between it and the charge measurer or distributor, with an independent bush and rubber packing, or their equivalent, for operation together and in combination with the distributor, essentially as and for the purpose herein set forth.

Eighth, gripping the shell, while being crimped, by an independent slide, or its equivalent, arranged to close upon the mouths of the shell chambers in the carrier, and afterward, to open and retire therefrom, essentially as specified.

Ninth, the combination in one machine of an automatic shell-carrier, bullet-feeder, powder-charger or measurer and distributor, and crimping device or die, for operation together, substantially as herein set forth.

Tenth, while not claiming irrespective of the mode herein described, raising the shell at certain points within its chamber in the carrier, I do claim, in combination with an intermittently rotating carrier provided with chambers substantially as described, the lifting rod *i*, arranged to raise, during a pause in the motion of the carrier, the shell further up within its chamber, and then to retreat, essentially as and for the purpose herein set forth.

Eleventh, elevating the upper end of the shell, prior to crimping, above the top surface of the carrier, and retaining it there while crimping by means of an intermittently reciprocating rod *e*, arranged to operate in connection with the carrier and suitable crimping device, substantially as specified.

61,457.—JAMES S. RALSTON, Indiana, Pa.—*Vise.*—January 22, 1867.—The two cam disks have a connecting rod which passes through the jaws of a vise. By turning the rod the disks close the jaws and are retained in that position by a pawl catching upon a ratchet upon the periphery of one of the disks.

Claim.—In combination with the A A' of a vise the cam disks C C, placed on a coupling rod B, for opening and closing the jaws, to be held to their work by the ratchet wheel *e* and spring dog *e*, constructed and operating substantially as herein described.

61,458.—ANDREW RANKIN, Philadelphia, Pa.—*Butt Hinge.*—January 22, 1867.—A roller is applied between the two plates so as to receive a portion of the lateral strain, which is ordinarily wholly received by the pintle. The roller occupies a slot in one barrel, and the axis of the roller is an axial screw pin.

Claim.—The roller *m*, adapted to the two plates of a lift-off hinge, substantially in the manner and for the purpose herein set forth.

61,459.—SMITH E. G. RAWSON, Saratoga Springs, N. Y.—*Globe Clock.*—January 22, 1867.—The globe time piece exhibits the difference in time between

places of differing longitude. The mechanism is contained within the sphere, exposing on the outside of the globe only the dial plate, pointers, and the pedestal support.

Claim.—First, providing for the winding up of a globe clock through an aperture in the shaft or axle of rotation of the globe within which the clock is contained.

Second, having the winding up shaft of a globe clock coincident with the axis of rotation of the globe within which the clock mechanism is contained.

Third, sustaining a globe clock upon an adjustable support C, or its equivalent, substantially as described.

Fourth, supporting a globe clock by means of a vertical spindle upon a pedestal in such manner that the globe can be rotated about a vertical axis, substantially as described.

Fifth, the combination of a fixed index *k* and movable index *n* with a globe which is rotated automatically, substantially as described.

Sixth, sustaining a globe which is rotated by means of clock-work upon a tubular shaft in such a manner that the clock spring can be wound up without detaching the sections of the globe, substantially as described.

61,460.—WILLIAM G. REDMAN, Louisville, Ky.—*Dental Plugger.*—January 22, 1867.—The pressure of the plugger upon the gold in the cavity of the tooth gives movement to a hammer which strikes upon the extremity of the plugger. The intermission of the pressure permits the extension of the spring and raises the hammer.

Claim.—First, the casing as represented in form by A and A', containing the bar D D', the let-off bar *f*, the spiral spring *h*, the spring and stop *z* and *z'*, the disks V and V', the partial disk or joint piece *w*, and the swivel joint E, constructed substantially as described for the purpose specified.

Second, the arm or lever C, connected with the spring helve by slot and bolt, substantially as described.

Third, the spring helve *b*, and its connection with the case at 11, and also the spring *d* acting against the helve.

61,461.—J. W. REYNOLDS, Hyde Park, Pa., assignor to himself and S. H. CUTLER.—*Car Truck.*—January 22, 1867.—The king bolt is placed on a socket applied to the cross bar of the truck to which the spring is attached. The springs rest on longitudinal bars connected to the pedestals which bear upon the axles. The latter are lubricated through openings in the outer sides of the boxes.

Claim.—First, the construction and arrangement of the pivot or king bolt D of the truck on a socket C, applied to the cross bar B, substantially as and for the purpose set forth.

Second, the combination and arrangement of the springs I, bars G, and the boxes F, substantially as and for the purpose specified.

Third, the openings *d* in the outer sides of the boxes F, in combination with the slides *e*, substantially as and for the purpose set forth.

61,462.—M. S. RICHARDSON and ERASMUS A. POND, Rutland, Vt.—*Valve Gear for Direct Acting Engines.*—January 22, 1867.—The series of piston valves are operated by a system of levers arranged within the cylinder and steam chest, and actuated by the contact of the piston at each end of its stroke.

Claim.—First, the piston valves connected with and directly actuated by a system of levers operated by the steam piston as herein described, so as to effect the induction and eduction of steam to and from the steam cylinder.

Second, the combination of the piston valves with an oscillating lever actuated by auxiliary levers arranged within the steam chest and cylinder, substantially as shown and set forth.

Third, the combination with a system of levers located within the steam chest and cylinder, and actuated by the steam piston as described, of the cylindrical plungers or piston valves sliding in recesses formed in the steam chest on each side of the central steam admission and exhaust chambers, substantially as herein shown and specified.

61,463.—JOHN ROBERTSON, Brooklyn, N. Y., assignor to himself and ABRAHAM BARTHOLF.—*Extracting Oil from Seeds.*—January 22, 1867.—The seeds are pulverized in a steam-jacketed cylinder, and the oil extracted by means of a centrifugal machine.

Claim.—First, the process substantially as herein described of treating seeds or other substances for the extraction of oil by subjecting the same to the action of beaters in a heated cylinder or case, essentially as herein set forth.

Second, the within-described process of extracting the oil from seeds or other substances reduced to a pulp by exposing the same to the action of a centrifugal machine, substantially as specified.

Third, the combination with a centrifugal machine of revolving beaters, working in a cylinder or case as described, and to which steam is or may be admitted for separate but joint action on the material from which the oil is to be extracted, essentially as specified.

Fourth, the arrangement in a loose or detachable manner within the revolving cylinder or holder of a centrifugal machine, and so as to rotate with said holder of the reticulated cylinder or screen in which the material is placed for action, as described.

61,464.—ALMON ROBINSON, McLean, N. Y.—*Peat Machine.*—January 22, 1867.—A series of molds are attached to an endless chain which passes over rollers and under the hopper which supplies them with peat. A band of woven material passes entirely round the chain and is pressed into the molds, forming a lining to each. As the molds pass over the roller they open and the peat is thrown out by means of the lining. The peat is pressed in the molds by a plunger.

Claim.—First, the carrier molds *a a*, arranged relatively to each other, and to the grinding and depositing mechanism *D¹ D²*, or their equivalents, substantially as and for the purpose herein set forth.

Second, the presser *G*, in combination with the carrier molds *a a*, and arranged to operate relatively, substantially as herein specified.

Third, the slack cloth *g* arranged on the presser *G*, so as to be pulled off by a motion commencing at the edge or edges, as represented and described, for the purpose herein specified.

Fourth, the slack cloth *M*, arranged as herein shown relatively to the section of molds *a a*, so as to unfold, peel off, and expel, in the manner and with the effect substantially as herein specified.

Fifth, the roller *I*, arranged to pass into and out of the several molds, and replace the slack cloth *M*, or its equivalent, in the manner herein shown.

61,465.—JUAN A. ROBINSON, jr., San Francisco, Cal.—*Amalgamator.*—January 22, 1867.—The design is to prevent the deposit of base metals from the solutions of their sulphates in the amalgamation of silver ores.

Claim.—An amalgamator constructed of copper and wood, or an alloy of copper, with frictional surfaces, substantially as and for the purpose described.

61,466.—GEORGE W. ROGERS, Lancaster, N. Y., assignor to himself and JOHN D. SHEPARD.—*Manufacture of Soap.*—January 22, 1867.—The boiling soap is forced into the cooling frames by means of a force pump until a pressure of 200 pounds to the square inch is attained. This pressure is maintained until the soap is cooled.

Claim.—The within-described manufacture of soap by subjecting the material to a high pressure at a moderate temperature, substantially as and for the purpose herein specified.

61,467.—ADALINE ROSE, Bath, N. Y.—*Carpet Sack.*—January 22, 1867.—Straps are added on each side of the handle and extend to the bottom of the sack. The straps are held in their places by loops, and are shortened by buckles to draw up the bottom of the sack and reduce its size.

Claim.—The carpet sack *A*, with the straps *B* and buckles, and with the keepers *C*, as and for the purpose specified.

61,468.—JOHN ROSS, Greenville, Mich.—*Pump.*—January 22, 1867.—The lower section is bored for piston chambers and communicating pipes, and its

upper end carrying the eduction valves is slipped into the upper portion of the stock. The plunger rods are worked by racks and pinions, and the vent tube above the eduction valve worked by a rod which reaches the surface.

Claim.—First, the arrangement of the bore *B*, bores *F F*, chamber *C*, chambers *L M*, and piston rods *P R*, secured to racks *S T*, in combination with the stock *A* and valve cylinders *H I*, and operating substantially as described for the purpose specified.

Second, in combination therewith, the vent tube *X* of the chamber *C* and notched rod *A'*, arranged to operate substantially as and for the purpose specified.

61,469.—ISAAC ROWELL and FRANCIS E. MILLS, San Francisco, Cal.—*Mounting Photographs for Exhibition.*—January 22, 1867.—The paper is carefully cut away from the outlines of the portrait figure and a substitute background placed behind it in another plane, diverging upwardly from the plane of the figure and intersecting the latter at the lower edge. By this means salient effect is obtained.

Claim.—First, arranging or mounting photograph likenesses on a plane divergent from the plane of the background and foreground, substantially as and for the purposes herein set forth.

Second, the picture frame or case *A*, with the sloping back for holding the background and likeness on separate and divergent planes, substantially as and for the purpose described.

Third, the combination of parallel wheels revolving independently around the same axis, for the purpose of changing the grouping and scenery of the picture, and bringing different figures in juxtaposition successively, substantially as set forth.

61,470.—ISRAEL LONG, Terre Haute, Ind.—*Plow.*—January 22, 1867.—The plow beams occupy positions outside of the wheels and are attached to the axles. The position of the plows is controlled by levers within reach of the driver.

Claim.—First, the adjustable beams *F F*, occupying positions at opposite sides of the machine and outside of the wheels, and each adapted for the attachment of one or more plows, substantially as and for the purpose herein specified.

Second, the combination with the plows *G G'*, beams *F F*, of the collars *E E*, fitted to turn upon the ends of the axle, and adjusted by means of levers or otherwise, as and for the purpose specified.

Third, the combination of the plow beams *F F*, collars *E E*, levers *H*, and notched bars *I I*, all arranged and operating in the manner and for the purpose herein set forth.

Fourth, the adjustable double-tree *K*, in combination with the independent hounds *D D'*, whereby the draft may be transferred to either side of the machine, substantially as and for the purpose described.

61,471.—GEORGE H. SANBORN, Boston, Mass.—*Machine for Separating Iron from Sand.*—January 22, 1867.—The sand passes along a concave trough, being advanced therein and ultimately discharged by the oblique plates of magnetized iron which project from the periphery of the cylinder. The iron in the sand is collected by the magnets, brushed from them, and received in a drawer.

Claim.—The use of the cylinder *B*, when provided with the magnets *g g g*, one or more rows arranged substantially as and for the purposes described, in combination with the brush *C*, the hopper *D*, the spout *E*, the trough *F*, and the drawer *J*, substantially as and for the purposes set forth.

61,472.—GEORGE W. SCOLLAY, St. Louis, Mo.—*Embalming Bodies.*—January 22, 1867; antedated January 19, 1867.—Explained by the claims.

Claim.—First, embalming dead bodies or preserving them from putrefaction, by introducing an anti-septic gas or gases into the arterial or vascular system, substantially as described.

Second, embalming dead bodies or preserving them from putrefaction by the introduction of an antiseptic gas or gases into the bowels, stomach, or lungs, substantially as set forth.

Third, embalming dead bodies or preserving them from putrefaction by combining the internal and external application of the gases thereto, substantially in the manner described.

61,473.—JOHN SEEMAN and SILAS P. CATROW, Middletown, Ohio.—*Clothes Dryer.*—January 22, 1867.—A hinged slatted stand supports a frame whose two sections are separately pivoted, but may be interlocked with each other by scarf joints to hold them in horizontal position for a clothes rack.

Claim.—In combination with the hinged frame B, the frame E hung thereto and locking together, substantially as described for the purpose specified.

61,474.—JOHN S. SHAPFER, New York, N. Y.—*Petroleum Still.*—January 22, 1867.—The still is surrounded by brick-work, and contains a coil which communicates with a superheater. Steam is supplied to the superheater from a generator, and the products of combustion, after passing through the flues in the generator and superheater, pass into the space between the still and the brick-work surrounding it.

Claim.—First, the arrangement of the boiler, superheater and still, by which the heat from the boiler is made to pass through the superheater, and then through under and around the still.

Second, the arrangement of the furnaces L L, collar C, and dampers N N N N, in combination with the coil F, for superheated steam within the still.

Third, enclosing a petroleum still in brick-work with two side channels, one above and the other below the collar C, and a third beneath the still, substantially in the manner and for the purpose described.

Fourth, placing the eyeglass Q in a tube connected with the still, so that the operation within the still can be seen, although enclosed in brick walls with channels for smoke and hot air between the masonry and the still.

Fifth, the air pipe S, when applied to a petroleum still for regulating the vacuum.

61,475.—BENJAMIN SHIVERICK and THOMAS L. CALKINS, Philadelphia, Pa.—*Railroad Switch.*—January 22, 1867.—The switch lever is contained within an enclosure and so arranged as to obstruct the door and prevent egress until the lever is moved and switch returned to the main track. Combined with the movable rails is a sliding bar, having inclined shoulders, working in fixed and corresponding slots in such a manner that the switch is moved by the longitudinal movement of the bar.

Claim.—First, the switch lever I, contained within a building or enclosure, and arranged in respect to the door of the same, substantially as set forth.

Second, the combination and arrangement of the frog rails D and D', and switch rails E and E', the bar H, with its inclinations x and y , guiding plates G and J, and rods F and K, the whole being arranged for joint action, substantially as and for the purpose herein set forth.

61,476.—GEORGE SHOVE, Yarmouthport, Mass.—*Cranberry Gatherer.*—January 22, 1867.—The side plates and guard wires direct the plants to the rake, whose collected fruit is received in the pocket behind the rake head.

Claim.—The combination as well as the arrangement of the guard wires or guards c with the inclined comb or series of wires $b b b$.

Also, the combination as well as the arrangement of the guards c , the inclined comb, and the trough B.

Also, the combination as well as the arrangement of the side plates $a a$, the comb $b b b$, the guards $c c$, and the trough B, the whole being substantially as hereinbefore explained.

61,477.—EARL A. SMITH, Waterbury, Conn.—*Buckle.*—January 22, 1867.—The buckle has two frames, the larger of sheet metal, one side convexed to receive the minor frame of wire, closing around at one side and forming a joint. One end of the belt is fastened to the central bar, and the other end is passed upward and through the rear space of the buckle, over the central bar and downward and outward with the first end. The duplicate belt is bitten and held secure by its own tension.

Claim.—The combination of the bow part, Fig 4, with the lever part, Fig. 3, when they are constructed, connected, and fitted for use substantially as herein described and set forth.

61,478.—E. J. SMITH, Washington, D. C.—*Gridle or Cooking Utensil.*—January 22, 1867; antedated

January 10, 1867.—The two dish-shaped cast-iron plates have projecting ears, and when placed together form a hollow dish to contain nests for cakes, &c. The gridle is supported by its projecting ears, which form journals whereby it is turned over upon a rim placed upon the pot-hole of a stove or range.

Claim.—As a new article of manufacture the cooking utensil herein described, composed of plates B B', removable nests a , and support A, substantially as and for the purpose set forth.

61,479.—WILLIAM W. SMITH, Montrose, Pa.—*Transplanting Tray.*—January 22, 1867.—The tray has removable partitions, and is designed to hold a variety of plants taken up for house protection during winter. The shifting boards allow the plants to be inserted or removed without seriously affecting their roots.

Claim.—A plant tray, constructed substantially as described, for the propagation and growth of plants and flowers, as herein set forth.

61,480.—NATHAN H. SPAFFORD, Baltimore, Md.—*Machine for Combing and Assorting Bristles.*—January 22, 1867.—The bristles are first partially straightened upon an endless apron, and then fall directly upon another apron which passes the bristles to the comb. An automatic guard holds the bristles while the comb passes through them. Automatic jaws seize the bristles and draw them out, when by movable fingers they are carried to the receptacle, whose sides have a jarring motion to assist in gathering, straightening, and adjusting them.

Claim.—First, the endless apron and feed roller E e, with the picker E' on the shaft F, having a continuous motion as described, in combination with the intermitting endless apron and feed roller E' e', operated substantially as herein set forth, for the purpose described.

Second, the comb J, with its appurtenances, consisting of the comb stock and teeth stem J', gauge plate K, arms K', and spring L, all combined substantially as and for the purpose set forth.

Third, the manner of operating the comb J by means of the shaft g and crank wrist I, in combination with the sliding stem J' and its socket, and with the adjustable joint K and cams m, m, substantially as set forth; and this I claim whether the intermittent motion of the comb be derived from the action of the segment H in the pinion h, or from any equivalent device.

Fourth, the comb J and its appurtenances, in combination with the gauge plate M, operated by means of the rock shaft L, stud n, and toe n', or their equivalents, substantially as and for the purpose hereinbefore set forth.

Fifth, the jaws O, furnished with one or two yielding lips, and the levers O' O', in combination with the cams R and springs s, and either with or without the toggle-joint levers q q, all combined with and operating by means of the windlass P' and chains, or any equivalent device, substantially as and for the purpose set forth.

Sixth, the dogs u u on the shaft v', in combination with and operated by the tumbler t, slotted bar v', and lever v, or its equivalent, substantially in the manner and for the purpose described.

Seventh, the endless platform w w, arranged substantially as described, and having an intermittent motion in combination with the endless apron W' over the deposit box W, for the purpose set forth.

Eighth, the sweeping fingers x' x', operating as set forth, and by means substantially as described, in combination with the moving platform w w.

Ninth, the cam Y, rods y y, and studs y' y', when combined substantially as herein described, for the purpose of giving a tremulous lateral movement to the sides of the box W, for the object set forth.

Tenth, the combination of the jaws o with the comb J and the endless apron and feed roller E' e', each with their several appurtenances, arranged and operating substantially as and for the purpose set forth.

61,481.—JOHN STEPHENSON, New York, N. Y.—*Street Car.*—January 22, 1867.—An improved mode of hanging horse cars; the pedestals have pendant jaws connected by vertical yokes or bolts to the springs in such manner that motion is permitted in all directions. Housings are applied to the axle

boxes; clog arms connect the axle boxes with the truck.

Claim.—First, the pedestals B, formed or provided with pendant jaws *a a*, in combination with springs D, located at each side of the axle box, and applied or arranged in such a manner as to admit of a universal motion or pendulous vibration of the car body, substantially as shown and described.

Second, the inverted T, connecting the lower ends of the jaws *a a* of the pedestals, and arranged or applied in relation with the axle boxes, substantially as and for the purpose set forth.

Third, the truck M, constructed with its horizontal side bars not under the springs or pendants, but at the sides thereof, and free therefrom, and connected with the axle boxes C or the housings G by means of the arms N, substantially as described.

Fourth, the yoke, or housing G, with one or both of the arms as described and applied to the axle boxes C, either with or without the elastic substance *b'*, substantially as and for the purpose specified.

Fifth, the clog arms N and O, both or either of them connected with the axle boxes, or with the yokes or housings G, substantially as and for the purpose specified.

61,482.—JOHN STEPHENSON, New York, N. Y.—*Roof for Railroad Cars.*—January 22, 1867.—The canopy covering the platform is detachable, and a smaller canopy or "frontlet" covers the windows above the door.

Claim.—First, the canopy D for the covering of the platforms of cars constructed separately from the roof and body of the car, and attached thereto substantially as and for the purpose specified.

Second, the smaller canopy or "frontlet" F, applied to the ends of the car roof A, over the end ventilators C, substantially as and for the purpose set forth.

61,483.—F. STROTHMANN, Louisville, Ky., assignor to PETERS, WEBB & Co.—*Sounding Board for Pianos.*—January 22, 1867.—The vibratory action of certain parts of the sounding board is cut off and concentrated upon those portions where vibration is necessary to confer sonorosity. The isolation of the portion is attained by curved bars placed above and beneath the sounding board and secured to the frame.

Claim.—The improvements in sounding board for pianofortes and other musical instruments herein specified, the same consisting in separating or dividing the board, substantially as and for the purpose specified.

61,484.—SENIUS E. TOTTEH, Brooklyn, N. Y., assignor to himself and C. L. TOPLIFF.—*Can Opener.*—January 22, 1867.—The spur on the end affords a fulcrum to assist the cutting edge in penetrating the tin.

Claim.—A tool A, provided with a sharp-edged end *c*, from which projects a pointed tooth *d*, substantially as and for the purpose described.

61,485.—WILLIAM H. VAN GHESON, Passaic, N. J.—*Cork Screw.*—January 22, 1867.—The screw is rotated by pressing the upper sleeve upon the steep thread of the middle section. A catch fastens the thread and prevents the rotation when the cork is withdrawn in the usual manner.

Claim.—First, constructing the upper part B of the stem, in the form of a twist, spiral, or screw, turned in a direction the reverse of that of the lower part A, substantially as and for the purpose set forth.

Second, the combination with the stem A B, constructed substantially as described, of the tube E, plate H, or its equivalent, spring catch I, and handle F, the whole working together in the manner and to accomplish the result set forth.

61,486.—CHARLES VOGEL, New York, N. Y.—*Machine for Cutting Files.*—January 22, 1867.—The devices consist of mechanism for feeding the file blank to the cutter; a file bed so constructed that files of varying sizes can be secured therein; a cutter so hung that the force with which it strikes the file blank can be readily adjusted to the depth of cut required; and of a pressure foot bearing upon the file blank just in front of the cutter to hold the blank upon its bed; this pressure foot is capable of adjustment according to the amount of pressure required.

Claim.—First, the sliding carriage D, for the file blank, arranged to move forward and backward upon the bed piece A, or its equivalent, when operated through a driving shaft Z, to which it is connected by a shaft screw-cut N, screw-threaded shaft O, gears P² and Q, shaft R, having ratchet wheel S, with which engages a pawl T, that is operated through a pitman rod V, hung to an adjustable box W of the crank arm X at one end of the shaft Z, substantially as and for the purpose described.

Second, the combination with the file bed or block of the notched plate K, for receiving the tang of the file, and side clutches or jaws L or M, each arranged and applied to the said block, so as to be operated substantially as and for the purpose described.

Third, the springs O², constructed and arranged as described in combination with the lifting beam D² and eccentric or cam pulleys T², substantially as and for the purpose described.

Fourth, the combination with one or more of the springs O² of the lifting arm W², arranged with regard to the same as and for the purpose specified.

Fifth, the arm J³, attached to file carriage D, in combination with the lever G³, connection rod H³, catch L³ and m³, and notched arm e³ of the beam shaft O³, when all arranged and connected together so as to be operated by the arm J³, substantially as described and for the purpose specified.

61,487.—RUDOLPH VOLLSCHWITZ, New York, N. Y.—*Boot and Shoe.*—January 22, 1867.—The flexible strip is attached below the bottom of the gusset, and is of a width equal to the length of the openings in the zigzag loops attached to the edges of the upper. By pulling on the cord the flexible strip is drawn through the loops and fastens the boot.

Claim.—The combination of a flexible wedge B, with zigzag loops *a*, attached to the opposite edges of the slit or opening in a shoe or gaiter boot, substantially as and for the purpose described.

61,488.—JAMES WALKER, Cincinnati, Ohio.—*Cork Extractor.*—January 22, 1867.—The collar is adjusted by means of different sized thimbles to the neck of the bottle, which stands in a frame, furnished with telescopic sliding ports. A corkscrew is then turned into the cork by rotating, a tube fitting in the above mentioned collar. A lever cam then raises the tube, corkscrew, and cork.

Claim.—First, the arrangement of an adjustable guide E, cylindrical stock E, collar I, crank H, and cam-headed lever J J' K, for the purpose set forth.

Second, the provision, in combination with the above, of the thimbles L, of equal external but dissimilar interior diameters, as and for the purpose explained.

61,489.—J. H. WALKER, Worcester, Mass.—*Machine for Cutting Soles.*—January 22, 1867.—The sole leather is spread upon the table under the platen. The cutting block having been adjusted, the die is placed upon the leather under the platen. The treadle is then depressed, throwing the clutch into operation, when motion is imparted to the shaft and the platen forced down on the die, which cuts a sole from the leather.

Claim.—First, the combination and arrangement of the broad table D for supporting the side of leather, with the adjustable bed or cutting block L, and the reciprocating platen K, substantially as and for the purposes set forth.

Second, the combination and arrangement with the table D, bed L, platen K, and shaft J, of the peculiarly constructed frame composed of the parts marked E H H' and G, substantially as described.

61,490.—LEWIS WEAVER, Canton, Ohio.—*Hand Corn Planter.*—January 22, 1867.—A tubular hopper on the hoe handle has an opening and a sliding gate, which is moved by pressure upon the piston, depositing a graduated amount of seed upon the ground.

Claim.—The bar L, in connection with the valve standard C and opening N, substantially in the manner and for the purpose specified.

61,491.—GEORGE WEBB, Williamsport, Pa.—*Railroad Chair.*—January 22, 1867.—The flanged gibs rest upon the base of the rail, and are secured in the slots of the chair by split keys.

Claim.—First, the joint plate A, resting on the ties C, in combination with the flanged clamp D, and rail B, constructed and secured in the manner as and for the purpose specified.

Second, the combination of the joint plate A, flanged clamp D, gibs *d*, split keys *e*, as and for the purpose specified.

61,492.—J. R. WEISIGER, Danville, Ky.—*Pump.*—January 22, 1867.—The pump stock has three chambers and three connecting pipes; each of the latter has a ball valve and seat, and the lower partition of the tube is similarly furnished. The action is double, two of the valves being induction and two eduction.

Claim.—The pump cylinder or tube A, provided with a piston B, partition plate D, and valve G, in combination with the tubes H J L, having valves I K M respectively, when all arranged with regard to each other so as to operate substantially in the manner and for the purpose described.

61,493.—THOMAS J. WELLS, St. Anthony, Minn.—*Peat Car.*—January 22, 1867.—The rectangular frame is mounted on wheels, and has a series of shelves pivoted at one side and resting at the other side upon intervening posts. Shoulders formed upon the up-rights serve to support the legs when the shelves are raised to an inclined position.

Claim.—A car for transporting and drying peat, constructed with a series of frames, arranged substantially in the manner as herein shown and described.

61,494.—GEORGE C. WESTOVER, Paducah, Ky.—*Churn and Egg Beater Combined.*—January 22, 1867.—The vertical shaft has radial wings and spiral beaters with serrated edges, and the interior of the cylinder has horizontal and vertical beaters to arrest the vortical motion of the liquid.

Claim.—The construction and combination of the churn with its devices G H I J L M, as herein described and for the purposes set forth.

61,495.—GEORGE WILLIAM WHITE, Greensburg, Ind.—*Lime Kiln.*—January 22, 1867.—The kiln has three or more doors in front; the rear has about half the area of the front; the partition near the rear has apertures for the passage of smoke.

Claim.—The horizontal taper lime kiln A, when constructed as described, and provided with the doors *b*, and dividing perforated partition C, in the manner and for the purposes set forth.

61,496.—ISAAC WHITNEY, Dayton, Ohio.—*Washing Machine.*—January 22, 1867.—The corrugated roller has its bearings in-side bars which are supported by elastic bands from the top of the tub. The cylindrical brush revolves the corrugated roll, is driven by the treadle and a band, and gathers soap from the detachable band above.

Claim.—First, the hinged soaping box I, with its bars *n n*, and removable trough L, adapted to contain either bar or soft soap, substantially as described. Second, the combination of the brush roller F, with the corrugated wooden roller E, substantially as described.

Third, in combination with the brush roller F, and corrugated wooden roller E, the treadle *k*, substantially as and for the purpose set forth.

Fourth, the arms C, operating independently of each other by means of the elastic bands D D, in combination with the corrugated roller E, in the manner and for the purposes described.

Fifth, the combination of the corrugated wooden roller E, brush roller F, treadle *k*, gear-wheels H *c*, arms C, springs D, and soaping cover I, and troughs K and L, substantially as and for the purposes set forth.

61,497.—L. C. WING, Concord, Mass., and A. R. BRADEN, Waterboro, Me.—*Window Fastener.*—January 22, 1867.—The short arm is attached to the blind; the pivoted perforated plate is attached to the window sill; two toggle arms unite the two, and a spring bolt locks the fastener at the required adjustment.

Claim.—An improved window blind fastener, formed by the combination of the arm A, bars B and C, perforated plate D, and spring bolt E, with each other,

substantially as herein shown and described and for the purpose set forth.

61,498.—LEONARD WOODWORTH, Morrison, Ill.—*Clothes Dryer.*—January 22, 1867.—The \wedge -shaped standards are hinged at the apexes, and are connected by pivoted bars so that not only may the legs of the standards be approached, but the middle pair may be raised, and the whole apparatus budded together into a cluster, occupying small space.

Claim.—The braces D D, in combination with the standards A A B B B B, and bars *e e e e*, substantially as and for the purpose set forth.

61,499.—NATHAN WRIGHT, Jersey City, N. J.—*Tool for Cutting off Boiler Tubes.*—January 22, 1867.—The pointed cutter is, by means of an eccentric, thrust radially out from the turning shaft through a mortise in a sleeve which surrounds the shaft, and through the wall of the tube; a stub upon the shaft then comes in contact with a shoulder on the end of the sleeve, by which, the shaft continuing to turn, the cutter is forced around, and thus made to sever the tube.

Claim.—A tool for dividing or cutting off boiler and other tubes, constructed substantially as described, or in any other equivalent manner, so that a thrusting cut is given to the tool, and whereby the continuance of the same action that thrusts the cutter through the tube also serves to complete the operation of severing the same by a draw cut, essentially as specified.

61,500.—WILLIAM H. WYLLY, Savannah, Ga.—*Life Boat.*—January 22, 1867.—The keel is raised into a stem at each end; the rudder being attached optionally at either end of the boat. The sides consist of elastic, air-proof bags whose edges are attached to the keel, and which are inflated to increase the buoyancy. The boat is capable of collapsing for storage, the row-lock and seat supports being hinged to the keel.

Claim.—The boat consisting of the gutta-percha or elastic sides A B, keel C, copper covering *b*, flexible tube *c*, force pumps D, bars I, seats J, supporting bars *ff'*, rudder D', when all are constructed and arranged as herein set forth and for the purpose specified.

61,501.—JOHN ASHWORTH, North Andover, Mass.—*Eye of Wire Heddles for Looms.*—January 29, 1867.—The eye is formed of two interlocking loops so as to present a continued surface to the threads on the points of strains, and prevent its running into the angle.

Claim.—A wire heddle eye for loom harnesses, made by interlocking loops of two wires, substantially as set forth.

61,502.—CHARLES W. BAILEY, Boston, Mass.—*Boot and Shoe.*—January 29, 1867.—The catches upon a metal plate attached to the shoe bottom enter holes in a plate on the upper surface of the heel, and are secured by a spring plate.

Claim.—The heel latch C, made as described and represented.

Also, the arrangement of the latch, its spring, the cap and catch plates, their catch holes and catches, with each other, and a heel and sole, as specified.

61,503.—HENRY D. BARNES, New Haven, Conn.—*Shingle Machine.*—January 29, 1867.—The knife has a draw cut. The stuff rests against a block whose oscillation is limited by set screws. The shingle passes between the knife and a spring so that the knife on its upward stroke carries the shingle with it to be discharged by the next shingle.

Claim.—The combination of the cutter D, and the adjustable guide H, and the spring I, constructed and arranged to operate substantially in the manner described.

61,504.—WARREN S. BARTLE, Newark, N. Y.—*Bedstead Fastening.*—January 29, 1867.—A hook on the end of a screw bolt traverses an end cleat on the rail and engages a transverse pin within a recess in the post.

Claim.—The combination of the appended wrench *d* and the nut *c* with the hook *a*, all as described and set forth in the foregoing specification.

61,505.—BURROUGHS BEACH, West Meriden, Conn.—*Sash Fastener.*—January 29, 1867.—The ratchet face of a cam within the jamb engages the edge of the sash to sustain it. The cam is depressed by a spiral spring, or raised by a lever. The latter has an arm which engages a notch on the cam to lock it.

Claim.—First, the combination of the lever E, and the cam D, constructed respectively with arms I and F, and so as to operate substantially in the manner described.

Second, the combination of the lever E and cam D, when constructed with the lip f, and the notches c, so as to operate to lock the cam, substantially in the manner described.

61,506.—DARIUS BEARDSLEY, Ithaca, N. Y.—*Exhausting Air from Fruit Cans by Steam.*—January 29, 1867.—The cylindrical vessel is surrounded by an annular chamber closed at the top and open at the bottom. Within the mouth of this vessel is secured a bulging chamber extending partly into the vessel above, within which water is placed and heated by means of a lamp. When the vessel and chamber are filled with steam the apparatus is inverted upon the cover of a fruit jar. Cold water is then poured into the annular chamber, which condenses the steam and creates a partial vacuum.

Claim.—First, the herein described method of exhausting air from fruit cans or jars by the condensing of steam.

Second, the double convex chamber extending into the steam chamber E, for the purposes specified.

61,507.—JACOB BECK, Williamsville, Ill.—*Wagon Seat.*—January 29, 1867.—The seat hooks which catch upon the side of the box are attached to the seat by rubber springs.

Claim.—The wagon seat A, provided with suspension rubber springs a, in combination with a wagon box provided with two or more rods c, substantially as and for the purposes specified.

61,508.—THEOPHILUS F. BERTRAND and PETER SAMES, Rockford, Ill.—*Plow.*—January 29, 1867.—The colter has a limited oscillation and is vertically adjustable in its frame, which is attached to the side of the beam.

Claim.—First, a vibrating colter, when limited in its vibrations, substantially in the manner and for the purpose set forth.

Second, adjusting the colter vertically, substantially in the manner and for the purpose described.

61,509.—LEWIS T. BLAKE, New Haven, Conn.—*Milking Cows.*—January 29, 1867.—Revolving rolls on triangular revolving frames operate in combination with recessed spring plates to expel the milk from the teats by a grasping, stripping, and releasing action.

Claim.—The combination of one or more sets of rolls c or d, rotated in the manner described with their respective pressure plates G or H, substantially as and for the purpose specified.

61,510.—ALONZO T. BOON, Galesburg, Ill.—*Window Sash Supporter.*—January 29, 1867.—An upwardly, laterally diminishing recess in the sash edge contains a free friction roller to sustain the sash at any altitude. A pivoted lever has a bent end to enter the recess and hold down the roller, and a straight arm to fasten the sash by engaging a notch in the jamb.

Claim.—The curved lever C, as constructed and arranged to operate on the pivot d, in combination with the right angled box a, for the control of the roller therein and its combination with the notches f to serve as a fastener, substantially in the manner as herein described.

61,511.—WILLIAM BRADLEY, Lynn, Mass.—*Nutmeg Grater.*—January 29, 1867.—The nutmeg box consists of two cylinders, the corresponding openings through which are closed by a partial revolution of the inner one. The grating plate may be slipped out for renewal.

Claim.—The combination and arrangement of the box A, and its rotary tube B, with the spout and rasping plate as specified, such box and tube being made with openings through their sides and with a stopping lip b,

and the plate D being applied to the space C, substantially as described.

61,512.—MARTIN BRENNEMAN, East Donegal Township, Pa., assignor to himself and SAMUEL EBY, Elizabethtown, Pa.—*Cultivator.*—January 29, 1867.—Convertible into a plow, harrow, cultivator, or scraper.

Claim.—The special arrangement and construction of the frame A A' B C D, in combination with the reversible handles E, and holes 10 12 13 14 and 15, adapted for the reception and application of the axle and wheels L M, scrapers O P, all constructed and operating in the manner and for the purpose specified.

61,513.—IRA S. BROWN and CHARLES N. BROWN, Providence, R. I., assignors to themselves and J. MASON GROSS, same place.—*Saw.*—January 29, 1867.—The shank of the tooth extends into a recess in the saw plate, so that a slide carrying a pin enters into a slot in each tooth, which, in connection with projections on the tooth that overlock one another, holds the whole series of teeth in place.

Claim.—First, a saw tooth B, so constructed as to interlock with the tooth on either side thereof, and mutually sustain and be sustained by such adjacent teeth, substantially in the manner herein set forth.

Second, the arrangement of the locking device F f G, or equivalent mechanism, by which several or all of the teeth may be fastened by one operation, substantially as above described.

61,514.—EBENEZER BUEL, Silver Creek, N. Y.—*Bee-Feeding Apparatus.*—January 29, 1867.—The valve regulates the entrance of bees. Explained by the claims and illustration.

Claim.—First, the drawers D D, for containing material for the bees to feed upon, in combination with the box A.

Second, the float W, of perforated paper, prepared by saturation with beeswax and buoyed with cork or other light substance.

Third, the introduction of a current of pure water into the apparatus or within access of the bees without their passing out of the hive into the open air, either under a float or through a spout with ribbed or corrugated bottom.

Fourth, the valve V, either arranged as described, or in a fixed position.

Fifth, the apparatus for conveying water in a continued current within access of the bees in the feeding apparatus.

Sixth, the coating of a bee-feeding apparatus with beeswax, thus rendering it the better adapted to the habits and tastes of the bee.

Seventh, in combination with the box A, the drawers D, the float W, of perforated paper, the valve V, the provision for introducing a current of pure water to pass through the apparatus, the apparatus for conveying the water, and the coating of beeswax on all the inner surfaces of the apparatus, when constructed and used for the purposes set forth.

61,515.—WILLIAM C. CHAMBERLAIN, Dubuque, Iowa.—*Churn.*—January 29, 1867.—The winged dashers have slotted stays and are pivoted to vertically revolving arms. The socketed angle irons afford attachment for the feet, and the inside grooved strips attached to the cover arrest and return the impinging stream of milk.

Claim.—First, the construction of the dasher of a churn of cross arms F F', having secured to them the pieces g g, and hinged to them the blades h h, the latter being attached by their free ends to the arms by means of slotted stays j j, and pins i i, substantially in the manner herein described and for the purpose specified.

Second, the socketed angle a a', constructed and applied to the churn box, substantially as described.

Third, the curved and grooved strips J j, applied to the cover G, so as to operate as set forth.

61,516.—ORLANDO CLARKE, Rockford, Ill., assignor to himself and ISAAC UTTER, same place.—*Sugar Cane Mill.*—January 29, 1867; antedated January 18, 1867.—The can is fed by a narrowing spout between the rolls; the juice is received in a pan, the rolls are kept clean by a scraper and the bagasse delivered onto a discharge board.

Claim.—The arrangement in a cane mill, substan-

tially as described of the frame, the rollers, the feeding tube, the pan, and the scraper, for the purpose set forth.

61,517.—CHARLES COLAHAN, Alton, Ill., assignor to himself and JOHN FEITIG.—*Baling Cotton.*—January 29, 1867.—The upright box has doors upon the side for removing the bale. The inside at the lower end has a follower, retained at any desired point by notches. The cotton is pressed by a weight to the desired density, when the weight is removed and the cords tied.

Claim.—First, the weight C, and follower E, in combination with the spring g, blocks e, and notches b, substantially as and for the purpose set forth.

Second, the arrangement of the casing or frame A, doors B, pulley B', rope D, and weight C, in combination with the notches b, follower E, provided with blocks e, and spring g, operating conjointly, substantially as and for the purpose set forth.

61,518.—JESSE D. COTRELL, Milford, Mass.—*Spindle Bolster for Spinning Frames.*—January 29, 1867.—The helical bushing is removable for cleaning, repairs, &c., and when placed in the bolster, fits a spiral groove therein; the cap holds it in place and allows of its removal. The notch opens a communication to an oil cup beneath.

Claim.—The combination of the separate helical bushing with the bolster, such bushing to be used therein, substantially in the manner and for the purpose described.

Also, the bolster as made with a chamber a and a screw cap C, or its equivalent, as specified, to receive and hold a helical bushing, to be arranged within the bolster and used as and for the purposes explained.

Also, the bolster as made with the helical bushing-receiving chamber, and with a passage or notch in the lower part thereof, to lead out of the said chamber and into the oil cup when the bolster is arranged upon such a cup, as specified.

61,519.—GEORGE COX, Reading, Pa., assignor to F. WILCOX and G. L. JENKINS.—*Wadding Waste Machine.*—January 29, 1867.—This machine is intended to utilize the waste usually lost in making wadding from ordinary cotton waste. It is placed in the carding room about a foot above the floor, so that the same endless apron that takes the web from the carding machines shall run under the inclined passage and take also the waste from the machine. A drawer receives the dirt and sand.

Claim.—First, the combination of the picker cylinder B, enclosed passage W, feed rollers F G, endless apron C, and drawer X, or their equivalents, respectively in the manner and for the purpose substantially as shown and described.

Second, the parts last mentioned, in combination with the gearing for giving motion to the feed, substantially as shown and described.

61,520.—THOMAS CROSSLEY, Bridgeport, Conn.—*Finishing Felted and other Goods and Fabrics.*—January 29, 1867.—The fabric is passed between heated rolls, the one plain and the other corrugated.

Claim.—A woven or felted cloth of wool, fur, silk, cotton, or other material, either dyed, colored, or printed, and subsequently corrugated as described, as a new article of manufacture.

61,521.—HENRY DAVIS, Abingdon, Ill.—*Self-Adjusting Trestle.*—January 29, 1867.—The extension beam of the trestle is supported on slotted standards which are vertically adjustable in the legs and then secured by clamp screws. The extension braces are adjustable to suit the varying conditions.

Claim.—The construction and arrangement of a trestle, in the manner and for the purpose herein described.

61,522.—DANIEL M. DONEHO, Beaver, Pa.—*Safety Bridle.*—January 29, 1867.—The ring of the bit is suspended on each side from a ring on the cheek strap by a running strap, which connected primarily to the bit ring passes up and through the cheek ring; the running strap is then carried down through the bit ring and connected to a safety rein; the latter is also connected to the gag rein, so that pulling upon the safety rein shortens up the gag rein, and at the

same time draws up the bit toward the ring on the cheek strap.

Claim.—The strap G connecting the bit ring F and safety rein I through the cheek strap ring D, in combination with the gag or riding rein K, all arranged to operate substantially as and for the purpose specified.

61,523.—JAMES DOWD, Boston, Mass.—*Wagon.*—January 29, 1867.—The platform is arched upwardly in front where it rests upon the front axle, giving the front carriage room to turn short; the seat and foot board are supported upon the elevated portion attached to the platform.

Claim.—First, the improved jigger, as made with the neck or arm B, combined and arranged with its platform A, the sweep frames, their supporting springs and front axle, the whole being substantially as described.

Second, the application of the driver's seat, or the same and the foot rest, to the arm or neck B, extending from the platform A and over the front wheel sweep frames and axle, as set forth.

61,524.—JOHN S. EDGAR, Janesville, Wis.—*Portable Fence.*—January 29, 1867.—The post is divided longitudinally, and each portion has a metallic flanged foot, the latter being hinged together. The sections of post are spread and the feet forced in; the approach of the portions of the post spreads the feet into their holding position.

Claim.—First, the feet B B, when constructed and used substantially as and for the purpose set forth.

Second, the combination of the feet B B, sections A A', and bars C, substantially as and for the purpose set forth.

61,525.—HORACE EVERETT, Philadelphia, Pa.—*Joint for Tinned Iron Vessels.*—January 29, 1867.—The edge of the upturned flange of the bottom is spun into and soldered in a circumferential depression in the cylindrical portion of the vessel.

Claim.—The within-described joint for tinned plate vessels, that is to say, the flange b and channel x on the plate B, and the flange a on the plate A, projecting partly across and into the said channel, and there soldered all as set forth.

61,526.—FRANKLIN EWER, Honeoye Falls, N. Y.—*Gate.*—January 29, 1867.—The gate swings on a vertical axis upon the end of a sliding panel which is retracted to bring the gate broadside against the end of the fence. A bar pivoted to the post and one end of the gate vibrates the latter as the panel is slipped longitudinally. The catch is made in two sections with a mid-link and engages posts on each side of the carriage way.

Claim.—First, the combination of a swinging gate A with a sliding section or panel B, substantially as described and for the purpose specified.

Second, the combination with a swinging gate A and sliding section or panel B of the connecting arm D, operating substantially as and for the purpose set forth.

Third, the combination of the double-acting catch n n with the swinging gate A and sliding section or panel B, operating in the manner and for the purpose substantially as described.

61,527.—HENRY FASSMAN, New Orleans, La.—*Cotton Bale Tie.*—January 29, 1867.—The shank of the button is inserted through openings in the respective ends of the hoop, and the said ends are drawn against the shank by the expansion of the cotton, while the inner bent flange prevents retraction.

Claim.—A hoop lock constructed in the shape of a hook, and of a flat form with legs a b, of different lengths, and a short curve or neck c, and with or without a shoulder d, substantially as and for the purpose set forth.

61,528.—JACOB FELBER, St. Louis, Mo.—*Governor Cut-off for Steam Engines.*—January 29, 1867.—The variable cam on the stem, which is raised or depressed by the vertical motions of the governor balls, makes two revolutions to each stroke of the engine. The two distinct fields of the cam have different radii, and act upon the short arm of a lever connected at its other end to the stem of a balanced cylin-

der valve which governs the admission of steam to the cylinder.

Claim.—First, the cam C¹, when constructed substantially as herein set forth, so as to produce a variable cut-off.

Second, the construction and arrangement of the balanced cut-off valve E³, as described.

Third, the adjusting nut E, in combination with the valve rod E¹, for the purpose of regulating the opening of the ports e¹, as herein set forth.

Fourth, the combination and arrangement of the cam C¹, the lever D, and the valve E³, substantially as herein set forth.

61,529.—J. R. FERGUSSON, Brooklyn, N. Y.—*Refrigerator.*—January 29, 1867.—A vertical channel divides the refrigerator into two separate chambers, each partitioned into three receptacles. Air circulates between the interior and exterior walls. Two front doors and one on top afford access.

Claim.—The refrigerator box, with its openings S' and t, doors C and J, constructed as set forth, receptacles M S C and R, interior walls P P, channel D, and ice box E, all arranged and used in the manner substantially as herein specified.

61,530.—F. G. FOWLER, Springfield, Ill.—*Wind-mill.*—January 29, 1867.—The wheel has vertical pivoted wings, which are feathered by connection to a stationary eccentric so as to present oblique surfaces to the wind; the vane is attached to the shaft of the eccentric, which is caused to occupy a position corresponding with the direction from which the wind blows.

Claim.—First, the eccentric e, in combination with the sails S, hung on pivots placed on their vertical central line, and revolving in the manner and for the purpose substantially as described.

Second, the vane V, in combination with the eccentric e, and sails S, arranged in the manner and for the purpose substantially as shown.

61,531.—CHARLES FREETSMA, Paterson, N. J.—*Pattern Chart.*—January 29, 1867.—Each block is pivoted in its place in the frame, and its faces are painted with distinct colors. These are exposed to view in such manner as to constitute a pattern or design.

Claim.—First, a pattern chart composed of a series of movable blocks, the different sides of which are colored in different colors, substantially as and for the purpose herein described.

Second, the combination of the covering rods c with the polygonal pattern blocks, substantially as and for the purpose herein set forth.

61,532.—JOHN GOMERSALL, Mansfield, Mass., assignor to himself and E. WINSLOW, West Roxbury, Mass.—*Composition for Oiling Wool.*—January 29, 1867.—Composed of 84 galls. salt water; 7½ lbs. aqua-ammonia; 4 galls. lard oil; 8 oz. Irish moss; 2 ½ lbs. borax, and 2½ lbs. sal-soda; incorporate and strain.

Claim.—The within-described composition for dressing wool or shoddy, consisting of the ingredients mixed in the proportions substantially as set forth.

61,533.—E. A. GOODES and E. L. MILLER, Philadelphia, Pa., assignees by mesne assignments to THE AMERICAN BUTTON-HOLE, CORDING, BRAIDING, AND EMBROIDERING MACHINE COMPANY.—*Button-holding Sewing Machine.*—January 29, 1867.—The eye-pointed perforating needle vibrates in a plane slightly inclined; the looper is on a horizontal axis and passes up from beneath the cloth plate, through and over the edge of the button hole; the path traversed by the needle thus crosses that traversed by the looper.

Claim.—The arrangement and combination herein described of the inclined vibrating needle arm E, its eye-pointed needle n, and the vibrating loopholder or carrier b, for the purpose specified.

61,534.—HENRY P. GREGG, Roscoe, Ohio.—*Seeding Machine.*—January 29, 1867.—The measuring cup is filled as it goes down, and the grain that had passed the opening at the top is dropped from the valve on to the ground. In the upward movement grain is admitted into the valve box from the measuring cup after it is raised out of the hopper, and the upper valve closes before the measuring cup returns into the grain.

Claim.—The valve box B, valve C, valve seat and measuring cup D.

61,535.—JOHN Y. HAMILTON, Clinton, Mass., assignor to GEORGE CROMPTON, Worcester, Mass.—*Shuttle for Narrow Ware Looms.*—January 29, 1867.—In the shuttle is a spring to create tension upon the bobbin; the pirn is so hinged as to be swung out from the shuttle without removal therefrom for reception or change of the bobbin. A spring is applied to the hinged pirn to keep it in normal position.

Claim.—In connection with a device for creating tension upon the bobbin, the arrangement of the pirn to swing, and the application of the spring to keep the pirn in normal position with respect to the shuttle, substantially as described.

61,536.—AUGUSTUS HARRINGTON, Warsaw, N. Y.—*Pipe for Wells.*—January 29, 1867.—The tube has a spear at its lower end; its series of perforations are lined with wire cloth and separated by ribs.

Claim.—The tube A, having a series of four or more perforations a, said perforations being lined with wire screens x, in combination with the ribs b and spear B, when arranged in the manner substantially as and for the purposes specified.

61,537.—WILLIAM HARRIS and CLINTON BROWNING, Rush Run, Ohio.—*Nut.*—January 29, 1867.—A spring stop attached to the nut engages the plate on which the nut is screwed and prevents the unscrewing of the latter except by a tool which raises the stop.

Claim.—The nut A, in combination with the stop D, provided with a spring point f, constructed and arranged to operate substantially as and for the purpose set forth.

61,538.—C. R. HARVEY, New York, N. Y.—*Frame, &c., for Hot Air Registers.*—January 29, 1867.—The register frame has a metallic flanged exterior by which it is supported in a shallow rabbet of the floor, and an interior made of cement or similar incombustible, comparatively non-conducting material.

Claim.—As a new article of manufacture, a compound register frame, consisting of an exterior metallic supporting frame, provided with an exterior flange, as described, and an interior frame composed of an incombustible, bad conducting material, substantially such as is described, applied to and supported by the exterior frame, substantially as set forth.

61,539.—OREN T. HAYES, Hastings, Minn.—*Carpenter's Square.*—January 29, 1867.—Near the angle of the square are slots for the pivotal attachment of plates, which may be set at any angle with the inner and outer edges of the square, for the purpose of laying off angles of work or miters.

Claim.—A square provided with a graduated scale of angles, and one or more curved slots at the intersection of its limbs for the attachment of an adjustable plate B, applied and operating substantially as and for the purpose specified.

61,540.—EDWARD A. HILL, Chicago, Ill.—*Apparatus for Instruction in Telegraphing.*—January 29, 1867.—The apparatus is arranged to vary the strength of the current by passing it through a greater or less number of battery cups, or by throwing on ground wires or escapes at any part of the circuit. The batteries are arranged in the center of the apparatus for the inspection of the instructor, while practically at the ends of the line, as in actual practice.

Claim.—First, the combination of the two batteries C C with a series of wires x y z, and their terminal points a b c, and the movable arms D D, connected with a wire q, or its equivalent, arranged and operating substantially as herein specified and shown.

Second, the employment of a series of escape wires r s t u and their terminal arms M N O P, in combination with a plate or plates L connected with a ground wire Q, arranged and operating substantially as herein shown and described.

Third, the arrangement of the two terminal batteries C C with the circuit through the same, so as to be placed at the center of the line upon each side of the instructor's desk, substantially as and for the purposes shown and set forth.

61,541.—B. HUBBE, New York, N. Y.—*Rotary Lard Press.*—January 29, 1867.—The oil is separated from the lard by centrifugal force. The grated cylinder is on a vertical shaft and has a solid bottom and a lining of fabric.

Claim.—First, the lining E made of cloth or other suitable fabric of sufficiently fine texture for the purpose, in combination with the cylinder A, constructed and operating in the manner set forth.

Second, the annular grate D, lining E, and rings *i*, in combination with the bottom F and shaft B, constructed and operating substantially as and for the purpose described.

61,542.—EDWARD B. JUCKET, Roxbury, Mass.—*Steam Generator.*—January 29, 1867.—The cylindrical shell contains a fire box, below which is an annular water chamber connected with the water space above the fire box by a series of vertical concentric tubes, which traverse the fire box and through which the water circulates. From the crown sheet of the fire box a series of smoke tubes pass up to a chamber above, which receives the products of combustion and passes them to the chimney.

Claim.—The combination and arrangement of the series of tubes E; the fireplace A, the annular chamber G, the water vessel or drum F, the pipes D, the drum B, and the discharge pipe C, the whole being applied together substantially in the manner and so as to operate as hereinbefore set forth.

61,543.—JOHN F. KELLER, Greencastle, Pa.—*Seed Drill.*—January 29, 1867.—The square openings are made in the adjacent edges of two strips which are singly or collectively attached to the operating lever. The regulating plates and the edges of the slides are made sharp to prevent clogging. By withdrawing one slide from operation the opening is diminished but is left square.

Claim.—First, enlarging and diminishing both the length and width of the feed holes of seed planters, in order to prevent clogging and secure uniformity of discharge, whether slow or fast, substantially as set forth.

Second, the arrangement and combination of two pieces M and M' of the feed slide, substantially in the manner and for the purpose described.

Third, the sharp-edged plates R, (fig. 5.) in combination with the sharp edges of the slides M M', substantially as set forth.

Fourth, the use of the half bolt (fig. 7) for locking the strip M to the lever O, substantially as set forth.

61,544.—JOHN F. KELLER, Greencastle, Pa.—*Seed Planter.*—January 29, 1867.—The axle arms are secured by bed plates to the frame and strengthen the spindles against the strain incident to driving the gear wheels by means of the hub. The gears which rotate the agitator of the guano attachment are enclosed in a boxing.

Claim.—First, the combination of the gear wheel L with the pinion M and gear wheel N, substantially as set forth.

Second, the peculiar axle O, with the bed plate O', for fastening the axle to the frame, substantially as described.

Third, protecting the gear wheels of wheat drills or seed planters against sticks, weeds, and other obstructions by means of a box or its equivalent, substantially as described.

61,545.—JOHN F. KELLER, Greencastle, Pa.—*Seed Planter.*—January 29, 1867.—An improvement on his patent of Sept. 26, 1865. The share is pivoted to a draft bar and its upper end pivoted by a link and rock bar to a cylindrical rubber spring, which is placed between disks and condensed by the backward vibration of the share, which it returns to place when the obstacle is passed.

Claim.—First, in the arrangement of a flexible boot or shovel plow with a lever and spring, placing the fulcrum of the lever between the boot and the spring, substantially in the manner and for the purposes set forth.

Second, the vibrating seat I for supporting the spring, in combination with the lever, substantially as set forth.

Third, the use of the washer W, or its equivalent,

in combination with the cap S and spring I, substantially as described.

Fourth, the above-described arrangement of the thumb screw T and guide pin P, for compressing the spring, and thus increasing the tension of the same, substantially as specified.

61,546.—C. W. THEODORE KRAUSCH, Philadelphia, Pa.—*Increasing Traction in Locomotives.*—January 29, 1867.—A train of cars is attached to the long arm of a coupling bar, the short arm of which is secured to a fixed point upon the locomotive. The strain produced upon the coupling bar will produce the pressure of the lever upon a roller serving as a fulcrum and thus increase the traction.

Claim.—First, the means, substantially as herein described, of increasing adhesion of driving wheels of locomotive engines upon their rails, consisting in transferring a portion of the weight of a car or engine tender to the locomotive frame by the act of starting the locomotive, substantially as described.

Second, the employment of steam or other power, in conjunction with a coupling lever S, or its equivalent, for the purpose of enabling the engineer to increase or diminish the weight upon the engine frame at pleasure, substantially as described.

61,547.—FREDERICK LOOS, Germantown, Pa.—*Button.*—January 29, 1867.—The shank of the button is threaded internally and is traversed by a screw inserted from the back, and with its head bearing against a disk, whose edges rest against the cloth.

Claim.—The combination of the screw c, concave-convex disk b, and serrated shank b a, the said serrated shank and disk being of unequal diameter, all substantially as described for the purpose set forth.

61,548.—SAMUEL LOVE, Indianapolis, Ind.—*Railroad Bumping Post.*—January 29, 1867.—The three members, sills, posts, and braces, are bolted together and a part of the strain transferred from the posts and thrown upon the sill beneath the locomotive.

Claim.—The arrangement of the ground sills, 4 4, in relation to the bumping post, its timbers and braces, 1 2 3, in such a manner so that the ground sills shall extend under the railroad track, receiving thereupon the weight of the car, in the manner and for the purpose herein set forth.

61,549.—WILLIAM H. MAY, Bridgeport, Conn., assignor to THE ORNAMENTAL WOOD MANUFACTURING COMPANY, same place.—*Initiation of Open Carving in Wood.*—January 29, 1867.—The wood is stamped on the face and then the back cut away to a point beyond the bottom of the depression, leaving the device open.

Claim.—As a new manufacture, imitations of open carvings in wood made by first subjecting the wood to a pressure of dies, and subsequently cutting the wood away at the back, as set forth.

61,550.—GEORGE L. MAYES, Buffalo, N. Y.—*Bronzing Machine.*—January 29, 1867; antedated January 14, 1867.—The horizontally revolving arms, on the lower end of the vertical shaft, carry fur brushes for bronzing the sheets of paper which are fed consecutively beneath them on the endless feed apron. A grooved roller distributes the bronze from a hopper. The sheets are steadied by adjustable wheels which traverse their margins. Paues of glass in the sides of the machine permit inspection. The feed apron is tightened by a set screw and the pressure of the brushes regulated by the vertical adjustment of the rotary shaft.

Claim.—First, the vertical rotary shaft A and brushes C and D, as described when used in combination with the feeding mechanism of a machine for bronzing printed sheets of paper or other equivalent material.

Second, in combination therewith of one or more lights of glass, or other transparent substance, for the purposes specified.

Third, the grooved roller O, as and for the purposes described.

Fourth, in combination with the endless apron Y, of the thumb screws C', the boxes C', plate C', set screws K' and C', as and for the purposes described.

Fifth, the adjustable feed-wheels A', in combination with the bands or belts as described.

61,551.—CLARK MCINTOSH, Utica, N. Y.—*Seed Sower*.—January 29, 1867.—The openings are arranged in line, in the bottom of the tray, with gaps in the series occupied by the oblique blocks of the agitator, which is reciprocated upon the perforated plate.

Claim.—The seed sower constructed and operating substantially as described.

61,552.—CHARLES H. MILLER, Dayton, Ohio.—*Cloth Gathering Attachment for Sewing Machines*.—January 29, 1867.—The piece of cloth to be gathered passes freely between the rigid base and the spring lip; the piece of cloth which is not to be gathered, but is to be stitched to the gathered piece, passes between the rigid lip and the slightly yielding adjustable lip. By pressing together these latter lips by means of a thumb screw, a drag is given to the upper cloth sufficient to pull back and gather the lower cloth.

Claim.—First, the combination of the two tension guides *b c*, constructed and arranged and operating conjointly, as shown and set forth for gathering one piece of cloth upon another, as they are sewed by a sewing machine, substantially as described.

Second, the combination of the two tension guides *b c*, with the slotted base plate *A*, box *B*, and set screw *D*, the whole being constructed, arranged and used in the manner and for the purpose specified.

61,553.—JOSEPH MILLER, Cuba, N. Y.—*Car Coupling*.—January 29, 1867.—The oscillating bumper has catches and flange on the head to interlock with similar heads on the opposite car; the draw bar has an endwise motion; is released by rotary motion imparted by means of levers; is adjustable vertically by wedges, to coincide with its fellow on the other car, and has vertical openings to admit the ordinary coupling pin for the engagement of the coupling link if required.

Claim.—First, draw heads *A*, with interlocking hooks *m n*, and flanges *n*, substantially as described. Second, the oscillating or turning hooked draw heads *A*, which are adapted for having connected to them the common coupling links, substantially as described.

Third, interlocking or hooked turning and sliding draw bars, constructed and operating substantially on the principle herein set forth.

Fourth, an adjustable stirrup *C*, in combination with the sliding wedge *F*, and adjusting rod *e*, substantially as and for the purposes described.

Fifth, the lever or rod connected to the lever arm *h'*, which latter is secured to a collar *h*, through which the draw bars have an endwise movement, substantially as described.

Sixth, the combination of a spring *j* with the devices which are employed for oscillating or turning the draw head and its bar, said spring being so applied as to act upon the draw heads to keep the hooks thereof together, substantially as explained.

Seventh, the combination of the turning and sliding draw bars with spring *b b*, substantially as and for the purposes described.

61,554.—ROBERT HENEAGE, GEO. MILSON, and HENRY SPENDELOW, Buffalo, N. Y.—*Combined Pulley and Cable*.—January 29, 1867.—The traction of the wire rope in the groove of the pulley is secured by an elastic ring in the latter, which assists the adhesion of the wire.

Claim.—The combination of the wire cable *H* with the grooved pulley *D*, and intervening packing *i*, constructed and operating substantially as described.

61,555.—JOSEPH H. MOORE, Chicago, Ill.—*Ventilating Apparatus for Railroad Cars*.—January 29, 1867.—The current of air generated by the motion of the train passes through openings, whose doors act as gatherers and impinges upon inclined fans, which are enclosed in a reticulated cylinder; the latter revolves in water by the impulse derived from said fans, and removes the dust from the air before it enters the cars.

Claim.—First, the fans *C*, when located inside of the case *A*, and rotating the perforated cylinder *B* by the same current of air that passes into the car in combination with such cylinder, constructed of netting or open work, substantially as specified.

Second, the combination of the cylinder *B*, rotated

by the fans *c*, located inside of the case, with a water bath substantially as described.

Third, the doors *E*, constructed and attached so as to operate as doors and wind gatherers, substantially as specified.

Fourth, the combination and arrangement of the perforated or gauze cylinder *B*, with the fans *C*, doors *E* or *F*, and both with the case *A*, substantially as and for the purposes specified.

61,556.—NATHAN P. MULLOY, Waltham, Mass.—*Knife Cleaner*.—January 29, 1867; antedated January 19, 1867.—An improvement on patent No. 20,391, May 25, 1858. Explained by the claims and illustration.

Claim.—An improved knife polisher as made with the fork cleaner, or, in other words, the piece of leather *i*, and its supporter *h*, arranged and combined with the knife polishing bed and its plunger, applied and to operate together substantially as set forth.

Also, the combination of the trough *k* with the knife polishing bed and plunger, applied together in manner and so as to operate as explained.

Also, the combination and arrangement of the leather-receiving slots *l l* with the trough *k*, the bed *A*, combined with the plunger as set forth.

Also, the arrangement and combination of the apron *g* with the plunger bed and trough, arranged and combined substantially as set forth.

Also, the arrangement and combination of the guide *n* with the bed *A* and the plunger *H*, when arranged and combined as and for the purpose set forth.

61,557.—JOHN MURPHY, Brandon, Vt.—*Composition for Polishing Shoes*.—January 29, 1867.—Composed of black lead, silver, lead or carbonate of iron, with molasses or other saccharine matter, muriate of tin or zinc, and water.

Claim.—The combination of the ingredients above named, as *wc* in the proportions specified as also in any and all other proportions, and in greater or less quantities.

Also, the right of substituting and using any other compound made substantially of the same materials hereinbefore specified, though known by any other name.

61,558.—THERON OUTWATER, Oleott, N. Y.—*Washing Machine*.—January 29, 1867.—The clothes are attached to a gate, which reciprocates vertically between the corrugated surfaces of two spring pressure bands attached to removable frames in the suds box.

Claim.—The arrangement of the convex spring wash boards *B*, attached to removable frames *C*, and of the swinging bars *D*, or equivalent, for retaining and holding open the boards; where the said parts are combined with the clothes frame *G* and gate *H*, constructed as described and for the purpose set forth.

61,559.—H. D. PALMER, Cleveland, Ohio.—*Roller for Wringing Machines*.—January 29, 1867.—To prevent the torsion of the covering on the metallic core, the latter is slotted or made in sections, and a piece of cloth is lapped upon it so as to bind firmly and form a basis for the elastic covering.

Claim.—First, the rubber or other nonabsorbent cloth-supported coverings *B b c*, whether they are made or vulcanized directly upon the shaft as described, or separately, and afterward applied to the shaft, substantially as described.

Second, securing a cover *B* upon a slotted or sectional shaft *A*, by means of a divisional coil or canvas connection *e*, the termini of which underlap upon the shaft as shown, substantially as described.

61,560.—WILLIAM PANTON, Quincy, Mass.—*Stuffing Hides and Skins*.—January 29, 1867.—The metallic drum revolves within a wooden casing, into which steam is admitted, and has a thermometer extending through one of its journals and terminating in the interior; a thermometer is also attached to the casing. The hides and stuffing are placed in the drum.

Claim.—The hide-stuffing machine, as composed of the cylinder *A* and the steam case or box *B*, made and arranged substantially in manner and so as to operate as and for the purpose stated.

61,561.—PHINEAS PARDEE, New Haven, Conn.—*Vermis Trap*.—January 29, 1867.—This insect trap is placed around the trunk of a tree or otherwise, and its entrance has a series of bristles which permit ingress and prevent egress.

Claim.—A case provided with an opening or openings B, beneath a plate C, and having the entrance protected by elastic wires, or their equivalents, placed around the said opening parallel to the entrance, and bearing upon the bottom or side of the case, as and for the purpose specified.

61,562.—L. D. PENY, Laura, Ohio.—*Self-Skimming Sorghum Evaporator*.—January 29, 1867.—The juice passes along a serpentine course in the pan, and at three distinct intervals the scum is removed by overflow openings which successively remove the green, brown, and white scum. The clear sirup then passes the gated opening into the finishing division, whence it is drawn through a pipe.

Claim.—The pan A, as constructed with the divisions 1 2 3 4, gate B, skimming openings D, and trough E, when arranged, combined, and operating as herein described and for the purposes set forth.

61,563.—DANIEL W. PEPPER, Philadelphia, Pa., assignor to H. EVERETT, same place.—*Securing Caps to Metal Cans*.—January 29, 1867.—The rim of the cover is reamed down upon the upturned flange around the opening in the top of the can.

Claim.—The can A, with its opening A and flange e, and the cap B, with its flange i, when the two are fitted and secured together as described.

61,564.—GEORGE W. PERRY, Providence, R. I., assignor to A. PERRY & Co., Boston, Mass.—*Steam Generator*.—January 29, 1867.—The generator is formed of a series of vessels with horizontal corrugations whose convexities protrude into the counterpart concavities of the adjoining chambers, so as to form a serpentine flue between them.

Claim.—The improved boiler or generator as composed of a series of vessels constructed, arranged and connected in manner as hereinbefore explained, and as represented in the accompanying drawings.

Also, each section or vessel A made with the convexities of the corrugations of its opposite sides to project in opposite directions with respect to each other, and with the ends and top and bottom of such vessel closed, in manner as above set forth, and as exhibited in the said drawing.

61,565.—SAMUEL L. POTTER, Wyandotte, Mich.—*Fagot for Railroad Rails*.—January 29, 1867.—The steel bar for the cap of the rail of T shape is so arranged in the pile that when finished a considerable portion of the steel will be enveloped in the iron and a more perfect weld secured.

Claim.—A pile or fagot for railroad bars, constituted of iron and steel bars, arranged substantially as herein represented and described.

61,566.—GEORGE W. PRICE, Bloomington, Ill.—*Gang Plow and Cultivator*.—January 29, 1867.—The four plows attached to the frame may be arranged to throw the soil toward or from the row of corn to act as a cultivator, or all in one direction to act as a seedling plow.

Claim.—First, the combination of the vibrating beams G G and the braces I I, connecting them with the draft pole E, the outside plows K K, connected by the sheaths b b and the rods d d with the beams G G, and the inside plows L L connected by the swivel couplings g g to the standards s s, and the rods e e to the braces I I, arranged and operating substantially as and for the purposes herein described.

Second, forming the shovels or shares K K L L in such a manner that if a line were drawn in its oblique section, as shown in figure 3 of the drawings, the same would stand at an angle of about 23° from the standards b b e e, to which the shovels or shares are attached, and said plows having such a bevel that the point of the cutting edge when throwing inwardly shall be upon the inside of a line confined in the direction of the length of the standards b b e e, and said point when throwing outwardly shall be upon the outside of said line for the purpose of preventing any lateral pressure, substantially as herein set forth.

61,567.—WILLIAM D. PRINDLE and CHARLES M. YERK, Tiffin, Ohio.—*Atmospheric Churn*.—January 29, 1867.—Air is driven through the hollow shaft by the bellows above, and is distributed through the perforated diaphragm. The cream may be tempered by water in the vessel around the shaft.

Claim.—First, in combination with a movable bellows C, which is applied on the cover B of the churn box, the pipes b b', perforated diaphragm F, and water chamber G, arranged substantially as described.

Second, the construction of the air pipe b' with a perforated foot c, a perforated and flanged diaphragm F, and a water receptacle G upon it, to be used substantially as and for the purposes described.

61,568.—TROMAS RODDA, St. Louis, Mo.—*Balanced Steam Engine Valve*.—January 29, 1867.—The tubular throttle valve has two faces and moves vertically in a cylindrical chamber. The valve is nearly balanced, the major pressure being downward and due to the greater area on the upper end of the valve.

Claim.—The construction of the valve with its cross piece B' with reference to the openings and construction of the pipe A, arranged as herein set forth.

61,569.—M. D. SAFFORD, Boston, Mass.—*Ironing Table*.—January 29, 1867.—One end of the ironing table is clamped to the edge of a common table. Folding legs to support the other end are carried on a frame sliding beneath the leaf, and are kept extended by a brace when in use.

Claim.—First, the combination and arrangement of the carriage M, the legs B B, the brace C, and the grooved cleats H H, or their mechanical equivalents, made substantially as described and for the purpose set forth.

Second, the combination of the bracket D and thumb-screw E with the table A, sliding legs B B, and the brace C, when the whole is constructed substantially as described and for the purpose set forth.

61,570.—M. SCHMIRK and P. McCOLLUM, Fayette, Mo.—*Quilting Frame*.—January 29, 1867.—The side bars are hinged for folding, and are supported on hinged legs. Rods connect the sides. A roller for winding the quilt has end ratchet wheels and pawls.

Claim.—The frame A, the legs B and C, the connecting piece D, in combination with the rollers a¹, the ratchet wheels a², and their pawls a³, the holes a⁴ a⁹ a¹⁰, the hooks a⁶ a⁷, the eyelets a⁸ and b¹, the pin c¹ and its corresponding holes, the hook d, and the slit c², as and for the purpose specified.

61,571.—HENRY SEARLE, Rochester, N. Y.—*Oil Ejector*.—January 29, 1867.—A pipe with an exit spout at top and an inwardly opening valve at bottom traverses the greater length and issues from the upper end of a larger pipe furnished with a similar valve at bottom. The annular space between these pipes is connected with one end of the cylinder of an air pump, so that the alternate pressure and attenuation of air shall draw liquid through the outer valve and force it through the inner one and through the spout. The other end of the air pump cylinder is connected to a similar device.

Claim.—First, the arrangement of two or more ejectors for raising oil or other fluids from wells and other deep places, with each other, and with pipes and cocks, or valves, substantially in the manner and for the purpose described.

Second, the arrangement of two or more cocks, or equivalent valves E F G and H, in combination with the pipes A and B, for the purpose of changing the action of a column of compressed air or other fluid alternately from one ejector to another, substantially in the manner and for the purpose described.

Third, the combination of the pipes A B C D and cocks or valves E F G H with independent ejectors a and b, for the purpose of making the chamber of each ejector act alternately as a compressed air chamber, and as an exhausted receiver.

61,572.—GEORGE E. SHAW, Pittsburg, Pa.—*Fire Test Torch*.—January 29, 1867; antedated January 17, 1867.—A lamp is pivoted to a clamp which is secured to the reservoir containing the oil to be tested. A set-screw on the wick tube regulates the position of the lamp when in use. The lamp is brought into horizontal position when the oil is to be tested.

Claim.—First, the torch or lamp G, pivoted, suspended, or hinged to the clamp D, or to a piece of a fire tester for carbon oil, so that it can be made to occupy either the vertical position or the horizontal position represented in figure 2 of my drawings, or any other positions between the same, in the manner substantially as set forth.

Second, the combination of the clamp D, screw C, pivoted piece E, and screw H, with the lamp G, tube T, and screw R, to make an adjustable fire-test torch, substantially as and for the purpose specified.

Third, the screw R, in combination with the tube T, piece E, and clamp B, for regulating accurately the position of the fire band in relation to the oil undergoing the test.

61,573.—HENRY F. SHAW, West Roxbury, Mass.—*Planing Machine.*—January 29, 1867.—A revoluble disk carries the journal bearings of the double-headed cutter shaft. The two cutters, when brought to the working position, will revolve to the right or left, respectively, to favor the grain of the wood.

Claim.—The combination of a cutter shaft, having cutters at each end, with a device for turning it end for end, and thus by crossing the band giving the shaft a reverse motion, substantially as described and for the purpose set forth.

61,574.—ALBERT SNYDER, Jackson, Mich.—*Potato Digger.*—January 29, 1867.—The potatoes are dug by forks attached to an endless carrier. The forks have two series of teeth of different elevation, which act as a trough to carry the potatoes above a riddle, into which they are dropped, and whence they fall into a trough below.

Claim.—First, the double-pronged fork C, when constructed substantially as and for the purpose set forth.

Second, the combination of the fork C, rods 5 6, projecting screen K, gearing *o d z*, when constructed and used substantially as set forth.

61,575.—PHILIP SOMMER, Newark, N. J.—*Wrench.*—January 29, 1867; antedated January 17, 1867.—The two jaws slide upon each other, and lugs upon them are pivoted to the handle so that its oscillatory movement will cause lateral movement of the jaws to grip or release the nut. The pivot of connection slides within a slot in one of the lugs.

Claim.—The combination of the jaws C D, staff B, and roller *e*, constructed, arranged, and operating in the manner substantially as shown and described, and for the purpose set forth.

61,576.—PHILO O. SOPER, San Francisco, Cal.—*Hay Knife.*—January 29, 1867.—The back bar is bent forward near the bottom and carried below the blade to cause the feed of the cutter.

Claim.—First, the point A, in combination with the blade B, to act as a self-feeder.

Second, the construction of the blade B.

Third, the bearing of the shank C, for the uses and purposes as set forth.

61,577.—I. N. STANLEY, Brooklyn, N. Y.—*Apparatus for Desulphurizing Ores.*—January 29, 1867.—The desulphurizing chamber is surrounded with flues through which the caloric currents from the furnace are compelled to pass on their way to the chimney. Within the chamber is a stirrer provided with conveyors and operated by gear wheels. The pulverized ore is placed in the center of the oven and carried by the conveyor to the discharge hole near the outside.

Claim.—First, an oven B, revolving arms F F, and upright shaft K, operated by means of gears G G and horizontal shaft H, or their equivalents, substantially as described.

Second, the conveying the ores or other material, while being operated upon, from the central part of oven B to the circumference, and there discharging them, or from the circumference to the center, as may be desired, by means of conveyors A A connected to arms F F, as shown on figure 3, substantially as described.

Third, the use of fire-clay, plumbago, or graphite enameled iron, or other metals, or any other refractory material for the construction of conveyors A A, and

for the protection of the upright shaft K and arms F F, that are exposed to the action of heat and gases, substantially as described.

Fourth, the construction of flues C C, underneath the oven B, so as to give a uniform heat; also flues D D, leading from underneath the floor and over the arch of oven B, in its passage to the drying floor or chimney, substantially as described.

Fifth, a stationary floor of the oven B, substantially as described.

Sixth, the supplying the necessary oxygen for the proper treatment of ores or other material for which the oven may be adapted through the supply pipe V, box M, shaft K, and arm F F, and openings W W, through said arms F F and conveyors A A, thereby preventing the arms F F from becoming too much heated when in action, substantially as described.

Seventh, the outlet W, for conducting gases or other volatile substances, and pipe O, with its connections to condenser N, and the steam or air jet Q, for the purpose of exhausting the gases, &c., from oven B; also chambers when used in connection with this furnace, which may be required for the treatment of such ores as cinnabar, zinc, lead, &c., or the manufacture of sulphuric or other acids, and for conducting the same through water, thence to the furnaces T T through pipes P P, where both the gases and steam or air are to be used to assist combustion when not otherwise disposed of, thereby economizing fuel, substantially as and for the purposes described.

Eighth, the hollow shaft K and arms A A, for the purposes named in the foregoing specifications, or their equivalents, substantially and for the purposes described.

61,578.—JOSHUA STEVENS, Chicopee Falls, Mass.—*Sash Fastener.*—January 29, 1867; antedated January 19, 1867.—A weighted or spring cam sustains the sash in position, and acts on a catch to fasten the latter when the window is closed.

Claim.—The cam *b*, finger or pawl *c*, and plate *a*, whether operated by a lever or a crank, all combined and arranged substantially as described.

61,579.—JOHN B. TARR, Chicago, Ill.—*Railroad Rail.*—January 29, 1867.—A tenon is cast on one end of the rail, to be secured into a socket upon an adjoining rail.

Claim.—Constructing solid railroad rail sections, with tenons formed on one or both ends which are adapted to fit into the ends of rail sections having sockets formed in them, the said tenons constituting part of the metal of their rails, substantially as described.

61,580.—JOHN B. TARR, Chicago, Ill.—*Metallic Pavement.*—January 29, 1867.—Rectangular slabs of metal have side projections and depressions at the ends and at mid-length, respectively, by which they are attached. The slabs are reinforced at the depressions.

Claim.—The metallic slabs A, constructed with interlocking projections and depressions, substantially as described.

61,581.—S. N. TAYLOR, Horicon, Wis.—*Universal Joint.*—January 29, 1867.—The radial projections of the socket act upon the projections of the ball to communicate rotary motion and allow inclined movement to its shaft.

Claim.—First, the shell B, provided with internal radially projecting flanges *e*, having their outer ends rounded off as shown.

Second, the shell B, in combination with the head A, when said parts are constructed as shown and described.

61,582.—FRIEDRICH VILLARD, Mount Eaton, Ohio.—*Crucible Tongs.*—January 29, 1867.—Explained by the claim and illustration. The jaws are adapted for grasping crucibles of different diameters.

Claim.—The arrangement of the bars A and hinged circular segments B and C, combined together to form one or more crucible tongs, substantially as described and set forth.

61,583.—SAMUEL WALKER, Boston, Mass.—*Narrow Ware Loom.*—January 29, 1867.—The guide

has a forward movement before the batten has completed its rearward movement, and before the shuttle commences its lateral movement, so as to bring the guides sooner into contact with the shuttle than if they were stationary, thus pushing the shuttles across the warp spaces by a continuous and positive movement.

Claim.—First, operating the shuttles of narrow looms by means of a path cam wheel H, in combination with the system of levers, connecting rod, and the cords or straps *n n'*, substantially as described.

Second, reciprocating the guide bar and guides by means of devices, such as described, or their equivalents, substantially as and for the purpose set forth.

Third, the combination of the roll *r'* with the levers *l* and *m*, the sliding weight *w*, and tension cord *t*, arranged and operating as and for the purpose set forth.

61,584.—L. F. WARD, Elyria, Ohio.—*Mail-bag Catcher for Railroad Cars.*—January 29, 1867.—Two rods are united at or near the point of attachment to the car and form an acute angle; the outer rod projects beyond the car and clasps the mail bag that is hung upon a crane, guides it into the angle and delivers it into the car.

Claim.—First, the combination and arrangement of mail-bag catchers when attached to a railroad car in the manner and for the purpose herein set forth.

Second, the combination of the arms B and C with the stem A, helical spring S, and handle D, in the manner and for the purpose set forth.

Third, the arrangement of the mail-bag supporter consisting of the crane stem E, braces X and *x'*, spring F, and irons *e'* and *f'*, in the manner and for the purpose herein set forth.

61,585.—WILLIAM L. WASHBURN, Brooklyn, N. Y.—*Ventilator for Windows, &c.*—January 29, 1867.—Improvement on his patent of July 2, 1861. The flap valves operate in connection with flanged shelves, and are closed by sudden gusts while remaining open under other conditions.

Claim.—The combination with a stationary or adjustable frame A, of two or more sets or pairs of swinging or flap valves and flanged shelves, substantially as and for the purpose hereinabove specified.

61,586.—JOSHUA WEBSTER, Malden, Mass.—*Manufacture of Peat Fuel.*—January 29, 1867.—The inclined trough contains a sliding frame carrying a series of scrapers and pressing rollers. The peat is thrown into the hopper and passes into the trough, in which it is pushed forward by the scrapers and pressed by the rollers, the water escaping between the slats.

Claim.—The arrangement in connection with a hopper or other crude peat receptacle, of a series of scrapers operating in connection with a stationary incline or bed, substantially as set forth.

Also, and in combination with such scrapers and incline, the series of presser rolls, operating substantially as set forth.

61,587.—GEORGE A. WELLS, Oskaloosa, Iowa.—*Combined Lantern, Foot Warmer and Water Heater.*—January 29, 1867.—The apparatus has panes in its sides, and may be used as a lantern, or as a foot stove, by turning over the upper hinged portion and exposing the surface of the mat for the feet; or as a heater by placing the pan in the necessary position.

Claim.—The arrangement of the device forming a foot warmer, lantern, and water heater, constructed and operating as described.

61,588.—HENRY WETTSTEIN, Philadelphia, Pa.—*Coverlet.*—January 29, 1867.—In this coverlet any of the different well-known styles of weaving, such as plain, twill, marseilles, honeycomb, damask, &c., may be introduced; but they are not arranged in a succession of stripes, each stripe being made up of one kind of weaving; but all or any number of the styles introduced may appear in the same longitudinal or transverse line.

Claim.—A coverlet woven substantially as herein specified, as a new article of manufacture.

61,589.—LORENZO D. WHEELER, Fitchburg, Mass.—*Oscillating Seam Rubber.*—January 29, 1867; antedated January 21, 1867.—The leather is clamped

upon the rest by the descending clamp, and the rubber reciprocated upon it to flatten the seam.

Claim.—First, the combination and arrangement of the clamp F and table D with bed piece A, slide frame J, and slide K, substantially as and for the purposes set forth.

Second, the combination with clamp F, constructed as shown and described, of table D and spring I, substantially as and for the purposes set forth.

Third, the combination with frame J of slide K and springs Q, as and for the purposes stated.

61,590.—HENRY M. WHITMARSH, Abington, Mass., and SILAS S. PUTNAM, Dorchester, Mass.—*Clothes Hook.*—January 29, 1867.—The hook is pivoted to a holder secured in the required position, and may be upwardly rotated out of danger with passing objects when so desired; a spring retains it in closed position.

Claim.—The pivoted hook C, with its slot *e*, so arranged that it may be closed up, and thus occupy less space, substantially as described.

61,591.—FRANKLIN W. WILLARD, New York, N. Y.—*Spoon.*—January 29, 1867; antedated January 12, 1867.—Attached to the back of the spoon and handle is a small tube extending from a point near the extremity of the bowl to and a little beyond the end of the handle, the object being to form a spoon combined with a sucker tube.

Claim.—A tubular handle to the spoon for the use and purposes substantially as set forth in specification.

61,592.—JAMES M. WILLIAMS, Connorsville, Ind.—*Blower.*—January 29, 1867.—For the purpose of preventing the reaction of the pistons upon the air from interfering with its ingress, it is admitted at two slots, one on each side of the median line, and in a direction in partial coincidence with the required direction of its motion.

Claim.—The construction of the three-vaned fans B B, used in combination with the semi-cylindrical case A, having openings at the ends for the admission of air; and the deflecting board *d*, arranged so as to leave a slot for the admission of air between it and case A, operating in the manner and for the purpose specified.

61,593.—ALONZO H. WOOD, Boston, Mass.—*Gas Regulator.*—January 29, 1867.—Attached to the upper end of the valve rod are a series of inclined vials partly filled with mercury and resting upon rollers beneath. These self-adjusting weights increase or diminish their force upon the disk as they are raised or lowered by the greater or less pressure of the gas upon the under side of the disk.

Claim.—An automatic gas regulator attachment having the functions, and possessing the characteristics, substantially as set forth.

61,594.—LUM WOODRUFF, Ann Arbor, Mich.—*Gate Latch.*—January 29, 1867.—The pin on the stile of the gate runs upon a block projecting from the face of the post, and is there retained by a slotted spring block which yields to it and then engages.

Claim.—The pin A; the rest B, the slotted latch C, and the vertical looped rod F, when arranged substantially in the manner and for the purposes above specified.

61,595.—A. S. BABBIT, Keeseville, N. Y.—*Bed Bottom.*—January 29, 1867.—The socket has flanges which are engaged by the spiral spring, and affords a flanged bearing for the bed slat.

Claim.—The casting A, with its ears *a a* and shoulders *x x*, when constructed substantially as described and used for the purposes set forth.

61,596.—STEBEN T. BACON, Boston, Mass.—*Apparatus for Generating Carbonic Acid Gas.*—January 29, 1867; antedated January 17, 1867.—The saccharine or farinaceous matter is fermented in an upper vat, and from that passes into the tun, where it is tempered by a coil pipe, the outer vertical portion of which has a steam jacket. The gas passes from the tun to the purifier, where it is washed in water, and from which it escapes to the reservoir.

Claim.—The arrangement herein described of the apparatus for facilitating the generation of carbonic acid gas from saccharine or farinaceous matter.

61,597.—H. P. BALL and A. L. GRAVES, Albany, N. Y.—*Shears*.—January 29, 1867.—The blades of the shears consist of pivoted plates adjustable upon the jaws.

Claim.—Adjusting the knives or blades C C upon the jaws B B of the shears, substantially in the manner and for the purpose herein specified.

61,598.—WILLIAM E. BASS, Lawrence, Mass.—*Weft Bobbin*.—January 29, 1867.—This is an improvement on Pearl's patent, No. 53,655. The object is to better secure the winding of the woolen yarn and to prevent the liability of the cop being pulled off when steamed prior to weaving.

Claim.—The improved weft bobbin as made with the series of swells *a a'*, arranged on its body as set forth.

Also, the arrangement of the taper of the portion *b*, with the series of swells *a a'*, of the body of the bobbin, as set forth.

61,599.—JOHN H. BEAR, York, Pa.—*Grinding Mill*.—January 29, 1867.—Explained by the claims and illustration.

Claim.—First, the runner stone G, constructed with a surface for grinding, which is a segment of a sphere in any direction in which it may be intersected, in combination with the concave E, which also is of a shape to conform to said runner stone; the said runner stone and concave being arranged and operated substantially in the manner and for the purpose described.

Second, the arrangement of the platform D, concave stone E, clamp screws *e' e'*, and adjusting screws C C, in combination with the vertically revolving runner stone G, substantially in the manner and for the purpose described.

Third, the deflector *n*, applied substantially in the manner and for the purpose described.

Fourth, arranging the hopper so that its lower end rests upon the stone E and connecting its upper end to the frame A, by hooks or fastenings which will allow it to descend or rise with the stone E, substantially in the manner and for the purpose described.

Fifth, the combination of the metal guards *n'* and clamp screws *e' e'* with the runner stone and concave, substantially in the manner and for the purpose described.

61,600.—JOHN S. BIRCH, New York, N. Y.—*Pendant for Watches*.—January 29, 1867.—The guard ring is continuous and swiveled to the watch on the pusher pin. An additional swivel furnishes extra security.

Claim.—First, the combination of the hollow stem D, swivel C, ring B, and spring top or pusher E, substantially as and for the purposes set forth.

Second, the continuous revolving ring B, fig. 2, in combination with the swivel C, as and for the purpose specified.

Third, the secondary swivel bow G, in combination with the guard bow and handle of a watch, to afford an additional attachment for the guard, as explained.

61,601.—WALTER BOUND, Hackensack, N. J.—*Carriage Clip*.—January 29, 1867; antedated January 19, 1867.—One end of the pin by which the shafts are coupled to the axle is held rigidly in the fixed jaw of the clip and the other end is engaged by a recess in the hinged jaw. The latter jaw is held to place by a perpendicular lip upon a spring.

Claim.—First, the hinged end piece E, in combination with the bolt D and frame B C, substantially as herein set forth for the purpose specified.

Second, the spring F, provided with the lip *c*, and applied in relation with the hinged end piece E, bolt D, and frame B C, substantially as herein set forth for the purpose specified.

61,602.—NATHANIEL A. BOYNTON, New York, N. Y.—*Coal Stove*.—January 29, 1867.—Vertical, centrally expanded air tubes traverse the fire chamber and discharge into the drum above. The drum is traversed by vertical flues.

Claim.—First, the annular heating drum A, provided with air pipes B and a central air space D, substantially as described.

Second, the arrangement of the air flues B, intermediate of the several fire flues J, in combination with

a heating drum having the form of a complete or of an incomplete annulus, substantially as described.

Third, the arrangement of the air and fire flues with reference to each other in the manner above shown, so that at adjacent points their circles shall coincide for the purpose of preventing the lodgment of soot and ashes at these places, substantially as described.

61,603.—A. N. BRENNEMAN, Lancaster, Pa.—*Jack*.—January 29, 1867.—The rear end of the last is pivoted to an upright, and may be entered in a vertical position and then turned down with the boot until the toe reaches its rest upon the other standard. The standards are adjustable for various sized boots.

Claim.—The manner of hinging the last A upon the end of the standard B, in combination with the rest C D, operated in the manner and for the purpose specified.

61,604.—WEBB BROOMHALL, Circleville, Ohio.—*Door and Gate Latch*.—January 29, 1867.—The latch bar has a T-shaped handle standing transversely to the gate and projecting from its sides. An L-shaped projection from the other end of the latch forms the catch.

Claim.—A rod with its middle portion journaled and the end bent to form a catch with or without a secondary device to act upon the handle, substantially as described.

61,605.—E. & A. BUCKMAN, East Greenbush, N. Y.—*Farm Gate*.—January 29, 1867.—The gate slides either way and turns on its center, resting upon the swiveled suspending collar.

Claim.—First, the arrangement of the posts B, and swiveled suspending collar *b*, in relation with each other and with the gate A, whereby the gate may be opened in either direction, substantially as herein set forth.

Second, the guide rail *e*, secured at the top of the gate, beveled upward and inward on its under side from both edges and operating in relation with the tapering friction rollers *d*, suspended in swivels A', substantially as herein set forth for the purpose specified.

Third, the inclined planes *f*, arranged with reference to the vertical braces *d* and supporting posts B of a double acting gate, substantially as herein set forth for the purpose specified.

61,606.—W. H. BURRIDGE, Cleveland, Ohio.—*Carbureting Illuminating Gas*.—January 29, 1867.—Balsam, turpentine, or camphor gum are dissolved in a distillate of any of the light mineral oils, and the mixture is used to enrich illuminating gas passed therethrough.

Claim.—The combination of an auxiliary gas from the organic volatile hydro-carbons with the common illuminating gas, as and for the purpose specified.

61,607.—WILLIAM CRAIG, Newark, N. J.—*Pipe Coupling*.—January 29, 1867.—The curved grooves for the projections are constructed with a cavity, so that the two joints, when locked, will not be readily loosed, the projections being constantly forced into the cavities by the operation of an elastic ring between the two ends of the pipes.

Claim.—The combination of the sliding or entering butt C, with its studs *g*, elastic ring D, and the adjacent butt-holding sleeve A, formed with grooves *b*, made to terminate in cavities or continuations *c*, that verge outwardly toward the end or face of the sleeve from which said grooves started at their open extremities or mouths, all for operation together substantially as and for the purpose or purposes herein set forth.

61,608.—THOMAS CRANE, Fort Atkinson, Wis.—*Take-up Mechanism for Knitting Machines*.—January 29, 1867.—This take-up device is designed to be applied to machines such as that patented to J. W. Lamb, September 15, 1863, and by its means the yarn carrier can be moved the whole length of the frame at each stroke without reference to the number of needles employed.

Claim.—First, in knitting machines an apparatus that lifts the yarn between a stationary eye, or its equivalent, and the yarn carrier, or between two stationary eyes, substantially as described, so that the slack is taken up as the yarn carrier approaches the

center of the machine, and is given out as it moves from the center.

Second, the means substantially as herein described of lifting the yarn, that is to say, a rod pivoted at one end to the yarn carrier or to the machine, while its upper part is free to slide through a stationary guide placed near the middle of the machine or the middle of the stroke of the carrier, substantially as described.

61,609.—EDMUND D. CROSBY, Scott, N. Y.—*Washing Machine.*—January 29, 1867.—Explained by the claim and illustration.

Claim.—The combination of the beaters *m m*, when pivoted upon the central bar and connected to the pitman cranks by the jointed arms *c c*, all as described and for the purpose set forth.

61,610.—RICHARD H. CUTTER, Cleveland, Ohio.—*Bed Lounge.*—January 29, 1867.—The construction admits the change from a lounge or settee to a bed, and affords a receptacle for storing the bed clothing.

Claim.—The combination with the folding seat *A*, the mattress *M*, and the folding head *C*, when constructed and operating in the manner and for the purpose herein specified.

61,611.—G. K. DEARBORN, South Boston, Mass.—*Window Frame.*—January 29, 1867.—The arrangement facilitates the removal of the window sash from the frame. The outer jointed beading is retained by a catch and bent for removal; the lower part of the parting bead, between the sashes, is stepped into the sill, and is removable laterally.

Claim.—First, the movable parts *D D'* of the stop bead, when combined and arranged substantially as set forth.

Second, the arrangement and construction of the parting bead *E E'*, made substantially as and for the purpose set forth.

61,612.—J. J. & DAVID DECKER, New York, N. Y.—*Piano-Forfe.*—January 29, 1867.—Improvement on patent of D. Decker, June 2, 1863. The flange of the plates laps against the wrest plank and end block. The strings are connected to the tuning pins near to the wrest plank, and the bearing of the strings upon the plate is avoided.

Claim.—First, the iron plate constructed with a vertical flange *C* at its rear end, arranged in relation with the wrest plank, as and for the purpose herein specified.

Second, interposing between the bridge *G* and portion *B* of the plate, an inclined support or shelf *H*, to obtain the attachment of the strings to all or the more forward portion of the tuning pins close to or at uniform distances from their wooden bearing, essentially as specified.

61,613.—DANIEL DE GARMO, Rochester, N. Y.—*Stove Pipe Damper.*—January 29, 1867.—Two perforated plates are pivoted on a common bearing on which they are adjustable to present their edges or surfaces to the caloric current. One of them has an adjustment in its own plane to cause its apertures to register with those of its fellow plate, or otherwise.

Claim.—The arrangement in stove pipe dampers of the plates *A* and *B*, journals *j k*, rib or rim *m*, and recesses *c*, pivot bolt *f*, and openings *a b*, in the manner and for the purposes set forth.

61,614.—GEORGE DRYDEN, Worcester, Mass., assignor to himself and E. A. PRESCOTT, same place.—*Piston Packing.*—January 29, 1867.—The segments occupy annular grooves in the periphery of the piston head and are expanded by spring plates, and the force of steam admitted through the perforations into the interior recess. Tongues act as dowels in connecting the adjacent segments.

Claim.—First, a packing ring consisting of the segments *b*, with the spring *c*, and tongues *a*, constructed and arranged to operate as shown and described.

Second, in combination with the rings, constructed as set forth, the annular recess *k*, and the slide *h*, arranged to operate as described.

61,615.—ADDISON C. FLETCHER, New York, N. Y.—*Grate Bar.*—January 29, 1867.—The successive steps are united by inclined plates, faced on the fire-side with refractory substances.

Claim.—First, the arrangement of the connecting webs *a* of the steps in a step-formed grate bar, in inclined or sloping positions, substantially as and for the purpose herein described.

Second, the facing slabs *b b*, of refractory material, in combination with the connecting webs of the steps of a step-formed grate bar, substantially as and for the purpose herein specified.

61,616.—GILBERT B. FRENCH, Dunbarton, N. H.—*Car Coupling.*—January 29, 1867.—The spring jaws hold the pin, so that the coupling link passes beneath. The entering link actuates the abutment and wedging standard, which opens the jaws and allows the pin to drop.

Claim.—As my invention or improvement, the arrangement of the spring jaws, the spring abutment and the wedged standard, together, and with the bunter bar, and its pin passage, as set forth.

61,617.—WARREN GALE, Chicopee Falls, Mass.—*Straw Cutter.*—January 29, 1867.—The edges of the spiral knives cut against corresponding surfaces of comparatively soft metal which are clamped in the arms of the cylinder above.

Claim.—A revolving pressure cylinder whose pressure surfaces are faced with or made of strips of copper, or some alloy thereof possessing equivalent properties, in combination with and geared to a revolving cutter cylinder or shaft, substantially as and for the purpose herein set forth.

Also, a spiral or oblique flanged pressure cylinder, faced with copper, in combination with a revolving knife cylinder, substantially as described.

61,618.—H. C. GOODRICH, Chicago, Ill.—*Tuck Marker for Sewing Machines.*—January 29, 1867.—Explained by the claim and illustration.

Claim.—The tuck marker, consisting of the plate *A*, formed as shown, with an open space around the cloth presser to permit the cloth to lie flat on the machine, the under side presenting a plain surface, so that it may be attached to any ordinary sewing machine, and provided with the point *I* and the spring arm *B*, having the notch *F* arranged to engage with the point *I*, said arm being arranged to be operated by the needle bar of the machine, as herein shown and described.

61,619.—FREDERICK S. GWYER, New York, N. Y., assignor to himself and LEVI H. MACE, same place.—*Meat Safe.*—January 29, 1867.—The portions are set up together and locked by dove-tailed tenons and slotted plates, so as to be readily separable and closely packed for economy in stowage.

Claim.—The separable meat safe, with detached parts fitted with fastenings, substantially as herein specified, and adapted to be packed and transported in a small compass and with protection to the delicate portions of its structure, as herein set forth.

61,620.—WILLIAM HARRIS and CLINTON BROWNING, Rush Run, Ohio.—*Nut Fastener.*—January 29, 1867.—The flexible metallic yoke is threaded at the portion which embraces the screw and forms a jamnut to keep the nut proper from becoming unscrewed.

Claim.—As an article of manufacture, a spring metal friction yoke, constructed substantially in the manner and for the purpose herein set forth.

61,621.—J. M. HOTALING, Waterport, N. Y.—*Broom Head.*—January 29, 1867.—The handle is wedged in the socket of the clasp which grips the butts of the broom stuff. An enveloping cap slips over the handle, encloses the upper part of the broom, and is retained by a transverse link and wedge.

Claim.—The combination and arrangement of the clasp *B*, envelope, *C*, link *E*, and keys *i*, with the handle *D* and broom *A*, as herein set forth, the whole operating in the manner and for the purpose specified.

61,622.—JACOB KESSLER, York county, Pa.—*Cultivator.*—January 29, 1867.—The draw bars of the teeth are pivoted to a transverse rod and rest upon another rod which may be thrown over a hook to raise the teeth from the ground. The teeth are pivoted to their bars and retained in their working position by wooden pins.

Claim.—The arrangement of the teeth G G, as constructed with the bars E E, rods D and a, and the frame of the machine, as and for the purpose specified.

61,623.—WILLIAM C. LESSTER, New York, N. Y.—*Fireplace Heater.*—January 29, 1867.—The fire pot is made of cast-iron rings in a vertical column, and the loose, flat, annular cap confines the gases at the joints, while permitting expansion of the rings. The perforated annular section admits air.

Claim.—The combination with the fire pot B, made up of rings mounted upon and fitting one within the other, as described, of the loose flange or cap D, constructed to enter a groove in the top ring, and resting on or lapping over the partition plate d of the heater, essentially as and for the purpose or purposes herein set forth.

61,624.—ARMAND MANUEL, Reims, France.—*Device for Uncorking Bottles.*—January 29, 1867.—The tie wire is wrenched apart by the vibration of a lever attached thereto.

Claim.—First, the method of removing or breaking the wire or other clasp or tie which holds the cork in the bottle, by means of a detaching lever or equivalent device attached to and secured upon the said clasp or tie, substantially as set forth.

Second, the combination with one or more clasps or ties applied to the cork, as described, of a detaching lever or similar device, under the arrangement and for operation substantially as shown and specified.

61,625.—JOHN R. MARTIN, Boothbay, Me, assignor to SAMUEL K. HILTON, Portland, Me.—*Fishing Line Sinker.*—January 29, 1867.—A plate of copper is attached to the hollow lead body of the sinker, and has a hinged cover, which shuts the weight-carrying cavity. The nut on the threaded ends of the link opens or closes the gap at which the swivel or the line is inserted. The "hawse" is detachable for convenience in stowage.

Claim.—First, the connection of a plate of copper or other hard metallic substance with a body of lead or other soft metallic substance, and the arrangement of a chamber therein enclosing weights of lead or other heavy substance, either or all of which may be removed or replaced at pleasure.

Second, the fixing firmly in the upper part of the body of a staple of copper or other metallic substance with disconnected parts (affording sufficient space for the admission of a swivel or line,) and a nut or burr working upon both parts of the staple at the same time, or one part alone, so that the sinker may be detached from the line and replaced at pleasure.

61,626.—JOHN MATTHEWS, JR., New York, N. Y.—*Pipe Coupling.*—January 29, 1867.—The socket piece which is to be screwed upon the nipple of soda apparatus is connected with the sleeve, which surrounds the leaden pipe by a swivel joint, formed by an inwardly turned flange on the end of the socket piece, setting behind an outwardly turned flange on the end of the sleeve. The lead pipe is turned out at the end so as to entirely cover the sleeve shoulder, and upon this leaden flange the annular packing piece is placed.

Claim.—First, the method of forming a swivel or screw connection of a metallic pipe or pipes, by passing the end of the pipe through the swivel, and flanging it on the face of the collar b, substantially as and for the purposes specified.

Second, the nut C, pipe A, and swivel B, having a flange or collar b and handle S, permanently secured to the swivel, all arranged and combined essentially as shown and described.

61,627.—JOHN MATTHEWS, JR., New York, N. Y.—*Bottling Machine.*—January 29, 1867.—The perforated metallic cups hold the bottle, and inverted cones adjust the mouth of the bottle to the filling tube.

Claim.—First, the combination in bottling machines of perforated detachable cups or wells of different depths or sizes, essentially as and for the purpose or purposes herein set forth.

Second, the bottle screen or guard made to form a guide to the mouth or neck of the bottle, by constructing it of a conical form or shape, with its guiding surfaces free from horizontal interruptions or breaks, substantially as specified.

61,628.—ROBERT MEYER, Buffalo, N. Y.—*Buckle Fastening.*—January 29, 1867; antedated January 19, 1867.—Of the two metallic cases, one acts as a covering for the end of the strap which passes into the buckle, and is provided with pins, which pass through the leather to which it is fastened, and through the perforated plates, to one of which the buckle is attached by a joint; the other case is used as a plate to hold the swivel parts together.

Claim.—First, in combination with the case D, the pins H I J, or the equivalent thereof, and the plates R and N, as herein substantially described.

Second, the case C, the pins F G, and plate M, for fastening the end of the strap in place, as described.

61,629.—JAMES MILLER, New York, N. Y.—*Boring Tool.*—January 29, 1867.—The two cutters are clamped in heads radially adjustable on opposite sides of the spring center, the coincidence of their distances being determined by graduated plates.

Claim.—First, the combination with adjustable slides D on a cutter head B of cutters S S' on opposite sides of their center of rotation, and with their two cutting edges or faces o lying in a plane, or thereabouts, intersecting said center and their outer sides s of a sweep not exceeding, or thereabouts, the sweep of the smallest circle they are designed to travel in, constructed and arranged substantially as specified.

Second, the combination of the adjustable cutters S S', arranged substantially as described, with the self-adjusting center or center pin C and cutter head B, essentially as herein set forth.

61,630.—JOB MILLER, Warren, R. I., and JASON A. BIDWELL, East Boston, Mass.—*Knitting Machine Needle.*—January 29, 1867.—The stitch caster has a spring shank, and is fastened to the rear end of the shank of the hooked needle. A cam arranged between the respective shanks raises the caster to drop the stitch, forming a mousing to the hook.

Claim.—A spring-stitch caster, hung or fastened to the shank or bar of a hooked needle in rear of the cam that lifts it.

Also, a cam arranged between the shank of the needle and the shank of the stitch caster to raise the stitch caster at the proper time to cast the stitch, and then let it drop, so that the yarn may be fed to the hook of the needle.

Also, a stitch caster made to spring in one direction after being worked by a sliding cam H in the opposite direction.

61,631.—WILLIAM JESSE MILLER, Linesville, Pa.—*Medicine.*—January 29, 1867.—Medicine for rheumatism, composed of equal parts of columbo root, burdock root, mustard seed, sulphur, white pine pitch, elecampane root, steeped in brandy.

Claim.—The above described composition of matter for the purposes set forth.

61,632.—GEORGE L. MOODY, New York, N. Y.—*Annular Petroleum Burner for Hot-air, Steam and Hydrocarbon Fluids.*—January 29, 1867.—The petroleum occupies the outer one of the concentric pipes, and is discharged in immediate contact with an annular jet of hot air, which in turn envelops a jet of superheated steam.

Claim.—First, the burning of petroleum or a hydrocarbon fluid by injecting it into a fire box or furnace in an annular form, so that all the components are consumed, leaving no residuum and making no smoke, substantially in the manner above set forth.

Second, the adjustable orifice through which the oil is discharged, made substantially in the manner and for the purpose above described.

Third, the mechanical combination and arrangement of the different concentric pipes for the discharge of heated air, superheated steam and oil, or a hydrocarbon fluid, with the adjustable orifice, as a whole, and its application substantially in the manner and for the purposes herein mentioned.

61,633.—EUGENE J. POST, Vienna, N. J.—*Hat and Coat Holder.*—January 29, 1867.—The twisted wire is bifurcated to form a hat holder, and has a hook from which a coat may be suspended when the device is attached to the wall.

Claim.—The arrangement and combination of the

hat holder and preserver with the coat hook and brackets, whether stationary or adjustable, substantially as and for the purposes herein set forth.

61,634.—THOMAS ROWATT, Jr., London, England.—*Lamp Burner.*—January 29, 1867.—Applied to the burner are two hollow domes, one within the other, producing distinct currents of air, which are admitted at separate points of induction.

Claim.—The two domes *f* and *l*, constructed with their openings *o*, increasing in width toward the base, and the opening in the outer dome broader than the opening in the inner dome, in combination with their respective air passages *m*, and passages *h* and *g*, the passages to the one dome being independent of the passages to the other dome, all constructed so as to operate substantially as set forth.

61,635.—JOSEPH H. RYAN, Boston, Mass.—*Toilet Glass.*—January 29, 1867.—The handle of the hand glass is jointed, and can be set at any required angle to form a foot for the glass while shaving.

Claim.—A hand toilet glass, the handle of which is so attached that it may be secured in position to serve as a rest for the glass when placed upon a table, substantially as described.

61,636.—ALEXANDER SELKIRK, Albany, N. Y., assignor to JOHN GIBSON, Jr., and E. J. SELKIRK, same place.—*Cover and Lifting Device for Kettles.*—January 29, 1867.—The lid has lips upon its edge, which engage lugs on the pot rim to keep it in position, while the pot is cauted to pour the liquid contents through notches in the rim of the lid. A perforated lug near the pot bottom receives a hook to assist in this operation.

Claim.—First, the pierced lug *e*, leg *e'* and T-lug *E'*, and the hook *h*, or their equivalents, in combination with the bail *c*, for the purpose set forth, substantially as described.

Second, the cover *B*, constructed with a notched edge in whole or in part, or made in open work, in combination with the lips *o o' i*, or their equivalents, for the purpose set forth and described.

61,637.—WILLIAM SIEFERT, New York, N. Y., assignor to himself and JOHN PRICE, same place.—*Safety Guard for Railroad Cars.*—January 29, 1867.—Guard blocks are attached to the axles, and are carried on each side of the wheels of street cars to throw aside from the rails any object which would otherwise be run over.

Claim.—The arrangement of the stationary guards *F F*, in combination with the axles *C*, carrying bars *D*, truss plate *g*, and truss rod *d²*, substantially as and for the purpose set forth.

61,638.—DANIEL E. SOMES, Washington, D. C.—*Cooling and Packing Meat.*—January 29, 1867.—Meat is cooled by applying to it liquids of gradually diminished temperature, so as to cool it through without too much chilling the outside, while the inside still retains the animal heat.

Claim.—First, cooling air and liquids, substantially as herein described.

Second, cooling meat, substantially as herein described.

Third, facilitating the salting of meat, substantially as herein described.

61,639.—JOHN STOKELY, Hiram, Ohio.—*Chimney Collar.*—January 29, 1867.—The collar is constructed of separate pieces overlapping from above, and provided with projecting strips of metal bent at right angles and having one edge inserted between the bricks and the other covering the upper edge of the collar.

Claim.—First, the chimney collar, constructed of the sections *A C* and *D*, substantially as set forth.

Second, the lap *B*, for the purpose of covering the loose edge of the chimney collar, substantially as set forth.

61,640.—FREDERICK STRATNER, Wilmington, Del.—*Valve Gear for Steam Engines.*—January 29, 1867.—The link is connected to the rock-shaft at the midlength and the outer edge of said link.

Claim.—The described arrangement of the slotted segment *G*, rock-shaft *J*, adjustable block *I*, pitman

E, and valve rod *A'*, whereby the motion of the valve may be accelerated, retarded, or suspended, as set forth.

61,641.—THOMAS TAYLOR, Washington, D. C.—*Elastic Mold.*—January 29, 1867.—Vulcanized rubber is used in place of glue and sugar or similar compositions for deep or undercut patterns.

Claim.—The use and application of vulcanized rubber, for the purpose herein set forth.

61,642.—CHARLES H. TRYON, Greenwood, Ill.—*Apparatus for Stacking Hay.*—January 29, 1867.—The derrick post is in sections; the lower one rests on the ground and the upper one, which carries the hoisting sheave, ends in a pin that passes through the gyro-plate. This allows revolution in the post. The guy ropes pass through straining braces which rest upon the ground.

Claim.—An improved apparatus for stacking hay and for other purposes, constructed of a central upright formed of one or more separate adjustable sections *A A'*, as shown in the accompanying drawings, in combination with a crowning pivot plate and pin *d*, revolving swivel head *G*, and suitable supporting ropes or chains *a*, all arranged and operating substantially in the manner and for the purpose herein described.

61,643.—ISAAC VAN TRUMP, Wilmington, Del., assignor to MARINE SIGNAL COMPANY.—*Fog Signal.*—January 29, 1867; antedated January 19, 1867.—The semicircular tubular vessel is mounted upon a rock-shaft and has at each extremity an ordinary whistle and a valve opening inward. When the vessel is partially filled with water and rocked to and fro, the air is forced through the whistle and sounds an alarm.

Claim.—An air pipe or tube hung upon centers or a rock-shaft, in combination with a whistle or whistles, substantially as specified, so that water or other liquid contained in said tube or pipe shall cause air to pass through the whistle or whistles when the apparatus is moved, as set forth.

61,644.—ANDREW WEMPLE, Chicago, Ill.—*Moving Machine.*—January 29, 1867.—The finger bar is attached to the machine by a single swivel joint on one side, so that the pitman can be placed in rear of the joint and attached to the head of the sickle bar in the center of the circle circumscribed by the finger bar in rocking. A lever in connection with a hinge is employed to raise and lower the finger bar, the lever and parts connected therewith being so arranged that the machine will be elevated and kept so without a catch or other appliance.

Claim.—First, the hollow rock-shaft or bar *D*, provided with arms *H*, for the purposes set forth, by means of which the position of the finger-bar and sickle relatively to the machine will not be changed when the fingers of the finger bar are rocked up or down, substantially as specified.

Second, the attachment of the finger bar to the machine or bed *B*, by a single swivel joint on one side, so that the pitman can be placed in the rear of the joint or connection and attached to the head of the sickle bar in the center of the circle or arc described by the finger bar in rocking, substantially as specified and shown.

Third, the location of the joint *m*, connecting the pitman with the head of the sickle or cutter bar on a level with and between the pivots *ll* of the shoe, so as to bring it into the center of the rocking movement and so near a line drawn from one pivot *l* to the other that it will cross such line in the cutting movements, so that whether the finger bar is rocked or its end elevated or depressed the sickle and pitman will work freely, substantially as shown and specified.

Fourth, the lever *N*, when so arranged and connected by the hinge *j* that it will hold the machine in an elevated position without a catch or other appliance, in combination with the rod *i* and draft pole, substantially as and for the purposes specified.

61,645.—MOSES WHISLER, New Market, Ohio.—*Churn.*—January 29, 1867.—The pinions of the two inclined dasher shafts are rotated by a single wheel.

Claim.—The single-faced wheel *E*, in combination

with the pinions *m* and *n*, the top B, and rings *i*, the whole constructed, arranged, and operating substantially as and for the purpose herein set forth.

61,646.—M. WOODMAN, Farmington, Me., and L. ATWOOD, Norwich, Conn.—*Horse Rake.*—January 29, 1867.—The elevating shaft has teeth on its ends which rest on a stirrup controlled by the driver when the rake teeth are down. By the sliding of the stirrup the shaft falls, the teeth catching in the ground, and the shaft revolves, carrying up the rake teeth; a sliding weight is connected with the shaft to aid in its movements.

Claim.—The combination of the elevating shafts B, the cross shafts B', the balls D, and the stirrup F, all constructed, arranged, and operating substantially as and for the purpose described.

61,647.—L. C. WRIGHT, Lockport, N. Y.—*Washing Machine.*—January 29, 1867.—The rubber is made up of rounds or slats hung so as to be moved backward and forward over a roller also composed of rounds rotating freely in their respective journals.

Claim.—The combination and arrangement of the stationary revolving roller B with the reciprocating rubber C, operating in the manner and for the purpose herein set forth.

61,648.—WLADYSLAW T. KOSINSKI, Brooklyn, N. Y.—*Cement Felt for Covering Steam Boilers, Pipes, &c.*—January 29, 1867.—A porous, plastic, elastic, non-conducting composition of charcoal, 16 parts, by weight; alum 2, pitch 4, molasses 8, and hair 2.

Claim.—The new article of manufacture consisting of a plastic cement compounded of the materials or ingredients and in the manner substantially as described, and suitable for covering steam pipes, boilers, hot and cold water pipes, refrigerators, &c.

61,649.—A. H. ALLISON, Charlottesville, Ind.—*Cultivator.*—January 29, 1867.—The plow beams are pivoted to the transverse draw bar and have lateral and vertical movement by the operator. Wheel guards protect the plants from clods.

Claim.—First, the plow beams D D, suspended to the curved guide rods *ff*, and connected with the stirrups or levers *g g*, for obtaining lateral movement in combination therewith and with the vertically sliding crossheads F F, the levers H H, and the springs *m n*, constructed, arranged, and operating substantially as and for the purposes herein described.

Second, the arrangement of the rotary perforated clod guards *n n*, combined with the plows *b b* and beams D D, constructed and operating as herein set forth.

61,650.—H. O. AMES, New Orleans, La.—*Rotary Steam Pump.*—January 29, 1867.—A rotary steam engine is combined with a rotary pump, which is placed within a pipe or chamber directly below the engine and is driven by a gear wheel which is fast to the rim of the revolving disk of the engine.

Claim.—The steam wheel A and screw or propeller blade M, combined together and arranged and operating substantially in the manner and for the purpose described.

61,651.—P. T. BADOUX, New York, N. Y., assignor to THOS. GANNON, New York, N. Y.—*Distilling and Evaporating Liquids.*—January 29, 1867.—The vertical reciprocation of the diving cup passes air into the liquid in the boiler and the air and vapor escape through a worm for condensation. The air escapes through the top of the cup.

Claim.—The arrangement of the air valve *y*, pipe *x*, vessel G, pipe *n'*, boiler A, condenser C, reservoir D, and diving bells F F', constructed and operating substantially as and for the purpose set forth.

61,652.—HENRY D. BIRD, Petersburg, Va.—*Fastening for Railway Car Doors.*—January 29, 1867.—The free end of the gravitating pivoted bar engages a clamp on the door when it is closed. The latch bar is raised by a key rod which is lowered through the car top.

Claim.—The improved mode of securing railroad-car doors and making them self-fastening by means of

a hinged bar, substantially in the manner herein described.

61,653.—DAVID E. BREINIG, New York, N. Y.—*Preparing Linseed or other Oils for Painting.*—January 29, 1867.—An insoluble soap formed by the union of the oxides of such metals as lead and zinc with the fatty acids of linseed or other drying oil, is combined with an additional quantity of the oil aforesaid.

Claim.—The within-described process of treating linseed or other oils or fats with metallic gum and spirits of turpentine, naphtha, or other suitable liquid, substantially as and for the purposes set forth.

61,654.—CHARLES COESTER, Jr., and W. L. DEWEY, Bridgeport, Conn.—*Tipping Attachment for Pots and Kettles.*—January 29, 1867.—The clasp is fitted to the lower part of the vessel, and in addition to its hook ends, has a bearing and handles by which it is manipulated.

Claim.—A tipping attachment for pots and kettles, constructed substantially as herein shown and described.

61,655.—JOHN G. DAVY, Newark, N. J.—*Bristle Boot for Horses.*—January 29, 1867.—The strap has radiating bristles and is buckled around the foot or pastern to prevent interfering.

Claim.—A bristle boot for horses, composed of a strap A, with radiating bristles C, as a new article of manufacture.

61,656.—BERNARD DOUGLAS, New York, N. Y., and WILLIAM H. WALTON, Brooklyn, N. Y.—*Apparatus for Carburetting Air.*—January 29, 1867.—The air is driven by the rotary fan in the chamber below, through the central vertical pipe to the upper chamber, from whence it passes in a circuitous, reverting, downward course, in contact with the hydrocarbon liquid in the successive trays, and thereby becomes impregnated with vapor.

Claim.—First, the removable pans H and I, in combination with the cylinder A, constructed and operating substantially as described.

Second, the use of warm air for the purpose described, without the direct application of fire or steam to the apparatus, substantially as specified.

Third, the alternate arrangement of the generating pans H and I, in the manner described, for the purpose specified.

Fourth, the apparatus so constructed that when the connecting parts of the pipes which open into the atmosphere are secured thereto, there will be no exposure to fire, and evaporation be prevented, as specified.

61,657.—Canceled.

61,658.—ANNA EDDOWES, Frankford, Pa.—*Attachment for Handles to Brushes, Brooms, &c.*—January 29, 1867.—The diminished portion of the handles penetrates the stock of the brush and the enlarged portion is secured by a bayonet joint to a socket on the back of the stock.

Claim.—The handle B, with its lower portion contracted and passing entirely through the head A, its enlarged portion fitting in the socket tube C, having right angular slots G, receiving and retaining the pin F, secured to the handle, in the manner described, for the purpose specified.

61,659.—WILHELM FEHLEISEN and ERNST FEHLEISEN, Cilli City, Austria.—*Blasting Powder.*—January 29, 1867.—Ferro-cyanide of potassium and sawdust are combined with the usual ingredients of gunpowder. The compound is less liable to explode from friction or ramming.

Claim.—A blasting compound made as set forth.

61,660.—JOHN FRAZER, Williamsburg, N. Y.—*Marking Skirt Wire in Lengths for Hoops.*—January 29, 1867; antedated January 21, 1867.—The endless band carries dies for marking the wire as it is fed from a spool. The band is stretched over drums and under an ink roller, and then passes between rollers, simultaneously with the wire to be marked.

Claim.—The method herein described of marking off skirt wire by means of a die-carrying band which,

together with the skirt wire to be marked off, is exposed to the action of a suitable printing roller, substantially as herein set forth.

61,661.—W. K. GARRISON, Abingdon, Ill.—*Cultivator*.—January 29, 1867.—The share-carrying frame is pivoted on the carriage so as to be horizontally vibratable by means of a lever, to accommodate the forward shares to the sinuosities of the row of plants.

Claim.—The frame D, in combination with the lever F, arranged and applied to the machine substantially in the manner as and for the purpose herein set forth.

61,662.—L. E. HOLDEN, Cleveland, Ohio.—*Liquids for Carburetting Gas and Air*.—January 29, 1867.—Explained by the claims.

Claim.—First, the combination of benzine or any other of the light hydrocarbons with colza, rape-seed, olive, or other equivalent vegetable oils, for the purpose of carburetting air or gas when used for heating or illuminating purposes, substantially as specified.

Second, the combination of benzine or any of the light hydrocarbons with lard oil or its equivalent animal oil, for the purpose of carburetting air or gas when used for heating or illuminating purposes, substantially as specified.

Third, the combination of one of the light hydrocarbons with one or more animal or vegetable oils, for carburetting air or gas, substantially as specified.

Fourth, the application of the fluid made by combining one of the hydrocarbons of light gravity with one or more animal or vegetable oils to carburetting air or gas when used for heating and illuminating purposes.

61,663.—HENRY HUNGERFORD, New York, N. Y.—*Carpet Stretcher*.—January 29, 1867.—The supporting frame is forked and the spurs on its feet engage the carpet and floor at points on each side of the line of direction, for the time being, in which the carpet is being stretched. The straining lever is hinged to a block at the point of junction of the legs and may be locked at a given tension.

Claim.—First, a carpet stretcher so constructed and arranged that its fixed point or points of resistance against which the restraining lever acts can be placed each side of or away from and beyond the line of direction of strain or tension of such straining lever, for the purposes set forth.

Second, the combination and arrangement of the lever C, legs A and B, and central or supporting block E, operating severally and together substantially as and for the purposes set forth.

Third, in combination with the supporting legs A B, or their equivalent, the arrangement of the straining lever C, with its fastening F, and operating substantially as set forth.

61,664.—ANDREW IRION, Femme Osage, Mo.—*Scrubbing Machine*.—January 29, 1867.—The brush is horizontally reciprocated by means of a crank shaft and pinions working in a gear, placed upon the inside of the propelling wheels which support the water tank above.

Claim.—The tank A, mounted on wheels E, in combination with the shaft g and brush I, constructed and operating substantially as and for the purpose set forth.

61,665.—JULES JEANNOTAT, Paterson, N. J.—*Apparatus for Cleaning Silk Threads*.—January 29, 1867.—The object is to free silk threads from knots and clear it of all foreign substances. The steel plates between which the thread passes are adjustable at will in parallel guides to and from each other.

Claim.—First, the plates B B, secured to and adjustable in the stand A, in the manner and for the purposes described.

Second, the combination of the plates B B, stand A, and set screws a, substantially as herein shown and described.

Third, the combination with the silk cleaner herein described of the guide or fender C, substantially as and for the purpose specified.

61,666.—ROBERT JENNINGS and JAMES A. MARSHALL, Bordentown, N. J.—*Preventing Horses from*

Cribbing.—January 29, 1867.—The device is to be secured to the throat latch of the bridle or halter and consists of two curved, steel springs. The outer one has points which protrude through the inner one and pierce the peck when pressed by the animal in the act of cribbing.

Claim.—First, the spring A, provided with the points a a, to prevent horses cribbing, substantially as herein described and for the purposes set forth.

Second, the inside shielding spring B, in combination with the spring A, substantially as shown and described and for the purposes set forth.

61,667.—A. P. JOHNSON, Edwards, N. Y.—*Water Wheel*.—January 29, 1867.—The tube leading upward from the case has a valve which is automatically opened when the gate is closed to admit of the discharge of water from the case and draft box.

Claim.—The tube K, provided with the valve J, operated automatically from the gate rod I, substantially as shown and described.

61,668.—WILLIAM A. JORDAN, New Orleans, La.—*Wash Board*.—January 29, 1867.—Springs are attached behind the ordinary wash board, their ends resting upon the inside of the tub; the object is to enable it to yield to pressure.

Claim.—The springs B, secured at their centers to the rear of the wash board and having their ends secured to the connecting rods C, substantially as and for the purpose specified.

61,669.—A. KAUFMANN, New York, N. Y.—*Paper Collar*.—January 29, 1867.—Explained by the claim.

Claim.—As a new article of manufacture a paper collar, cuff, or similar article of wearing apparel, embossed and perforated, that portion which imitates the cambric lace portion of a textile article being tinted throughout its face, except where it is embossed, substantially as described and for the purpose set forth.

61,670.—AMANDES KRAUSE, West Liberty, Ohio.—*Horse Rake*.—January 29, 1867.—The teeth are pivoted to their bars and are adjustable on their pivots, the bars vibrating freely upon a rod on the main frame, to this rod is also hinged a lever frame, the front bar of which rests upon the forward ends of the teeth bars. The lever frame is raised or depressed to tilt the rake by means of a hand lever attached to the rock shaft, to which hooked arms are also fixed; the hooks extend upward over the front bar of the lever frame.

Claim.—First, the bent lever G, with its hooked end, and the lever H in combination with the rake bars D, operating substantially as described, for the purpose specified.

Second, the independent bars D and teeth E, in combination with the rock shaft F, the lever H, and frame A, for the purposes and substantially as described.

61,671.—GEORGE A. LINGARD, New York, N. Y.—*Stud Fastening*.—January 29, 1867.—The stud face has a perpendicular screw pin which traverses a frame and engages a disk which slides on the frame by the revolution of the screw pin. The disk is brought in contact with the inner side of the garment at the button hole.

Claim.—The combination with a button, stud, &c., having a center screw spindle a, of a plate or disk B, and frame D, when combined and arranged together, substantially as and for the purpose described.

61,672.—IRA E. LOUGHBOROUGH, Pittsford, N. Y.—*Clothes Line Reel*.—January 29, 1867.—The casing has a longitudinal aperture for the passage of the cord which winds upon the shaft within. The latter is retained by a pawl.

Claim.—As a new article of manufacture the crank reel for clothes lines in combination with the ratchet r, pawl a, brackets B, and casing C, substantially as and for the purposes set forth.

61,673.—C. M. MACK, Brooklyn, Pa.—*Washing Machine*.—January 29, 1867.—The follower reciprocates in the inner box, which has a slatted bottom and

is supported by springs in the suds box. The clothes are placed between the follower and the slatted surface.

Claim.—The rack frame *c*, placed on the springs *d d*, in the box *A*, in combination with the follower *g*, operated by the lever frame *i i*, arranged and operating substantially as and for the purposes herein described.

61,674.—ISAAC B. MAHON, Dunkirk, Ohio.—*Cultivator.*—January 29, 1867.—The frame is of iron. By the devices described the inner plows are adjusted laterally to conform to the sinuosities of the rows of plants and all the shares are adjusted vertically for depth of tilth and for complete removal from the soil for transportation and turning.

Claim.—First, the sliding frame *G* fitted on the rod *F* at the rear of the axle *A*, in combination with the plow beams *I I*, connected at their front ends by universal joints *d d*, to arms *e*, secured to the lower ends of the bar *J*, and provided with curved standards *H*, which work in guides *c*, attached to frame *G*, substantially as and for the purpose specified.

Second, the plow beams *N N*, connected by pivot bolts to the lower ends of the bar *J*, and provided with curved standards *r*, which work in guides *s*, formed at one end of the bolts *a*, which secure the arms *B* to the axle *A*.

Third, the shaft *O*, provided with the segments *P*, to which the plow beams *I I N N* are connected by chains *Q*, and also provided with a segment *P*, to which a hand lever *R* is connected by a chain *S*, all arranged for the purpose of raising and lowering the plows, substantially as set forth.

Fourth, the whiffletree bars *V V*, having their lower ends pivoted to the lower ends of the bar *J* and their upper ends connected with the doubletree *U*, substantially as and for the purpose specified.

Fifth, the securing of the plows *M* to the beams *I I* by means of the sockets *t* at the rear sides of the plows, the lose sockets *a'* and the screw bolts *v* which pass through the oblong slots *w* in the beams *I I*, substantially as and for the purpose set forth.

61,675.—JOHN McCOUN, Lockport, N. Y.—*Milk Rack and Table Combined.*—January 29, 1867.—A series of milk shelves and a table are supported on a single post which revolves in a frame.

Claim.—A combined revolving milk rack and table, substantially as herein shown and described.

61,676.—G. McKNIGHT, Hebron, N. Y.—*Gate.*—January 29, 1867.—By the described arrangement of levers, connecting rods, &c., the gate is opened and closed without dismounting.

Claim.—First, the combination of the gate *C*, when constructed as herein described, with the ground frame or planking *A*, substantially as and for the purpose set forth.

Second, the combination and arrangement of the levers *F*, connecting rods *H*, upright frame *E*, and inclines *I* with each other, with the gate *C*, and with the ground frame or planking *A*, substantially as herein described and for the purpose set forth.

61,677.—CHARLES V. MEAD, Hamilton, N. J.—*Roller for Wringers.*—January 29, 1867.—The elastic covering clings to the cloth, which is wound upon and through the central core, so as to prevent its slipping thereon.

Claim.—The roller, consisting of the two sections *a b*, with material *c*, between and completely surrounding them, and incased by the elastic covering, when constructed as herein shown and described.

61,678.—W. H. MILLER, Brandenburg, Ky.—*Dies for Bending Nozzles of Coffee Pots.*—January 29, 1867.—A pair of dies bend the nozzles of the coffee pots and a spring catch holds the metal from slipping under the action of the dies.

Claim.—The combination of the die *A*, and follower *G*, secured to a holder or lever *C*, hinged to the die *A*, and spring catch *E*, or its equivalent, when arranged together and operating substantially in the manner described.

61,679.—F. OAKLEY, London, England, assignor to himself and JOHN WILLS, Newark, N. J.—*Egg and Cream Beater.*—January 29, 1867.—The rotary beater

revolves with the case, which has a spout to discharge the contents when sufficiently beaten.

Claim.—First, the combination of the case *A*, having the spout *d*, and the disk *e*, with the triangular beaters *B*, of unequal length, as and for the purpose specified.

Second, the case *A*, having the tube *h*, bearing the shaft *g*, to which the beater disk *e* is secured and supporting the shaft independent of any other bearing, in the manner as and for the purpose specified.

61,680.—ALBY H. PAGE, South Boston, Mass., assignor by mesne assignments to W. M. B. RHODES, River Falls, Wis., NATHANIEL A. RHODES, Waterbury, Vt., and DAVID LYMAN, Middlefield, Conn.—*Clothes Wringer.*—January 29, 1867.—The wringer is erected upon and swiveled to a pair of clamps whose feet adjust themselves to and clasp the edge of the wash tub.

Claim.—First, the combination with the standards of a wringing machine of a clamping device under an arrangement such as described, so that said machine may be adjusted to tubs of various diameters.

Second, in combination with the standards of wringing machines and clamping devices, as described, the use of screws, or their equivalents, for the purpose of firmly securing the wringer after its adjustment to the tub, substantially as set forth.

Third, the application of a clamping device to a wringer, with a swivel joint to adapt itself to tubs of various forms.

61,681.—E. M. PAYNE, Waverly, N. Y.—*Folding and Cot Bedstead.*—January 29, 1867.—The cot bed has both folding legs and casters so that it may be raised upon the legs while in use, and when the legs are folded up the bed may be run upon its castors under a larger bed.

Claim.—The combination and arrangement of the castors *J*, and the folding legs *I*, whereby the device is adapted for use as a bed bottom, trundle bed or cot, substantially as herein shown and described.

61,682.—C. C. P. PEABODY, Calais, Me.—*Steam Engine Valve Gear.*—January 29, 1867.—The position of the valve rod on the link is governed by the lever which is connected to the latter by a rod. The link is connected at one end by a rod to the eccentric rod and at the other to a rock bar, moved by the eccentric. When the valve rod is shifted to one end of the link, the coupling at that end works parallel with the valve rod and the other connecting rod swings at right angles to the former.

Claim.—The construction of the link *D* and its combination with a steam engine valve movement.

Also, the rock bar *E*, the connecting rods *a'* and *d*, and the lever *H*, arranged substantially as described, in combination with the link *D* and the eccentric *B*, as and for the purposes herein set forth.

61,683.—H. H. PEMBER, New York, N. Y.—*Machine for Cutting Canvas, &c.*—January 29, 1867.—The machine is for cutting canvas, card board, and other sheet materials into strips; the stuff is fed between rollers, guided by a strip, and slit by a knife which is adjusted to such distance from the latter as may be desired.

Claim.—The combination of the feed rollers *D*, table or platform *O*, having guide bar *Q* and cutter or knife blade *L*, susceptible of adjustment, when all arranged and combined together substantially as and for the purpose described.

61,684.—HIRAM PHINNEY, Kingston, N. Y.—*Rotary Bellows.*—January 29, 1867.—The rotary cylinder has segmental peripheral grooves parallel to its axis, and in these are segmental valves rotated by means of cranks on their axis, so as to act as pistons in contact with the cylinder during the greater portion of their movement, and rotated to pass the abutment at a point between the induction and eduction openings.

Claim.—An improved rotary bellows or pump formed by the combination and arrangement of the semi-cylindrical valves *C*, chambered cylinder *B*, cranks *H*, connecting rods *I*, and shafts *J* and *L*, with each other, substantially as herein shown and described.

61,685.—JOHN POL, New York, N. Y.—*Cab*.—January 29, 1867.—Explained by the claim and illustration.

Claim.—The arrangement in covered cabs of a driver's seat behind the body of the cab, resting on a spring *c*, formed as here shown, and supported on a rear extension of the frame of a vehicle, and also a supplementary seat next the dash board, and also an opening in the back of the cover to permit communication between the driver and passengers, when the several parts are arranged in the manner here shown.

61,686.—GEORGE H. REAY, New York, N. Y.—*Machinery for Stamping and other Purposes*.—January 29, 1867.—The punch and die are brought together by a sudden impulse imparted to the fly wheel, which actuates the spring plunger of the punch. The motion is obtained by the action of a cam on a forked rod, which straddles a wrist pin on the fly wheel.

Claim.—The method herein described of producing the blow required for stamping or embossing, consisting of a fly wheel, or other equivalent device, which, after having received an impulse, produces the desired action of the punch, substantially as set forth.

61,687.—GEORGE H. REAY, New York, N. Y.—*Envelope Machine*.—January 29, 1867.—The sliding arms move in guide grooves and have studs which hold the pile of blanks in position, while being pushed under or removed from the pickers or gummets, without stopping the machine. The ridge beneath the pile of blanks causes them to bend when the pickers descend upon them.

Claim.—First, the arrangement of a slide or sliding arms, in suitable guide grooves, in the bed of an envelope machine, in combination with the pickers or gummets, constructed and operating substantially as and for the purpose set forth.

Second, providing the bed with a ridge or depression to operate in combination with the pickers or gummets, substantially as and for the purpose described.

61,688.—JAMES F. SAYER, Macomb, N. Y.—*Stave Joiner*.—January 29, 1867.—The staves are clamped in their bent position on a frame, to which are pivoted a double-acting knife and a swing plane.

Claim.—The arrangement of the swinging plane *C*, double-acting knife *B* and bed *A*, operating substantially in the manner and for the purposes specified.

61,689.—J. SHATTUCK, Waterloo, N. Y.—*Seed Planter*.—January 29, 1867.—The planting device is adjustable vertically to regulate the depth of planting. One of the supporting wheels has a side cam, which operates the seed roller within the hopper, a vertical shaft which carries a roller to press the seed into the ground, and also a projection by which valves at the lower end of the seed standard are opened. A segmental rack upon the hub of a supporting wheel intermittently turns a toothed roller within the hopper to loosen up the seed and forward it.

Claim.—First, the rising and falling or adjustable frame *D*, placed within the frame *A*, and having the hollow standard *V* attached, all arranged to operate substantially as and for the purpose set forth.

Second, the reciprocating slide rod *S*, operated by the cams *T*, on the wheel *C* and the spring *U*, and provided with the rack *g*, in combination with the toothed segment *R* and the seed-dropping cylinder *Q*, all arranged substantially as and for the purpose specified.

Third, the intermittently rotating toothed cylinder *M*, operated from the wheel *C* through the medium of the gearing, as shown, in combination with the hollow standard *V* attached to the adjustable frame *D*, substantially as and for the purpose set forth.

Fourth, the sliding rod *Y*, provided with the roller *Z*, spring *m* and arm *l*, and placed within the hollow standard *V*, and operated from the sliding rod *S*, as shown, in combination with the valves *XX*, placed within the standard, substantially as and for the purpose specified.

61,690.—SAMUEL SHEA, Corry, Pa.—*Barrel or Cask*.—January 29, 1867.—The periphery of the head

is tongued, and has rectangular shoulders bearing against the staves.

Claim.—First, securing the head and bottom *D* and *E* in the barrel, by means of the flange *a* and groove, as herein described and for the purposes set forth.

Second, securing the staves of the barrel or tank together by means of the dowel *a*, feathered on both ends, in the manner as specified.

61,691.—ROBERT STANLEY, Chariton, Iowa.—*Churn*.—January 29, 1867.—The dasher has radial arms, carrying vertical wings, with a triangular vertical section. The churn side has radial inwardly projecting wings. The power is communicated by a horizontal hand-wheel, and a belt to a pinion pulley on the dasher shaft.

Claim.—An improved churn formed by the combination of the vertical tapering flanges or ribs *C*, the triangular blades *H*, horizontal arms *G* and vertical shaft *D* of the dasher, and the horizontal hand-wheels *K N* and band *M* with each other, and with the body *A* of the churn, substantially as herein shown and described.

61,692.—WILLIAM H. TRUESDELL, Elgin, Ill.—*Sash Fastener*.—January 29, 1867.—A pivoted dog operates upon the edge of the window sash, so as to hold the same at any given height. The dog is raised by a lever in the stile.

Claim.—The combination of the slotted box *C*, dog *D* and lever *E*, when constructed and arranged as set forth.

61,693.—M. WALLWORK, Shelbyville, Tenn., assignor to himself and JAMES NUTT.—*Preventing Accidents on Railroads*.—January 29, 1867.—An adjustable double inclined plane is placed in the middle of the track, and made movable from a distance to operate a whistle on the passing train and throttle the steam.

Claim.—The adjustable inclined plane *C*, in combination with the plunger or rod *H* on the locomotive, and connected or arranged with the throttle and whistle valves thereof to operate in the manner substantially as and for the purpose set forth.

61,694.—JOSEPH B. WIESMANN, Cincinnati, Ohio.—*Express Call Signs*.—January 29, 1867.—The frame has a number of panels, each having a hinged shutter and catch. The inside of each shutter has an inscription "Express," "Dray," &c., and is exposed as required.

Claim.—The frame *A*, hinged sign boards *B C C* and spring catch *b*, constructed and arranged as above described and for the purpose set forth.

61,695.—JAMES R. WILETT and LIVINGSTON BRIEN, Nashville, Tenn.—*Rotary Steam Engine*.—January 29, 1867.—The piston wheel is arranged eccentrically within the cylinder, and has two buckets, which are expanded radially by springs, and withdrawn to pass the abutment by contact with the cylinder. Packing segments on the piston wheel and the edges of the buckets confine the steam.

Claim.—The construction and arrangement of the bucket *C* and the recess *E*, with the packing pieces *h* and *j*, spring *g* and piston *B*, as herein described and set forth.

61,696.—E. K. WOOD and R. W. HENRY, De Witt, Iowa.—*Compound Oil for Mixing Paints*.—January 29, 1867.—Composed of carbon oil, 10 galls.; resin, 15 lbs.; beeswax, 4 lbs.; litharge, 4 lbs.; caoutchouc, 1 lb.; and turpentine, 1 gall.

Claim.—The oil made of the ingredients mixed together in or about the proportions and in the manner substantially as described for the purpose specified.

61,697.—E. B. WOODRUFF, Morristown, N. J.—*Horse Hay Fork*.—January 29, 1867.—A catch, pivoted to the shank, falls over a cross-bar attached to the upper end of the tines, which are also pivoted to the shank. The catch is held in position by a cam lever, also pivoted to the shank. The cam holds the catch down, when resting upon it, but upon being raised the pressure of the cross-bar will raise the catch and release the tines.

Claim.—The cam lever *D*, pivoted to bar *A*, in combination with the catch *C*, and the pivoted forks

B, provided with the cross-bar *d*, constructed and operating substantially as described for the purpose specified.

61,698.—C. F. ZIMMERMANN, Philadelphia, Pa.—*Strap for Accordions.*—January 29, 1867.—The strap is hinged to a post, and forms two loops, one passing around the wrist, and one to admit the thumb.

Claim.—A strap for accordions and other similar instruments forming a double loop like the figure 8, substantially as and for the purpose described.

Also, the combination of the hinged joint *a* with the strap, substantially as and for the purpose set forth.

61,699.—JAMES ADAMS, Newark, Del.—*Starting Street Cars.*—February 5, 1867.—A weighted lever is connected by a chain to the draft device, and this lever acts by a pawl on a ratchet wheel upon the axle to turn it in starting the car. The lever gravitates to take a fresh hold on the ratchet when the power is withdrawn.

Claim.—The weight F, in combination with the chain H, the roller K, the rod I, the ratchets E E, and ratchet wheels C C, and the spring L, the whole arranged, constructed, and operating substantially as herein set forth.

61,700.—PHILANDER ANDERSON, Kalamazoo, Mich.—*Sheep-Shearing Instrument.*—February 5, 1867.—The engine to operate the cutters is enclosed within the handle, and preferably worked by compressed air in place of steam, to prevent heating.

Claim.—First, the construction of a portable sheep-shearing instrument whereby to be enabled to use air under pressure so as to operate the engine and perform the functions substantially as herein set forth.

Second, the combination and arrangement of the engine with the case and cutting device, substantially as described.

Third, the combination of the cross-head of the piston rod of the engine directly with the shear lever D, so that this lever shall receive a vibrating motion from the piston rod, substantially upon the principle and in the manner as herein set forth.

Fourth, the shear lever D, pivoted to the plate A, by means of an adjusting screw *c*, located outside of the case or handle A B of the instrument, substantially as described.

Fifth, the construction of a handle or case for a pair of sheep shears of two concavo-convex parts A B, substantially as described.

61,701.—ALBRO BARBER, Port Byron, Ill.—*Corn Planter.*—February 5, 1867.—The seeding mechanism is adjustable longitudinally and vertically, and may be thrown out of gear when desired. The covering rollers are carried on adjustable pivoted frames connected to the front of the main frame by a spiral spring.

Claim.—First, the frame D, having both a vertical and horizontal adjustment for the purpose of controlling the operation of the seed-dropping mechanism and adjusting the vertical position of the furrow openers, substantially as described.

Second, the combination and arrangement of the movable frame D, stationary frame C, lever or handle R, arms *a' a'*, shaft Q, levers *h'*, slotted arms *i*, rods S, springs S', and shaft U, as herein described and for the purpose specified.

Third, the crank shaft U, arms X X, and connecting rods X' X', in combination with the slides Y Y *a a*, spring valves I I J J, and discharge tubes G G, all arranged and operating in the manner and for the purpose set forth.

Fourth, the pivoted frames N N' and rollers M, in combination with the springs P and rods *j*, all constructed and operating in the manner and for the purpose specified.

61,702.—S. M. BARNETT, New Orleans, La.—*Chest Expander.*—February 5, 1867.—Handles are attached to the ends of a rubber band, which, in use, is passed around the back. The elastic band yields to the forward outward extension of the arms, and assists the vigor of the return movement.

Claim.—The band B, provided with handles A A, whether the latter are made hollow or not, substantially as described for the purpose set forth.

61,703.—N. S. BEAN, Manchester, N. H.—*Carriage Wheel.*—February 5, 1867.—The outside ends of the hub mortises are beveled to about 45° from the radius for the reception of the spoke shoulder. The inner end of each spoke is cut away on one side to allow the passage of the rectangular corner of an adjoining spoke.

Claim.—The peculiarity of construction of the mortises of the metallic hub, and of the tenons of the wooden spokes, substantially as and for the purpose set forth.

61,704.—EDWIN L. BERGSTRESSER, Hublersburg, Pa.—*Harvester Rake.*—February 5, 1867.—The rake teeth project upward between the slabs forming the floor of the platform, and are depressed at the discharge of the gavel passing through holes in the platform. The rake is returned beneath the platform, and its teeth, in turning up into working position, raise the free ends of the two outer slabs to start the cut grain toward the place of discharge. The rake is actuated by two belts.

Claim.—First, the hinged slats of the platform, arranged so as to rise and let the teeth pass up, and also assist in carrying the sheaf off as herein described.

Second, the construction and arrangement of the rake teeth so as to pass under or in the platform at one end thereof, and raise the free ends of the hinged slats, as they rise at the other end to carry off the sheaf.

Third, the combination of a platform provided with two or more hinged slats and an automatic reciprocating rake, substantially as herein described and for the purposes set forth.

61,705.—JAMES C. BETHEA, Blakely, Ga.—*Cotton Cultivator.*—February 5, 1867.—The shares are attached by rings and wedges to the standards and braces, and the latter similarly fastened to the beams. The braces are thus rendered adjustable at either end.

Claim.—First, the mode, substantially as described, of fastening together the standard brace and share by a shackle and wedge.

Second, the mode of adjusting the pivoted standard by slipping forward the shackle and the upper end of the brace upon the beam.

Third, the relative lateral adjustment of the beam by means of the bolts with their collars, washers, and set nuts, substantially as represented.

61,706.—ALFRED BORGNET, Swansea, Wales.—*Apparatus for Smelting Zinc Ores.*—February 5, 1867.—Two or more fire grates are used in the furnace. The retorts have, on their hottest sides, pipes for the passage of air, vapor or liquid, for the regulation of heat by the amount of cooling matter passed through them.

Claim.—The several improvements and combinations herein described.

61,707.—P. BRADFORD, New Haven, Conn., assignor to SARGENT & Co., same place.—*Ornamenting Coffin Screws.*—February 5, 1867.—The ornamental washer plate has a pivoted cap, which shuts down over the screw head and is held by a curved lip on its rim.

Claim.—The cap F, provided with a tongue N, so as to be secured to the plate A, substantially in the manner and for the purpose herein set forth.

61,708.—E. K. BRECKENRIDGE, West Meriden, Conn.—*Sash Lock.*—February 5, 1867.—The lower bar of the upper sash has a horizontal lever pivoted to it, and a lug upon this lever projects through a slot in a spring above it, whose free end has a handle by which it and the lever are swung around. A recess retains the spring when in its locking position.

Claim.—The combination of the plate C, the lever E, and the spring G with the keeper D, when the said spring G is applied to and operates upon the said lever E, substantially as set forth.

61,709.—WM. BROWN, Worcester, Mass.—*Fruit Picker.*—February 5, 1867.—The serrated edge of the upper jaw is placed beyond the fruit and the movable lower jaw drawn up past its edge, by the rope, to sever the stalk.

Claim.—First, the combination of the hinged mouth piece C with the back B and bag E, substantially as set forth.

Second, the combination with the mouth piece C of the ropes or cords *d d* and G, as and for the purposes set forth.

61,710.—ANDREW BUCKHAM and JOSEPH EVANS, Newark, N. J., assignor to ANDREW BUCKHAM.—*Tin Smith's Seaming Machine.*—February 5, 1867.—A horizontal mandrel is adjustable upon its axis, so that different faces may be brought up to correspond with the forms of the joints to be made. A gauge regulates the position of the point to be stamped. The punch is worked by a treadle.

Claim.—First, the die A, figures 1 and 2, in combination with the guide plate B, figures 1 and 2, when constructed in the manner and for the purposes set forth.

Second, the revolving mandrel C and sliding gauge D, figures 1 and 2, in combination with the die A and guide plate B, when constructed in the manner and for the purposes set forth in the above specification.

61,711.—EMIL CAJAR, New York, N. Y., assignor to self and CHARLES SICHEL, same place.—*Button Hole Sewing Machine.*—February 5, 1867; antedated January 28, 1867.—The forward feed is effected by the thread when pulled by the action of the looper, and when the needle is up and the adjustable foot or stitch regulator has risen from the thread, so as not to offer any impediment. One of the lower bobbins carries a thread and the other a gimp or cord; and the loop of the needle thread is drawn first over one bobbin and then over the other. The case over each bobbin is so formed that its enclosed spool may be wound with thread without the need of removal from the case. An arm aids in giving a positive strain to the needle thread at the proper time, in order to draw the surplus thread. The structure and movements of the cloth holder and slide are such as to feed the cloth straight, and also to turn it for the eyelets, and to allow of sewing button holes of different lengths.

Claim.—First, the stitch regulator F to act in conjunction with the needle thread, substantially as and for the purpose set forth.

Second, the arrangement of two longitudinally sliding bobbins S S', in combination with the looper L, constructed and operating substantially as and for the purpose described.

Third, the cam groove *q*, and the double crank *h l*, in combination with the looper L, constructed and operating substantially as and for the purpose set forth.

Fourth, the barrel *r*, surrounding the bobbin S or S', in combination with the central tension screw *s*, which is provided with concave centers, substantially as and for the purpose described.

Fifth, the sliding yoke J, with disks *v v'*, in combination with the bobbins S S' and spool holders I I', constructed and operating substantially as and for the purpose set forth.

Sixth, the oscillating arm K, in combination with the two bobbins S S', spool holders I, needle *n*, and looper L, constructed and operating substantially as and for the purpose described.

Seventh, the longitudinally sliding and revolving cloth holder N, in combination with the slide *m* and with the cloth plate A, constructed and operating substantially as and for the purpose described.

61,712.—EDWIN M. CHAFFEE, Providence, R. I.—*Elliptic Spring for Carriages.*—February 5, 1867.—Explained by the claim.

Claim.—The introduction of india-rubber, or similar elastic substance, between the leaves or lifts of elastic springs, substantially as and for the purposes specified.

61,713.—JAMES CHRISTY, Philadelphia, Pa.—*Bolster for Railroad Cars.*—February 5, 1867.—This has two longitudinal beams, two end transverse beams, intermediate transverse beam and diagonal braces, all connected together so as to prevent sagging at the outer ends of the bolster, and so that those ends may be elevated when required.

Claim.—First, the bolster composed of the within described longitudinal and transverse beams, diagonal braces and stay rods, the whole being arranged and connected together, substantially as and for the purpose herein set forth.

Second, the combination of the strap *b*, adapted to

the longitudinal and central beams, the adjustable bolts *d* and *d'*, and plate *e*, and stay rods *n* and *n'*.

Third, the combination of the longitudinal and transverse beams, the adjustable or self-accommodating braces G G', and H H', rounded at the lower ends, and bolts *g* and *k*.

61,714.—D. R. CLEM, Front Royal, Va.—*Grinding Mill.*—February 5, 1867.—The central piece fits upon the spindle and is connected at each end by a link to an arm about midway of the length of the latter. The object is to obtain an even action upon the stone if the parts wear irregularly.

Claim.—The driver composed of the central piece A and the arms B, united and arranged to operate substantially as and for the purpose set forth.

61,715.—JOHN W. CLOSE, Buffalo, N. Y.—*Pipe Wrench.*—February 5, 1867.—The divergent jaws are fixed, one is serrated and the other has a sliding serrated block, which is adjustable to adapt it to varying diameters of pipes.

Claim.—The sliding jaw block *e* in combination with the diverging jaws *b c* and lever A, substantially as and for the purpose set forth.

Also, in combination therewith, the use of the spring *g*, or its equivalent, operating substantially in the manner and for the purpose described.

61,716.—DE WITT CLOUGH, Auburn, N. Y.—*Churn.*—February 5, 1867.—The cover of the churn has a central chamber traversed by the dasher rod and having holes to permit free ingress and egress of air.

Claim.—The vertical air chamber F with the horizontal openings 1 2 5 6, as above set forth.

61,717.—FREDERICK F. CORNELL, JR., New York, N. Y.—*Beater in Baling Press.*—February 5, 1867.—The beater is lifted by means of its toggle links and pressure arms, the latter drawing inward to avoid contact in raising, and the arms become sockets for the ends of the toggles when the beater becomes the follower of the press. Other devices are cited in the claims.

Claim.—First, forming the grooves or slots *f f f f*, in the ends of the beater B, and providing the inner faces of the narrow ends of the press chamber with the track *e' e' e' e'*, and continuing the same upon the inner faces of the superstructure, for the purposes herein described.

Second, forming the slots *c c* in the ends of the pressure arms C, through which the ropes I and J may play freely.

Third, carrying the ropes I and J, one at either end, down within the framing of the press between the posts G G G G, sheeting *m m*, and shanks *b b*.

Fourth, the levers L L, segmental shanks *b b*, shank pins *o o*, guards *d d d d*, and concave lugs of pressure arms C, all combined and arranged for the purposes hereinbefore specified.

Fifth, the rope I, sheaves K K H H H and F, arranged to operate and control the levers L L, as described.

61,718.—FREDERICK F. CORNELL, JR., New York, N. Y., assignor to himself and EDWIN M. WIGHT.—*Baling Press.*—February 5, 1867.—The beater is subsequently used as a follower in combination with toggle levers whose movable ends work upward in the act of compressing. The devices and relation of the parts are set forth in the claims.

Claim.—First, the use of the beater B as a follower when operated as such by the levers N N, located at the ends of the press.

Second, the use, in a baling press, of stirrups or crossheads, located outside of the lining of the press chamber, but within the framing of the press as a means of communicating motion to the follower when the same has arms or beams projecting through slots in the lining of the press chamber for the purpose of forming a connection with mechanism used for compressing, located and operating at the sides or ends of the press framing.

Third, the use, in a baling press, of toggle levers, located outside of the framing of the press when the feet of the radii of the levers are below the plane of the top of the finished bale and the points of connection between the upper ends of the levers and the rods, chains, or their equivalents, connecting the same

with the arms or beam of the platen are above the said plane.

Fourth, the use of the guides *g g* to control the motion of the levers *N N*, when operated as herein substantially described.

Fifth, the use of the guides *t t*, crossheads *Q Q*, ropes *S S*, and counterpoises *R R*, when used and combined for the purposes herein described.

Sixth, making a close press chamber in a baling press, operated by means of a follower, having arms or beams projecting through the lining thereof, to form a connection with the compressing mechanism by means of removable sections of said lining, which, when in position, render the press box tight on all sides, but when removed, allow the said arms or beams to move freely in the openings formed thereby.

Seventh, the removable sides *I I*, in combination with the tongues and grooves *f f f f*, arms *C C*, and crossheads *Q Q*, substantially as and for the purposes described.

Eighth, the levers *N N*, radii *O O O O*, sheaves *U U U U*, chains or ropes *S S S S*, crossheads *Q Q*, arms *C C*, and follower *B*, combined, substantially as and for the purposes hereinbefore described.

Ninth, the use in a baling press of two horizontal drums, so located under the press framing that a vertical plane passing through the points in the ends of the toggle levers located at the ends or sides of the said framing to which the chains or ropes used for operating them are attached will be tangent to their perimeters for the purpose of winding the said ropes or chains and yet retaining them always in the same vertical plane.

Tenth, the use in a baling press of the drums *D D*, gear wheels *E E*, driving pulley *F*, and ropes or chains *X X* and *Y*, substantially as and for the purposes hereinbefore described.

Eleventh, the use of a hollow beater *B* with the arms or beams *C C*, bolts or pivots *c c*, and head beam *L*, so constructed and arranged that the said arms when allowed to turn freely on the bolts *c c*, will of their own weight assume a position entirely within the exterior lines of said beater, but when drawn upon by the cord *Z* will assume a horizontal position with their inner ends held firmly by the head beam and their outer ends projecting a sufficient distance beyond the exterior lines of the beater to engage with the mechanism used to operate it as a follower.

61,719.—FREDERICK F. CORNELL, Jr., and EDWIN M. WIGHT, New York, N. Y.—*Press for Compressing Bales already Formed.*—February 5, 1867.—Explained by the claims and illustration.

Claim.—First, the use in a press designed for the compressing of bales already formed or of goods requiring no press box to retain them in position between the platen and the head block and not provided with sides or ends for the purpose of forming such chamber or press box, of toggle levers, the fixed fulcrum points of whose radii are located above and upon the head block or head beams of the press.

Second, the use in a toggle-lever press not provided with permanent sides or ends for the purpose of forming a press chamber of a platen suspended by means of rods or bars passing down through the head block or between the head beams thereof from the ends or shanks of toggle levers located on and above said head block or the beams thereof.

Third, the use in a toggle-lever press not provided with permanent sides or ends of posts located two at either end, and so arranged that while serving as supports for the head block and its superincumbent weights they shall also act as guides to retain the motion of the platen in right lines by engaging with suitable notches or slides in the same, substantially as hereinbefore described.

Fourth, the use in a toggle-lever press having the fixed fulcrum points of the radii of the levers thereof located on and above the head block or the beams thereof of a vertical guide attached to the center of said head block and furnished with a slide provided with horizontal bars attached thereto and extending to and connected by joints with the shanks of the toggle-levers on either side, and so arranged as to prevent the same from altering their relative position and to retain their motion in perpendicular and parallel lines when operating the platen.

Fifth, in a press having a platen suspended from toggle-levers located above and having the fixed ful-

crum points of their radii resting upon the head block or the head beams of the press extending the lower portions of said levers downward from the center pins a sufficient distance to allow the moving power to be applied thereto at points *n n*, whose distance from the center pins *g g* (when the radii are brought into a perpendicular position) shall be equal to the elevation of said center pins above the lower faces of the guide sheaves *a a*, located in the ground sills of the press.

Sixth, the sheaves *a a b b o o*, chains *c c*, levers *E E*, draw rods *G G G G*, horizontal connecting bars *H H*, shank pins *h h*, and slide *I*, all arranged and combined as and for the purposes hereinbefore specified.

61,720.—DAVID COX, Cincinnati, Ohio.—*Cradle.*—February 5, 1867.—The rockers of the cradle oscillate upon the padded convex edges of the standards and are tied thereto by flexible straps. The treadle has a vertical rod whose resilient tip is projected against and rocks the cradle. The turn bar arrests the motion.

Claim.—First, the combination of the cushions *E e* with the rockers *B c* and the straps *F f*, as and for the purposes explained.

Second, the combination of the treadle *G* and cushioned rod *H h* with the cradle *A B* and convex rocking surfaces *E*, substantially as and for the purposes specified.

Third, the combination of the turn bar *I*, cradle *A B*, and trestle *C D E*, as and for the purposes specified.

Fourth, the combination of the inclined planes *K K'* with the turn bar *I*, cradle *A B*, and supporting trestle *C D E*, for the purpose described.

61,721.—CHAS. M. CRANDALL, Montrose, Pa.—*Children's Building Blocks.*—February 5, 1867.—Explained by the claim.

Claim.—A new and useful improvement in children's building blocks, which consists in so indenting the blocks (which may be of any size, shape, or material) by tonguing and grooving or other similar process that the indented parts of each block will closely fit into the indented parts of any of the other blocks forming when placed into each other a substantial fastening or joint flexible in two directions, easily put together and removed at the will of the operator.

61,722.—SILAS CRISPIN, New York, N. Y.—*Breech-loading Fire-arm.*—February 5, 1867.—The upward vibration of the breech-block lever drives the cartridge into its seat, and it is locked in this firing position by the spring catch. After firing, the catch is released, and the vibration of the block engages its spur with the flange of the cartridge and extracts it.

Claim.—The employment of a solid plane-faced vibratory (or rotating) breech block, having its axis at its anterior inferior portion, in combination with the lever *G* and spring catch, when there is no connection between such parts and any portion of the lock work, and the whole is arranged to operate as specified.

Also, the combined arrangement, as set forth, of the extractor with the breech block and swinging lever or long arm, for the purposes set forth.

61,723.—GEO. CROWTHER, Philadelphia, Pa.—*Spinning Mule.*—February 5, 1867.—This relates to the means for giving the automatic inward motion to the carriage by belts and pulleys combined with the rim shaft and for winding the yarn; and also to the construction and arrangement of the back catch for stopping the shifter and holding it securely during the time it should remain on the loose pulley on the driving shaft.

Claim.—First, the combination of the loose pulleys *1* and *2*, constructed and applied as described, with the driving shaft *C*, for giving the inward motion to the carriage and winding the yarn on the spindles, the said pulleys acting through the pulleys *3* and *3'*, the band *F*, and cord *e*, for giving an inward motion to the carriage and the pulleys *4 5 7 8* and *9* and bands *G I R* and *S*, or their equivalents, for operating the spindles as above set forth.

Second, the combination of pulley *1* with pulley *3* by means of the cross belt *F*, for operating the shaft

E, substantially as described and for the purpose specified.

Third, the combination of pulley 2 with pulley 5 on shaft J by means of the intermediate double pulley 4 and belts G and I, for operating said shaft, substantially in the manner described and for the purpose specified.

Fourth, constructing the back catch L with the shoulder b, and combining with said catch the vertical rod M, lever N, and rod Q, or its equivalent, the said parts being arranged for joint operation substantially as described and for the purpose set forth.

61,724.—JAMES WARREN DAVIS, Washington, D. C.—*Bed Bottom*.—February 5, 1867.—One end of each spring is fixed to pivoted bars and the other has free play in the mortise so as to straighten when it yields to pressure.

Claim.—First, the curved wooden springs G G', interlocking with each other, secured at their upper ends and having their lower ends free, which ends pass through slots in guide bars c c', substantially as described.

Second, the guide bars c c', provided with mortises H H', and pins e e', working in slots d d', substantially as described.

Third, the plates b b' in combination with the pivoted head and foot bars F F', for the purpose and in the manner described.

Fourth, the combination of the wooden springs G G', bars F F', plates b b', guide bars c c', provided with mortises H H', and pins e e', slots d d', and mattress C, substantially as and for the purpose set forth.

61,725.—JOHN DICKASON, Vevay, Ind.—*Farm Gate*.—February 5, 1867.—The gate has adjustable diagonal braces to counteract sagging. A rack is applied to the upper part of the gate near the hinge post, and in connection with the adjustable brace a lever is employed for the double purpose of straining the gate, and securing the brace to any notch of the rack to which it may be adjusted.

Claim.—The combination of the rack J j j with the brace G G', pin I, lever L, and detaining bar M, all arranged to operate in the manner and for the purposes set forth.

61,726.—ANDREW J. EDGETT, Hornellsville, N. Y., assignor to himself, JOHN W. FERRY and ALONZO GRAVES, same place.—*Well Tubing*.—February 5, 1867.—Each part has openings so arranged that while the tube is being driven the openings, not being coincident, are closed. By rotating the tube the openings are brought into correspondence and the water conducted.

Claim.—A driving point for tube wells composed of two parts, A and B, having openings a² and b³, screw shank b², and each having a clutch formation b¹, all arranged and operating in the manner substantially as herein described.

61,727.—HENRY FASSMANN, New Orleans, La.—*Cotton Bale Tie*.—February 5, 1867.—The chamfered corners permit the passage of the hoop without "buckling," and it is then caught upon the arms of the open loop. The ridges rest upon and bite the hoop which is pressed against them by the expansion of the cotton.

Claim.—The bale tie buckle constructed with an opening in one loop with chamfered corners a b and with a ridge or ridges c c on one or both sides, substantially as and for the purpose described.

61,728.—L. B. FLANDERS, Philadelphia, Pa.—*Piston for Steam Engines*.—February 5, 1867.—An alternate series of springs and blocks of metal is placed between the annular disk of the piston head and the packing rings for the purpose of holding the rings in contact with the cylinder. Keys are applied in connection with two or more of the blocks of metal by which the whole series can be forced out against the interior of the packing rings; a key is driven in between the sections of the metal blocks for the same purpose.

Claim.—First, the within-described packing, composed of blocks and springs constructed and arranged alternately on a piston between the annular rib d and split rings e, substantially as described.

Second, the keys i i, arranged between the blocks and annular rib d, for the purpose specified.

Third, the key m applied for expanding the packing, in the manner described.

61,729.—RUSSEL FRISBIE, Cromwell, Conn., assignor to J. & E. STEVENS & Co., same place.—*Cast Iron Frame for Toy Looking-Glasses*.—February 5, 1867.—Explained by the claim.

Claim.—The fastening of the glass into the cast-iron frame of a toy looking-glass by means of small pieces of tin, sheet-iron, or other suitable metal cast into the edge of the frame, as herein described.

61,730.—FRANCIS P. GARDNER, New Haven, Conn.—*Medical Compound for Cure of Catarrh*.—February 5, 1867.—Composed of Scotch snuff, 2 lbs.; castile soap, 2 lbs., and tannin, 1 oz. To be used as a snuff.

Claim.—The herein described compound, prepared substantially as set forth.

61,731.—FRANKLIN T. GILBERT, Elgin, Ill.—*Water Elevator*.—February 5, 1867.—The described automatic devices are for changing the gears in a double-bucket water elevator, the central ratchet being brought into engagement with one or the other of the spools, as required.

Claim.—First, the hollow double lever B, when operated or held in place by balls, substantially as specified.

Second, the jointed lever P P', constructed substantially as set forth in combination with the weighted lever B.

Third, the combination and arrangement of the double weighted lever B, jointed lever P P' and ratchet S, with the loosely revolving cylinders T, miter wheels L L' N well cords, straps e, friction roller i, buckets A and discharging bail x, when constructed and arranged substantially as specified.

61,732.—GEORGE D. GOODRICH, Joliet, Ill.—*Clay Pipe Machine*.—February 5, 1867.—The drain pipes are made by automatic series of operations. The clay is forced continuously through the mold, issuing as a pipe into a receiving trough, and is cut into sections. The sliding shaft and cutter are operated by a wheel. A sliding bar beneath the receiving platform regulates the length of the sections, which together with their receiving troughs are elevated and dumped, and the troughs returned.

Claim.—First, the wheels or rollers T, cross rollers u, and platform N N', in combination with the trough O, substantially as and for the purposes specified.

Second, the wheel I, when provided with the arms e and cams k, substantially as and for the purposes specified.

Third, the sliding bar K, provided with the arms or stops d.

Fourth, the spring g, provided with the hook h, in combination with the catch i and cams k of the wheel I, constructed and operating with the shaft J and sliding bar K, substantially as specified.

Fifth, the bent arms e and cutting wires f, arranged and operating substantially as set forth.

Sixth, the head P of the side elevator when provided with the cams o and n upon each side.

Seventh, the head P, constructed substantially as described in combination with the bent arms i.

Eighth, the bent arms w, when provided with the points or projections k'.

Ninth, the arms w, in combination with the springs z, projections k' and head P of the elevator, arranged and operating substantially as and for the purposes specified.

Tenth, the combination and arrangement of the side elevator, constructed substantially as set forth with the guide post D, and automatically operating arms and rest w.

Eleventh, the conical or wedged-shaped block t, when attached to an elevating cord, rope or chain, substantially as and for the purposes specified.

Twelfth, the spring u, provided with the ledge or catch y, in combination with the lever v, having its head or upper end enlarged, substantially as and for the purposes specified.

Thirteenth, the combination and arrangement of the cylinder R, lever v, spring u, rope q and block t, with the elevator P and automatic rest w, constructed and arranged substantially as and for the purposes specified.

Fourteenth, the standard or post E, provided with the T-shaped guides Z, substantially as specified.

Fifteenth, the double wedge or conical block *f'* when attached to the cord *a'*, for the purposes specified.

Sixteenth, the double acting friction clutch *d'*, arranged and operating substantially as specified.

Seventeenth, the combination and arrangement of the rollers *g'* and clutch *d'*, with the cord *a'* and double acting block *f'*.

Eighteenth, the dumping platform X, when provided with a hinge *c* on one side, and guides *n'* on the other, substantially as specified.

Nineteenth, the platform X, in combination with the bent bar Y and sliding head *h'*, constructed and hinged substantially as specified.

Twentieth, the bent bail *b'*, when so bent as to pass the back of the platform X, and hinge or attach to it near the front at *e*, substantially as and for the purposes specified.

Twenty-first, the combination and arrangement of the platform X, hinged bent bar Y, sliding head *h'*, with the bail *b'*, cord *a'* and standard E, substantially as and for the purposes specified.

Twenty-second, the combination and arrangement to two dumping platforms, constructed substantially as specified, with a single guide standard, so that one will elevate the other, and bring its opposite one into position while dumping a trough.

Twenty-third, the receiving platform F, provided with rollers *v*, located on the same plane as the rollers *u* of the receiving frame, substantially as specified.

Twenty-fourth, the screws *a* for adjusting the height of the receiving frame to the different sizes of pipe being made.

Twenty-fifth, the use or employment of rollers or carriers for supporting and carrying a trough used to receive and carry off clay pipes, which are forced from the die continuously, and cut while in motion.

Twenty-sixth, the arrangement of the cutting wires, in combination with a receiving trough, so that both ends of the section of pipe will be cut, and the wires while cutting take the same motion as the pipe and trough, and produce a square cut across a continuous pipe while in motion.

61,733.—MARK B. HARDIN, New York, N. Y.—*Taking Copies of Manuscripts, &c.*—February 5, 1867.—The transfer paper is treated with an infusion of nutgalls, the reaction taking place between them and the sulphate of iron in the ink of the manuscript, causing the impression. Oxalic acid is used to assist when the writing is old.

Claim.—First, the process hereinbefore described of copying manuscripts, maps, &c., which have been written with common ink, substantially as above set forth.

Second, in the copying of manuscripts as herein contemplated, which have been written with common ink, and which have been long written, the use of a weak solution of oxalic or other equivalent acid, substantially in the manner and for the purpose hereinbefore described.

61,734.—ROBERT A. HARRIS, Philadelphia, Pa., assignor to himself and B. S. HARRIS, same place.—*Refrigerator.*—February 5, 1867.—By the described arrangement the air is chilled in the ice chamber before entering the food chamber.

Claim.—The combination of the ice chamber D, its opening *v* and perforated end *g*, the compartments G and F, channel *j* at the bottom of the ice chamber and the opening *n*, the whole being arranged as and for the purpose described.

61,735.—ANDREW HARTUPEE, Pittsburg, Pa.—*Steam Engine Air Pump.*—February 5, 1867; antedated January 20, 1867.—To obtain two strokes of the air pump to each stroke of the steam cylinder piston, the slide of the latter is attached to one end of the walking beam, which actuates the pistons in the two cylinders below.

Claim.—The horizontal or inclined steam engines, the combination of the link S and lever L, with the head K, piston rod I and slides G G, arranged as described and for the purpose specified.

61,736.—HENRY P. HASKIN, Roseoe, Ill.—*Apparatus for Handling Hops in Slaughtering.*—February 5, 1867.—A scalding tub, bench, and suspending frame

are placed within the radial range of a swing pole, by which the hogs are lifted and transferred.

Claim.—The bars D and *d*, in combination with the lever C, revolving socket B and post A, when constructed substantially as described, when arranged and operating as and for the purpose specified.

61,737.—B. B. HOTCHKISS, New York, N. Y.—*Snap Hook.*—February 5, 1867.—The tongue is formed of sheet metal, bent at the root in the form of a hook, and the joint is formed by the aid of the spring, which presses and confines the hook in a corresponding recess in the body, so that the spring performs the double function specified.

Claim.—First, in a snap hook having a rigid internal tongue, operated by a separate spring, the interlocking of the root of the tongue and the confining of the locked parts by the same spring which operates the tongue, substantially in the manner and for the purpose herein set forth.

Second, in combination with a rigid tongue mounted and operating in a hook, as described, the slot or recess *a*, having parallel sides adapted to guide the tongue near its point and resist side strains, substantially as herein set forth.

61,738.—GEORGE C. HOWARD, Philadelphia, Pa.—*Dressing Grindstones.*—February 5, 1867.—The cutter wheel is placed in a case which only allows a segment to protrude, and excludes grit. The traverse sliding surfaces and the long journal bearings are also encased. The rests of the journal are adjustable toward and from the stone, while the traverse is effected by rack and pinion.

Claim.—The combination of long bearings for cutting wheel *b*, the rests F, the lip *o* and ears *s*, as set forth and for the purposes described.

61,739.—ELIAS S. HUTCHINSON and HUGH J. McAVOY, Baltimore, Md.—*Apparatus for Carbureting Air.*—February 5, 1867; antedated January 19, 1867.—The drum used for forcing air in the carbureting machine has hoods or buckets, which take up the hydrocarbon fluid as the drum revolves, and keep the surface of the wheel continually covered therewith.

Claim.—First, a revolving drum partially submerged in hydrocarbon fluid, and provided on its interior or exterior periphery of both, with buckets, receptacles, retentions or depressions which raise portions of the fluid for the purpose of moistening the surface, which is exposed to the air in the carburetor.

Second, the combination of the inner and outer drums revolving together, and between whose moistened surfaces the air is conducted, substantially as described.

Third, in combination with a revolving drum provided with devices for raising the fluid, the hood C, which compels the air to traverse the outer periphery of the drum, as described and represented.

Fourth, in combination with the air-forcing machine, the two concentric series of fluid-raising devices, and the hood arranged substantially as described and represented.

61,740.—SILAS Y. IVES, Meriden, Conn.—*Cart Brake.*—February 5, 1867.—The backward vibration of the yoke on the end of the tongue brings the shoes against the rims of the wheels by means of rod and lever connection.

Claim.—First, the combination and arrangement described of the shoes G, the levers H and L, with the equalizer M and the rod N, substantially in the manner and for the purpose specified.

Second, in combination with the above, the bar P and rod R, constructed and arranged to operate substantially in the manner and for the purpose specified.

Third, the combination of the shoe G and lever H, when linked together so as to operate substantially as and for the purpose specified.

61,741.—CLARK JILSON, Worcester, Mass.—*Lightning Rod.*—February 5, 1867.—A strip of copper occupies and projects from a groove in the iron rod. The thimble connections have slots to correspond. A disk of copper is placed intermediate between the ends of the sections, and is, with them, enclosed by the thimble.

Claim.—First, the combination of the iron conduct-

ing rod with the copper strips secured in a groove formed in said rod, substantially as shown and described.

Second, The combination with the ends of the sections or pieces forming a joint of copper or other metal washers, substantially as set forth.

Third, making the connecting pieces C with slots b, as shown and described.

61,742.—MOSES A. JOHNSON, Lowell, Mass.—*Insole for Boots and Shoes.*—February 5, 1867.—To correct the tendency of insoles to crimp up or crease under the pressure of the foot in the act of walking, a wire, or other equivalent stiffener, is secured to the edge.

Claim.—An insole composed of layers of felted or woven material, or of thin leather or their equivalents, and margined by a wire or its equivalents secured to the edge of the insoles, substantially as described.

61,743.—J. J. JOHNSTON, Allegheny City, Pa.—*Manufacture of Iron.*—February 5, 1867; antedated January 18, 1867.—The charge of 480 lbs. of iron, during the process of puddling, receives a composition of iron ore, 3 lbs.; wood charcoal, 1 lb.; manganese, 1 lb.; red lead, 1 lb.; blue vitriol, 8 oz.; common salt, 4 oz.; borax, 3 oz.; and lye, 2 oz. The above ingredients are mixed, and the mass is divided and made up into two long narrow packages, which are placed in the furnace at different stages of the puddling process, and mixed with the iron.

Claim.—Treating iron during the puddling or boiling process with a chemical compound composed of the ingredients herein named, in about the quantities specified, and prepared and used in the manner and form described and for the purpose set forth.

61,744.—GEORGE W. LARGE, Yellow Springs, Ohio.—*Gate Latch.*—February 5, 1867.—The latch, in the act of closing, becomes available as a lever to slightly elevate the free end of the gate and correct the tendency to sag.

Claim.—The reversely gravitating lever latch constructed and operating substantially as and for the purpose set forth.

61,745.—HENRY and ALBERT LOVIE, Philadelphia, Pa.—*Curtain Fastener.*—February 5, 1867.—The tension of the cord is adjusted by means of the set nut which engages the screw to which the pulley block is attached.

Claim.—The sliding screw rod C having a pulley cage D formed in it, in which the pulley d is contained, substantially as specified and described.

61,746.—ROBERT O. LOWREY, Tabor, Iowa.—*Tile and Brick.*—February 5, 1867.—Explained by the claims.

Claim.—First, a plastic cement, which is composed of marl and coal tar, mixed together in suitable proportions, substantially as described.

Second, a roof which is composed of unglazed and unburned slabs or tiles which are secured firmly down upon the roofing boards, and then covered with a cement consisting of marl and coal tar, substantially as described.

Third, a roof covering which consists of a bottom layer of dry clay, a second layer of clay, marl, and coal tar, and a top or surface layer of marl and coal tar, applied to roofing boards, substantially as described.

61,747.—E. B. MANNING, Middletown, Conn.—*Ice Pitcher.*—February 5, 1867.—Arranged between the two bottoms of an ice pitcher is a strengthening support which will admit of a free circulation of air between the said bottoms, and preserve the inner bottom from injury when heavy pieces of ice are dropped upon it.

Claim.—In combination with bottoms D and B the plate a, constructed and arranged so as to support the bottom D, substantially in the manner and for the purpose set forth.

61,748.—FRANCIS MARLOW, Cleveland, Ohio.—*Carriage Horse Controller.*—February 5, 1867.—A line whose bifurcated end is attached to the rings of the bit is wound at its other end around a spool on the side of the carriage and retained by pawl and ratchet.

The effect is to transfer a part of the pull from the hands of the driver to the vehicle.

Claim.—The line F, spool B, and shaft A, in combination with the pawl and ratchet G D, attached to a carriage, as and for the purpose set forth.

61,749.—BENJAMIN A. MASON, New York, N. Y.—*Screw-Making Machine.*—February 5, 1867.—In this apparatus are: a series of vertical rotating screw drivers arranged in a circle; a rotating series of chucks from which the blanks are suspended; a series of cutters arranged in a circle on an annular platform, which surrounds the circle of chucks, which has a reciprocating up and down motion as well as an intermittently rotary motion. The cutters are secured each to the end of a sliding stock, and to the opposite end of every stock is attached an anti-friction roller which bears successively against every one of a series of pattern formers. The feeding device moves around at intervals and deposits successively in every chuck a blank, and the annular platform moving around intermittently brings every cutter in succession in contact with every blank.

Claim.—First, the arrangement of the slide 12, inclined ways 8, and retainers 13 and 14 to supply the blanks, one at a time, to the machine, substantially as set forth.

Second, the arrangement of mechanism for actuating the screw drivers *l*, consisting in the revolving cam ring *m*, rods *o*, levers *o'*, and shackles, in combination with the sleeve gears *k*, for rotating said screw drivers, as set forth.

Third, the chucks 11, for holding the blanks, in combination with the screw drivers for revolving such blanks, and the cutters for forming the thread as set forth.

Fourth, a series of screw drivers and screw blank holders, arranged in a circular position, in combination with a series of cutters moved around outside the screw blanks, and acting to cut the thread on such blanks by progressive cuts, the cutters being caused to move lengthwise of the screw blanks, and then pass to the next screws, substantially as set forth.

Fifth, the tool guides *u*, supported by the blocks *v*, and adjusted by the screws 32, in combination with the sliding cutter stocks *t'*, and cutters *t*, substantially as set forth.

Sixth, in a screw-cutting machine, a series of cutters *t*, formed as specified and attached to the stocks *t'*, in combination with the series of rollers 31, of gradually increasing size, as and for the purposes specified.

Seventh, the pawl *r*, carriage *s*, and plate 24, in combination with the tool carrier *n'*, and bed *q*, for the purposes and substantially as set forth.

Eighth, the bed *q*, tools and carrier *n'*, and cams *p p'*, in combination with mechanism, substantially as set forth, for rotating the screw blanks, whereby the screw threads are formed by the descent of the carrier *n'*, with a speed proportioned to the rotation of the screw blanks.

Ninth, the bolt 21, and actuating lever 22, in combination with the pawl *r*, lever *s*, and tool carrier *n'*, arranged and operating substantially as and for the purposes specified.

Tenth, the raiser 34 and lifting jaws *v'*, fitted and actuating substantially as and for the purposes specified.

Eleventh, the tool carrier *n'*, to which a progressive rotary movement is imparted, in combination with the bed *q*, to which a rising and falling movement is given, substantially as set forth, so that the tools may have imparted to them a movement parallel with the axis of rotation as well as a progressive rotary movement, as specified.

Twelfth, the head block *c'*, formed with a cavity *w*, for water or other liquid, and from which jets pass to the screw blanks, as specified.

61,750.—MORRIS MATTSO, New York, N. Y.—*Flexible Syringe.*—February 5, 1867.—Explained by the claim.

Claim.—The application and use in syringes having an elastic bulb or air chamber and a flexible discharge pipe, of a rigid inflexible inlet or suction tube or pipe, to serve as a rest or support for the hand, when such inlet tube is constructed in sections as described, so as to allow of being extended or contracted in length, substantially as and for the purposes set forth.

61,751.—ISAAC M. MILBANK, Greenfield Hill, Conn.—*Breech-Loading Fire-arm.*—February 5, 1867.—The hammer shank closes over the wing of the horizontally-swinging breech block before the hammer head strikes the detonating cap or punch, and thus holds the breech block laterally. If the breech be unclosed the hammer is arrested in falling.

Claim.—First, the wing *h* in combination with the swinging breech block *c* and hammer *k*, for the purposes and substantially as set forth.

Second, the locking projections *n* and *o*, in combination with the hammer *k* and wing *h* of the swinging breech block, as and for the purposes set forth.

61,752.—HENRY MITCHELL, Dayton, Ohio.—*Handle for Sad Irons.*—February 5, 1867.—The handle is removable and is connected by a rear, center, and a forward spring catch to the branches which rise from the upper surface of the iron.

Claim.—The construction of the handle *C*, socket *E*, spring catch *G*, and thumb piece *H*, or their equivalents, when arranged, combined, and operated as herein described, for the purpose of having a movable and cool handle at all times.

61,753.—JOSEPH G. MOODY, New York, N. Y.—*Vessel and Tank for Holding Hydrocarbon and other Liquids.*—February 5, 1867.—The tank has a dome upon its top from which extends a tube which terminates under water. By this means direct communication between the interior of the tank and the open air is avoided.

Claim.—First, the method of discharging the gases generated within the tank, or other receptacle, containing the hydrocarbon liquid, into an uninflamable liquid medium, substantially as shown and set forth.

Second, the combination with a floating tank, or other receptacle, for hydrocarbon liquids, of a gas discharge tube attached to the dome or upper part of said tank, and having its mouth or open end immersed in and surrounded by water, substantially as and for the purposes described.

61,754.—SAMUEL MORTIMER, Leicester, Mass., assignor to CHARLES W. GILBERT.—*Mechanism for Operating the Picker Staffs of Looms.*—February 5, 1867.—The curvature in the arms is designed to afford an easy and effective motion to each picker staff. The series of holes in the staffs permits an adjustment of their straps.

Claim.—The combination with the arms or tappets *H*, mounted at angles with respect to each other upon a shaft *F* of the peculiarly constructed curved levers or arms *G*, arranged to operate the picker staffs, substantially as shown and set forth.

61,755.—M. A. MYER, Decatur, Ill.—*Boot and Shoe Blacking Machine.*—February 5, 1867.—The blacking and polishing brushes are driven by machinery and so arranged that while in motion the blacking brush may be extended down to the blacking box for its supply.

Claim.—In combination, a polishing brush having a reciprocating motion, a blacking brush also having a reciprocating motion, and capable also, while in motion, of being thrust down for a supply of blacking, and rising again while it continues to vibrate or reciprocate, substantially as herein described and represented.

61,756.—HENRY M. MYERS, Allegheny City, Pa.—*Constructing Shovels.*—February 5, 1867.—The tang is forged out of the blank and then split; by suitable tools a socket is made for receiving the end of the shovel handle.

Claim.—Forming the straps on and socket (for the handle) in the stock or "blank" from which the shove blade is formed, said straps and socket being formed in the manner herein described for the purpose of avoiding the old practice of forging and welding.

61,757.—S. E. PETTEE, Bethlehem, Pa.—*Bed Bottom.*—February 5, 1867.—The springs have side attachments to the edges of the slats.

Claim.—The helical spring *A*, having at the top projections or lugs *i* arranged to embrace, but not to project above, the slat *B*, and forming eyes for receiving pins *m* to be driven into the edges of the slat, all as set forth for the purpose specified.

61,758.—JAMES POWELL, Cincinnati, Ohio.—*Globe Valve.*—February 5, 1867.—Improvement on his patent of May 2, 1865. The valve has flexible connection to the stem and free revolution upon it when in use. For grinding, a sliding plate on the stem engages the valve and enforces their co-rotation.

Claim.—First, in the described combination with a valve stem adapted to maintain an axial position, independently of its screw, and provided with a self-adjusting valve, the locking piece *K*, or its equivalent, adapted to operate as set forth.

Second, in the described combination the following elements, to wit: a valve stem having guides for preserving its axial position when released from the screw cap, a self-adjusting valve, and the tongued and adjustable piece *K*, adapted to enter the cavity *J* in the valve, and to be secured either in or out of lock, substantially as and for the purpose set forth.

Third, the loose guide collar *F'* and *K'*, which permanently occupies a cavity in the valve, and is secured in or out of lock by a set screw *b*, in the manner described.

61,759.—ASA R. REYNOLDS, Auburn, N. Y.—*Shaft Coupling for Carriages.*—February 5, 1867.—The thill-iron ends in a hook which engages the clip-pin. A bent piece of metal is bolted to this iron and presses against the lower side of the pin to prevent detachment.

Claim.—A shaft coupling, composed of a loop bar or bolt wrought in one and the same piece, with the loop and strap and an under and upper piece fitting over or against it, and a tightening bolt controlling said under and upper piece to adjust their frictional contact with the loop or draw bar or bolt, substantially as and for the purpose described.

61,760.—W. A. RHINEHART and H. FELKER, Miami City, Ohio, assignors to themselves and O. P. RUSSELL.—*Corn Cultivator.*—February 5, 1867.—The left side of the front plow and the right side of the second plow are turned forward in projecting flanges. The former, which runs nearer to the corn, turns the earth from the plants, and the latter fends off the clods but throws the mellow earth to the plants.

Claim.—The plows *C C'*, when constructed substantially as described, and their arrangement with reference to the plow *D* and frame, in the manner and for the purpose specified.

61,761.—S. G. RICE, Albany, N. Y.—*Thill Coupling.*—February 5, 1867.—The cap piece of the socket is attached to the base by a bayonet fastening and cannot be turned for removal when the thills are raised for use.

Claim.—First, a ball and socket thill coupling, which is so constructed that the thill iron will serve, when in an elevated position, as a means for preventing a casual disconnection of this iron, substantially as explained.

Second, the combination of the parts *A B* with the sections *C C'*, slot *c*, and a bayonet fastening *b*, substantially as described.

61,762.—M. RICHARDS and J. VANDEGRIFT, Princeton, Ill.—*Plow.*—February 5, 1867.—The down-curved rear end of the beam is stepped in a connecting transverse bar between the mold board and landside. The beam is clamped at the proper inclination, by a strap and plugs, to a bar extending backward from the mold board.

Claim.—First, the combination of the beam *C*, support *B*, landside *A*, and mold board *A'*, as set forth.

Second, the arm *D*, in combination with the beam *C*, plugs *h*, clamp *F*, and mold board *A*, as described and set forth.

61,763.—CLARK ROBERTS, Winchester, Ill.—*Gate Latch.*—February 5, 1867.—The triangular latch piece is attached to a pivoted hanging bar, from which it projects outwardly in a horizontal direction. The closing of the gate swings the latch out of the way, and it is brought back by gravitation to secure the gate. The latch is thrown back by a pivoted T-bar or a lever projecting above the latch post.

Claim.—First, the pendulum *A* and guard *c*, constructed and arranged substantially as described and for the purpose set forth.

Second, the pendulum A and guard c, in combination with the attachment D, substantially as described.

Third, the pendulum A and guard c, in combination with the lever P, substantially as and for the purpose set forth.

Fourth, the pendulum A, in combination with the guard c, lever P, attachment D, pin s, and thumb piece n, arranged substantially as described and for the purpose set forth.

61,764.—JOSEPH L. RUTZAHN, Frederick, Md.—*Shutter Fastener.*—February 5, 1867.—A semicircular pivoted bar on the fixed leaf has notches to engage the plate of the other hinge at different points of openness.

Claim.—The construction of the hinge with its square notches at the top, and its semicircular bar with corresponding notches, when combined and operated as herein described and for the purposes set forth.

61,765.—J. R. RUDE, Liberty, Ind.—*Grain Drill.*—February 5, 1867.—The draw bars of the boots are connected by their forked ends to pivoted plates, and these plates are connected to a lever by which the boots may be laterally adjusted. The boots may all be raised by a single lever. The seed box is over the axle and has connecting pipes to the boots.

Claim.—First, the combination of the movable plates L L, the levers F, the rods X X, the toothed bar J, the levers F and H, and the spring I, the whole constructed, arranged, and operating in the manner herein specified.

Second, the lever O, the straps P P P P P P, the rollers Q Q, in combination with the drills G G G G G G, when constructed in the manner and for the purpose herein specified.

Third, the seed box A, when constructed so as to extend over the wheels D D, in combination with the tubes N N, the levers F H and O, and the drill rods K K, for the purpose of feeding over wheels, when constructed in the manner and for the purpose as herein specified.

61,766.—JOSEPH SCHAFER, New York, N. Y., assignor to himself and GEORGE HEYDT, same place.—*Hinge.*—February 5, 1867; antedated January 27, 1867.—The hinge does not allow the joint to open, and is adapted for table leaves. One leaf is tongued into the other, and each portion has square ends. They are united by pins, which travel in segmental slots.

Claim.—A hinge composed of two parts A B, which are united by pins a b and slots c d, and otherwise constructed and operating substantially as and for the purpose described.

61,767.—JAMES SCHOFIELD, Worcester, Mass., assignor to himself and OSGOOD PLUMMER, same place.—*Loom.*—February 5, 1867.—The devices are for so operating all the harness frames as to make a perfect shed. The jack elevators and depressors, as also the eveners are hinged at one end. The illustration shows the construction.

Claim.—First, the combination and arrangement of the hinged arms H H', hinged eveners G G', connecting rods i, arm f and connecting rods e g, substantially as set forth.

Second, the combination of pins 1 and 2, with the slotted ends of arms H H' to retain the ends of said arms in proper position, and at the same time allow them to have a slight longitudinal motion to prevent binding of the parts, when the loom is in operation.

61,768.—JAMES SCOTT, Washington, D. C.—*Illuminating Compound.*—February 5, 1867.—Composed of naphtha, 40 galls.; sugar, 2 lbs.; liquor ammonia, 1½ lb.; lard, 5 lbs.; potash, 1½ lb.; glycerine, 8 ozs.

Claim.—An illuminating compound, composed of the ingredients heretofore mentioned in about the proportions stated, and compounded substantially as set forth.

61,769.—ALONZO SEDGWICK, Poughkeepsie, N. Y.—*Supporting Carriage Thills.*—February 5, 1867.—A turn-button pivoted to the bolster forms a catch in front of the thill bar to retain the thills in a vertical position.

Claim.—A device for the purpose specified, con-

sisting of a frame A and catch D, arranged and operating substantially as described.

61,770.—THOMAS SIMMONS, New York, N. Y.—*Compound Vacuum Rectifier for Alcoholic and other Liquids.*—February 5, 1867.—The bottom of the reservoir is covered by a perforated plate above an opening, which connects by a pipe with a cylinder below, and a second, lower, similar cylinder. The pipe has two cocks, which govern the flow of the liquor. A branch pipe leads to another cylinder, and has two stop cocks.

Claim.—The use of the cylinder D, when used in combination with one or more cylinders for receiving the rectified liquor, for the purpose of creating a partial vacuum in the receiving cylinder without the introduction of steam, substantially as specified.

61,771.—HENRY SOGGS, Columbus, Pa.—*Car Coupling.*—February 5, 1867.—The flat spring in the roof of the mouth holds the link straight for self-coupling, and the self-adjusting catch on the outside of the coupling head drops the pin when the cars collide.

Claim.—The flat spring in the upper side of the mouth of the coupling head, and the self-adjusting catch on the outside of the head, when arranged, constructed, and operated as herein described and for the purposes set forth.

61,772.—M. V. B. STEINMETZ, Ansville, Pa.—*Churn.*—February 5, 1867.—To the arms of the vertical shaft are attached oblique blades, whose relative convergence in pairs collects the cream and dashes it through the orifices in one, and the space between the two.

Claim.—First, a case B, having four sides, in combination with a dasher, composed of the spindle G, having arms and blades, and constructed and operating substantially as described.

Second, the dasher, composed of the spindle G, with its arms h k, perforated blades m m' and solid blades n n', when the said blades are inclined in respect to each other, as and for the purpose specified.

Third, the cases A B and shaft G, with its arms and blades, in combination with the standards C C', cross piece D, keys e e', or their equivalents, and driving shaft E, the whole being constructed substantially as described.

61,773.—JOSHUA STEVENS, Chicopee Falls, Mass.—*Machine for Pulling out Hat Tips.*—February 5, 1867; antedated January 21, 1867.—The four uprights are moved to and from the center in grooves by suitable gearing, and carry upon their upper extremities the four quarters of a disk, the separation of which expands the hat body into a flattened crown, as desired.

Claim.—The stretchers e e, standards E E and slides D, in combination with each other, and with a supporting table A, or its equivalent, substantially as and for the purpose herein specified.

61,774.—WILLIAM D. STROUD, Oshkosh, Wis.—*Broom Head.*—February 5, 1867.—The broom stuff is thrust into the cap, and retained by transverse bolts and side bars, which clamp it in a flattened shape.

Claim.—The combination of the metallic broom head, with the bars r and i, connected by means of the screw bolts, and the projections k k forming female screws, substantially as described and for the purpose herein set forth.

61,775.—D. M. THOMAS, Dowagiac, Mich.—*Bed Bottom.*—February 5, 1867.—The inclined springs are rooted in transverse slats, and present the flexible, upper, bowed surfaces to the mattress.

Claim.—A spring seat or bed bottom, which is composed of inclined springs that are supported and held in place by means of transverse bars B, substantially as herein described.

61,776.—FREDERICK VAN PATTEN, Auburn, N. Y.—*"Fifth Wheel" or Whiffletree Attachment for Carriages.*—February 5, 1867.—The connecting joint will enable the bolster to traverse freely, but will resist separation. The under plate has a flanged sleeve, and the upper piece is sectional, with half collars to enclose the neck of the sleeve.

Claim.—A fifth wheel or whiffletree connection for carriages, composed of the plates C D D', with the hub and collars, constructed and operating substantially as and for the purpose described.

61,777.—WILLIAM WALLACE, Ansonia, Conn.—*Chain.*—February 5, 1867.—The chain is formed of hollow spheres linked together by means of small bars having enlarged heads.

Claim.—A chain formed by uniting hollow balls and double-headed bars, substantially in the manner hereinbefore described.

61,778.—JAMES and R. C. WALRATH, Chittanooga, N. Y.—*Artificial Fuel.*—February 5, 1867.—A composition of peat, coal dust and blood, with or without salt.

Claim.—The compound prepared, substantially as herein described for fuel.

Also, cakes, lumps or bricks, pressed and dried, made from the within-described compound.

61,779.—AUGUSTUS J. WARNER, Brooklyn, N. Y., assignor to himself and JAMES E. CONOR.—*Window Blind Fastening.*—February 5, 1867.—The slot in the lever has a fixed bearing in the bracket, which allows it a longitudinal motion, but prevents vibration until it has been longitudinally moved from the position at which it has been set.

Claim.—A shutter or blind holder or fastener, having the slot *h* and face *t*, constructed and operated substantially as herein described.

61,780.—ALEXANDER T. WATSON, New York, N. Y.—*Artificial Leg.*—February 5, 1867.—The bar of the leg is adjustable in length, and is planted upon a segment of a cylinder, which has a backward and forward oscillation in its socket; the toe and heel leaf springs modify and limit its vibrations. The toe spring extends the toe section, flexed by the act of walking. The slotted hoops and set screws of the thigh adjust its capacity. An axial coil on the knee articulation extends the leg for forward movement, when raised from the ground.

Claim.—The connection of the foot with the leg by means of the joint, substantially as described, in combination with the springs extended both ways for action at the heel and at the toes, substantially and for the purposes described.

Also, the toe piece hinged to the front part of the foot, substantially as described, in combination with the spring, which controls the movements substantially as described.

Also, the leg made in two parts, and adjustable in length, substantially as described, or any equivalent thereof for adjusting the length of the leg.

Also, the adjustable longitudinal straps and the adjustable hoops, in combination substantially as described, as a means of fastening the artificial leg to the thigh or to the stump of the leg, as described.

Also, the knee joint, substantially as described, in combination with the leg and foot, or their equivalents.

61,781.—OLIVER N. WEAVER, Dover, Ky., assignor to himself and G. W. WINTER, Augusta, Ky.—*Whiffletree.*—February 5, 1867.—The tugs are attached to the ends of the spring, which is secured by its midlength to the rear of the thill bar.

Claim.—The spring whiffletree A, adapted for fastening in rear of the shafts cross-bar, its ends being provided with the yokes D D', and terminating in hooks or other devices for the attachment of the tugs as set forth.

61,782.—OLIVER N. WEAVER, Dover, Ky., assignor to himself and G. W. WINTER, Augusta, Ky.—*Unhitching Horses from Vehicles.*—February 5, 1867.—The breeching remains attached to the thills; the snap hooks by which it was suspended from the hip straps are hooked to loops on the tugs.

Claim.—First, in the described combination a provision of the snaps A on the hip strap, and of the eyes, rings, or loops B b upon the breeching and tugs, for ready hitching and unhitching, as set forth.

Second, the provision of the snaps A, at the lower ends of the hip straps, for the purpose set forth.

Third, in combination with the elements of the first clause of claim, the hook C projecting from the inside

of the shaft to temporarily support the breeching when the horse is unhitched.

61,783.—FINLEY F. WESTERFIELD, Fort Dodge, Iowa, assignor to himself and C. WESTERFIELD, same place.—*Corn Planter.*—February 5, 1867.—The hopper is attached to the beam of a double shovel plow, and the seeding mechanism is operated by hand.

Claim.—The combination of a corn planter constructed as herein above set forth, and operated by means of the bent lever E, with a double shovel plow, or sod plow, substantially as described.

61,784.—JAMES E. WHEAT, Rochester, N. Y., assignor to himself and OTIS COLE.—*Snow Shovel.*—February 5, 1867.—The hold for the left hand is secured to the stock of the blade by the stale, which affords a hold for the right hand. The parts are detachable for convenience in storage.

Claim.—The combination of the auxiliary handle *h* with the blade B and handle *b*, substantially as herein shown and described.

61,785.—THOMAS B. WICKHAM, Granville, Ohio.—*Farm Gate.*—February 5, 1867.—The gate runs upon a roller on the post, another roller on the gate resting upon a track frame. Lips on the post prevent the removal of the gate.

Claim.—First, supporting the gate upon bar E and roller G, together with the movable roller H.

Second, cutting away or dividing slot K, and leaving space at the top and bottom rails for passing through the grooves *m m'*.

Third, making a mortise in stile O, through which passes bar E, also joining grooves *m m'*, for supporting the gate in position, all as substantially described, and for the purposes set forth.

61,786.—CHARLES WILSON and J. H. McNALL, Clinton, Pa.—*Car Wheel.*—February 5, 1867.—The wheel *h* as a circular recess to receive a collar on the axle, over which is bolted a covering annular disk. This device is to allow the revolution of one of the wheels upon the axle in curves of the track.

Claim.—The construction of the wheel, with its circular recess C, collar D operating in the recess, and circular plate H, arranged and combined as herein described, and for the purposes set forth.

61,787.—JAMES R. WOODWORTH, Nunda, N. Y.—*Roofing.*—February 5, 1867.—Laths are attached to the boards which cover the rafters, and a coating of hydraulic cement spread upon them. This is afterward covered with coal tar and sand.

Claim.—The combination of the ingredients, substantially as and for the purpose set forth.

61,788.—C. M. YOUNG and E. M. BENSTER, Detroit, Mich.—*Gas Stove.*—February 5, 1867.—The generating chamber is of a metal less liable to oxidation than cast iron, and is protected by a movable plate beneath, which is suspended over the surface of the burning hydrocarbon. The heat is concentrated by an annulus which encloses the combustion chamber. A fire cup beneath the burner catches the waste oil.

Claim.—First, the combination and arrangement of the fixed ring A' with the fire cup B, for the purposes described.

Second, the combination and arrangement of a movable combustion disk C with the wrought iron or copper generating chamber D, substantially as and for the purposes set forth.

Third, the movable combustion disk C, as described.

Fourth, the fire cup B, as described.

61,789.—JOHN YOUNG, Brooklyn, N. Y.—*Piston Rod Packing.*—February 5, 1867.—The strands of hemp are wound on wire and form sections, annuli or a coil around the piston rod in the stuffing box.

Claim.—A metallic packing formed by enclosing an ordinary hemp or other packing, or its equivalent, in a netting of brass wire, by either winding, weaving, or braiding the enclosing wire around it, substantially as and to the effect described.

61,790.—FEDERAL C. ADAMS and JOSEPH PECK-OVER, Cincinnati, Ohio.—*Cooking Stove.*—February 5, 1867.—The oven top is concavo-convex, and strength-

ened by a coiled ridge on its convex upper side. The fire-back has perforations for the admission of air from the space between it and the oven, and inclined overhanging ridges to allow the passage of air. It is allowed side space for expansion. The side fire plates have curved corners to project over the fire-back and hold it in place, and are bent to allow air between them and the stove shell, with perforations leading from this air space to the fire, and perforations in the shell for air supply. A blower plate has catches which take over lugs to suspend it in front of the grate. Projections on the door hinges strike against the stove to limit the movement of the doors in both directions.

Claim.—First, the concavo-convex oven top A, substantially as and for the purpose described.

Second, the concavo-convex oven top A in combination with the spiral strengthening rib, or its equivalent, substantially as described.

Third, the short fire back B, with its air holes z, and air tubes w, substantially as described.

Fourth, the sides C C, with their flanges and air holes v s, in combination with the air passages on the sides of the stove, substantially as described.

Fifth, the combined duster and blower D, in combination with the grate and the projections n o, or their equivalents, at the top and bottom of the front opening, substantially as described.

Sixth, the quadrant shaped doors E E, arranged, attached, and operating substantially as described.

Seventh, holding the fire back in place by the overlapping sides of the end lining plates, so as to dispense with the use of catches, and permit the fire back to expand and contract freely, substantially as described.

61,791.—J. N. ADAMS, Bloomfield, Iowa.—*Machine for Jointing Stove Pipes.*—February 5, 1867.—The machine is intended to swage threads upon the ends of stove pipes for the purpose of joining them by screwing them together. The outer end of the stove pipe rests in the angle of a frame which is adjustable to give the required obliquity for the formation of a screw upon it by the swaging rollers.

Claim.—The combination with the projecting arm C of the adjustable holder D E, substantially as and for the purpose described.

61,792.—GEORGE ARRISON, Trenton, N. J.—*Water Wheel.*—February 5, 1867.—An additional bucket is placed between the usual buckets, and by vertical adjustment regulates the water space between the latter.

Claim.—The gates D, made adjustable by set screws a and slots b, in combination with the buckets C of a water wheel constructed and operating substantially as and for the purpose described.

61,793.—CHARLES C. AYER, Chelsea, Mass., assignor to himself and HENRY A. BREED, Lynn, Mass.—*Carriage Wheel.*—February 5, 1867.—The spokes are metallic bolts, and are screwed into the hub. The outer end of each spoke enters a chamber in the rim, and has a head and set-nuts with washers by which it has bearing on annular rubber springs held within the chamber.

Claim.—The combination as well as the arrangement of the two springs g h, their separate chambers f i, the head a, and the bearer e, with the wheel fellow A, and the spoke C applied to the hub B. And in combination therewith the spring l and its chamber k, arranged with respect to the spoke as set forth.

Also, the combination and arrangement of the follower e, or the same, and the check-nut d, with the series of annular springs, and the spoke made and applied to the fellow, substantially as set forth.

61,794.—THOMAS and JOHN BARBER, Brooklyn, N. Y.—*Globe Valve.*—February 5, 1867.—The stem is confined to a vertical movement by a spline key, and is actuated by the engagement of a screw upon it with the frustal socket connected with the hand wheel. This socket is supported by a spiral spring in a suitable case. A central hole in the socket conveys oil to the screw. The steam joint between the socket and case dispenses with packing.

Claim.—First, the combination of the cap F, the socket G, and the valve stem D, constructed and arranged substantially as described.

Second, the guide piece E, with the chamber h, and with the feather seat at j, substantially as set forth.

Third, the spiral spring o, in combination with the guide piece E and the socket G, substantially as described.

Fourth, the lubricating hole p, with the tapering socket G, substantially as herein shown and described.

61,795.—G. W. BEARD, Baltimore, Md.—*Heating Stove.*—February 5, 1867.—An annular heating chamber has a partial horizontal diaphragm and is traversed by a central, vertical flue. A rake beneath the grate rests on a handle and two rear slide bars, and has teeth projecting upward between the grate bars.

Claim.—First, in combination with a stove, an air-heating chamber, constructed and arranged substantially as described.

Second, in combination with the foregoing a grate, with the rake S R, constructed and operating substantially as described.

61,796.—JAMES C. BETHEA, Blakely, Ga.—*Gang Plow.*—February 5, 1867.—The standard is attached to the beam by rings which embrace forward and backward projections upon it. The rings are secured by wedges. This standard is reversible, and has flanges on its two edges for the attachment of right or left hand plows respectively.

Claim.—First, the standard A, with flanges at the front and rear edges, adapted for the attachment of a right or a left share, substantially as described.

Second, in combination with the standard A, the reversible landside, constructed and applied substantially as described and represented.

61,797.—CARL AUGUST BIERMANN, Waterloo, Ill.—*Hemp Break.*—February 5, 1867.—Two series, having three brake bars each, are supported on a fixed post, and a slide block carries two series, each containing two bars, to act in conjunction with the fixed bars both in their up and down stroke.

Claim.—First, the combination arrangement of the stationary post A and the sliding head C, substantially as described and set forth.

Second, the stationary brakes a and the operating brakes c when constructed and operated as described and set forth.

Third, the combination of the sliding head C and its brake c with the stationary brakes a, as and for the purpose set forth.

61,798.—ELI S. BITNER and J. B. HOPKINS, Lock Haven, Pa.—*Hinge.*—February 5, 1867.—A depression on the upper edge of the socket receives a projection on the pintle side of the hinge to close the shutter by gravitation. The pintle has a projection at its lower end which prevents unhooking except when brought in conjunction with a groove of the socket.

Claim.—The combination of the edge block B and spiral incline planes G G with the projections D and groove H, all constructed as and for the purpose described.

61,799.—H. A. BOARDMAN, New Haven, Conn.—*Calipers.*—February 5, 1867.—The arms have a spiral spreading spring over their pivot which is covered by a separate cylinder. A set nut confines the jaws at any required point of expansion.

Claim.—The barrel or collar C when made in one entire or continuous piece and independent of the caliper arms and secured thereto, substantially as and for the purpose described.

61,800.—JAMES D. BOURNE, De Witt, Iowa.—*Gate Fastening.*—February 5, 1867.—A swinging bar on the post engages the extension of the rails of the gate. A spring operates by friction to retain the bar as placed.

Claim.—First, the combination with a gate having elongated rails e of the front post and the swinging arm D, substantially as shown and described.

Second, the combination of the spring E with the swinging arm D and post C, substantially as shown and described.

61,801.—BENJAMIN BRITTEN, Galena, Ill.—*Window Sash Supporter.*—February 5, 1867.—The lug of the pivoted spring lever enters notches in the sash to

lock the same. The sash is freed by a thumb piece on another lever which acts on the former.

Claim.—The arrangement of the compound levers *a b* combined with the flat thumb piece *c* and the spring *e*, when applied to a sash supporter in the manner herein described.

61,802.—ANSON R. BROWN, Litchfield, Mich.—*Medical Compound.*—February 5, 1867.—An irritant to be injected beneath the skin, consisting of alcohol, croton oil, oil of cinnamon, mandrake, blood root, scoke, cuphorbium, St. John's wort, rhus toxicodendron or radicans, Spanish flies, and olive oil.

Claim.—The medical compound substantially as described.

61,803.—WILLIAM BROWN, Springfield, Mass.—*Carpet Stretcher and Tack Driver.*—February 5, 1867.—The tube has at one end a handle and at the other a claw to engage the carpet, and contains a plunger, which is propelled by a spring and retracted by a cord. A side tube conducts a tack to the end of the main tube from which the point issues. On releasing the plunger it strikes the tack head and drives it between the hinged jaws of the tube and into position in the carpet.

Claim.—First, the combining and arranging together the tubes B and D to form a compound carpet stretcher and tack conductor, as described.

Second, the combination of the tube B formed as a carpet stretcher with the tube D as a tack conductor, and the plunger E and the jaws G, constructed and operating in the manner and for the purposes described.

Third, the construction of the plunger with different dimensions in its different parts, in combination with the corresponding parts of the interior of tube B, as described, by which the action of the plunger is controlled and the tack held back in the tack conductor and then conducted point downward into the jaws when required.

Fourth, the manner of constructing and operating the jaws G, in sections for receiving the tack, in combination with a plunger for driving the tack, operating together in the manner and for the purposes described.

Fifth, the combination of the plunger, spring, and the cord with the tubes B and D and the jaws, arranged and operating as described.

Sixth, the forming of a bevel bottom to the tack conductor D, by which the tack is by its gravity turned with its point toward the opening from the tube D to that in tube B, for the purpose and in the manner described.

Seventh, making the ends of the tubes D and B removable and adjustable by box or sliding covers, for the purpose and in the manner described.

61,804.—J. B. CLARK, Auburn, Mass.—*Edge Plane for Boots and Shoes.*—February 5, 1867.—The mouth-piece is adjustable and holds the curved paring knife by means of its jaws and set-screw. The projecting side guide is also adjustable.

Claim.—First, the combination with the sides E E' of the plane F and the screw bolt J and thumbnut I, substantially as set forth.

Second, the combination with the sides E and E' of the adjustable mouth-piece G and side guide K with the adjustable screws *d* and *j* and nuts *f* and *h*, substantially as set forth.

61,805.—W. F. CLARK, Hagamans Mills, N. Y.—*Cultivator.*—February 5, 1867.—The longitudinal bars to which the shares are attached, are inserted in grooves on the under side of the main transverse beam of the carriage, to which the wheels, tongue, and seat support are also attached, the latter through the medium of perforated segments.

Claim.—First, the plank A, grooved at its under side to receive the bars B B', which have the teeth standards C C' attached, as shown, in combination with the levers F F, having the wheels I I attached to the plank A, pivoted between their front ends and the driver's seat H, secured to a cross-bar G attached to the rear ends of the levers, all arranged substantially as and for the purpose herein set forth.

Second, the perforated segments J K, attached respectively to the levers F F and plank A, substantially as and for the purpose specified.

61,806.—GEORGE H. CLINTON and D. H. HARRIS, New Haven, Conn.—*Pruning Shears.*—February 5, 1867.—One jaw has a rotary circular knife, and the other a hook.

Claim.—The construction of pruning shears, with a circular revolving knife *b* attached to the jaw or handle, as described, as the cutting edge of said shears, and the curved grasping jaw or handle, operating as described and for the purposes specified.

61,807.—A. H. COLE, Sylvania, Ohio, assignor to M. T. COLE, same place.—*Neck Yoke Trundle.*—February 5, 1867.—To avoid the wearing of the breast strap by the ring of the neck yoke, it is passed around rollers in the frame, which permit it to pass back and forth without severe friction.

Claim.—An improved neck-yoke trundle, formed by combining the two rollers C with notched frame A B, the whole being constructed and arranged substantially as described and for the purpose set forth.

61,808.—CHARLES C. COMSTOCK, Grand Rapids, Mich.—*Lumber Rack for Wagons.*—February 5, 1867.—The described device affords an inclined bed of rollers for the lumber, and are for loading and binding the load upon the rack, and running it off at the rear when unloading.

Claim.—First, the combination of the lever stakes C and rollers D with each other, and with the frame A of the rack, substantially as herein shown and described.

Second, the combination of the connecting bars F, ropes G, chains I, crank N, shaft H and spring N, with the lever stakes C, and with the frame A of the rack, substantially as herein shown and described.

Third, the combination of the shaft H and chains I, with the frame A of the rack, for the purpose of binding the load, substantially as shown and described.

61,809.—WILLIAM COOLEY, Bunker Hill, Wis.—*Plow.*—February 5, 1867.—The handles are connected to the landside by a bent bar.

Claim.—The securing of the handles D D' in the position shown and described, by means of the bar C, bent as shown, and attached to the land side, the two handles and to the beam, substantially as and for the purpose set forth.

61,810.—JOSEPH CORBETT, Salt Lake, Utah.—*Permutation Lock.*—February 5, 1867.—By the construction of the knob, arbor, and the shell enclosing the same, access by drilling is avoided. The tumblers are enclosed in a case secured to the outer plate of the lock, and are thus protected when the lock is entered. The projections on the slide serve as checks for the bolt, until withdrawn by the action of one end of the bit against the roller.

Claim.—First, constructing the shell C and the arbor D of plates or pieces of steel and other metal, arranged alternately in position, welded together or otherwise secured, and the steel hardened by tempering, substantially as and for the purpose set forth.

Second, enclosing or partially enclosing the tumblers by means of a case or chamber K, substantially as and for the purpose specified.

Third, the tumbler case or chamber K, when used in combination with an arbor D, arranged so as to be connected with the tumblers by pulling or drawing it outward from the lock case, as and for the purpose specified.

Fourth, the slide L, provided with the projections *i i'*, and arranged with the bolt B and tumblers I, substantially as and for the purpose specified.

61,811.—HUGH L. CRAIGIE, New York, N. Y.—*Water Closet.*—February 5, 1867.—The horned cam and segment are moved by the cock that operates to turn down the jet pipe previous to the admission of water into the latter. The cock is turned to regulate the force of the jet of water, and upon the reverse movement the water is shut off, and then the jet pipe turned up to its normal position by the action of the horned disk and cam.

Claim.—First, the adjustable standard and drip cup in combination with the cock *f* and jet pipe *k*, substantially as and for the purposes set forth.

Second, the thimble 2, in combination with the cock *f*, jet pipe *k*, and plug on the pipe 3 for allowing said

pipe *k* to be turned, but keeping the joint water tight, as set forth.

Third, the horned cam *i* and segment *l*, in combination with the cock *f* and pipe *k*, for the purposes and as set forth.

61,812.—JOHN HENRY DALLMEYER, London, England.—*Lens for Photographic Purposes.*—February 5, 1867.—Both outer surfaces of the combination lens belong to the crown or plate glass, protecting the flint glass surfaces from atmospheric influences. By preference the intermediate lens is a concavo-convex, enclosed between two meniscus lenses.

Claim.—The construction of compound lenses suitable for photographic use, with a negative lens of flint glass convex on one face, placed intermediate of crown or plate glass lenses, substantially as described.

Also, the construction of compound lenses suitable for photographic use, with a negative lens of flint glass placed intermediate of two crown or plate glass lenses, when the anterior crown or plate glass lens has its anterior face concave, substantially as described.

61,813.—DAVID DALZELL, South Egremont, Mass.—*Attaching Carriage Thills.*—February 5, 1867.—The semi-cylindrical eye at the end of the thill iron is fitted on a journal between two collars on the axle; the tube fitting on the collars encompassing the eye and laps over the inner end of the box.

Claim.—First, the arrangement of the semi-cylindrical eye *c*^s, on the thill iron H, and between the collars E E', journal G, tube I, axle F, and box B, when constructed as herein set forth, as and for the purpose specified.

Second, the key J, passing through the thill iron H, and fitting in the *b*^s, in the tube I, substantially as and for the purpose set forth.

61,814.—MAHLON S. DRAKE, Newark, N. J.—*Machine for Pouncing Hats.*—February 5, 1867.—Provision is made for the motion of the hat, placed upon the block of peculiar shape, and for collecting for use the fur that is rubbed from the hat during the operation.

Claim.—Combining the various parts in one whole, in the manner and for the purpose specified, as a new article of manufacture or a new implement for use.

61,815.—RICHARD DUDGEON, New York, N. Y.—*Apparatus for Expanding and Fastening Boiler Tubes.*—February 5, 1867.—The hollow stock is operated by a lever and pawl, terminating at one end in a series of cutting teeth. Within this stock is a roller stock, one end of which projects beyond the toothed extremity of the first-named stock, and carries in the projecting portion a series of rolls fitted in mortises and prevented from becoming removed therefrom. A tapering screw-threaded expanding rod passes axially through the inner stock and between the several rolls, the latter surrounding the rod and resting against its surface, and not as in other similar devices, resting in journal bearings.

Claim.—The combination in an expanding tool of the following herein described implements, viz: the roller, roller stock and free expanding instrument, these three operating in combination substantially as set forth.

Also, the combination in an expanding tool of the following implements, viz: the roller, roller stock, expanding instrument, and cutter for trimming the tube, all operating in combination substantially as set forth.

Also, the combination in an expanding tool of the following implements, viz: the roller, roller stock, cutter, and ratchet handle for turning it, all operating in combination substantially as set forth.

Also, the combination in an expanding tool of the following implements, viz: the roller, roller stock, cutter, and screw feed therefor, all operating in combination substantially as set forth.

61,816.—A. T. DUNBAR and A. McNAUGHT, Alba, Pa.—*Combined Grain Separator and Straw Carrier.*—February 5, 1867.—The grain and straw pass down the inclined slotted board and the teeth of the rising and falling beaters beneath are interminglingly projected through the slots to agitate the

straw and assist the separation of the grain therefrom.

Claim.—The separator boards G, perforated with holes, one side of each hole being beveled off as herein described, the reciprocating beaters E, attached to the frame F, upon the crank shaft B, so that at each revolution of the said crank shaft B, all the beaters may pass at the same time through the separator-boards, when all are constructed and arranged as herein set forth.

61,817.—JOHN T. ELLIOTT, Grand Rapids, Mich.—*Clothes Dryer.*—February 5, 1867.—The extensible, radiating arms are attached to a hub, whose axle is vibratable in the plane of its length.

Claim.—The combination of the arms C, pivoted and adjustable upon the projecting arms F of the head block D, mounted on a tilting arm and operating substantially as described, for the purpose specified.

61,818.—J. E. EMERSON, Trenton, N. J.—*Swage for Sharpening Saws.*—February 5, 1867.—Improvement on his patent June 5, 1866.—The peculiar bifurcated form of the cutting edge is given by the angular recess and central ridge of the die, which is contained in the stock of the swage.

Claim.—A swage for sharpening saw teeth provided with the adjustable die B, having one or more recesses *e*, formed with a central ridge *f*, substantially as described for the purpose specified.

61,819.—JOHN M. ENOS, St. Joseph, Mich.—*Steam Engine.*—February 5, 1867.—At one end of the working cylinder is placed a steam generator into which is admitted only enough water to generate steam to give the piston one stroke. The generating chamber is connected by ports leading through a superheating chamber to the cylinder. A removable cylinder is placed within the generator into which the water is injected, so that it may be converted into steam before it comes in contact with the walls of the generator.

Claim.—First, the arrangement of the generating cylinder or chamber with the steam cylinder of a steam engine when connected by one or two ports and operating substantially as and for the purposes set forth.

Second, the arrangement within the generator of one or more removable cylinders E F, substantially as and for the purposes specified.

Third, the arrangement of the generator with respect to the furnace in such a manner that after the water is converted into steam in one part thereof said steam passes through an intensely heated chamber and becomes superheated in its passage into the steam cylinder, substantially as specified.

Fourth, the arrangement of the cold air passage A', with respect to the generator and steam cylinder, substantially as and for the purposes described.

61,820.—DANA ESTES, Newton, Mass.—*Ventilating Pipe for Houses, &c.*—February 5, 1867.—Explained by the claim.

Claim.—A ventilator made of two separate flues, one located within and surrounded by the other, when each flue is provided with independent openings into the enclosed space which is to be ventilated, and is otherwise constructed and arranged substantially as described.

61,821.—THOMAS FALVEY, Racine, Wis.—*Carriage Axle.*—February 5, 1867.—The bearing is formed by a collar cast upon the skein, and the latter has an irregular thread upon it to prevent the slipping of the collar.

Claim.—Casting or forming an irregular thread upon the skein A, for the purpose of firmly securing and stationing the collars D D', which are cast over said irregular thread, substantially as herein specified.

61,822.—EDWARD FARNUM, Blackstone, Mass.—*Butter Worker.*—February 5, 1867.—The butter is driven by the plunger through the foraminous partition, issuing in long slivers, and is deposited in the drawer in a vermicular state in a favorable condition for the incorporation of salt. The buttermilk flows into a pan.

Claim.—The improved butter working machine above described consisting of the case A, with its

foramious partition *a* and drawer *b*, for the plunger C, and lever D, or its equivalent, as and for the purposes set forth.

61,823.—EDWARD FARNUM and GEORGE W. SCOTT, Blackstone, Mass.—*Husking Machine*.—February 5, 1867.—The stalks are placed on the floor and drawn through the rollers; the ear being kept back by the retaining bars, is thereby broken off, a portion of the husk going with the stalk. The ear passes down a chute and thence along the trough formed by the proximity of two endless aprons which strip off the remaining husk.

Claim.—The improved stripping and husking machine as composed of fluted rollers *e e'*, the hold-back bars *r r*, the endless aprons *g g*, the bridge *b'*, and the horizontal bars *a' a'*, combined and operating in connection with the hopper or chute *d*, substantially in manner as specified.

Also, the peculiar construction and arrangement or combined action of the two stripping rollers *e e'*, and bars *r r*, essentially in manner and for the purpose as before described.

Also, in combination with this arrangement of the rollers *e e'*, and with the chute *d*, the inclined bars or "bold" backs *r r*, substantially as before explained.

Also, the employment of the two endless aprons *g g*, as a means of husking or completing the husking of the ears of corn, in manner and for the purpose as set forth.

Also, in combination with the endless aprons *g g*, the transverse bars *a' a'*, as and for the purpose before set forth and explained.

61,824.—J. A. A. FONTAINE, New York, N. Y.—*Aerial Railroad*.—February 5, 1867.—The weight of the car is counterbalanced by an attached balloon. The cigar shaped car is driven by steam, the deeply indented side wheels traveling upon wires which rest upon brackets whose flanges project into the circumferential depressions in the wheels.

Claim.—First, the combination of the balloon car A, with the structure C, driving shaft F, sail M, when arranged and applied in connection with an elevated track K, substantially as and for the purpose herein shown and described.

Second, the posts L, provided with arm *l* and *l'*, for the purpose of continuing the track K, substantially as herein shown and described.

61,825.—CATHERINE A. GRISWOLD, Willimantic, Conn.—*Corset*.—February 5, 1867.—The flexible metallic strips are connected by belts and by an interlacing cord down the back.

Claim.—The body supporter, consisting of the strips A, extending around the shoulders and provided with the straps C and D, and the cord *a*, all arranged for joint action substantially as herein shown and described.

61,826.—ALFRED GUTHRIE, WARDELL GUTHRIE, and THOMAS L. HUMES, Chicago, Ill.—*Water Indicator for Boilers*.—February 5, 1867.—The float and weight are suspended in the boiler from the respective ends of a chain which passes over a shaft whose exterior finger indicates the height of water upon a dial.

Claim.—The combination of the floating weight with its equivalent counter balance weight operating in the manner and for the purpose herein set forth and described.

61,827.—WILLIAM L. HALLER, Carlisle, Pa.—*Fruit Jar*.—February 5, 1867.—The rim of the bottle fits in a groove in the lid, and a shoulder on the inside of the flange of the lid presses upon the collar round the neck of the jar.

Claim.—A glass jar having a conical neck, having a rubber ring invariable on its exterior and depressed by the shoulder *a'*, of the lid C, whose groove *a''*, in combination with the lip *a*, forms a nearly tight joint to keep the fruit from contact with the rubber, the whole arranged substantially as described and represented.

61,828.—G. W. HATFIELD, Holton, Ind.—*Cultivator Plow*.—February 5, 1867.—This is an iron structure consisting of two beams held together by peculiarly formed braces, clips, and keys. The handles are attached in a similar manner.

Claim.—First, the loop B, clips C, and keys or wedges D, all arranged to secure the front ends of the beams A together, substantially as and for the purpose herein set forth.

Second, the beams A A, handles E E, brace K, held together by the clips P F, and key G, when all are combined and arranged as herein set forth.

61,829.—JARAD HAWTHORN, Coshocton, Ohio.—*Converting Motion*.—February 5, 1867.—The frame has two racks and these are brought to bear alternately upon a pinion, being on opposite sides and brought alternately into action by the oscillation of the rack; the action of each upon the pinion is to rotate it in the same direction.

Claim.—The reciprocating rack frame A A', B B', guided in an oscillating yoke E, and engaging alternately with opposite sides of a pinion H, so as to impart continuous rotation thereto substantially as described.

Further, the tappet C C', to reverse the position of the rack-frame as described.

61,830.—T. HAZARD and J. M. RICHARDSON, Wilmington, Ohio.—*Door Stop*.—February 5, 1867.—A pad of India-rubber is placed in a metallic case inserted in the jamb to receive the impact of the door. Flanges upon both rubber and case enable it to be fixed in position in a hole of proper size, bored in the jambs of the door.

Claim.—The combination of the case A C and shouldered elongated cushion B, when constructed and adapted for use in the manner and for the purposes herein shown and described.

61,831.—HERMAN C. HEERMANCE, Cloverack, N. Y.—*Matting for Carpet Lining, &c.*—February 5, 1867.—Grasses or other elongated vegetable growths are sewed together so as to form the body of the fabric, while the thread acts as a warp to hold the said weft together.

Claim.—First, a matting composed of straw, grasses, rushes, or other similar vegetable growths, sewed together in the manner substantially as and for the purposes set forth.

Second, the combination with a matting constructed as herein described of sheets of paper or other thin fabric, secured upon one or both sides thereof by means of the sewing that constitutes the warp thereof, substantially as herein set forth, for the purpose specified.

61,832.—JEROME HIBBARD, Prospect Lake, Mich.—*Gate*.—February 5, 1867.—The diagonally-set posts are connected by a bar which carries the pivot of the swing bar from which the gate is suspended. The gate slides on the swing bar and is then horizontally rotated 90° by the bar.

Claim.—First, pivoting the gate L, by means of the swing bar I, to the cross bar C, connecting the two rear posts A and B, substantially as described and for the purpose set forth.

Second, the swing bar I and downwardly-projecting arms J and K, constructed, arranged, and operated in the manner described, in combination with the rear and front gate posts A B D E, and with the front uprights P P of the gate L, substantially as described and for the purpose set forth.

61,833.—PHILIP HILL, Philadelphia, Pa., assignor to himself and W. B. CURRY, same place.—*Damping Apparatus*.—February 5, 1867; antedated January 28, 1867.—The band of cloth passes over the roller, and its lower portion is submerged in the water of the cup. By rotating the roller a newly wetted portion of cloth is exposed to wet the object presented thereto.

Claim.—First, the cup A, band *a*, and roller B, or its equivalent, the whole being constructed and operating substantially as and for the purpose described.

Second, the reservoir D, in combination with the cup A, and the roller and band, or their equivalents, for the purpose set forth.

61,834.—WILLIAM B. HOWARD, Baltimore, Md.—*Shutter Fastening*.—February 5, 1867.—The shutter has a bracket with double cheeks, between which is engaged a hinged gravitating catch attached to a bracket on the jamb. The catch is raised by an

inclined face of one cheek, and is locked by falling into place between the two cheeks.

Claim.—The arrangement of the tumbler bracket C D and the cheek bracket F G E, constructed and operating substantially as described and represented.

61,835.—JAMES INGRAM, New York, N. Y.—*Hoisting Machine for Cellars.*—February 5, 1867.—A pair of screws are combined with a sustaining frame and actuating gearing moved by a crank handle. Their office is to raise a platform from the level of the cellar floor to that of the floor above.

Claim.—The arrangement of the shaft *h*, gears and handle for rotating the screws *e* *l*, in combination with the guide bars *b* *b* and platform *l*, as set forth, to form a hoisting machine for cellars or buildings, as specified.

61,836.—THOMAS JOBE, Clarksville, Ohio.—*Cultivator.*—February 5, 1867.—When the plows are at work their beams rest upon an adjustable bar in the rear of the axle, and their depth is thereby regulated. The beams are pivoted to the front bar of the frame, and vertically adjusted by levers pivoted to the bridge piece.

Claim.—The arrangement of the plow beams G and levers H, applied to the frame of the device, in combination with the adjustable bar *a*, at the rear of the axle B, all arranged to operate substantially in the manner as and for the purpose set forth.

61,837.—JAMES M. KEEP, New York, N. Y.—*Toy Cross Bow.*—February 5, 1867.—The bow is secured to the stock as usual, and the shaft of the arrow slips within a short tube which forms a holder.

Claim.—The construction of a bow and stock or handle, with the arrow guide, substantially as and for the purposes herein described.

61,838.—RICHARD KETCHAM, South Dansville, N. Y.—*Fence Post.*—February 5, 1867.—The post is made in two sections, uniting in a vertical line, passing through the mortises which receive the boards, and is secured by flanged feet and spikes to the ground. An extra, notched side piece permits the attachment of a renewed panel or a set of bar rails.

Claim.—First, the combination of the iron spikes or stakes B with the flanges *a*' of the posts A, substantially as herein shown and described, and for the purpose set forth.

Second, the iron brace G, notched bar F, in combination with the post A, when all constructed and arranged as herein set forth, as and for the purpose specified.

61,839.—J. E. KLEIN, Oskaloosa, Iowa.—*Gate Latch.*—February 5, 1867.—Two semicircular, gravitating slotted plates are pivoted on the adjacent faces of the gate post. The gate strikes one, which permits the other to fall as a detent or button to hold the gate closed. The one in the face next the gate acts as a detent for the other to allow the gate to pass it.

Claim.—The plates *a* and *a'*, constructed as described and used, substantially as and for the purposes herein set forth.

61,840.—GEORGE T. LAPE, New York, N. Y.—*Carpenter's Gauge.*—February 5, 1867.—The gauge has two sliding bars, one of which has a rack upon its upper side moved by a pinion, whose shaft is journaled in the head block; by turning a button head on the pinion shaft the bar is slipped longitudinally, and is retained at its adjustment by the clamping screw in the head.

Claim.—An improved joiner's gauge formed of two sliding longitudinal sections A A', combined with the rack *a'* and pinion *a*, the set screws *g* *g'*, the head block B, and the double marking points *d* *d'*, arranged and operating as and for the purposes herein described.

61,841.—CHAS. E. F. LEWIS, Washington, D. C., assignor to himself and C. M. ALEXANDER, same place.—*Washing Shield.*—February 5, 1867.—A corrugated palm-shield or armor protects the person and forms an effective surface for rubbing, or upon which to rub the clothes.

Claim.—The corrugated or ribbed shield or guard, when so constructed and arranged as to protect the inside of the hand and forearm and to perform the

functions of a wash board, in the manner and for the purpose set forth.

61,842.—CHARLES T. LIERNUR, Frankfort on the Main, Germany.—*Sewer.*—February 5, 1867.—When the stop cocks are closed the air is exhausted from the reservoir, and by opening the stop cocks consecutively the contents are drawn into the reservoir without the emission of bad odor.

Claim.—The method herein described of cleaning privies, sinks, &c., consisting of an air-tight reservoir A, sunk in the street and connecting with several privies, and sinks by pipes B, provided with stop cocks *a*, substantially as and for the purpose set forth.

61,843.—WM. B. MASON, Boston, Mass.—*Hand Stamp.*—February 5, 1867.—After an impression, the type rises and detaches the pawl, releasing the inking device, which swings up against the face of the type. In descending, the type bed displaces the inker, which is maintained in a perpendicular position until again detached.

Claim.—First, the disk N, with a notch, in combination with the pawl P, to hold the inking pad clear of the type and plate when they are raised.

Second, so arranging and operating the plate D that it shall release the pawl P and let the inking pad swing against the type plate and ink it, substantially as described.

61,844.—SAMUEL McCAMBRIDGE, Philadelphia, Pa.—*Car Brake.*—February 5, 1867.—A chain runs the entire length of the train and takes turns around sheaves in heads of levers which operate the brakes; the force may be applied to the chain at the engine, and the application of the brakes begins with the rear car, thus preventing cars from running together.

Claim.—The combination of the chain E, connected at each end as described, with the sheaves *e* in the ends of the levers D, and the fixed sheaves *d* arranged as described, the chain taking a half turn around each sheave throughout the whole train of cars, substantially as described and for the purpose specified.

61,845.—CHARLES A. MCCAUGHAN, Moscow, Tenn.—*Machine for Thinning Cotton Plants.*—February 5, 1867.—Shares suspended from the carriage frame pass on each side of the row of plants. A cutter swings transversely and chops gaps in the rows of plants, leaving them in hills. The cutter is attached by compound levers to the frame, and is operated by gearing and endless chain connection to the driving wheels.

Claim.—The double scraper F, attached to suspended frame E, combined with the double transverse cutter *g*, operated by the swinging frame *h*, for the purpose of thinning cotton plants in a row at one operation, constructed and operating substantially as herein described.

61,846.—SAMUEL McCLAIN, Philadelphia, Pa.—*Whistle and Bird Call.*—February 5, 1867.—The concave edge of the semi-annulus is placed in the mouth, the teeth resting on the perforated plate. By breathing upon the membrane it is vibrated, and the tension being regulated by the pressure of the teeth, different notes are produced.

Claim.—The construction and arrangement of pieces A A B and C, substantially in the manner and for the purpose set forth.

61,847.—JAMES G. MCGREW, Caledonia, Minn.—*Seeding Machine.*—February 5, 1867.—The triangular frame has a series of shovels, and at its rear carries a seeder whose feed shaft is rotated by a wheel whose peripheral spokes penetrate the soil. The wheel thus forms a motor for the seeder as the machine advances.

Claim.—First, the application of the traction wheel C, provided with spokes O, to the triangular frame A and to the axle C' of the cylinder D, substantially as and for the purpose herein shown and described.

Second, the application of the shovel plows *a* to the triangular frame A, when in combination with the wheel C, substantially as and for the purpose herein shown and described.

61,848.—HARRISON B. MEECH, Fort Edward, N. Y.—*Treating Straw and other Materials for the Manufacture of Paper Pulp.*—February 5, 1867.—

The straw is cut into short lengths and soaked in hot water in a rotary boiler, after which the water is pumped off and the air exhausted from the boiler. A solution of soda ash, lime, salt, sulphuric acid, and water is then allowed to flow into the boiler, and a pressure of from 40 to 100 lbs. to the square inch is produced by means of a pump; after this the contents are boiled until the straw is disintegrated.

Claim.—First, the composition and manner of constituting the boiling liquor in the manner and for the purpose hereinbefore substantially set forth and described.

Second, the manner of applying a boiling liquor to the stock by first producing the vacuum, in the manner and for the purpose as is hereinbefore described.

Third, the combination of the improved liquor, with the manner of applying the same by the production first of a vacuum, substantially in the manner and for the purpose above described.

61,849.—GEORGE H. MELLEN, Alexandria, Va.—*Composition for Making Elastic Hand Stamps.*—February 5, 1867.—Composed of glue, 8 parts; glycerine, 8; sugar, 4; plumbago, 2; scateite, 2; isinglass, 1; mixed and molded.

Claim.—The combining of the above ingredients to form, when boiled, a new and useful composition of matter for the purposes above described, and the coating of the same when set and cold with a varnish of shellac to render the face of the composition impervious to dampness and the immediate effects of the weather, and so that the composition produces a clear and sharp edge and surface from the mold or matrix without any blow holes or other imperfections, substantially as described.

61,850.—A. J. MILLS, Scott, N. Y.—*Churn.*—February 5, 1867.—The box has two rotary dashers which move in opposite directions, their exterior pinions being engaged by the outer and inner gears on the rim of the master wheel.

Claim.—The arrangement of the square or oblong box A, with its ridge X, formed by the interior bottom C C, shafts G H, with their interlocking arms i and exterior gear wheels D E and F, when constructed, arranged, and operating as set forth.

61,851.—WILLIAM MOLLER, New York, N. Y.—*Cooling Animal Coal.*—February 5, 1867.—The hot, reburied coal is poured into hoppers, passed through an annular opening and then through pipes into a car. The plates against which it passes are kept cool by a current of cold air through a surrounding channel. The tops of the plates may be arranged so as to form a railroad car track, over which trucks containing the hot coal may travel.

Claim.—The arrangement and combination of the diagonal plates B and D, forming chambers for the purpose of facilitating the cooling of animal coal, substantially as set forth and described.

61,852.—AUGUST MORAVEK, Rosnyo, Hungary.—*Corn Harvester.*—February 5, 1867.—The stalks, after having been cut by combined stationary and rotary cutters, are carried by an endless toothed apron upon a wagon body having a movable bottom. When a sufficient quantity of stalks has accumulated upon the movable bottom it is moved backward by the driver by means of a lever and connecting rod, and the stalks are discharged from the machine.

Claim.—The movable portion I of the bottom of the wagon body, in combination with the endless elevating apron G, stationary cutter E, and rotary cutters f f, all arranged to operate substantially as shown and described.

61,853.—W. A. MUNN, Milwaukee, Wis.—*Attaching Spouts to Sheet Metal Vessels.*—February 5, 1867.—Explained by the claim and illustration.

Claim.—Attaching the spout to the body of a sheet metal vessel with a double seam, substantially as herein shown and described.

61,854.—IRA MUNSON, Wayne, Mich.—*Scraper.*—February 5, 1867.—The frame has a pole and shovel, the latter being adjustable to any angle or depth desired by means of a lever-catch attached to the pole.

Claim.—The frame B, tongue A, lever-catch D,

arms b¹, and shovel C, all constructed, arranged, and operating as herein set forth, for the purpose specified.

61,855.—WILLIAM NASH, New Britain, Conn.—*Saw Set.*—February 5, 1867.—The saw is held between the points of the jaws and the teeth set by V-shaped projections. One of the jaws carries an adjustable guide plate. A set screw regulates the set given.

Claim.—The circular-jointed parts A and B, with their guides, dies, set screws, and spring, when constructed, arranged, and used for forming a saw set, in the manner as specified.

61,856.—ENOS S. NICHOLS, New Haven, Conn., assignor to J. H. PRENTICE, Brooklyn, N. Y.—*Curved Spring for Hat Brims.*—February 5, 1867.—The under roller has a steady revolving motion, and the upper roller, beside the rotary, has a rocking motion, giving the varying pressure to the spring.

Claim.—Producing a curvature or tendency to curvature in springs adapted for sustaining the brims of hats by passing them through rolls adapted to draw the edges alternately on one side and the other, substantially as and for the purpose herein specified.

61,857.—CHARLES PAGE, West Meriden, Conn.—*Top Driver or Spinner.*—February 5, 1867.—The top string acts on a reversible spindle, either end of which fits into a central socket of the top. The unwinding of the string in spinning with one end of the spindle, winds it for the use of the other end.

Claim.—The combination of the cord or tape with the pressers or rollers and the driving spindle arranged in the handle of the driver, for operation, substantially as specified.

61,858.—MARY E. PARSONS, Hillsdale, Mich., administratrix of the estate of MILO J. PARSONS, deceased.—*Washing Machine.*—February 5, 1867.—The revolving fluted roller operates in conjunction with a concentric series of rollers to work the clothes in the suds.

Claim.—The combination and arrangement of the crowned or curved springs H, the bars or springs E, and standards J, with each other and with the box or tub A and cylinder C, substantially as herein shown and described.

61,859.—JAMES N. PEASE, Panama, N. Y.—*Adjustable Handle for Shovels and Forks.*—February 5, 1867.—The handle is for attachment to a shovel or fork stale, at a point where it would otherwise be grasped by the lower hand.

Claim.—The supplemental handle attachment, constructed substantially as shown and described, for the purpose of being applied to the stale or handles of shovels, manure forks, and other similar implements, as set forth.

61,860.—CHAS. R. PEDDLE, Terre Haute, Ind.—*Pneumatic Brake for Railroad Cars.*—February 5, 1867.—Steam from the steam chest may be turned at will into the air pipe which connects to pneumatic cylinders on the car trucks. The piston of each of these cylinders operates through a cross-head and bell-crank levers to work the brakes.

Claim.—The combination of the steam cylinders, steam pipes, and steam chests of a locomotive with air pipes E H extending the whole length of a train of cars, the valves F in the steam chests and the air cylinders K provided with pistons L connected with the brake mechanism of the cars, to operate in the manner substantially as and for the purpose set forth.

Also, the lever N connected to the rod M of piston L and to the bent or right-angular levers P P, to which the rods c c of the levers Q are connected, for the purpose of transmitting the power to the brakes, substantially as shown and described.

61,861.—JORDAN H. PHILLIPS, St. Louis, Mo.—*Propeller.*—February 5, 1867; antedated January 30, 1866.—The paddles are hung on jointed frames and actuated by eccentrics so that they shall be extended during their working stroke and withdrawn during their back stroke.

Claim.—The combination and arrangement of the paddles G, levers F, eccentrics E, rods or bars H, levers I, and rods K, with each other and with the

driving shaft B, substantially as described and for the purpose set forth.

61,862.—ORRIS PIER, Wimhall, Vt.—*Horse Rake.*—February 5, 1867.—The rake frame and its operating mechanism are centrally pivoted to the main frame so that the rake can adapt itself to inequalities of the ground by swinging on an axis at right angles to the line of draft.

Claim.—The bar H pivoted at its center to the frame D, having the connecting bar L of the lever J pivoted on its upper side and the connecting rods I of the rake head G pivoted at its rear, substantially as described for the purpose specified.

61,863.—LUKE A. PLUMB, Biddeford, Me.—*Nurse Stove.*—February 5, 1867.—The conical frame surrounding the lamp supports a sheet iron vessel of an inverted conical form which has a conical central tube for the reception of the lamp chimney. Side openings in the central tube and surrounding vessel allow the escape of the calorific current. The matter to be heated is placed in a metal cup upon the heat chamber.

Claim.—First, the combination of the lamp chimney C, heating vessel D, tube E, and skeleton frame c, arranged and operating in the manner and for the purpose herein specified.

Second, in combination with the above, the reflector E', constructed and applied in the manner herein represented and described.

61,864.—DAN'L R. PRATT, Worcester, Mass., assignor to J. MARCUS RICE, same place.—*Spike Machine.*—February 5, 1867.—The jointed handle dies for holding the spikes are carried in the sockets of a revolving disk which works in combination with a similar disk carrying heading dies. The disks revolve in opposite directions and so as to cause the heading pressure in the direction of the length of the spike.

Claim.—First, the divided holding die B hinged together and made with handles and of tapering shape from top to bottom, with a shoulder on the outer surface.

Second, in combination with the holding die B, a revolving pocket made fast to one of the revolving wheels with a corresponding tapering surface on the inside and a shoulder to receive the pressure of the heading die while the head is being formed on the bar of metal.

Third, in machines for heading bars of metal in which rolls are used substantially as herein described, placing the blank at such an angle in the die that when the end of the blank or bar comes in contact with the heading die the pressure will be in a line coincident with the axis of the blank or nearly so, as set forth.

61,865.—JAMES W. PRESTON, Newton, Mass., assignor to A. B. ELY.—*Breech-Loading Fire-arm.*—February 5, 1867.—The rear end of a musket barrel is cut away at top for the reception of a hinged plug-block, which, when open, falls upon the barrel, and when shut is held by a spring catch which is released by pressure on a projection of its operating lever. A passage leads through the block from the usual nipple to the cartridge. A claw at the front of the block tears the rear end of the cartridge.

Claim.—First, inserting the solid plug in the barrel of the gun instead of the breech, when constructed, arranged, and operating in the manner substantially as described.

Second, the combination and arrangement of the plug constructed and inserted substantially as described with the locking bolt, constructed, arranged, and operating substantially as set forth.

61,866.—JULIO H. RAE, Syracuse, N. Y.—*Treating Auriferous and Argentiferous Ores.*—February 5, 1867.—The ores in a powdered state are put into a tank and mixed with cyanide of potash or other salt, which will produce a solution of the precious metals by the aid of a current of electricity. A wire cage of platinum revolves in the vessel and is connected with the positive pole of a galvanic battery. The other pole is connected with a plate of copper on which the gold or silver is deposited after being dissolved.

Claim.—First, the within described process of treating auriferous or argentiferous rock by exposing the

same to the combined action of a current of electricity and of suitable solvents or chemicals, substantially such as herein specified, or any others which will produce the same effect.

Second, separating gold or silver from the rocks containing the same by the action or aid of electricity, substantially as described.

Third, using the agitator B as an electrode, substantially as and for the purpose set forth.

61,867.—GEO. P. REED, Boston, Mass.—*Regulator for Timepieces.*—February 5, 1867.—The indicating end of the regulator lever has a spring on one side and a set screw on the other, by which it is moved.

Claim.—The combination of an adjusting screw and spring with the index lever of a common watch regulator, substantially in manner and so as to operate such lever as specified.

61,868.—JACOB REESE, Pittsburg, Pa.—*Fastening for Bale Hoops.*—February 5, 1867.—The flattened ring is attached to one end of the hoop and the other end passed through and rebent upon it.

Claim.—First, the hoop c constructed and attached substantially as described to one end of a metallic hoop and of a sufficient size to admit the opposite end of such hoop, so that when such opposite end is passed through and folded back in either of the forms described, it will be held in place either by the outward pressure of the bale or by sleeves n n', one or more.

Second, compressing the folded end of a hoop at or near the point of folding by the joint action of the loop c and bale, or of the loop c and sleeve n, for the purpose of preventing the slipping of the hoop at the point of fastening, substantially as described.

Third, the sleeves n n' of the metallic hoop in combination with the loop c, for the purpose of fastening bale hoops, substantially in the manner described.

61,869.—J. WYATT REID, New York, N. Y.—*Steam Generator.*—February 5, 1867.—A removable cap is placed directly over the vertical tubes to change the direction of the calorific currents and afford access to the upper ends of the tubes for repairs.

Claim.—The arrangement of the flues C C', removable cap E, shell B, jacket A, and furnace D, substantially as and for the purpose specified.

61,870.—FRANCIS C. RENNER, Ladiesburg, Md.—*Fertilizer.*—February 5, 1867.—To 1,600 lbs. of rich earth is added 100 lbs. saltpeter, 200 lbs. sulphate of ammonia, and 100 lbs. bone flour. The mixture is heaped up to sweat.

Claim.—The combination of the several ingredients as previously described, or in any manner substantially the same and for the purposes set forth, the effect of which is to furnish a cheap fertilizer and at the same time one which may be economically used and yet supply the soil with the largest amount of ammonia.

61,871.—DAN'L T. ROBINSON, Boston, Mass.—*Machine for Cutting Straw and Hay.*—February 5, 1867.—One end of the knife is carried by the depending arm of the rectangular lever and the other on a swinging bar, which gives a downward draw out.

Claim.—The special adaptation to the purposes of a hay cutter of the mechanism before described, consisting of the lever a, swinging arm d, knives c and f, and spring g, applied to and supported by the bracket b, substantially as described.

61,872.—ROBERT ROBINSON, New York, N. Y.—*Lockup Safety-Valve.*—February 5, 1867.—The lever and weights are enclosed in a lockup chamber which the steam does not enter, so that they are secure from any not possessed of the key and can be inspected at any time. A rod passing through the chamber top enables the engineer to blow off, but affords no facility for holding down the valve.

Claim.—First, the plates K and L, separately, removable when so arranged as to afford access to either chamber F or G without opening the other.

Second, the combination and arrangement of the valve chamber F, weight chamber G, partition E, blow-off C, valve D, and lever H, substantially as and for the purposes set forth.

61,873.—D. B. ROGERS, Pittsburg, Pa.—*Railroad Car Truck.*—February 5, 1867.—The journal boxes

are bolted to side bars, which enclose a spring whose two ends are pivoted to a central shackle and have bearing by shoulders on a series of transverse spring plates.

Claim.—An improved car truck to which is attached the spring *g*, or its solid counterpart, when the same is pivoted or otherwise applied at *R*, and its central connections controlled and supported by means of metallic springs enclosed in a casing with the lid *H* and catch *I*, or their equivalent, to hold them in position, as and for the purpose herein described.

Also, in combination with the devices mentioned above, the side bars *K* when bolted to either side of the journal box vertically, in the manner and for the purpose herein set forth.

61,874.—P. ROSENBLATT, Greenville, Tenn.—*Door and Window Sash Fastener.*—February 5, 1867.—The corrugated tapering plate has prongs on one side to catch in the frame.

Claim.—The fastener *A*, consisting of a plate or bar *B*, tapering in thickness at one end and at the other provided with a series of teeth or prongs *a*, substantially as described for the purposes specified.

Also, the corrugations *c* of the fastener plate *B*, substantially as and for the purpose specified.

61,875.—ALBERT D. RUST, Vernon, Mich.—*Clothes Line and Clamp.*—February 5, 1867.—The wire clasps slip upon the galvanized metallic clothes line and secure the clothes to the latter.

Claim.—A clothes line formed of links of wire, galvanized, in combination with a wire clothes fastener, arranged and operating in the manner herein described.

61,876.—JUSTIN RYAN, Waukegan, Ill.—*Manufacture of Soap.*—February 5, 1867.—Composed of beef tallow, 6½ lbs.; dark rosin, 3½ lbs.; soft water, 12 lbs.; lime, 1½ lb.; sal soda, 6½ lbs.; borax, 1½ oz.; salt-peter, ¼ oz.; and beeswax, 1½ oz.

Claim.—A soap made of the ingredients herein specified and mixed together, substantially in the manner and about in the proportion set forth.

61,877.—NAPOLÉON SARONY, New York, N. Y.

—*Holder for Retouching Photographic Negatives.*—February 5, 1867.—The negatives are secured in a frame made in two parts hinged by their edges. One portion has a reflecting mirror and the other is adjustable to occupy different angles, and has a nest of removable frames adapted to different sizes of negatives.

Claim.—The combination of the adjustable main frame sections *A B*, mirror *b*, and independent frames or holders *C C*, substantially as and for the purposes specified.

Also, the combination with the same of the hinged support *h*, essentially as shown and described.

61,878.—JOHN SCANLAN, Chicago, Ill.—*Felt Roofing.*—February 5, 1867.—The fabric is composed of a layer of dry felt, a layer of canvas, and two layers of felt saturated with coal tar, and arranged to lap upon each other on the roof.

Claim.—As a new article of manufacture, the roofing composed of the materials and arranged as herein specified.

61,879.—PETER and PETER J. SCHMITT, Waterloo, Ill.—*Grain Drill.*—February 5, 1867.—Improvement on their patent April 24, 1866. The longitudinal shaft in the seed box has blocks by which the holes are alternately closed and opened, the seed being stirred by pins upon the blocks. The motion of the bar is regulated by the distance from its axial center of the pitman whereby it is actuated. The seed holes are opened or closed by the motions of the shoes, through the medium of a lever beneath the seed box. The upper slide is connected by a lever to the horizontal wheel and the latter to an index; the graduated adjustment is retained by a thumbscrew on the wheel.

Claim.—First, the metal or wooden blocks or valves *n*, which are secured to the feed bar *D* and the pins *o*, which are attached to the blocks *n*, substantially as and for the purpose herein shown and described.

Second, the slotted crank *p* of the feed bar *D*, operating substantially as and for the purpose herein shown and described.

Third, the slotted lever *K*, which is pivoted to the seed box *A*, and whereby the flow of the seed may be automatically regulated, substantially as herein described and shown.

Fourth, the thumb screw *l*, in combination with the slot *m* in the wheel *f*, for the purpose of securing the bar *B* in any desired position, substantially as herein shown and described.

Fifth, the hand *v* and index *v'*, in combination with the rod *z*, wheel *f*, and handle *h*, all made and operating substantially as herein shown and described.

61,880.—JOHN J. SERRELL, Hudson county, N. J.—*Apparatus for Collecting Floating Oil.*—February 5, 1867.—The divergent booms rigged out from the prow of the vessel are partially submerged, and lead the oil to the skimmer, whence it is pumped into a tank, being delivered therein with such force as to create ebullition.

Claim.—First, the combination of a floating vessel containing a tank for the reception of oil, with an arm or arms placed diagonally to the motion of or through the water, substantially as and for the purposes set forth.

Second, combining with an oil-collecting apparatus a movable boom or arm, fitted substantially as specified, so as to be drawn or extended, substantially as and for the purposes set forth.

Third, in combination with an apparatus for collecting surface oil, substantially as herein described, a pump for producing a violent agitation of the oil and water, for the purpose of removing the oil from foreign substances, as set forth.

Fourth, in combination with an oil-collecting apparatus, substantially as set forth, a vat and pipe, in which the pipe opens below the surface of the oil, so that the impurities will be separated, as set forth.

61,881.—JAMES SEWARD CLITHEROE and HENRY SMITH, Enfield, England.—*Steam Generator.*—February 5, 1867.—A sediment collector is placed within the boiler on a line corresponding to the water level, and has a series of compartments divided from each other by partitions of gradually increasing height, and communicating with a discharge pipe for conducting off the sediment.

Claim.—A sediment or scum collector for steam boilers, provided with a series of compartments divided from each other by partitions of gradually increasing height, and communicating with a discharge pipe or pipes, substantially in the manner herein set forth.

61,882.—Z. B. SHANNON, Port Washington, Ohio.—*Rotary Pump.*—February 5, 1867.—The water is raised by a turbine pump actuated by a water wheel. The check paddles prevent the vertical motion of the water in the penstock.

Claim.—The combination and arrangement of the elevator *A*, penstock *D*, and check paddles *H*, constructed and operating substantially as described, and for the purposes set forth.

61,883.—I. M. SINGER, Paris, France.—*Guard for Carriages.*—February 5, 1867.—The hood on the carriage wheel is attached to the running gears instead of to the body, and always maintains its proper relation to the wheel.

Claim.—First, a carriage guard or hood covering, or extending over the sides and top of the tire or rim of the wheel, substantially as shown and described.

Second, the combination with a wheel and axle, or the equivalents thereof, whose positions relatively to the body of the wagon or other vehicle are variable, of a carriage guard so arranged as to constantly maintain the same proximity or relative position to the wheel, substantially as set forth.

Third, the combination with a carriage guard or hood covering the top and sides of the wheels of the arms or supports by which the said guard is held, substantially as shown and set forth.

Fourth, the method of uniting the guard with the arms or supports, by which it is held, by means of an elastic and detachable connection, substantially as shown and for the purposes set forth.

61,884.—AMOR SMITH, Cincinnati, Ohio.—*Machine for Cutting Cracklings.*—February 5, 1867.—Cracklings, &c., are comminuted to a condition fit for manures by means of the grinding disk, whose teeth

are frustums of cones, whose axes are vertical to the plane of the disk and their bases presented outward.

Claim.—A cutter for reducing compressed animal matter, constructed substantially as described.

61,885.—H. B. SMITH, Enreka, Ill.—*Plow Attachment.*—February 5, 1867.—The plow beam is suspended by a curved rod from the tongue, and is drawn by the usual clevis attachment. The rear support of the plow is from the bent axle of the carriage, by whose adjustment the depth of furrow is regulated.

Claim.—First, the tongue O, attached to a curved bar M on the plow beam A, by means of a clip N, in such a manner that a universal joint connection will be obtained, substantially as and for the purpose set forth.

Second, the attaching of the plow beam A to the frame D, through the medium of the clip H, attached to the frame, and having the plow beam fitted in it, substantially as described.

Third, the adjustable wheel E, fitted on the crank arms a, and adjusted by the lever F, substantially as and for the purpose set forth.

Fourth, the bar K, or an equivalent chain attached to the clip H, and extending along underneath the plow beam, and connected at its front end to the clevis at the front end of the plow beam, substantially as and for the purpose herein set forth.

61,886.—DANIEL E. SOMES, Washington, D. C.—*Moistening, Cooling, and Warming Air.*—February 5, 1867.—Systems of warming and cooling devices are combined with means for adding moisture to the air used in ventilating buildings. The air is conducted through a tunnel excavated to a depth of uniform temperature. The same pipes and tubes are used either for heating or cooling, as required, and instruments are used for indicating the hygrometric condition of the air.

Claim.—First, securing and regulating a high or low temperature of air, substantially as and for the purpose described.

Second, moistening and purifying the air, substantially as set forth.

Third, the combination of the devices herein described for moistening, with the devices for cooling and warming air.

Fourth, the series of skylights constructed with air spaces between them, substantially as and for the purpose set forth.

Fifth, the false roof above the skylights, substantially as described, in combination with the series of skylights, as and for the purpose set forth.

61,887.—JAMES F. SPENCE, Williamsburgh, N. Y., assignor to himself and ALFRED PHILIPS, New York, N. Y.—*Gas Apparatus.*—February 5, 1867.—A series of S-shaped pipes are arranged in the interior of the hollow drum which revolves in the interior of a vessel partially filled with hydrocarbon oil. The steam and hydrocarbon vapor are introduced into the central space, forced through the S-shaped pipes into the annular casing, and escapes thence through a pipe to the burners.

Claim.—The S-shaped pipes G, in combination with the revolving hollow drum C, vessel A, steam-pipe D, and liquid supply pipe E, all constructed and operating substantially as and for the purpose described.

61,888.—JOSEPH STONE, Chicago, Ill.—*Forging Machine.*—February 5, 1867.—The sliding anvil has both a vertical and horizontal face, and the two swages are operated by cams which press the bar alternately against the two faces, the anvil being moved backward and forward to permit of these two alternate actions. Two springs are so arranged as to support the bar to be forged a slight distance above the horizontal face of the anvil when the horizontal swage is to act, but readily yield to action of the vertical swage, and allow the bar to be forced down by it upon the horizontal face, the bar having been previously drawn forward from its contact with its vertical face by two hooks arranged for that purpose and operated by cams.

Claim.—First, in combination with the alternating hammers C D, the sliding anvil E, when arranged and operating substantially as and for the purpose set forth.

Second, in combination with the vertical hammer C and the anvil E, constructed substantially as de-

scribed, the arrangement of the hooks S S, or their equivalents, substantially as set forth, operating as and for the purposes specified and shown.

Third, in combination with the anvil E, constructed as described, and the horizontal hammer D, the employment of the springs s s, or their equivalent, arranged and operating as and for the purposes set forth.

61,889.—ALFRED STORM, Brooklyn, N. Y.—*Animal Trap.*—February 3, 1867.—The revolving lever is actuated by a spring which has sufficient force to deal a killing blow and knock the rat away from the trap. The motion of the bait hook actuates a pivoted lever which withdraws the stop bolt and releases the striking lever.

Claim.—The spiral cam J, levers I K, stop bolt H, spring L, catch rod M, and bait hook O, operating in combination with the revolving lever F, substantially as and for the purpose specified.

61,890.—JAMES B. STUART, Bunker Hill, Ill.—*Securing Boxes in Metallic Hubs.*—February 5, 1867.—The threads of the longitudinal screws are half in each, the box and the hub. The transverse screws traverse the hub and impinge by their ends upon the periphery of the box.

Claim.—The securing of boxes D in metallic hubs by means of the screws c and d, substantially as and for the purpose herein set forth.

61,891.—CHARLES M. STURGIS, Washington, Iowa, assignor to himself and JOHN C. WOOLLEY, Chicago, Ill.—*Harness Tree.*—February 5, 1867.—The two-part nut for receiving the screw shank of the terret is so fitted into the pad tree as to require no opening in the under side of the pad tree for its insertion.

Claim.—The combination of the two-part nut E E, pad tree A, and yoke C, substantially as and for the purpose set forth.

61,892.—J. B. SWEETLAND, Pontiac, Mich.—*Churn.*—February 5, 1867.—The air passes around the edges of the glass pane in the cover and has access to the cream, which is beaten by the vertically rotating oblique dashers.

Claim.—The cover D, provided with the ventilating door G, dropped below the opening out through said cover, whereby a free circulation of air is had to and from the churn box, around the sides of the door, used in combination with the churn box, dasher shaft, screw H, shaft a, pinion I, and spring L, the whole being arranged in the manner substantially as specified.

61,893.—J. B. SWEETLAND, Pontiac, Mich.—*Sawing Machine.*—February 5, 1867.—The sprocket driving wheel acts upon a worm sleeve on the saw shaft to give motion to the saw when engaged by means of the clutch.

Claim.—The wheel H and worm sleeve F, when used in combination with the clutch c and coupling E, for revolving the shaft D and saw I, all constructed and operating substantially as described.

61,894.—JOHN A. THOMAS, Buffalo, N. Y., assignor to himself and HENRY J. MILLER, Dunkirk, N. Y.—*Machine for Polishing Metal Tubes.*—February 5, 1867.—The series of non-revolving mandrels are arranged on a sliding carriage and act in connection with the gear wheels that revolve the tubes to be reamed out, and into which they are thrust by the motion of the carriage.

Claim.—The combination of the series of stationary cutter mandrels m m, on the sliding carriage O, with the pinions H H, and their sockets j j, adjustable bearing frame K, and driving wheels D E, arranged and operating substantially in the manner and for the purpose set forth.

61,895.—E. S. TORREY, New York, N. Y.—*Cream Freezer.*—February 5, 1867.—From the casting, permanently secured to the pail, rise two lugs, which form parts of a joint by which a plate is hinged to the casting. The latter carries the crank and fly-wheel; the plate carrying the bevel wheel and shaft of the rotary stirrer.

Claim.—The fixed plate, or casting b, sustaining the fly-wheel, with the plate d, jointed thereto so as to permit the shaft h, and its gearing, to be removed

from and coupled with the fly-wheel shaft, substantially as and for the purposes set forth.

61,896.—PHILIP P. TRAYSER, Baltimore, Md., assignor to himself and RICHARD W. TYSON, same place.—*Bolt Heading Machine.*—February 5, 1867.—The square head of the heading tool adjusts itself within the square matrix of the die to insure a more perfect formation of the bolt head, as the die comes against the bolt blank, which is clamped between the two jaws in which the matrix is formed.

Claim.—The heading tool F, working within the die D D', and so secured within the tool carrier as to be capable of adjusting itself within the die, substantially as and for the purpose herein set forth.

61,897.—JOHN E. TUCKER, Montfort, Wis., assignor to himself, THOMAS TUCKER, J. H. LINCOLN, and A. P. HAMMON.—*Rest Foot for Horses.*—February 5, 1867.—A revoluble foot rest is supported on legs which have horizontal plates projecting from their lower ends for the feet of the operator to rest on to steady the stand.

Claim.—The device herein described for blacksmiths' use in shoeing horses, said device consisting of the foot rest A, supported on the block B, so as to revolve, the leg C having feet b, all constructed and arranged substantially as shown and described.

61,898.—WILLIAM VAN WYCK, Belleville, N. J.—*Refining and Bleaching Sugar, Sirup, &c.*—February 5, 1867.—Sirup at boiling heat is filtered through fine bone black at the same temperature.

Claim.—First, in this new method of mine the keeping at a high heat (say about 212° Fahrenheit) the filter, the filtering material in the filter, also the sugar, sirup, and molasses, during the entire operation of filtration.

Second, the application of the steam jacket, or its equivalent, in the refining of sugars, sirup, and molasses, for the purpose of keeping to a high heat (say about 212° Fahrenheit) the filtering vessel, the filtering material, and the sirup, sugar, and molasses, to be filtered.

61,899.—J. C. WANDS, Nashville, Tenn.—*Roofing.*—February 5, 1867.—The breadths of fabric, felt, prepared paper, or covered wire cloth are laid parallel upon the roof from ridge to eave, their edges lapping each other upon raised, angular strips and there secured by metallic angular plates.

Claim.—The mode of fastening the edges of the fabric, by lapping between the angular strips B and the bent metallic plate D, substantially as described and represented.

61,900.—ALMON WARNER, Hamden, Conn.—*Hub for C carriage Wheels.*—February 5, 1867.—A metallic ring is shrunk on the wooden hub and has agreeing mortises therein and extended bearing upon its surface.

Claim.—The combination of the ring B, formed with its mortises a, and flanges C C, with a wooden hub A, substantially in the manner herein set forth.

61,901.—WILLIAM WEAVER, Phenixville, Pa.—*Bed Bottom.*—February 5, 1867.—The wires cross from end to end and from side to side of the frame, being connected by loops at some of their intersections. Springs at their ends give elasticity.

Claim.—The combination of the spiral springs E, curved wires F, provided with buttons f, and loops g, washers i, links L, supporting wires H I, and looped wires K, substantially as and for the purposes described.

61,902.—A. V. D. WESTERVELT, New Brunswick, N. J., assignor to himself, J. W. WESTERVELT, and H. SMITH, Jr.—*Calipers.*—February 5, 1867.—A worm wheel is axially attached to one leg of the calipers and is moved delicately by a worm whose shank has bearings on the other leg.

Claim.—First, the pivot c, fitted on one end to the leg a', forming the bearing for the two legs of the calipers, provided at the other end with the spur wheel b, operating with the worm e, mounted on leg a, substantially as and for the purpose specified.

Second, the leg a, provided with standards d, bearing the worm e, and the leg a', to which the pivot c

is secured, in combination with the pivot c, to which the wheel b is secured, constructed and operating in the manner and for the purpose specified.

61,903.—S. H. WHEELER and W. TUTTLE, Jr., Dowagiac, Mich.—*Grain Drill.*—February 5, 1867.—The axle is divided at mid-length. The seed spouts are inclined alternately backward and forward. The shoes are alternate in two series of different advancement, and have draw bars pivoted to transverse bars. The seed is covered by drag chains.

Claim.—First, the arrangement of a divided axle with the seed box discharge spouts E E, and shoes I I, the several parts being constructed in the manner and used for the purpose specified.

Second, the arrangement of the frames F F, provided with the shoes I I, in such a manner that the said shoes shall run substantially in the relative position to each other herein described for the purpose set forth.

Third, the arrangement of the chains m m with the shoes I I, as and for the purpose herein specified.

61,904.—T. L. WHITEBECK, Kenosha, Wis.—*Combined Seed Sower and Cultivator.*—February 5, 1867.—The machine is convertible into a seed drill, a cultivator, or may be used as both. The tongue hounds are connected to brace bars by which the side draft is regulated. The rear end of the tongue has a limited oscillation by which an agitator in the seed-box is moved. The height of the plow frame is regulated by wheels running at the ends of bars adjustable by bolt connections to plates with segmental slots.

Claim.—First, the bars N N, in combination with the bifurcated bars or braces H H, so they can be adjusted to form a center draft and to vary the bearing or pressure upon the castor wheels.

Second, the circular brace P and pin I, in combination with the seed-box and frame A, substantially as shown and described.

Third, a combined cultivator and seeder so combined and arranged so that the seed-box M, together with the traction wheels B B, may be elevated upon the pole and carried without impeding the operation of the cultivator, for the purposes and substantially as herein described.

Fourth, a seeder where the slide in the seed-box is worked and operated by the pole W, through the medium of the lever o, or its equivalent, for the purposes and substantially as herein set forth.

Fifth, the pole W, lever o, slide E, and cylinder M, in combination with the spur wheel F, pinion G, shaft d, and traction wheels B B, all for the purposes and substantially as described.

61,905.—N. L. WHITNEY, Effingham, Ill.—*Coffee Roaster.*—February 5, 1867.—The hexagonal barrel revolves in a trough on an axis which passes through one of the ends eccentrically.

Claim.—First, the cup G, in combination with the cylinder C, substantially as described and for the purposes specified.

Second, the combination and arrangement of the polygonal cylinder C, shaft D, supporting tray A B, plate F, and cup G, in the manner and for the purpose specified.

61,906.—CHARLES WILLARD, Newtown, Pa.—*Cultivator.*—February 5, 1867.—The frame is connected to the wheel by cranks and may be raised more or less by levers. The two central shares are movable laterally by a backwardly projecting pivoted lever.

Claim.—First, the combination of the adjustable arched couplings N and O, with the frames A and B, and rigid plows and rigid tongue, all constructed, arranged, and operating substantially as and for the purpose set forth.

Second, the combination of the plate R, carrying cultivator teeth or plows with the frames and with the rod U, when arranged to operate substantially in the manner and for the purpose set forth.

61,907.—GILES B. WILLIAMS, New York, N. Y., assignor to ELSHA M. ALLEN, same place.—*Apparatus for Stirring and Cooling Lard.*—February 5, 1867.—The revolving shaft has a spiral flange partially submerged in the lard and keeping it moving in the vat.

Claim.—The continuous flange C, secured to the

shaft B, by arms a^* , leaving an opening b^* , between the flange and shaft, in combination with receptacle A, whose bottom is curved concentrically with said shaft, substantially as described, for the purpose specified.

61,908.—WILLIAM S. WORLEY, Tuscola, Ill.—*Ditching and Grading Machine.*—February 5, 1867.—This is used to throw previously loosened earth out of a ditch when drawn with its vertex forward, but to "round up" loose earth when drawn in an opposite direction.

Claim.—First, the bars A, A, constructed as herein described, whereby they may be adapted to a ditching and grading frame, substantially as specified.

Second, the plate E, used in combination with the bars A, A, fig. 2, for the purpose of making an excavating and grading frame, as and for the purpose specified.

61,909.—MICHAEL H. WRIGHT, Chicago, Ill.—*Grain Dryer.*—February 5, 1867; antedated January 25, 1867.—The axes of the cylinders are inclined in alternate directions so as to discharge into the next in series below and give a continuity to the feed; the flue pipes pass through them consecutively, the hollow trunnions affording entrance and exit to the calorific current.

Claim.—Passing the fire flue of a furnace through a series of revolving cylinders in a grain-drying apparatus, arranged and operating substantially as herein specified and shown.

61,910.—ROBERT WYATT, Brooklyn, N. Y.—*Scrubbing Brush.*—February 5, 1867.—The handle is adjustable to any inclination upon the brush by a pivot screw. The reservoir for water has a mitral valve through which it is supplied, and which closes against the return of the liquid. The brush head may have a central sponge.

Claim.—First, the attachment of the brush A to the handle or staff C by means of the plate d , screw e , and spring g , substantially as herein set forth, whereby the brush may be adjusted at any desired angle to the said staff or handle.

Second, the collapsible bag or purse m , arranged in relation with the opening k of the reservoir B, substantially as herein set forth for the purpose specified.

Third, the combination of the reservoir B, brush A, springs h and straps c' , substantially as herein set forth for the purpose specified.

61,911.—F. G. WYNKOOP, Corning, N. Y.—*Sad-iron Heater.*—February 5, 1867.—The hollow iron is heated by a flame, and is open at each end, so as to form a chimney above the burner, when it is erected on its heel. The pins in this position slant obliquely upward and toward the sole, so as to direct the heat to that surface.

Claim.—The body A, cast in one piece, inclined pins I, directing the heat against the part J, thereby relieving proportionally the part K of the flat iron and the lid H, when arranged and constructed as herein shown and described.

61,912.—WILLIAM YAMAN, Connerville, Ind.—*Saw Mill.*—February 5, 1867.—The log carriage and the frame of the circular saws, which work at right angles to each other, are adjustable to saw boards or scantling from the log singly until the log is cut away.

Claim.—First, the carriages H and I, in connection with shaft L, pawl K, ratchet J, and curved shaft M, substantially as and for the purposes described.

Second, the lever O and upright standard Q, and pendant P, in combination with the spring N, substantially as described.

Third, a self-setting carriage, operated by means of the curved shaft M, substantially as herein shown and described.

61,913.—EDMOND JOHNSON and AUGUST STEUR-NAGEL, Washington, D. C., assignors to themselves, JOHN W. PARSONS, DAVID R. SMITH, D. W. BLISS, and MARCUS P. NORFOLK.—*Preventing Frauds on the Revenue derived from Spirits and Malt Liquors.*—February 5, 1867.—The saccharometer has a special scale in combination with a system of tables to be used by the inspector to test the gravity of the wort and mash, so as, in connection with the known capa-

city of the vessel, to ascertain the amount of spirits produced therefrom.

Claim.—First, the saccharometer A, containing scale B, when applied to and used in combination with the scale or table of sheet two of the drawings to prevent frauds in the distillation or manufacture of whiskey or other similar liquors, in the manner substantially as herein described and set forth.

Second, the employment of said scale or table, sheet two of said drawing, constructed and operated in the manner and for the purposes substantially as herein described and set forth.

Third, the process or means herein described and set forth for detecting and preventing frauds in the distillation of whiskey or other or similar liquors by distillers, substantially as herein described and set forth.

61,914.—ALBERT L. BARCOCK, New Haven, Conn.—*Arm for Car Seats.*—February 12, 1867.—The pivot is formed in one piece with the arm, and has a radial projection to lock it in place.

Claim.—The seat-arm herein described, as an improved article of manufacture.

61,915.—SAMUEL H. BARBER, East Greenwich, R. I.—*Oiling Spindles, Top Rolls, &c., of Spinning and other Machinery.*—February 12, 1867.—In order to oil simultaneously a series of spindles or top rolls, tubes having a series of orifices are so arranged as to rock and discharge the oil when wanted. Wicks may be applied to each outlet to cause a slight continual flow by capillary attraction.

Claim.—The combination of the tubes, constructed and operating substantially as described, with the various machines used for manufacturing cotton, wool, and other material, for the purpose and substantially as herein set forth.

61,916.—JOHN S. BARDEN, Providence, R. I.—*Steam Engine.*—February 12, 1867.—The piston has two connected ends, and between them, and operated by them, is the slide-valve lever. The piston rod passes through a mouth-piece, which extends from the stuffing box to and communicates with the pump cylinder, and water space.

Claim.—The improved steam engine, constructed not only with the two connected heads C D to its piston, and with the exhaust passage d , extending from the steam chest laterally into the space between the said two heads, and out the side of the cylinder, but as provided with the lever G to extend between the two heads, and into the slide valve H, such lever being for operating with such slide valve, in manner substantially as explained.

Also, the combination of the mouth-piece L, with the force pump and the steam engine, arranged and so as to operate substantially as specified.

61,917.—EDWARD BEANES, London, England.—*Treating Saccharine Matter.*—February 12, 1867.—The sugar to be bleached may be dry, moist, or in solution. Ozone to be used may be prepared by passing pure oxygen through an ozone tube, or instead of pure oxygen, common air dried and purified, may be ozonized and used for bleaching the sugar.

Claim.—Subjecting saccharine matters to the action of ozone, substantially as and for the purpose described.

61,918.—W. W. BIERCE, Cleveland, Ohio.—*Apparatus for Carbureting Gas.*—February 12, 1867.—The gas enters through the central vertical pipe, and passes through slots into the space between the float and the perforated plate, which supports the absorbent material, which is saturated with the carbonaceous liquid through which the gas passes.

Claim.—First, the float D, perforated tin F, and covering F', as arranged, in combination with the sleeve G, tube B, and slot C, for the purpose and in the manner as substantially described.

Second, the shield K, pipe B and sleeve G, in combination with the case A, for the purpose and in the manner as herein set forth.

61,919.—GEORGE W. BIGELOW, New Haven, Conn.—*Blower.*—February 12, 1867.—The shaft which communicates motion to the reciprocating piston is hollow, and is so divided by a partition, and provided

with openings as to serve for a valve, admitting the air at one end, and discharging it at the other.

Claim.—The combination of the revolving valve E, with the vibrating piston D, substantially as and for the purpose herein set forth.

61,920.—REUEL BLACKWOOD, Philadelphia, Pa.—*Dies for Forming Spike Heads.*—February 12, 1867.—The spike is clamped in the shank of the cameo die, whose salient corners are beveled. The inner corners of the intaglio die are beveled to give the proper form to the head, and to assist in forming the claws on its lower side.

Claim.—A die consisting of the parts A and B-D constructed substantially as described, and operated by any suitable machinery, substantially as and for the purpose set forth and described.

61,921.—JOSEPH BORDEN, Bridgeton, N. J., assignor to F. and J. BODINE, Philadelphia, Pa.—*Cap for Preserving Jars.*—February 12, 1867.—The cover has a gun gasket beneath, and is kept down by claw pieces, which take over its rim and under spiral segments on the neck of the jar.

Claim.—A cap consisting of a disk B and arms *b b*, the whole being constructed and adapted for attachment to a jar, substantially as described.

61,922.—ALBERT BROWN, Troy, N. Y.—*Coal Stove.*—February 12, 1867.—An open-bottom basket for coal is centrally supported above the burning fuel. Its upper end communicates with the feed opening of the stove top.

Claim.—In combination with a fire-box and combustion chamber of stoves, a fuel magazine or reservoir A, as provided with lateral vents or apertures *a a*, substantially in the manner as herein described and for the purposes set forth.

61,923.—REUBEN F. BROWN, Lewisburg, Pa.—*Sash Spring Holder.*—February 12, 1867.—This sash stop has a solid frame and a pivoted latch, pressed forward by a coiled spring, and manipulated by a thumb knob.

Claim.—[As a new article of manufacture] the arrangement and combination of the casing A, its solid base H and notches *a a*, latch B, spring D, covering plate C, all constructed and operating in the manner and for the purpose specified.

61,924.—M. H. CARD and A. SALLE, Fulton, Ill.—*Clothes Line, Reel and House.*—February 12, 1867.—The line is wound upon the reel by the force of the coiled spring. The drum is journaled in a protecting box, and retained at a given point by an end bolt.

Claim.—In a clothes-line reel, the combination and arrangement of the flanged drum G, the spring C, house J, and stop L, all operating as and for the purpose specified.

61,925.—WM. L. CARD, Gardiner, Ill.—*Churn.*—February 12, 1867.—The centrifugal force induced by the rotary motion throws the cream outward to the periphery of the churn, where it strikes against stationary arms, which throw it back again to the center.

Claim.—The combination of the revolving churn and stationary dashers, the hollow shaft *a*, and removable spindle F, arranged and operating as and for the purposes specified.

61,926.—J. S. COPELAND, Bridgeport, Conn.—*Screw Gauge.*—February 12, 1867.—The gauge has several points, which are actuated by graduated screws, so that while moving at different rates they maintain an equal distance between each other; these points corresponding with the thread to be measured.

Claim.—A screw gauge constructed substantially as described.

61,927.—EBENEZER CURTICE, Yonkers, N. Y.—*Hymn and Tune Book.*—February 12, 1867.—The page is divided horizontally. The upper contains the music and the lower the text. The text of any page on that side of the book, or section of the book, may be associated with any music adapted to it. A strap and sliding buckle lap upon the opposite pages and keep them displayed.

Claim.—First, in singing books having their leaves cut as herein described, the use of whole leaves, inter-

veining the cut leaves, for the purpose mentioned herein.

Second, the application of a holder, in the manner and for the purpose herein specified.

61,928.—GEORGE O. DUNLAP, Chicopee, Mass.—*Carpet Stretcher.*—February 12, 1867.—The bed plate of the stretcher has a projection which shields from false blows the spring used for holding the tack. Combined with the stretcher are two claws for withdrawing tacks.

Claim.—First, the spring D, arranged upon the plate A, in combination with the projections *b b'*, substantially as herein shown.

Second, the claws E E, in combination with the carpet stretcher, substantially as shown.

61,929.—TIMOTHY EARLE, (Valley Falls,) Smithfield, R. I.—*Wrench.*—February 12, 1867.—The movable jaw has teeth on the inner face of its shank, and is engaged by the teeth of a spring plate, attached to the handle, and thrown into attachment by a temper screw.

Claim.—The invention in wrenches, described, consisting of a movable jaw C, provided with a serrated or equivalent, roughened surface *a a'*, in combination with a spring clamp F, or its equivalent, substantially as set forth.

61,930.—OLIVER ELLSWORTH, Boston, Mass., assignor to himself and RICHARD SMITH, same place.—*Machinery for Drying Paper in Paper-Making Machines.*—February 12, 1867.—In passing from one drying cylinder to another, the paper is conveyed over a roller supported on spring bearings, and connected by links to a regulating valve in the steam pipe. An excess of steam in the cylinders causes the paper to dry too fast and be contracted;

this contraction depresses the roller and through its connection partially closes the valve and lessens the flow of steam; when this tension diminishes, the roller again rises and supplies more steam. When the paper breaks, a roller ceases to hold back a rod against the force of a spring, and this rod then detaches the parts of the link and so disconnects it from the valve, leaving it in the same position as when the paper broke; thus preventing the cutting off of the steam by the rising of the roller.

Claim.—Graduating the supply of steam to the cylinders which dry the paper by the expansion and contraction or tension of the paper made and dried.

Also, in combination with the drying cylinders, the movable roller over which the paper passes, and the link and lever which connect it to the valve in the steam pipe which supplies the drying cylinders.

Also, making the link which connects the movable roller with the regulating valve detachable and connecting it to a roller held in place by the paper, by the mechanism described, or its equivalent, so that when the paper breaks and releases the roller the connecting mechanism will detach the link so that it will cease to operate the valve in the steam pipe.

Also, making the link X X' adjustable in its length, by means of a slotted slide and screw, or other equivalent device.

61,931.—ANTHONY L. FLEURY, Philadelphia, Pa.—*Preparing Soluble Silica, and in Applying the same to Useful Purposes.*—February 12, 1867; antedated December 28, 1866.—Silica is converted into sulphide of silicium by means of sulphur or compounds of sulphur, and decomposed in hot water or steam, whereby a hydrate of silica is formed, which is soluble in hot water, and which may be used in the manufacture of artificial stone, fire and water-proof paint, cement, &c.

Claim.—The process herein described for preparing hydrated silica.

Also, as a new manufacture, hydrated silica, prepared substantially as described and set forth.

Also, the improvement herein described in the manufacture of artificial stone, marble, paints, cements, and the like, substantially as described.

61,932.—WARREN GALE, Chicopee Falls, Mass.—*Straw Cutter.*—February 12, 1867.—Spiral knives upon the lower cylinder act in connection with the upper adjustable pressure cylinder of softer material, and to which it is geared.

Claim.—First, the pressure cylinder A, constructed substantially as described, and geared to the cutting cylinder B in such a manner that the edge of the knife or knives shall, at the point of contact with the pressure cylinder, move at equal speed therewith, when the said pressure cylinder is constructed of disks of wood, rawhide, leather, or other similar material, not including metals of any kind, and is of full cylindrical form, substantially as set forth.

Second, in combination with the above claim, sliding box A, screws E E, spring D, operating as described and for the purposes set forth.

61,933.—WARREN GALE, Chicopee Falls, Mass.—*Straw Cutter.*—February 12, 1867; antedated August 12, 1866.—The upper and lower rollers have similar diameter and speed. The upper roller is covered with soft metal and is made adjustable by springs beneath, and set screws above its boxes.

Claim.—First, the pressure cylinder B, constructed as described, and having its entire periphery covered with a surface of soft metal, in combination with a knife-cylinder, provided with oblique of spiral knives, when the said cylinders are constructed and operated so that the edge of a knife, at the point of contact with the soft metal, shall move at the same speed as the pressure cylinder, substantially as and for the purposes specified.

Second, the sliding boxes c, springs S, and screws E, in combination with the devices claimed in the first claim.

Third, the spiral knives K, when secured in spiral grooves h, in the cylinder G, when the said cylinder is geared to the pressure cylinder B, all constructed and arranged substantially as above described.

61,934.—JAMES GREENWOOD, Clinton, Mass.—*Machine for Straightening the Weft or Figures of Textile Fabrics.*—February 12, 1867.—The cloth is passed over tension rollers and beneath the straightening roller, which is adjustable in pressure by the oscillatory movement of its journal arm, and adjustable diametrically by conical pieces which are moved longitudinally within its ends.

Claim.—The machine, substantially as and for the purposes described, that is, as composed not only of a straightening roller, made expandible and contractible, as set forth, but of rollers, or their equivalents, for presenting the cloth to the action of such roller and moving such cloth with respect to it, substantially as explained.

Also, the combination of the adjustable lever, or its equivalent, with the straightening roller, supported as described, and combined with rollers, or their equivalents, for presenting a piece of cloth to the action of such roller, in the manner and for the purpose as set forth.

61,935.—PHILANDER HARLOW, Hudson, Mass., assignor to himself and ASA F. HALL.—*Belt Clasp.*—February 12, 1867.—Two flexible metallic plates are secured by rivets, the upper having teeth, the lower provided with corresponding serrated cuts.

Claim.—The belt fastening composed of the two plates A and C, constructed and operating together in the manner and for the purpose substantially as described.

61,936.—JOSEPH W. HASKINS, Charlestown, Mass.—*Edible Preparation from Indian Corn.*—February 12, 1867.—Indian corn is parched until it splits, when it is ground in a mortar and mixed with gum acacia and sugar, made into cakes and pressed.

Claim.—The improved edible composition, as made of maize and gum acacia, or the same and one or more sweetening or flavoring matters or substances, substantially as set forth.

61,937.—HORATIO F. HICKS, Grand View, Ind.—*Steering Apparatus.*—February 12, 1867; antedated January 28, 1867.—The opposite ends of the bar by which the rudder is immediately operated connect respectively to the piston rods of two steam cylinders, so that steering is accomplished by the movements of the pistons. An index shows the position of the rudder.

Claim.—First, the arrangement of the pistons S S, rods L, index M, and pointer d, substantially as and for the purpose specified.

Second, the arrangement of the levers H H with levers a a and rods K, by means of which the boat may be steered from forward or aft, substantially as set forth.

61,938.—ALONZO HITCHCOCK, New York, N. Y.—*Machine Gearing.*—February 12, 1867; antedated January 30, 1867.—A pinion with an angularly convex rim is placed between two driving friction pulleys with concave rims. The axles of all the pulleys are in a right line, so that the side pressure of the pulleys on the pinion shall counterbalance each other.

Claim.—Distributing the power around the shaft to be driven, so that the tendency to displace the shaft on one side is counteracted by that on the other, by the means and in the manner substantially as described.

61,939.—THOMAS B. HODGE, Francistown, N. H., assignor to himself and D. McCAINE, Groton, Mass.—*Harness Clamp.*—February 12, 1867.—For making round reins and traces. The clamp has base pieces, transferable core strips, and metallic clamping jaws, to hold the pieces of leather in position while sewing.

Claim.—The above described arrangement and combination of the clamp D, the looped straps C C, the bed piece A, the rod E, and the ratchet F, and catch H.

Also, the combination therewith of one or more of the auxiliary bed pieces I, made substantially as described.

61,940.—A. D. HUFF and L. D. HUFF, Clinton, Iowa.—*Sorghum Stripper.*—February 12, 1867.—The forked stock has a double-edged knife and crescent-shaped spring stripper. The stem is topped by a forward thrust, stripped by a downward movement, and severed by an upward draw of the stripper.

Claim.—The knife C, provided with two cutting edges d e, the first for topping with an endwise thrust, and the other for cutting when drawn back, when combined with the forked guides b b of the stock A, and solid curved stripper F, arranged and operating substantially in the manner and for the purposes described.

61,941.—HENRY LEE, Oberlin, Ohio.—*Animal Trap.*—February 12, 1867.—The arm arising vertically from the armed falling disk has at top a staple which rests on the top of a vibratable lever, to which the bait is tied.

Claim.—The fall F, armed with teeth or points F', standard G, and yoke H, in combination with the post B, baited lever D, and staple I, as and for the purpose set forth.

61,942.—J. C. LEONARD, Union City, Mich.—*Fence.*—February 12, 1867.—The transversely inclined pickets are supported by a bar or enclosed wire at their intersection and confined near their feet by a surrounding wire.

Claim.—The combination of inclined stakes or pickets with a horizontal supporting wire or rod when said stakes are slotted or kerfed to receive the wire, and are prevented from spreading apart at their base, all substantially as herein described and illustrated.

61,943.—IVORY LORD and SEWALL WOODMAN, Saco, Me.—*Cultivator.*—February 12, 1867.—The shank or standard of the share is forked vertically, and the arms are traversed by rods which project laterally from the frame and on which the outer standards have side adjustment by set nuts.

Claim.—First, the shank s, as shown in all the figures of the drawings, elongated and perforated as described, and the brace b, connected therewith.

Second, the attachment of the teeth by the rods or arms at a distance from the wood, as shown in Figs. 1 and 4, and secured in place by nuts and keys, as described.

Third, the mode of widening or narrowing the machine by sliding the teeth on the arms r r h h in Fig. 4, and the combination of all, forming the cultivator as represented and described.

61,944.—JAMES S. MARSH, Lewisburgh, Pa.—*Harvester.*—February 12, 1867.—A metal platform is used in lieu of a draft frame; is supported upon the

axle of two ground wheels and affords bearings for the gearing which drives the cutters. Caster wheels support the grain platform in connexion with bars by which it is adjusted. The bars are operated by levers.

Claim.—First, casting the platform C in one piece with a tool box on its upper surface to give the required strength to this platform, and with recesses in its outer corner for gears C² C³ substantially as described and shown in Fig. 2 of the drawings.

Second, the double-hinged joint platform supported upon inner and outer caster wheels H H' in combination with the adjustable transverse bar D¹ and drag bar E, substantially in the manner and for the purpose described.

Third, in combination with the hinged platform caster wheels H H', suspending devices D¹ and E, the lever F¹, and link d², substantially as and for the purposes described.

Fourth, the combination of the lever F² with the hinged cutting apparatus and draft frame transverse bar D¹, link d¹, drag bar E, and transverse bar D², all arranged and operated substantially in the manner and for the purpose described.

Fifth, the combination and arrangement of the forward adjusting device F¹ with the rear adjusting device F², each having a separate axis whereby the ordinary adjustment is retained and the adjustment of the pitch of the points of the guard fingers made to suit the condition of the grass to be cut, substantially as described.

61,945.—JAMES MARSHALL, New Orleans, La.—*Cooking Stove.*—February 12, 1867.—The sides are held without bolts by their junction with the hollow corner column. The wrought-iron oven has curved corners. The grate bars are hollow and contain water. A wrought-iron oven is set in the chimney across the course of the calorific current.

Claim.—The combination of the columns b and ledges a with the oven A, hollow grate bars, the oven B, openings c, when covered by a cast cross-bar D, when these several parts are constructed and relatively arranged with respect to each other, as described, for the purpose set forth.

61,946.—J. B. MERIAM, Cleveland, Ohio.—*Apparatus for Extracting Paraffine, &c., from Oil.*—February 12, 1867.—The frame is placed within a pan attached to a base and has a sliding cross-head to which a follower is secured by means of a link. Below the pan is a shaft connected with the cross-head by chains, and to one end of said shaft is secured a lever operated by a cord passing over pulleys and attached to a windlass. The oil is prepared for the press by cooling in a refrigerator which consists of a box containing a series of cylindrical vessels resting on the false bottom and surrounded with a freezing mixture.

Claim.—First, the stanchions G, pulleys d N and O, as arranged in combination with the frames A and pan B, for the purpose and in the manner as set forth.

Second, the cross-head D, friction rollers c', in combination with the stanchions G as arranged and operated by the links K and levers L, for the purpose and in the manner specified.

Third, the cylinder P, as constructed with ribs or corrugations b on the inner surface, as and for the purpose specified.

Fourth, the follower E with the dependent arms c, in combination with the cylinder P, for the purpose and in the manner as substantially described.

Fifth, the arrangements of the cases S, bucket U, pipe T, in combination with the tank Q, provided with the perforated bottom R, as and for the purpose set forth.

Sixth, the cases S, buckets U, in combination with the tank Q and freezing mixture, for the purpose and in the manner as described.

61,947.—FREDERICK J. MILLER, Brooklyn, N. Y.—*Caster Frame.*—February 12, 1867.—Cells in the base piece of the caster frame contain sugar or condiments, and a spring on the handle clasps the bill of fare.

Claim.—First, the caster frame whose base is provided with receptacles or compartments for salt, sugar, &c., when constructed in the manner described and shown.

Second, the combination of the base a and th

spring or holder f when applied to a caster frame, in substantially the manner described and shown.

61,948.—GEORGE N. MUNGER, New Haven, Conn.—*Dumping Wagon.*—February 12, 1867.—The forward part of the wagon bed is attached to the front bolster, and for the purpose of tilting the bed slides on the hind bolster as the fore carriage is worked to the rear. The bed frame is hinged midway and the bed tilts as the hinge comes back of the hind bolster.

Claim.—The framework D and E which supports the body, the one part being fixed to the body and the other to the forward axle, and the two parts hinged together and combined with a device for securing the two axles in their proper relative positions, the whole constructed and arranged so as to operate substantially in the manner and for the purpose specified.

61,949.—HARVILIN PADDOCK, St. Johnsbury, Vt.—*Hardening Iron.*—February 12, 1867.—The articles of iron are heated in a tight case with a composition of common salt, carbon, and carbonate of iron.

Claim.—The within described process of hardening iron with the employment of carbonate of iron and carbon in a finely divided state, applied in the manner substantially as herein set forth.

Also, the combination of common salt, carbonate of iron, and carbon in a finely divided state, as a material for hardening iron when used substantially as herein set forth.

61,950.—PHILANDER PERRY, Charlestown, Mass., and JOSHUA BROOKS, Newton, Mass.—*Stamp Holder and Inkstand Combined.*—February 12, 1867.—The cells for stamps of various denominations, the corrugated pen wiper, and other cognate devices are associated with the ink bottles upon the stand.

Claim.—First, the stamp holder O having openings in the cover with chambers containing each a plunger O, &c., used with or without springs, substantially as and for the purpose described.

Second, in combination with a stamp holder the well G G, with a rotating cylinder H thereon, constructed substantially as and used for the purpose described.

Third, the combination of the mucilage pot I I and the sand box L L with one inkstand, substantially as described.

Fourth, the grooved steps C C C for holding pens and pencils in combination with an inkstand, constructed and used substantially as described.

Fifth, the corrugated pen wiper, substantially as described.

Sixth, the two standards Q Q, with the ears R, &c., fitted to receive a calendar, when used in combination with an inkstand and constructed substantially as described.

Seventh, the combination of the stamp holder, finger wiper, mucilage pot, sand box, pen rack, and calendar stand, with an inkstand, all constructed substantially as shown and used as described.

61,951.—RUSSEL B. PRINDLE, Norwich, N. Y.—*Hold Back Iron for Carriage Thills.*—February 12, 1867.—The loop is higher at one end than at the other, and permits the holdback strap to pass through it and over it with less strain and torsion.

Claim.—The holdback iron or stop A, substantially as and for the purpose set forth.

61,952.—AMOS RANK, Salem, Ohio, assignor to ZETNA MANUFACTURING COMPANY, same place.—*Harvester.*—February 12, 1867.—The longitudinal drag bar or brace has a right angled projection at its lower end and is employed in conjunction with a lateral brace, both of which are hinged to the main draft frame at one end, and so connected at their outer ends as to serve, in conjunction with a shoe which is hinged to their ends, as a compound brace for the finger beam and also as a brace for each other.

Claim.—First, securing the finger beam rigidly to a rocking shoe J, which is sustained at its front end by means of a transverse brace H which has a hinged connection with the draft frame and is coupled to the drag bar or brace G by means of devices i and j, or their equivalents, and at its rear end to an angular projection G' of a longitudinal brace G, all constructed and operating substantially as described.

Second, in combination with a shoe hinged as at h,

the two braces G and H coupled together by means of devices *i j*, or their equivalents, which will admit of the rising and falling of the front end of the shoe J, substantially as described.

Third, the construction of the drag bar G with the projection G' on its rear end, said projection G' and the bar being wrought metal and in one piece, substantially as and for the purpose described.

Fourth, the combination with the two-wheeled draft frame and the gearing thereof of the compound brace G G' H coupled together by the loose connection *i j* and the double hinged shoe J, substantially as and for the purposes described.

Fifth, the arrangement of the transverse brace H, angular drag bar or brace G G', coupled loosely together and a depressed hanger of a two-wheeled draft frame, said wheels being independent drivers, all substantially as and for the purpose described.

61,953.—AMOS RANK, Salem, Ohio, assignor to *ETNA MANUFACTURING COMPANY*, same place.—*Harvester*.—February 12, 1867.—To the swivel connecting pin at the forward end of the drag bar is applied an elongated collar of determinate length, by means of which, when the finger bar is raised or lowered for reaping or mowing, the proper set of the finger beam with reference to the wrist pin of the pitman crank is established by changing the collar from one side of the hanger to the other, and the pitman rod and sickle are prevented from binding.

Claim.—Providing for keeping the sickle and pitman rod of a combined reaper and mower in a straight line vertically by means of a gauge collar *h* applied to the swivel pin *a*, substantially as described.

61,954.—HELEN M. REMINGTON, Springfield, Mass.—*Mincing Knife*.—February 12, 1867.—Explained by the claim and illustration.

Claim.—The sectional stems or shanks *h* with the knives *c* in combination with the cylindrical clamp or ring *a* and the socket *g*, substantially as herein described and for the purpose set forth.

61,955.—JOHN RICHARDS, Columbus, Ohio.—*Machine for Grinding Saws*.—February 12, 1867.—The machine is designed for beveling the blades of web saws. The described devices are for supporting and ganging the blades in a position for grinding and for adjusting them up to the grindstone.

Claim.—First, the arrangement substantially as herein described, whereby saw blades are supported, fed up to the position desired, adjusted at different angles with respect to the face of the carriage D and beveled on both sides, all substantially as set forth.

Second, the combination of the two screws *a' d* with the sliding carriage D of a saw-beveling machine, substantially in the manner described.

Third, the combination of the shouldered holder *h*, hinged adjustable support G, and curved gauge *g*, substantially in the manner and for the purpose described.

Fourth, the hard metal-shouldered holder when constructed to operate as described.

61,956.—J. J. SAVAGE, Troy, N. Y.—*Cooking Stove*.—February 12, 1867.—The fuel is pushed by a lever from the kopper, forward and upward into the combustion chamber, and the lever being removed, the lid is shut down. A guard plate protects the front plate, and the upper part of the latter is perforated for the admission of air above the incandescent fuel.

Claim.—First, the location of the fuel doorway or feed mouth B, below and forward of the combustion chamber C of stove furnaces, and in such immediate position to the fire-box A, as to operate in manner substantially as herein described for the purposes set forth.

Second, when operated in combination with and through said located fuel doorway B, in manner as and for the purpose described, the lever feeder F, constructed substantially as set forth.

Third, in combination with the front plate D of stove furnaces, the arrangement of a fire or guard plate E in position above the fuel doorway B of the fire-box, and about opposite the combustion chamber C, substantially in manner and for the purpose as set forth.

Fourth, in combination with the fuel doorway B, when located substantially as described, the arrange-

ment of the front plate D of stove furnaces in an inclined or slanting position, such as to overhang the fire-box and combustion chamber of the furnace, substantially in the manner and for the purpose as herein set forth.

61,957.—CHARLES SEIDEL, New York, N. Y.—*Chemical Composition for Blasting Rocks*.—February 12, 1867.—Compounded of a powder and a liquid, separately non-explosive, but united to form a blasting compound. Sulphuret of antimony one part, and chlorate of potassa two parts, are pulverized and mixed. The fluid composition consists of phosphorus one part, dissolved in bisulphuret of carbon four parts. Of the powder seven parts are placed in the drill-hole, and one part of the liquid poured upon it. It is exploded by agitation or by a fuze.

Claim.—The above-described composition of matter, substantially as and for the purposes described and set forth.

61,958.—WILLIAM H. SHURTLEFF, Providence, R. I.—*Pavement*.—February 12, 1867.—Applied to the wooden block is a metal cap or frame, whose top is composed of wedge-shaped bars, arranged to form an opening or lattice-work, as the cap is driven down upon the wooden block.

Claim.—First, a paving block, composed of wood and iron or other suitable metal combined and applied to each other, substantially as shown and set forth.

Second, the combination with a wooden block of suitable form of a skeleton or open-work metal cap or frame applied to the said block, in such manner that the fibers of the wood shall be compressed between the sides of, and forced up into the openings in the top of the said cap or frame, substantially as shown and described.

Third, the skeleton or open-work metal cap for paving block herein described, the same consisting of a frame of iron or other like material, the sides of which extend a suitable distance below the bars forming the top of the frame, the said bars being wedge-shaped or tapering toward their lower ends, and arranged so as to form a grating or lattice-work, substantially as and for the purposes shown and set forth.

61,959.—ALANSON SLAUGHTER, Middletown, N. Y.—*Cheese Vat*.—February 12, 1867.—The vat is held up by the sides of the water trough, and forms a steam-tight joint therewith; the water trough has a downward recess, traversed by steam pipes, over which is a corrugated heat disseminating plate.

Claim.—The arrangement and combination of the hot-water trough A, with its recess C, the steam and drip pipes D E, the corrugated disseminator F and milk vat G, with or without the agitator K, substantially as and for the purpose herein specified.

61,960.—FISHER A. SPOFFORD and MATTHEW G. RAFFINGTON, Columbus, Ohio.—*Portable Pistol Gallery*.—February 12, 1867.—The revolvable, shallow, lengthened box has at the distant end a canopy to stop the balls propelled from the toy gun at marks set up at that end. Numbered divisions at the lower and nearer end receive the balls as they roll back.

Claim.—First, a miniature portable pistol gallery, constructed substantially as shown and described.

Second, the gun and turret, Figs 3 and 8, arranged and operating in the manner and for the purposes herein described.

61,961.—R. C. TAYLOR, Brockport, N. Y.—*Rail-road Time Indicator*.—February 12, 1867.—Intended to indicate the time of departure of trains from a railroad station, and is operated in connection with an ordinary clock. By shifting the adjustable cams on the wheels, the changes are made to correspond with changes in the time of departure of trains, and by the employment of adjustable centers to said wheels the indicator finger can be varied to adapt it to the various stations on the route, without changing the cams.

Claim.—First, the employment of a series of adjustable cams C C, with a graduated cam wheel B, and an escapement lever D, or equivalent, operating substantially as described and for the purpose set forth. Second, making the wheel B in two parts *c d*, when

combined with the cams, in the manner and for the purpose specified.

61,962.—ADAM P. WARE, Camden Co., N. J.—*Metallic Carriage Wheel.*—February 12, 1867; antedated January 28, 1867.—The fellos which form the rim are connected by plates, which lap upon their joints and are secured by bolts and nuts.

Claim.—Constructing a wheel for carriages, substantially as described, when the fellos B are made of malleable iron, and constructed and fitted together with the plates b, nuts a and spokes C, in the manner described.

61,963.—BENJAMIN O. WARREN, Elkhart, Ind.—*Excavator and Potato Digger.*—February 12, 1867.—The central, narrower carrier runs over the broader carrier to take the earth from a lower point. The excavating share is elevated by a lever, and guided by another lever. The bottom of the earth-receiving box is formed of pivoted boards with chain couplings, whose connections pass over a roller, which is moved by a lever to close or open the box bottom. It is convertible as a potato digger or excavator.

Claim.—First, the central carrier C', as arranged relatively to the inclined plane of the shovel b, in combination with the larger carrier C, substantially in the manner and for the purpose as herein set forth.

Second, the longitudinal frame B, arranged in combination with the beams A, axles a and carrier C, substantially in the manner and for the purpose as herein set forth.

Third, the guide lever G, in combination with the frame B and shovel b, substantially in the manner and for the purpose as herein set forth.

Fourth, the semicircular plate f, lever e', hooked spring e, and windlass F, as arranged, in combination with the beams A and frame B, substantially in the manner and for the purpose as herein set forth.

Fifth, the box I, provided with a movable bottom, in combination with the double carrier C' and C, substantially in the manner and for the purpose as herein set forth.

Sixth, the boards i of the bottom of the box I, having eccentrically constructed pivots j on their ends, and so arranged as to drop by their own gravity, substantially in the manner and for the purpose as herein set forth.

Seventh, the lever g, windlass H and looped chain l, in combination with the chain couplings k of the boards i of the box I, substantially in the manner and for the purpose as herein set forth.

61,964.—GEORGE WARRINER, Little Ilford, England.—*Furnace and Fireplace Grate.*—February 12, 1867.—Air, steam, or gas is admitted to the fire through the hollow grate bars, the ranks of which rest upon hollow bearing bars. An apron below the ash pit dips beneath a water surface, and prevents the access of air at that point. All the avenues of fluid, whether inflammable or supporting combustion, are controlled by stop cocks.

Claim.—The inverted cone or pyramid, or the air-excluding screen or apron, sealed at the bottom by water or other liquid, as herein set forth.

Also, in combination with the above, a hollow furnace or fire bars or tubes, in conjunction with solid grate bars, connected with a hollow-bearing bar or bars, whereby steam, air, or gas is introduced to support combustion, the introduction thereof being regulated by any convenient or suitable means, substantially as herein specified.

Also, introducing petroleum or other such like inflammable substance or gases through tubes over, or by the side of, or underneath the fire, as hereinbefore stated.

Also, the application or adaptation, in the manner hereinbefore described, of pipes or tubes in furnaces or fireplaces, in immediate juxtaposition with ovens or other cooking apparatus or heating chambers, which pipes or tubes admit heated air into the oven or other chamber to be heated.

61,965.—DARIUS WELLINGTON, Boston, Mass., assignor to CORNELIUS WELLINGTON, same place.—*Peat Machine.*—February 12, 1867.—The peat is disintegrated and pressed down by curved wings in a vertical cylinder, opening into a chamber which contains the molds. The latter are placed in a box,

and are pushed forward under the cylinder by a reciprocating follower.

Claim.—The combination of the cylinder d, and its reducing and pressing mechanism, the mold cell c and pit i, and the follower l, when the whole are constructed and arranged to operate together, substantially as shown and described.

Also, so combining the driving shaft n by which the follower is directly operated and the mill shaft e, that the pressure upon the peat may be increased or diminished relatively to each reciprocation of the follower, substantially as set forth.

Also, forming the bed of the mold cell of the stone, as and for the purpose set forth.

Also, combining with the cylinder b the cutting edge u, operating as set forth.

61,966.—SAMUEL K. WELLMAN, Nashua, N. H.—*Fire Brick.*—February 12, 1867.—Fifty per cent. of fire clay is combined with twenty-five per cent. of fine powdered diamond rock, (pure quartz,) and twenty-five per cent. of coarsely powdered diamond rock.

Claim.—An improved fire-brick, when made from the materials, and combined in the proportions and in the manner substantially as above described.

61,967.—GEORGE WESTINGHOUSE, JR., Schenectady, N. Y.—*Railroad Switch.*—February 12, 1867.—The frog is branched to each side of the rail, and has double grooves on its upper face to receive the flange of the wheel from either side. It is grooved below to receive the rail, and has projections to rest on and to be secured to the ties.

Claim.—First, a portable railroad switch having double branch tracks D D, which converge as shown, and are intersected by grooves H H, substantially as set forth.

Second, the double-grooved frog C, having branch tracks D, in combination with the switch bar E, substantially as set forth.

Third, the retention of the rests F of the branch tracks D, backward, so as to form a bearing surface for the switch bar behind its joint, substantially as shown.

Fourth, the combination of the double grooves, the right and left branch tracks, and the track I at the forward end of the frog C, substantially as shown.

61,968.—SETH WHEELER and EDGAR JEROME, Albany, N. Y.—*Manufacture of Paper Boxes.*—February 12, 1867.—Explained by the claims.

Claim.—First, in the manufacture of hollow paper articles directly from paper pulp by mechanical pressure, means substantially as described, whereby the water is allowed to escape freely and form is given to the pulp at one operation, as set forth.

Second, the combination of vertical and horizontal followers in a machine adapted for making paper boxes and other hollow articles from pulp, substantially as and for the purpose described.

Third, the combination of a perforated die and a follower or followers in a machine adapted for making paper boxes from pulp, substantially as described.

Fourth, in a machine adapted for making paper boxes and other hollow articles, the use of a light, rigid frame upon or within which the article of pulp is formed, said frame being removable from the dies, substantially as and for the purpose set forth.

61,969.—SETH WHEELER and EDGAR JEROME, Albany, N. Y.—*Manufacture of Boxes from Paper Pulp.*—February 12, 1867.—Different parts of the box are made directly in form, from paper pulp in molds. The parts thus formed are then united by cement.

Claim.—First, a new article of manufacture, to wit: the paper box with its body and the rim of its top pressed into form directly from paper pulp, and the end pieces of the body and top cemented in place, substantially as described.

Second, a box top, as a new article of manufacture, made as described.

Third, the body and bottom of a box, as a new article of manufacture, made as described.

61,970.—ALBERT S. WILKINSON, Pawtucket, R. I.—*Horseshoe Nail.*—February 12, 1867.—The head of the nail is lengthened into a long tapering form of

considerably larger diameter than the shank, and may project from the shoe as a calk.

Claim.—The horseshoe nail B C, for securing shoes to the feet of animals, having a slow tapering head B passing quite through the shoe or through the lower plate of a double shoe, substantially in the manner and for the purpose set forth.

61,971.—ALBERT S. WILKINSON, Pawtucket, R. I.—*Horseshoe.*—February 12, 1867.—Explained by the claims and illustration.

Claim.—First, the placing of a toe clip B on one side of the toe of the shoe, so as to be mainly opposite one of the heels of the shoe, when the said opposite heel and toe clip are used to secure the shoe to the foot, while one heel of the foot is left free for lateral expansion, substantially in the manner and for the purpose set forth.

Second, a clamping band K K', running from one heel of the shoe over in front of the hoof, and fastening to the toe of the shoe opposite to the starting point of the heel, in combination with the heel rest j, substantially in the manner and for the purpose set forth.

Third, the ratchet-headed clamping screw h i, in combination with the catch or detent m, Fig. 2, substantially in the manner and for the purpose set forth.

Fourth, the combination of the heel clip b', band K, and the bar clip J, arranged substantially as herein represented, to firmly clamp one side of the heel of the hoof.

61,972.—ALBERT S. WILKINSON, Pawtucket, R. I.—*Horseshoe.*—February 12, 1867.—The shoe is clasped upon the foot and buttoned behind. The clip is continuous from front to rear, and has two branching arms which hug the heel.

Claim.—A continuous clip B B' b g j, in combination with the bar A, elevated at the toe B', and heel b, and having the arms g j extending upward and taking hold of the heel of the foot, the heel clips being fastened by the button fastening h i, substantially in the manner and for the purpose set forth.

61,973.—ALBERT S. WILKINSON, Pawtucket, R. I.—*Horseshoe.*—February 12, 1867.—The rubber shoe extends over the entire sole and has a rear flap to be fastened up behind the heel. The air cushions project upward against the sole. An imbedded stiffening plate gives shape and facility for attachment.

Claim.—First, a rubber sole B, extending over the whole sole of the foot, in combination with a stiffening metallic shoe a, substantially in the manner and for the purpose set forth.

Second, in combination with the above the metallic shield k, substantially in the manner and for the purpose set forth.

Third, the air cushion P, in combination with the flap R, substantially in the manner and for the purpose set forth.

61,974.—ALBERT S. WILKINSON, Pawtucket, R. I.—*Horseshoe.*—February 12, 1867.—The upper face is level and the lower curved. The rounding edges are protected from rapid wear by steel plates.

Claim.—A round-bottom shoe A, Figs. 1 and 2, armed and protected at the heel and toe with steel plates e e e, substantially in the manner and for the purpose set forth.

61,975.—ALBERT S. WILKINSON, Pawtucket, R. I.—*Horseshoe.*—February 12, 1867.—Flanges from the inner and outer edges form calks.

Claim.—A calk formed by parts d f d, placed alternately on the outer and inner edge of the bar A, substantially as shown and described.

61,976.—SAMUEL WILLIAMSON, Cincinnati, Ohio.—*Molding Sash Weights.*—February 12, 1867.—Iron cut-off blocks are placed in the mold to make divisions between the weights. These blocks are cylindrical, with recessed ends, and have axial holes to receive the ends of the bent cores which extend from the side of the mold to said holes. The cores form the holes for the hanging cord.

Claim.—First, the iron cut-off or stop D, when applied and used in casting weights.

Second, the application and use of the horn-shaped

conical iron chill or sand cores E E', in casting weights.

Third, the exclusive use of the stops D D, and the cores or esiles E E', whether used separately or in combination in casting weights, substantially as set forth and described.

61,977.—JOSEPH WISE, Branford, Conn., assignor to THOMAS KENNEDY, same place.—*Die for Making Knobs.*—February 12, 1867.—The plastic material is pressed into form between counterpart dies. A socket in one of the dies occupies the space corresponding to the opening in the knob and has projections to form the notches in the knob. A spindle with projections on its end is rotated by a lever and forms a groove within the knob which may have a spiral form. The axial plunger detaches the knob from the socket.

Claim.—First, the combination and arrangement of the socket C and spindle D, provided respectively with projections a and d, and arranged to operate substantially in the manner described.

Second, in combination with the above, the arrangement of the spindle I, as and for the purpose specified.

61,978.—HARRY P. WITBECK, Rochester, N. Y.—*Manufacture of Vinegar.*—February 12, 1867; ante-dated August 12, 1866.—29 parts corn meal, 3 parts ground rye, 1 part ground malt, and 1 part ground oats are mashed together. After fermentation the liquid is filtered therefrom. The saline and alkaline properties are neutralized by dilute muriatic acid. The liquid is then treated with oxygen while agitated in a vessel exhausted of air.

Claim.—The process of producing a liquid for vinegar or acetic acid from the product of the mixture of grains, as herein described, by pressing the same through a filter, for the purpose of purification, substantially as herein specified.

Also, the rapid process of acidulating the liquid by subjecting it to a charge of pure oxygen, as herein specified.

61,979.—HENRY S. WOODRUFF, Janesville, Wis.—*Buckle.*—February 12, 1867.—Rigid tongues are placed upon the cross-bars on the outer and inner sides. The strap is bent outward to pass over them and straightened to engage with them. When two are provided the strain is thereby distributed.

Claim.—First, the application to the cross-bar b, and on the outer surface of a buckle, of a fixed or rigid tongue g, when arranged and used substantially as and for the purpose set forth.

Second, the combination and arrangement of the cross-bar b and tongue g with the cross-bar d and tongue i, substantially as and for the purpose set forth.

Third, the fixed and rigid tongue z, when arranged and used substantially as and for the purpose set forth.

Fourth, the combination and arrangement of the tongue g and cross-bar b tongue i and cross-bar d, and tongue n, with the side-bars a and end-bars c and e, substantially as and for the purpose set forth.

61,980.—ISAAC YOUNG, Byhalia, Miss, assignor to himself and ISHAM H. HAYES, same place.—*Combined Cultivator and Plow.*—February 12, 1867.—The bent colter in front of the share scrapes and cuts a track in advance.

Claim.—The attachment C, to shovel or other plows, when shaped and operating substantially as and for the purpose herein specified.

61,981.—JOHN N. ARVIN and JOSEPH M. WHITMORE, Valparaiso, Ind.—*Corn Planter.*—February 12, 1867.—The implement is drawn by horses and has a grooved pulley which receives a chain traversing the field from side to side and by which the seed, dropping device is driven.

Claim.—The driving pulley E and the friction pulleys F F, in combination with the chain e c, the rollers d d, in the hoppers g g, and the cam k on the shaft h, the pawl n, on the vibratory rod n, and the flaps p p, in the shutles k h, all arranged and operating as and for the purposes herein described.

61,982.—JOHN AUSTIN, Rockford, Ill.—*Horseshoe.*—February 12, 1867.—The shoe is attached by

bolts whose nuts are within an under recess of the shoe. In each calk is imbedded a vertical plate of steel to render it self-sharpening.

Claim.—First, securing the shoe to the animal's foot by means of the bolts C, constructed and applied as shown and described.

Second, the movable pieces e, secured in the slot n, substantially as and for the purpose set forth.

Third, making the calk self-sharpening, by inserting within the body of the calk a piece of steel, substantially as described.

61,983.—GEORGE L. BAKER, Astoria, N. Y.—*Floating Anchor.*—February 12, 1867.—The planks are attached to the spar above, and the weight beneath, by eye-headed traverse bolts.

Claim.—The combination of the spar A, detachable planks B, weight C, and bolts D, when constructed and arranged as herein set forth and for the purpose specified.

61,984.—J. S. BALDWIN, Elmira, N. Y., W. H. JONES, Rochester, N. Y., and E. N. GIBBS, Elmira, N. Y.—*Cement for Walks, Floors, Pavements, &c.*—February 12, 1867.—Retains its hardness and elasticity when exposed to heat or cold.

Claim.—A cement formed by the combination of coal tar, coal pitch, sand, coke or coal ashes, furnace cinders or iron scale and rosendale cement, substantially in the proportions herein specified.

61,985.—HOSEA BALL, New York, N. Y.—*Treating Peat.*—February 12, 1867.—The peat is broken and driven by screws through tubular conductors and discharge spouts, from which it passes in the form of hollow cylinders.

Claim.—The vertical conductor B and horizontal conductor A, arranged at right angles to each other, provided with corresponding screws B E, independent of each other, and operating substantially as and for the purpose specified.

61,986.—V. BARKER, Otisfield, Me.—*Mosquito Bar for Windows, &c.*—February 12, 1867.—The side pieces of the frame have side grooves to receive the edges of the netting, and a key-slat to fit into the grooves and confine it. The side pieces are inserted into metallic corner pieces.

Claim.—First, the corners of a frame made from sheet metal, as herein shown and described, and for the purposes set forth.

Second, the bars C, provided with grooves in which is fitted a tongue, in combination with the socket corners, substantially for the purposes herein shown and described.

61,987.—J. B. BARNES, Fort Wayne, Ind.—*Hydraulic Punching Machine.*—February 12, 1867.—A screw rod passing through a stuffing box works in the press cylinder of larger diameter, whose plunger is attached to the punch rod.

Claim.—An improved hydraulic punch, formed by the combination of the large hollow screw B, the small interior screw C, and the plunger G, with each other and with the yoke A, substantially as herein shown and described.

61,988.—JACOB BEHEL and JOHN NELSON, Rockford, Ill.—*Gauge for Saw Mills.*—February 12, 1867.—The fence is adjustable on vertical and horizontal pivots, to enable sawing of the stuff to any bevel.

Claim.—First, the adjusting of fence C to any desired angle by means of two rotary motions, one around an axis in itself and the other around an axis in B, or its equivalent.

Second, in combination with the fence B of a saw gauge, the block E, slide F, and set screw J, when said slide is grooved to fit the inclined faces of the graduated way bar L, and the latter is set into and is flush with the face of the saw table, the said parts being constructed and arranged substantially in the manner and for the purpose set forth.

61,989.—ANDREW BENNETT, Brooklyn, N. Y., assignor to himself and JOSEPH OECHLER, same place.—*Hook and Eye.*—February 12, 1867.—The re- bent ends of the hook, which form rings of attachment to the garment are carried forward and form

springs to pass beneath the eye, and prevent accidental unhooking.

Claim.—As an improved article of manufacture, a hook A, provided with side springs a a, substantially as and for the purpose herein shown and described.

61,990.—THOMAS B. BISHOP, Baltimore, Md.—*Horseshoe.*—February 12, 1867.—The rubber sheet has a thinner margin part for position between the shoe and foot, and a thicker portion to fill the space between the sides of the shoe. Its thicker portion is perforated for ventilation.

Claim.—First, the combination of the artificial calk b and flange a, formed above the base of said calk, when the calk bears upon the ground and the flange is adapted for being applied between the hoof of the horse and the shoe, substantially in the manner shown and described.

Second, the combination of air passages c with the elastic sole or frog, substantially as and for the purpose described.

Third, serrating or grooving the bottom surface of the frog b, substantially as and for the purpose described.

Fourth, the combined cushion and elastic frog or calk, constructed as described, the same being a new article of manufacture.

61,991.—VICTOR G. BLOEDE, Brooklyn, N. Y.—*Mucilaginous Compound.*—February 12, 1867.—Made by treating ordinary American starch with a mixture of nitric and muriatic acids.

Claim.—First, the gum produced by treating starch with a compound of nitric and hydrochloric acids mixed together, substantially as and for the purpose described.

Second, the within described process of producing gum from starch, by treating the same with nitric acid, in about the proportion herein set forth, and drying it on metal sheets at a heat of about 260° F., as specified.

Third, the combination of oil of almonds with an aqueous solution of gum, prepared by treating starch with acids, substantially as and for the purposes set forth.

61,992.—STEPHEN BOURNE, Headstone Drive, HARTON, England, assignor to himself and THEODORE BOURNE, New York, N. Y.—*Treating India Rubber.*—February 12, 1867.—The rubber article is enclosed in a vessel to which steam or other heat may be applied, and surrounded by charcoal, bone-black, or other carbonaceous matter. Cloth goods may be placed in alternate layers with the charcoal in powder.

Claim.—Deodorizing India-rubber, or any compound of which it forms a part, by means of charcoal, substantially as described.

61,993.—WILLIAM BOYNTON, Auburn, N. Y.—*Metal Bung.*—February 12, 1867.—The bushing which is screwed into the bunghole has grooves for the passage of the catch nut, to which the stopper disk is connected by a bolt. A gasket is placed beneath the edge of the disk. The turning of the connecting screw bolt first rotates the nut to bring its ends against projections on the bushing, and then draws down the disk to place.

Claim.—First, the screw e, in combination with disk B, the nut d, and washer e, the whole constructed and operating as and for the purpose herein set forth.

Second, the case A, constructed in the manner and for the purpose substantially as herein described.

Third, a combination of a case A and disk B, both constructed and operating substantially as herein set forth.

61,994.—GEORGE W. BRUCKER, Philadelphia, Pa., assignor to BRENKER and KESSLER, of the same place.—*Panel for Lamp Shades.*—February 12, 1867.—Explained by the claim.

Claim.—The manufacture of panels for lamp shades by applying to the varnished surface of a sheet of mica or sheet of paper, or other material, on which two or more layers of oil color have been deposited, as herein specified.

61,995.—JOHN BRUCKER, Chicago, Ill.—*Soap.*—February 12, 1867.—Composed of cocoa-nut oil, 100 lbs.; sweet oil, 25 lbs.; tallow, 13 lbs.; rosin, 10 lbs.;

soda-ash lye, 50 lbs.; potash lye, 10 lbs. Boil and discharge into frames.

Claim.—The soap consisting of the above enumerated ingredients, and prepared substantially in the manner herein described and specified.

61,996.—WILLIAM BULLOCK, Philadelphia, Pa.—*Printing Press.*—February 12, 1867.—Endless belts carry nippers to transfer the sheets from the printing or an intermediate cylinder to the fly board. The fly is raised to allow passage to the sheet, and descending at the point of its release, arrests it in place. The nippers are raised by fixed cams, and depressed by spiral springs on their axial shafts.

Claim.—The endless belts carrying the nippers in combination with the vibrating fly frame for throwing down the sheet and arresting its motion, substantially as described.

61,997.—OSCAR F. BURTON, Jersey City, N. J.—*Alloy for Mold Boards and other parts of Plows.*—February 12, 1867.—The alloy has but slight tendency to rust, and the soil does not readily adhere thereto.

Claim.—The manufacture of the mold boards, shares and other parts of plows and cultivators working in and exposed to the soil, of an alloy composed of copper, tin, and zinc, with or without antimony and lead, or either, substantially as specified.

61,998.—CHARLES BUSHMAN, West Chester, Pa.—*Skate.*—February 12, 1867.—Both ends of the runner are prolonged inward and downward beyond the heel and toe plates in a volute form. A raised socket on the heel of the skate has an elliptical hole in its top for the passage of the similarly shaped head of a screw in the boot heel, which is secured by a turn of 90°.

Claim.—The curls *c f*, formed out of the same piece as the runner, and arranged with regard to the heel and toe plate, and the runner as herein described and represented.

Also, a raised circular socket *m* on the heel plate of the skate, and furnished with an elliptically shaped hole *n* in its top, so that a screw head slightly filed away on its opposite sides and set in the heel of a boot or shoe may enter and turn in said socket to form a fastening between the heel of the boot or shoe and the skate, as herein described and represented.

61,999.—CHESMON BUTTERFIELD, West Water-ville, Me.—*Dust Receptacle.*—February 12, 1867.—The sliding cover is so connected to the pivoted bottom that the opening of either closes the other.

Claim.—A dirt or dust receptacle having its cover or top *D* and bottom plate *F* connected together through rods *G* and *J*, and swinging lever or beam *H*, so as to operate substantially in the manner and for the purpose described.

62,000.—EPHRAIM CAPEN, Batavia, Ill.—*Truss.*—February 12, 1867.—The pad is attached to a boss on the pivoted arm, which is secured by a sleeve joint on the shaft, between two collars, one of which has a sloping surface against which the sleeve is pressed by the nut so as to graduate its pressure upon the rupture.

Claim.—First, the combination and arrangement of the shaft *c*, provided with an inclined stationary shouldered *B*, the nut *D*, movable collar *C* and its pad *A*, operating substantially as described, for the purpose of adjusting and securing the requisite pressure, as herein set forth and specified.

Second, constructing the pad arm in two parts *E F*, pivoted together as described for the purpose of affording a lateral adjustment to the pad, as herein set forth.

Third, forming a boss *g* upon the arm *F*, whereunto the pad is attached, substantially as and for the purposes specified and shown.

62,001.—GEORGE J. CAPEWELL, West Cheshire, Conn.—*Button Fastening.*—February 12, 1867.—One flange of the eyelet is embraced between the cone and the annular rear plate of the button, and the other flange is seamed down upon the fabric to make the fastening. By the intervention of a second eyelet the shank is strengthened and elongated.

Claim.—First, a button provided with the cone *f*, either as shown in figure I or figure V of the drawings, substantially as and for the purpose specified.

Second, the combination of a single eyelet with the

cone *e*, either with or without the washer *d*, substantially as shown and described.

Third, the two eyelets *f f*, in combination with the cloth *c* and the cone *e*, either with or without the washer *d*, when arranged and combined as and for the purposes set forth.

62,002.—ALEXANDER CARMICHEL, Westerly, R. I.—*Tea Pot.*—February 12, 1867.—A perforated plate is reciprocated against the reticulated plate at the entrance of the discharge spout, its object being to prevent clogging.

Claim.—First, the plate *B*, arm *b*, and slot *a*¹, arranged relatively to the body *A* and the exit holes *a*, substantially as specified.

Second, the case *A*², combined and arranged as represented, and extending upward from the slot *a*¹ to a level above the top of the tea pot, substantially as and for the purpose herein specified.

Third, in combination with the clearing plate *B*, arm *b*, and casing *A*², or their respective equivalents, the spring *D*, adapted to operate substantially in the manner and for the purpose herein set forth.

Fourth, the lever *E*, arranged to operate in combination with the clearer *B*, and the several connections, substantially as and for the purpose herein specified.

62,003.—G. F. CASE, New York, N. Y.—*Drill.*—February 12, 1867.—The diamonds are secured in divergent rows upon the conical drill face, and a loose collar on the rod relieves it of friction.

Claim.—A diamond drill, having its diamonds arranged in two or more rows, substantially as described.

Also, in combination with the above, the diamonds when so set as to cut the entire surface of the rock, substantially as described for the purpose specified.

Also, the loose collar or ring upon the drill rod, substantially as and for the purpose described.

62,004.—E. CHILDREN, Lancaster, Wis.—*Cultivator.*—February 12, 1867.—The beams are hinged to a bar which rests upon a roller on the tongue, and is laterally moved by a lever. The rear of the beams is suspended by links and rock-bar, and raised by the vibration of the latter. The share is attached to the standard by staples and keys in the rear.

Claim.—First, the friction roller *j*, inserted in the pivoted draft pole *C*, in combination with the bar *H* attached to the pivoted arms *h h*, all arranged to operate in the manner as and for the purpose herein set forth.

Second, the links *I* and T-shaped levers *J* applied to the plow beams and frame *A*, to operate in the manner substantially as and for the purpose set forth.

Third, the securing of the plows *K* to the standards *L* by means of the staples *M*, bars *r* and the keys *t*, all arranged substantially as and for the purpose herein set forth.

62,005.—JOHN S. CLARK, Philadelphia, Pa.—*Grate.*—February 12, 1867.—The oscillating portion has alternately long and short bars, which act in conjunction with others projecting inward from the ring, the ends of each being deeper as more exposed to wear.

Claim.—A stove or range grate, consisting of the fixed part *A* having the two series of parallel, alternate short and long bars *a*¹ *a*², and the rotary part *B*, having the two series of parallel, alternately long and short bars *b*¹ *b*², the said parts being constructed and arranged to operate together, substantially as and for the purposes described, and in combination with the subject-matter of the preceding claim.

Also, making the free ends of all the bars *a*¹ *a*² *b*¹ *b*² deeper than the frame or shaft from which they project, and giving to the ends of the movable bars *b*¹ *b*² the curved edge form shown, substantially as and for the purposes described.

62,006.—J. WARREN CLARK, Iowa City, Iowa.—*Apparatus for Distributing Liquid Manure.*—February 12, 1867.—The stirrer in the mud box is rotated by a strap from one of the wheels, and the mortar issues from the nozzle of the hose in the rear of the plow share.

Claim.—The combination of a box wagon for containing water and earth, forming a puddling compound, with a plow for cutting a trench connected

with a mixer of the compound within the wagon box, and a hose or its equivalent for conducting it into the trench behind the plow, for the purpose of setting young trees or plants in rows, constructed and arranged substantially as herein described.

62,007.—THOMAS H. CLARK, Indianapolis, Ind.—*Steam Boiler Furnace*.—February 12, 1867.—Each cylindrical boiler lies in a cradle of form concentric therewith, the space around it forming a flue, and a ridge between the respective flues corrects the tendency to diagonal draft. Transverse channels admit air, which is introduced through pipes to aid in the consumption of the carbon.

Claim.—The combination of a boiler furnace, where one or more boilers are arranged in the same longitudinal plane of the flues E, made concentric in the transverse section with the bottom of the boilers, and which extend beneath the boilers in the direction of their length, and are separated from each other by ridges S with the transverse channels I and air channels F and H, and the continuation of the partition between the boilers over the chambers C', leaving a space under the boilers, substantially and for the purposes as herein shown and described.

62,008.—BARNES CLAYTON, Philadelphia, Pa.—*Sleeve Bygon and Stud*.—February 12, 1867; antedated February 2, 1867.—The shank is inserted and the spring plunger then slips forward and prevents the retraction.

Claim.—In combination with the shank and head of a shirt bosom stud, or sleeve button, the self-adjusting fastening, consisting of the hollow cylinder 1, slide or bolt 2, and spiral spring 4, the same being constructed, arranged, combined, and operating together, as and for the purpose described.

62,009.—CHARLES T. CLOSE, Brooklyn, N. Y.—*Lifting Jack*.—February 12, 1867.—The axle rests on a step on one leg of the lever, which is tilted forward and raised by means of a toggle, the operating limb of which has a foot upon which the middle bar raises.

Claim.—A wagon jack, composed of the legs A and B, and lever, when combined together, substantially as described.

62,010.—JAMES H. COGSHALL, Lexington, Mich.—*Nursing Couch*.—February 12, 1867.—The child lies upon the couch, which is adjustable in inclination by a segment bar and set screw, and in height by its threaded stem.

Claim.—The nursing couch, consisting of the support A, screw B, set screw E, semi-circular arms D, table C, and straps F, when constructed and arranged as herein set forth.

62,011.—C. CONKING, Ashland, Ohio.—*Letter Envelope*.—February 12, 1867.—The supplementary back and the belt are attached by wire loops to the envelope, and the latter may be reused by renewing the described adjuncts thereto.

Claim.—First, the belt D and loops B C, in combination with the envelope, substantially as described.

Second, the duplicate back F and loops E, and envelope, substantially as and for the purpose set forth.

Third, the duplicate back F, in combination with the envelope, as and for the purpose set forth.

Fourth, the self-sealing belt D, in combination with the envelope, as and for the purpose set forth.

62,012.—MAXWELL CORNELIUS, Cheviot, Ohio.—*Claw Bar for Railroads*.—February 12, 1867.—The bar is so constructed as to form a more or less powerful fulcrum itself, to apply the rail as a fulcrum, or to operate with a detached fulcrum block, to draw railroad spikes.

Claim.—First, the hinged double headed claw bar A B B' D, d, E E', constructed and adapted to operate as set forth.

Second, in combination with the above the single clawed auxiliary head F, adapted to be hinged to the bar proper, and to operate in the manner set forth.

Third, the claws proper B B', E E', adapted for ready removal and replacement, as set forth.

62,013.—JULIEN L. COURCIER, Paris, France.—*Lubricator*.—February 12, 1867.—The central tube is open, and when the oil sinks below its lower end air

is admitted through it and the annular passage to the reservoir above, and allows an equivalent amount of oil to descend. The vertical adjustment of the tube regulates the flow by determining the height of the column of oil resting upon the journal.

Claim.—The tube e, in combination with the closed reservoir a and tube g, substantially as herein set forth for the purpose specified.

62,014.—ISAAC T. CRUM, Chicago, Ill.—*Device for Forming Horse Collars*.—February 12, 1867.—The former has the shape of the collar, and has flanged projections outward from its lower part for the purpose of holding the rim in position when being bent. To the top of the former is attached a standard for holding the rim on the form when and after being bent.

Claim.—The combination of the form A with the flanges D and standard C, substantially as set forth.

62,015.—TIMOTHY A. CURTIS, Brookfield, Mass.—*Sole Cutting Machine*.—February 12, 1867.—The knife holder is swung horizontally 180° between each stroke so as to cut toes and heels in alternation. The leather is placed on a block which is elevated against the knife, and the same motion actuates levers, &c., which rotate the knife holder, disengaging the stop pin temporarily for that purpose.

Claim.—First, supporting the knife holder B on an internal support in connection with the solid bearings of the holder on the frame at x' x, when the knife is swung half round between each cut by means of the levers, rack, and catch ring, or their equivalents, substantially as set forth.

Second, raising the block and table in connection with the swinging knife, in the manner and for the purposes substantially as above described.

62,016.—GEORGE CUSTER, Monroe, Mich., assignor to himself and CHARLES TOLL, same place.—*Toe Calk for Horseshoes*.—February 12, 1867.—To assist the welding joint the toe calk has one projection at its center, on the inside, the front part having a recess.

Claim.—A toe calk provided with a recess and also a projection upon its inner and upper surface, all as set forth, and substantially as described.

62,017.—GEORGE W. DAVIS, Milford Centre, Ohio.—*Boot Heel*.—February 12, 1867.—The hollow metallic heel is secured to the boot by nails which turn over and clench upon the foundation sole.

Claim.—A cast metallic heel, constructed as described, in combination with the devices for uniting the same to boots and shoes, as herein set forth.

62,018.—JOSEPH DE LA MAR, Brooklyn, N. Y., assignor to himself and ABRAHAM EMANUEL.—*Machine for Pressing Hats*.—February 12, 1867.—Hydraulic pressure is introduced into an expandible sac within the hat and the latter thereby forced against the cylindrical shell which rests on the brim of the hat and also against the follower, which is vertically adjustable to determine the height of the crown.

Claim.—First, the combination of steam cylinder d, piston l, and steam ring e, for the purpose of affording heated surfaces to press against.

Second, the application of hydraulic pressure into an expandible india-rubber hat over which the hat to be pressed is placed.

62,019.—FRIEDRICH EICHNER, Chicago, Ill.—*Razor Strap*.—February 12, 1867.—Composed of oxide of iron, crocus martus, stone dust, and emery flour, rubbed on to the strap with a lather of soap in such combinations as required for the respective sides of the strap.

Claim.—The use of the four substances herein enumerated in three different proportions as herein set forth, for the purpose of making three different kinds of razor straps, in the manner substantially as herein described and specified, for concave razors as the barbers use.

62,020.—JAMES E. EMERSON, Trenton, N. J.—*Saw*.—February 12, 1867.—The portions projecting into the recess of the saw plate or from the rear of the tooth constitute an equivalent for the dovetailed form previously used.

Claim.—The method of securing teeth inserted in

or attached to a saw plate by forming the dovetail of one or more rivets, permanently secured either in the saw plate or the tooth, in the manner substantially as shown and described.

62,021.—GEORGE A. ENO, Philadelphia, Pa.—*Ice Pitcher.*—February 12, 1867.—The contraction of the chamber at its lower end renders the bottom less liable to injury in placing ice therein.

Claim.—The inner casing of an ice pitcher or water cooler contracted at the lower end as described, for the purpose specified.

62,022.—B. GARVIN and R. J. PETTIBONE, Oshkosh, Wis.—*Tubular Grate.*—February 12, 1867.—The tubes are combined into a continuous passage for the water, the alternate ends being connected by caps which admit of expansion.

Claim.—The combination of the tubes A with the caps B when constructed and applied substantially as and for the purpose set forth.

62,023.—A. W. GIFFORD, Worcester, Mass., assignor to himself and HENRY D. WARD, same place.—*Scissors Sharpener.*—February 12, 1867.—The scissors blades is passed between guide plates, with its edge in contact with a cutter set at the proper inclination.

Claim.—The serrated or file bar B with the sides D C provided with the spring F, substantially as described for the purpose specified.

62,024.—HENRY GILBERT, Philadelphia, Pa.—*Vaporizing and Burning Gasoline for Heating and Illuminating.*—February 12, 1867.—Improvement on the patent of Wm. Beschke, Aug. 14, 1866. By means of the stopcock the amount of vapor which comes from the burner can be regulated. Other devices are cited in the claims.

Claim.—First, the screw stop, with or without valve at the bottom, intended to fill the reservoir or vessel with the combustible fluid from below.

Second, the stop cock, or its equivalent in the burner, serving to regulate the exit of gasoline vapors, and consequently the size of the flame.

Third, the filling of the lamp or burner, or both, with sawdust, charcoal, powdered or otherwise, bone dust, cotton, flax, hemp, wool, ratan, jute, or other similar porous substance.

Fourth, the modification of said lamp by omitting the metallic burner entirely and burning it by means of a wick, covered or not covered by a cap of wire gauze, or by burning without any wick by means of the metallic burner.

Fifth, the use of a bundle of fine metallic wire in the openings and stop cocks of cans, bottles, tanks, barrels, or other reservoirs for fluid combustible substances, giving a better ingress and egress to the liquid material than is the case with wire gauze, and acting as an improved safety arrangement in preventing any flame to communicate to the interior and cause explosion.

62,025.—H. C. GILBERT, Cambridge, Vt.—*Evaporator.*—February 12, 1867.—The pan is attached to a frame which may be moved from over the fire by means of the pinions and racks.

Claim.—The combination of the shaft D, cog wheel G, racks H, and sliding frame I with each other, and with the top a' of the furnace A when said parts are constructed and arranged substantially as herein described and for the purpose set forth.

62,026.—J. S. GOCHNAUER, Goshen, Ind.—*Washing Machine.*—February 12, 1867.—The lower pan has springs beneath and a circular system of conical rubbers; similar rubbers are pivoted in the hinged segments above which revolve the lower series in the pan.

Claim.—The yielding bed formed of a series of radiating conical rollers in combination with the rubber F, composed of a series of conical radiating rollers and made in two parts, which are hinged together by a rod e passing through the vertical shaft D, substantially as and for the purpose described.

62,027.—W. B. GOULD, New York, N. Y.—*Stair Rod.*—February 12, 1867.—The rod is held at each end in fixed sockets, one or both of which have spring or adjustable bottoms, so that the rod may be entered into one socket and partially returned into the other.

Claim.—The combination of a stair rod A and socket or hollow tips B when they are constructed or arranged together so as to hold the rod at either one or both of its ends with an elastic or yielding pressure, substantially as and for the purpose described.

62,028.—RANSOM W. GREEN, Bradford, Pa.—*Car Coupling.*—February 12, 1867; antedated February 10, 1867.—The pin is attached to a rectangular guide-frame which moves in vertical grooves in the side of the draw-head. It is supported by a flanged pivoted spring arm which is vibrated to the rear by the entering link, allowing the pin to drop into coupling connection.

Claim.—The arrangement of the flanged draw-head B, the link I, the shouldered pin E D, guide frame C, and the shouldered spring arm H G, operating substantially as described.

62,029.—W. H. HANKINSON, New York, N. Y.—*Carpet Beater and Cleaner.*—February 12, 1867.—The carpet is carried by feed rollers sustained on supporting cords and is acted on by flexible revolving beaters and brushes.

Claim.—First, the two pairs of feeding rollers B and C and the cylindrical brush F made self-adjusting as described, and arranged in relation with each other and with the supporting cords E and flexible beaters a*, substantially as herein set forth for the purpose specified.

Second, the stiff brushes c arranged upon a rotating frame in combination with the feeding rollers B C and cylindrical brushes F, substantially as herein set forth for the purpose specified.

62,030.—THEOPHILUS HARRISON, Bellville, Ill., assignor to himself and Wm. C. BUCHANAN, same place.—*Horse Power.*—February 12, 1867.—The power of the master wheel is communicated to two pinions on nearly opposite portions of the rim. The pinions are on different shafts having an oblique relation to each other and united by bevel gears. The elliptical pin is intended to compensate for irregularity in the action of the gears.

Claim.—The arrangement of the pinion D and the pinion D', shaft F, and pinion H, diagonally with the pinion H' and the shaft E in combination with the master wheel A, constructed in the manner and for the purpose herein specified.

Also, the elliptical or oval pin or axle B of the master wheel A in connection with the two pinions D D' and separate shafts E F, substantially as and for the purpose set forth.

62,031.—THOMAS HENNEY, Dubuque, Iowa.—*Heating Stove.*—February 12, 1867.—Interior pipes traverse the diving fine pipes surrounding the main body of the stove. These interior pipes are supplied with outer air and discharged into the room. A damper regulates the admission of air.

Claim.—First, the combination of the branch pipes I, inlet pipe H, pipes G G', damper J, central fire cylinder A, hollow base B, cap section C, and the pipes D D', all arranged and operating substantially as and for the purpose described.

Second, the combination of pipes H I with the pipe G' and D' applied to a stove composed of sections A B C and pillars or pipes D, substantially as described.

Third, providing for securing the several movable sections of the stove together by means of rods, nuts, and flanges applied to the air pipes G, substantially as described.

Fourth, the arrangement of the air pipe G' opening at the top and bottom of the stove and passing through the exit pipe D' and damper E, substantially as described.

62,032.—JOHN HENRY, Jersey City, N. J.—*Printing Press.*—February 12, 1867.—Two fountains distribute the ink from two points so that it may be spread in regular and small quantities. Revolving ink disks are connected to the oscillating table.

Claim.—First, the arrangement in combination with the reciprocating distributing table C, of disk distributors D D, for action in concert with distributing rollers, substantially as specified.

Second, the combination with the inking rollers, distributing rollers, table C, and disks D D, of separate

fountains E F, essentially as and for the purpose or purposes herein set forth.

62,033.—**JOSIAH HOLMES** and **CHARLES W. NICKERSON**, Pittsburg, Pa.—*Burglar and Fire Alarm*.—February 12, 1867.—The alarm is sprung by the burning or breaking of an inflammable guard cord stretched throughout the building.

Claim.—The plate lever *n*, with the slot *s*, in combination with the catch rod *m*, and scape wheel *h*, when arranged and operated in connection with a clock alarm, substantially as and for the purposes herein described.

Second, the guard cords *v v*, with their ends *v' v'*, the spiral springs *r r*, and the lever plate *n*, combined, arranged, and operating substantially as and for the purposes set forth.

62,034.—**EDGAR HUSON**, Ithaca, N. Y.—*Horse Rake*.—February 12, 1867.—The rake is raised to discharge the hay by a lever assisted by a spiral spring. Horizontal bars run back between the rake teeth to clear them from the hay when raised.

Claim.—First, the spring B, anterior to the rake head for the purpose of relieving the labor of operating the rake and also for the purpose of a quick upward motion of the teeth, so that the hay or other article raked shall not be bound, by the forward motion of the horse, between the teeth and the strippers or cleaners of the rake.

Second, the combination of the spring B, rod E, and head lever F, as described.

Third, the rake head O P, teeth I, and staples J, all constructed and arranged substantially as and for the purposes set forth.

62,035.—**ROBERT V. JONES** and **HENRY FESSLER**, Canton, Ohio, assignors to themselves and **JAMES SHORT**.—*Harvester Rake*.—February 12, 1867.—The rake is operated by treadles under a segmentally slotted shield situated immediately over and hinged to the platform. The rake teeth are elevated and depressed in passing to and fro over the slotted platform, by means of tumblers and lugs.

Claim.—First, the circular metallic case A, provided with the wheels L, M, G, and F, springs G, M, I, and R, in combination with the pins I and 2, treadles N and O, rack bar K, and wheel P, all arranged and used substantially as herein specified.

Second, the quadrantal-shaped platform D, with its slotted shield, hinged as described, and the rake bar P, connected to a stud at the geometrical center of the platform, rake shaft Y, tumbler U, and lugs J and J', for carrying the grain to the rear of the machine, the whole being constructed, arranged, and operating as specified.

Third, the circular metallic case, constructed as described, with rack bar K and wheel P, in combination with the platform and rake, the whole being constructed and operated in the manner herein specified.

62,036.—**FRANCIS JUST**, Buffalo, N. Y.—*Door Lock*.—February 12, 1867.—The lower edge of the bolt enters a slot in the key. The side tumblers catch in separate notches. The latch has to be partially or wholly drawn back and the key inserted in inverted position to move pivoted spring catches out of the course of the key when moving the bolt. The latch is reversible.

Claim.—First, in combination with the tumblers B B, and a key bit, the bolt A, when constructed and operated as shown.

Second, the catches F F, in combination with the key bit, for the purpose specified.

62,037.—**HENRY KELLOGG**, New Haven, Conn.—*Manufacture of Hats*.—February 12, 1867.—Animal and vegetable fiber reduced to a pulpy condition are intermixed in 50 to 80 times the quantity of water used for the manufacture of paper pulp. This mixture is poured into a cylinder above the perforated hat-former. The plunger is then slowly raised, causing the liquid to pass through the "former" to the partial vacuum beneath, and so depositing the particles upon the "former." The wool fibers prevent the pulp from obstructing the passage of water through the perforations, thus avoiding the unequal distribution of the material on the "former."

Claim.—A hat formed and constructed by com-

bing animal fiber with vegetable pulped fiber, substantially as herein set forth and described.

62,038.—**LEWIS Y. KETCHAM**, Port Jervis, N. Y.—*Water Crane for Supplying Locomotives*.—February 12, 1867.—The supply pipe has a vertical pipe stepped in it, which passes through and is revealable in a packing box, to bring its discharge spout over the tender of the locomotive. A lever on the spout has connection to a valve in the supply pipe.

Claim.—First, the water shaft C, within the pedestal A, constructed, arranged, and operating substantially as described.

Second, the arrangement of means or devices for operating the water valve and the outlet valve, as herein shown and described.

62,039.—**JOHN KIPS** and **WILLIAM ALLMENDINGER**, Melrose, N. Y.—*Oiler*.—February 12, 1867.—The elastic bulb supplies pneumatic pressure to the oil in the reservoir, and the orifices is thus adapted for use above the level of the operator and in an upright position. Air is admitted through the aperture of a valve, which is closed by the movement of compressing the bulb.

Claim.—First, an oiler consisting of a reservoir C and air pipe B, a discharging pipe E with a removable nozzle F, all constructed and operating substantially as herein described, for the purpose of oiling below the level of the operator.

Second, in combination with the elements recited in the foregoing claim, an elastic bulb, operating substantially as and for the purpose as herein described.

Third, in combination with the elements recited in both of the foregoing claims, a suitable device for opening and closing the air hole in the air pipe B, substantially as and for the purpose herein described.

Fourth, the curved removable nozzle and the adjustable discharging pipe, in combination with the other parts of an oiler, all being constructed substantially as herein shown and described.

62,040.—**J. KNIGHT**, Louisville, Ky., assignor to **T. C. COLEMAN**, same place.—*Cotton Bale Tie*.—February 12, 1867.—The otherwise rectangular metallic plate has one oblique side, and the parallel sides are bent over to form a loop. One end of the hoop is rebent over this loop and the other passed through the loop and doubled over the oblique edge, which favors its presentation, to be tucked underneath and held by the expansion of the cotton against it.

Claim.—Forming a bale tie loop A, with turned edges *a a*, and one diagonal and one square end, arranged and applied for securing the ends of a hoop in the manner herein described.

62,041.—**EZRA B. LAKE**, Bridgeport, N. J.—*Railway Switch*.—February 12, 1867.—A rod projecting from the car turns down a lever by the side of the track, and operates the switch in advance; the rod being reversed on the rear car, the switch may be replaced by a person on the train.

Claim.—First, the rails A and A' of the main track, and the rails B and B' of the turnout and switch rails C and C', in combination with the operating lever J, and the devices herein described, or their equivalents, for communicating motion from the said operating lever to the switch rails.

Second, the operating levers G H and D, and their connections, in combination with the switch rails.

Third, the combination of the above-mentioned operating levers with the movable bars X, situated beneath the cars.

Fourth, the combination of the slotted bar D, eccentric P, its arm I, and rods I and N.

62,042.—**BENJAMIN LEE, JR.**, Williamsburg, N. Y., assignor to himself and **ALFRED WOODHAM**, New York, N. Y.—*Fish Hook*.—February 12, 1867.—The hook shank is twisted to constitute it a spiral spring.

Claim.—A spring B, or its equivalent, in combination with a fish hook, substantially as and for the purpose described.

62,043.—**C. P. LLOYD**, Portsmouth, Ohio.—*Beehive*.—February 12, 1867.—Several interior boxes, with glass sides and movable comb frames suspended therein, are provided with entrance openings at the bottom; the same being regulated by slides.

Claim.—The combination of the boxes C, with sides as described and openings *f*, slides *g*, and suspended attachable frames D, constructed and operating substantially as and for the purpose specified.

62,044.—JOHN KNOX LOWE, Cleveland, Ohio.—*Bronzing Machine.*—February 12, 1867.—An improvement on his patent of August 28, 1866. The freshly-printed paper is carried between endless tapes under a fur-covered roller, through a fur-lined box, and around a roller beneath a wiper apron. It operates by first coating the freshly-inked parts with bronze dust, and then removing the same from between the letters.

Claim.—First, the fur or otherwise lined case, described, constructed and operating substantially as and for the purposes set forth.

Second, wiping cylinder D and cloth E, in combination, for the purposes, and operating in a bronzing machine, substantially as described.

Third, the combination of the fur roller with the lined box, its cylinder, the wiping cylinder, and its cloth, constructed and operating together, substantially as and for the purposes explained.

Fourth, feed tapes G G, or their equivalents, in combination with tapes F F, to receive, carry and deliver the sheet substantially as described.

62,045.—ALMON D. MANLEY, Washington, Mich.—*Mud Boat.*—February 12, 1867.—The mud boat has several vats resting on two boats, which are placed parallel and connected by timbers. The floors of the vats have sectional drops for discharge, and lever catches which control their discharging functions.

Claim.—First, the combination of one or more mud vats C with two boats or buoys A, placed parallel with each other and connected with timbers B, substantially as herein described, and for the purpose set forth.

Second, the combination of the sectional drop bottoms $c^1 c^2$ and the lever catch E with the mud vats C, when the said drop bottoms are constructed and arranged substantially as herein described and for the purpose set forth.

62,046.—GEORGE W. MANSON, Buxton, Me., assignor to NICHOLAS W. MANSON, same place.—*Churn.*—February 12, 1867.—The dasher rods are connected to a walking beam reciprocated by a pitman and gears. A support for the beam rises from the cover, and by detaching the dasher rods the top hamper can be lifted off together.

Claim.—As a means of imparting motion to two dashers in a churn, the arrangement of the geared wheel B, geared wheel D, crank shaft E, connecting rod *h*, and working beam F, swinging on the support G, the working beam F being so connected with the two dashers that it can be separated from the dashers when the cover of the churn is to be removed, in the manner and for the purposes set forth.

62,047.—FRANK MARTIN, Aurora, Ind.—*Seat for Railway Cars.*—February 12, 1867.—The car seat has a hinged back, is reversible on its frame, and has hooks and flexible side straps for supporting the arms of the sitter.

Claim.—First in combination with a revolving seat E F F', and ainged back G, the flexible straps H H' and retaining hooks I I', or their mechanical equivalents.

Second, in combination with the frame A B and revolving seat E F F', the hooked bar K k' and lugs L L', employed to secure the seat against rotation, substantially as described.

62,048.—J. B. McCLANATHAN, Horicon, Wis.—*Machine for Sharpening Calks of Horseshoes.*—February 12, 1867.—The foot of the horse is lifted, and the calk of the shoe being inserted between the cutter and the rest, is sharpened by rotating the cutter.

Claim.—First, the frame A having the bur D mounted therein, in combination with the rigid pivoted plate C and set screw E, arranged as described.

Second, providing the upper front face of the plate C with the corrugations, to act as rests or supports for the point of the calk as described.

62,049.—A. D. McCoy, New Orleans, La.—*Tent Bedstead.*—February 12, 1867.—The canopy is made in sections, so as to be readily detached and packed for transportation, and is supported on the bed frame.

Claim.—The bedstead A having adjustable head rest B, operated by the frame C, supporting the uprights b, with connecting stretcher rods c d, bearing the inclined rod d^2 , which intersect and form crutches *f*, on which rests the beam g, constructed and operating as described, for the purpose specified.

62,050.—JAMES S. McCURDY, New York, N. Y.—*Sewing Machine.*—February 12, 1867.—The claims and illustration explain the loop-taking devices. The feed is varied by turning the thumb screw, so as to bring the cam edge of the adjustable feed cam nearer to or further from the arm of the feed dog; a spring serves constantly to press back the cam against the thumb screw.

Claim.—First, the hoop F, constructed with an opening *d*, a point *b* on one side of the said opening, and a hook *c* on its inner circumference, and driven by a tongue or projection *a* on the rotating mandrel of the sewing machine, all substantially as herein specified.

Second, in combination with a rotating hoop, constructed and operating substantially as hereinbefore specified, a bobbin so held within but out of contact with the said hoop as to be confined in the direction of its axis, but to be capable of free rotation, substantially as herein specified.

Third, the holding device by which the bobbin is held within and in proper relation to, but out of contact with the rotating hoop, consisting of the two rings K and L, one of which has an offset *k* for the partial support of the bobbin, substantially as herein specified.

Fourth, the arrangement of the adjustable feed cam P, stop collar R, spring *t* and nut T, the whole applied to the rotating mandrel C, or its equivalent, substantially as herein set forth.

62,051.—CHARLES MCGREW, Bloomington, Ill.—*Beehive.*—February 12, 1867.—Holes in the side beneath the bottom board allow the moth to deposit her eggs in a place absolutely separated from the bee chamber. A water trough around the sides prevents the passage of the moth.

Claim.—The bottom *c* above the openings *b'*, leaving the space *d*, in combination with the case A, having water trough C on its sides, which with the front space below the alighting board is painted white, for the purpose described, and operating in the manner as and for the purpose specified.

62,052.—PURCHES MILES, New York, N. Y., assignor to THEODORE MACE, same place.—*Sausage Stuffer.*—February 12, 1867.—The pivoted follower oscillates 180° in the hopper, folding against the side while filling, and then as the handle is vibrated, forcing the meat out of the nozzle into the gut.

Claim.—The follower *d* and axle *c*, in combination with the vertical hopper *a*, having a curved bottom and the nozzle *f*, introduced through the vertical side *a'*, as specified.

Also, forming the hopper *a* with the curved bottom and sides, cast in one piece to receive the follower *d*, axle *c* and front *a'*, as and for the purposes specified.

62,053.—WARREN P. MILLER, San Francisco, Cal.—*Fireplace.*—February 12, 1867.—The air is admitted to a smious chamber behind the fireplace, and again emitted by openings into the room. Absorption of heat by the back plate of the chamber is reduced by giving it a reflecting surface.

Claim.—First, a lining or partition *g*, made of a suitable reflecting metal, and located within an air-heating chamber behind the fireplace or chamber, and separating the latter from the dead air chamber, substantially as and for the purpose specified.

Second, in combination with the partition *g*, the air-heating chamber *c c c*, and dead air or non-conducting chamber *d*, all constructed and arranged in the manner and for the purpose specified.

62,054.—JACOB F. MORRIS, Lansingburg, N. Y., assignor to himself and CALVIN LOCKROW, same place.—*Lubricating the Axles of Vehicles.*—February 12, 1867.—A cup inserted in the hub has a capped supply tube and a discharge tube which penetrates the

boxing of the spindle. The lubricant passes through a filtering sponge, supported on a perforated diaphragm.

Claim.—The combination of the oil cup or reservoir I, one or more furnished with short tubes G and J, strainer H, sponge I and cap K, or equivalent, with the hub D and axle box E of the wheel, substantially as herein shown and described, and for the purpose set forth.

62,055.—WILLIAM MULLEE, Franklin, Pa.—*Preparing India-rubber.*—February 12, 1867.—The rubber is cleaned and ground in the ordinary manner, and rolled into sheets. These are placed in frames made of iron wire, and the mass immersed in melted sulphur at 220° or 230° F., where they remain for an hour or more. They are then clear of any adhering crystals of sulphur. A mass of these sheets is then passed through the kneading mill, and next rolled into very thin sheets, which are wound upon the steam heated drum, on which it is pressed by a roller. It is then removed from the drum, and pressed while heated into flat plates.

Claim.—First, the above described process or method of treating or preparing india-rubber for use or manufacture.

Second, as a new article of manufacture the substance produced by subjecting india-rubber, either pure or when mixed with other substances, to the process herein described.

Third, the racks R or their equivalent for holding the sheets of rubber while in the bath, as set forth.

Fourth, the combination of the feed roller B and the roller C, armed with teeth for removing the crystals from the sheets as described.

Fifth, the hollow drum E and roller D, when combined and used for the purpose set forth.

Sixth, the bath with the fireplace A and the heat fue or passage a, arranged as herein shown and described.

62,056.—WILLIAM M. MURREY, Tiffin, Ohio.—*Machine for Dressing Stone.*—February 12, 1867.—The machine is so attached to the "runner" that the former can be adjusted, and set at any desired angle. For the purpose of regulating the depth of the furrows, the fulcrum of the vibrating pick handle is made vertically adjustable, while the pick is in motion or at rest. The main frame is adjustable upon its bed, toward or from the center of the stone at right angles to said motion. The speed of the pick or the cessation of its motion is effected without changing or stopping the motion of the main driving shaft.

Claim.—First, supporting the adjustable frame A, which carries the vibrating pick and the mechanism for operating it upon a bed frame A' and adjustable frame B, in such manner that frame A can be adjusted substantially as described.

Second, the combination of the adjusting screw a, hook A², stay a' and perforated cross bar A³, with the bed frame A', substantially in the manner described.

Third, the construction of the device m m' n, for the purpose and in the manner substantially as described.

Fourth, pivoting the pick arm E to a vertically adjustable block d', substantially as and for the purpose described.

Fifth, the means substantially as described for adjusting the fulcrum block d² for raising and depressing the rear end of the hammer arm.

Sixth, the application of the shaft of the wheel G to a vibrating frame H, substantially as described.

Seventh, the combination of vibrating frame H, pinion wheel h and spur wheels d and j, arranged and operating substantially as described.

Eighth, supporting shaft c carrying the parts described at one end by frame A, and at the other end upon the end of a lever C, substantially as and for the purposes described.

62,057.—JOHN H. NELLIS, Richmondville, N. Y.—*Attaching Bits to Braces.*—February 12, 1867.—The bit of the shank is grooved, and the latter contains a spring having a catch upon it to engage with a recess in the socket of the brace.

Claim.—A bit having a groove, with the spring C, constructed as described, and operating in the manner substantially as specified.

62,058.—WILLIAM NELSON, Boston, Mass.—*Construction of Papier Mache Matrices for Stereotype Plates.*—February 12, 1867.—The composition of the matrix consists of two parts by measurement of wheat flour, made into a paste, one part of moistened Paris white, and a small quantity of plumbago, well incorporated. This is spread on thick paper, is covered with a thinner sheet, and the latter with a linen paper. The combined layers are pressed between wet cloths, backed with zinc plates, and when fully softened the sheet is used as a matrix.

Claim.—A papier mache matrix for casting stereotype plates, composed of flour paste, Paris white and plumbago, and molded in the manner substantially as herein set forth.

62,059.—HEIMANN NEUMANN, New York, N. Y.—*Buckle.*—February 12, 1867.—The tongue is loose or looped to the frame, and the free end of the strap is folded round it, and thereby clamped against the side of the frame when tension is applied.

Claim.—The combination of the tongue B, free at one or both ends, with side bars F of the buckle frame, the whole constructed and operating substantially as described.

62,060.—W. J. OXER, Williamsport, Ind.—*Cultivator.*—February 12, 1867.—The frame is made of four pieces—a draft piece carrying the forward share, two bent side bars, to which the rear shares are attached, and a transverse brace bar.

Claim.—An improved iron cultivator frame formed by the combination of the bars A C and F with each other, when said bars are constructed and arranged substantially as herein shown and described.

62,061.—J. A. PARK, Lansing, Mich.—*Door and Gate Latch.*—February 12, 1867.—The latch is of triangular form, is hung in bearings, and has an overbalance weight and a spring. The oblique edge of this plate comes in contact with the keeper in closing, and is pushed to a perpendicular or locking position.

Claim.—The arrangement of the plate A with the latch C, and shaft with weight D, with or without the spring, when constructed in the manner substantially as herein set forth.

62,062.—JOHN PEACE, Camden, N. J.—*Pipe Tongs and Cutter.*—February 12, 1867.—One jaw has a hook, and the other a socket, which is set in or out to suit varying sizes of pipe. By placing a bridle over the socket, a corner of the socket is presented to the pipe, which is cut by the rotation of the tongs around it.

Claim.—A pair of pipe tongs having an adjustable screw E, socket D, with a series of gripping edges at each end, substantially as and for the purpose described.

62,063.—JOHN PEACE, Camden, N. J.—*Machine for Bending Skelp.*—February 12, 1867.—A die of required form is made in two parts, so arranged on a slide as to open for the admission of the end of the sheet and be closed by a lever. The end is then bent up, when it is seized by the proper apparatus and drawn through the die.

Claim.—The horizontal slide rest A, or its equivalent, the adjustable bracket C, the bent lever E, the adjustable stop D, and the dies F F', all constructed, combined and arranged substantially as and for the purposes herein described.

62,064.—DANIEL PETERS and JOHN W. PAULY, Keokuk, Iowa.—*Carrier's "Slicker."*—February 12, 1867.—The handle is made in two parts, each having on its inner surface a longitudinal semicircular groove lined with metal. In each groove fits a bar of corresponding shape, and between these bars the blade is clamped; the bars acting as a pivot, by means of which the blade may be adjusted.

Claim.—First, forming the handle A in two parts a' a², substantially as herein described, and for the purpose set forth.

Second, forming the blade B with a slot b², substantially as herein described, and for the purpose set forth.

Third, the combination of the half round friction wires b' b² and the metallic-lined grooves a² and a³ with the blade B and handle A, substantially as described, and for the purpose set forth.

Fourth, the combination of the friction and strengthening bolt C with the slotted blade B, and with the handle A, substantially as described, and for the purpose set forth.

62,065.—ABRAHAM H. PHILLIPPI, Reading, Pa.—*Oil Can.*—February 12, 1867.—An interior spring closes the valve against the inner end of the exit nozzle.

Claim.—The box L, flat spring X, rod R, arm A, and rod U, when the whole are arranged as and for the purpose set forth and described.

62,066.—HIRAM PULSE, St. Paul, Ind.—*Grain Drill.*—February 12, 1867.—The draft bar is laterally adjusted to obviate side draft by a notched rod and bell crank. The seed passes through a rotary screen on its way to the discharging seed slide, being cleaned in transit. The screen is rotated by band connection to gearing operated by the ground wheel.

Claim.—First, the provision in a grain drill of the separator I between the place of supply and delivery, substantially as and for the purpose set forth.

Second, the arrangement of notched rod W, bell crank X, draft rod Y, and slotted clevis Z, or their mechanical equivalents, for the optional rectification of the side draft by a person at the rear of the machine, substantially as set forth.

62,067.—JOHN M. REEDS, Millwood township, Mo.—*Corn Planter.*—February 12, 1867.—Two planters are united by bars, at the proper distance, to plant two rows simultaneously. The actuating levers are drawn together in the act of dropping the corn, and the springs on each assist in the return movement.

Claim.—The steel spring marked A on the drawing, and roller and double gearing, also above described, in combination with the hand corn planter, as specified.

62,068.—JOHN REILLY, Racine, Wis., assignor to himself and THOMAS FALVEY.—*Axle Box for Vehicles.*—February 12, 1867.—The axle box is cast around rings which bear upon the thimble skein, and has longitudinal ducts for a lubricant, fine radial ducts leading from them to the surface of the skein. The box is secured by flanges on the thimble skein at the axle end, and by a nut at the outer end.

Claim.—Casting the box around the rings, as and for the purpose described.

Also, the arrangement, as described, of the rings within the boxes, so that the box shall overlap the rings to prevent the displacement of the rings from end thrust of the axle on the boxes.

Also, the combination substantially as described, with an axle box of hollow longitudinal ribs, which serve both to fasten the box in the hub and to convey oil to the axle, whether said ribs or chamber be cast with the box, or made separately of cast or wrought metal, and afterward attached to the box.

Also, the arrangement of the oil reservoirs, the axle, and the lining rings, as and for the purpose set forth.

62,069.—J. REINECKER, New Orleans, La., assignor to GUSTAVUS RICKER, Covington, Ky.—*Cotton Bale Tie.*—February 12, 1867.—The end of the hoop is bent around one end bar of the locking piece, and the other end is passed through the diagonal opening near the other end, while the plate is at an angle relatively to the bale. As the cotton expands against its tie the last mentioned end becomes doubly bent against the sharp edges, which prevent its retraction.

Claim.—The plate B, provided with the semicircular opening a and the opening c, with inclined sides d, presenting two sharp edges or angles to the strap, substantially as described for the purpose specified.

62,070.—JOHN W. RICHARDSON, Ogden, Ohio, assignor to himself, DANIEL L. DAVIS, and JEREMIAH KIMBROUGH, same place.—*Manufacturing Alcoholic Spirits.*—February 12, 1867.—Sorghum juice is fermented with yeast prepared from rye meal and barley malt, and the fermented liquor is distilled in the ordinary manner.

Claim.—The process of manufacturing alcohol from the juice or skimming of sorgho, or other (so called "northern" cane, substantially as described.

62,071.—JOHN D. RILEY, Cincinnati, Ohio.—*Gauge for Circular Sawing Machines.*—February 12, 1867; antedated February 2, 1867.—The fence or stiff-supporter is hinged to the frame of the carriage, so that it can be adjusted to any angle with respect to the saw, to cut a keef of the required bevel.

Claim.—First, the beveling fence B, hinged to the arms A A, and adjustable to cut a bevel at any desired angle, substantially in the manner and for the purpose set forth.

Second, and in combination with the above, the guide bar G and piece H, having curved slots, set screws I I, and hinged arms F F, connected with the cross bar E, substantially in the manner and for the purpose set forth.

Third, The hinged beveling fence B, provided at its back edge with the hinged slotted cross bar C, in combination with the hinged uprights D D, to adjust said fence to any desired angle, substantially in the manner and for the purpose set forth.

62,072.—WILLIAM E. RISHER, Austin, Texas.—*Smith's Forge.*—February 12, 1867.—A cylinder is introduced for the reception of the refuse from the fire, and contains a drawer beneath for emptying the same. Air is introduced into a chamber surrounding the cylinder, and passes thence around the top of the same to the fire.

Claim.—First, the construction of the tuyere with a central chamber k, into which the ashes, cinders, and other matters collect; said chamber having a passage between its upper end and the fire bed of the tuyere, so that the air of the bellows or blast nozzle shall circulate in a chamber outside of the chamber k, and pass up to the grate through the space which is between the fire bed plate and the upper edge of the chamber k, all substantially as and for the purpose set forth.

Second, the construction of the tuyere, substantially in the manner and for the purpose described.

62,073.—CHARLES E. ROBINSON, Concord, N. H.—*Belt Lap Cutter.*—February 12, 1867.—The knife is attached to a grooved sliding block, and works in grooves in the top leaf or upper part of the machine. The upper and lower leaves are hinged to each other, and the latter has a rubber seat enabling the knife to cut leather of unequal thickness.

Claim.—First, attaching the knife to a grooved sliding block E, working in grooves in the top leaf or upper part B of the machine, and provided with a handle G, substantially in the manner and for the purpose herein shown and described.

Second, the combination of a rubber or other elastic seat with the lower leaf or part A of the machine, substantially as herein shown and described.

Third, hinging the lower and upper parts or leaves A and B to each other at one end, substantially as herein shown and described.

62,074.—W. S. RYERSON, Philadelphia, Pa.—*Enamel for Covering Hoop Skirt Springs.*—February 12, 1867.—The enamel is composed of white lead, pumice stone, No. 1 carriage varnish, and turpentine.

Claim.—Enameling the covering of hoops or springs of a hoop skirt, or of so many of them as may be necessary, with a composition prepared of the ingredients, and in the manner and proportions herein described and set forth.

62,075.—JAMES SERRILL, Philadelphia, Pa.—*Ice Planer or Cutter.*—February 12, 1867.—A fixed plane for the comminution of ice for immediate use. The ice is moved by the hand and discharged from the mouth below into a glass.

Claim.—An ice cutter or planer, consisting of the adjustable cutting knife A, supporting block B, guides C C, incorrodible surface plates D D, and the tunnel or spout E, arranged and combined together as described, as an improved article of manufacture, for the purpose specified.

62,076.—GEORGE SEWELL, Poughkeepsic, N. Y.—*Horseshoe.*—February 12, 1867.—The upper plate is nailed to the hoof and has dovetail sockets on its lower surface, which are entered by projecting dovetail tenons on the upper surface of the supplementary shoe. Transverse keys lock the plates together.

Claim.—First, the construction of a horseshoe

with a supplementary detachable portion B, substantially as herein set forth, for the purpose specified.

Second, the attachment of the supplementary portion B to the part A of the shoe, by means of the tapering dovetails *g*, tapering dovetail socket *e*, spurs *h*, and keys *i*, arranged in relation with each other, substantially as herein set forth.

62,077.—CHRISTIAN SHARPS, Philadelphia, Pa.—*Breech-loading Fire Arm.*—February 12, 1867.—An improvement on his patents September 12, 1848, and October 29, 1861. The breech piece is prevented from accidental elevation by a hooked projection on the operating lever. The longitudinally sliding spring-bar at the breech has a catch which takes over the cartridge flange, and by which the shell is withdrawn, either by hand or automatically, by a pivoted lever which engages the said bar. This pivoted lever is acted on by a pawl spring on the operating lever-guard.

Claim.—First, the combination of the hooked projection *w*; or its equivalent, or the lever D, with the lip *y*, or its equivalent, on the sliding breech, for the purpose specified.

Second, the spring-bar H, arranged to slide in the frame B, and having a notched projection *j*, in combination with the lever D, and its arm F, the whole being arranged substantially as described, so that the cartridge may be extracted either by the manipulation of the lever D or sliding rod H.

Third, the combination of the spring plate G, on the lever D, the notch *e*, on the arm F, and portion *h* of the frame, by which the said spring plate is released from the notch on moving forward the said lever D.

62,078.—J. D. SIMMONS, Quincy, Ill.—*Window Fastener.*—February 12, 1867.—One side of the angle plate is attached to the sash, and the other is perforated for the passage of the cam part of a lever, and for a pin projecting at right angles from a spring, to enter the frame and fasten the sash. The spring is operated by the cam lever, and the same cam also supports the sash.

Claim.—The eccentric lever B, provided with the notch X, and the lug or wing Z, for the purpose of stopping the spring and preventing strain upon the same, in combination with the plate A, formed as described, and the spring D, provided with bar *b*, the whole arranged and used as and for the purpose specified.

62,079.—JACOB SLAUDER, Osborn, Ohio, assignor to himself and LEVI C. SMITH, same place.—*Wheat Drill.*—February 12, 1867.—The agitator rod of the seed hopper has screw-threaded sections with plain intervals. One side of each thread is at a right angle to the axis, the inclination being all on the other side.

Claim.—The shaft *d* with the worms or screws *c* over the openings *i* in the bottom of the hopper C, in combination with the gear wheels *b* *c* and one of the driving wheels E, constructed, arranged, and operating substantially as and for the purposes herein described.

62,080.—FREDERICK F. SMITH and ADNAH THURSTON, Four Corners, Ohio.—*Seeding Machine.*—February 12, 1867.—Draft upon the lever rotates the shaft and simultaneously raises the shares and unlatches the connection with the rotary seed cylinder. The side plates of the latter are retained in place by a rabbit on the frame at their lower side and above by the removable upper portion of the hopper.

Claim.—First, so combining the lever E with the seeding stocks G and clutches *e* *f* that the movements of the said levers will elevate the seeding stocks simultaneously with the operation of the clutches to stop the motion of the seed-dropping mechanism, substantially as herein set forth.

Second, the retention of the plate *e* in its place with reference to the cylinder J and hopper I, by means of the groove *e'* and removable upper part *a'* of the aforesaid hopper, substantially as herein set forth for the purpose specified.

62,081.—HENRY K. SMITH, Norwich, Conn., assignor to himself and CHARLES OSGOOD, same place.—*Shaft Coupling.*—February 12, 1867.—By turning the screw-bolts the wedge blocks jam the shaft against

the opposite side of the sleeve and couple the shaft thereto.

Claim.—The shaft coupling herein described, the same consisting of the sleeve C having beveled or inclined ways or grooves D, pieces or blocks F, and screw bolts H, when combined and arranged together, substantially as and for the purpose specified.

62,082.—SIDNEY SMITH, Greenfield, Mass.—*Sink.*—February 12, 1867.—The sink has near the bottom a grating and its grooved sides furnish support to movable metallic baskets.

Claim.—First, the arrangement in a metallic kitchen sink of a grating C, substantially as described and for the purpose set forth.

Second, the arrangement in a metallic kitchen sink of the movable baskets, substantially in the manner described.

62,083.—WILLIAM STAMP, Susquehanna Depot, Pa.—*Steam Gauge.*—February 12, 1867.—The steam presses upon the under side of the flexible steel diaphragm and elevates the pendent lever. The latter presses upon the arm of the segment rack which engages with the pinion on the shaft of the index finger. A set screw on the arm impinges on the lever and by rotation adjusts the device.

Claim.—First, a concave flat-bottomed or saucer-shaped steel plate diaphragm fitted in a steam gauge and constructed substantially as herein described.

Second, the eccentric adjusting pin *i*, or its equivalent, in combination with the pendent lever *h* and the segment *d*, constructed and operated substantially as herein described.

62,084.—M. W. STAPLES, Catskill, N. Y.—*Wash Boiler.*—February 12, 1867.—The wash boiler has two perforated diaphragms dividing it into three chambers, the upper and lower ones of which are connected by side tubes.

Claim.—The chambers B and C, the perforated partition E and the circulation tubes D with apertures *a*, arranged substantially as shown and described, in combination with a boiler for the purposes herein set forth.

62,085.—GEORGE STORER, New Britain, Conn.—*Basket Machine.*—February 12, 1867.—The "former" holds the basket either in a horizontal or perpendicular position while being made. A socket clamp is forced upon the basket stuff to conform it to the shape of the "former" and the pressing upon the axial center of the "former" allows it and the basket to be revolved while thus clamped by the socket.

Claim.—First, the gudgeon *c* extending from the stock *m* and turning upon the pin *i* in combination with the mold block *d*, as specified, so that said gudgeon *c* will be sustained by its stock in a horizontal or vertical position, for the purposes set forth.

Second, the mold block fitted so as to be revolved in combination with the clamping cap *e* and movable center *f*, substantially as and for the purposes specified.

62,086.—JOHN E. SWEET, Syracuse, N. Y., assignor to JOHN T. BON and E. R. SANFORD, same place.—*Machinery for Making Oral Picture Frames.*—February 12, 1867.—The wooden frame having been brought to its true form but in a rough condition, a plastic composition is laid thereon suitable for receiving the finishing pigment or gilding. The frame is moved during the operation, the "former," which determines the contour of the molding, remaining at rest. The motion of the frame is derived from a crank wrist and proportioned by a sleeve thereon.

Claim.—First, the combination and arrangement of the shafts C D E and their pinions with their crank and its boxes, substantially as described and for the purposes set forth.

Second, the eccentric sleeve S for varying the throw of the crank, substantially as described.

Third, the combination of the scraper R, arm O, upright L, with or without the pedal P, as described and for the purposes set forth.

62,087.—WILLIAM J. THORN, Westbrook, Me., assignor to himself and F. A. BETTS, same place.—*Picker Cushion for Looms.*—February 12, 1867.—Several layers of leather are cut of the desired size and

shape. They are then soaked in water to soften the leather, then covered with a thin layer of cement and next placed in a former, layer upon layer, and pressed forcibly together.

Claim.—A tanned leather picker cushion for weaving looms, manufactured and prepared in the manner herein set forth.

62,088.—WM. E. TICKLER, EZRA T. MARSHALL, and DAN'L M. MARSHALL, Pierceton, Ind.—*Smut Machine.*—February 12, 1867.—The hollow shaft of the cylinder contains another shaft having conical projections which act on the lower ends of the rods supporting the brushes to thrust them against the cylinder sides; springs act in opposition to these projections. The brush bars are so inclined as to forward the grain. A pan draws in the air over the grain at its discharge opening for the removal of dust. A plate in the spout spreads the grain to the action of the air.

Claim.—First, the smut machine consisting of the cylinder B, hollow shaft C, brushes E, shaft D, cones *d*, standards *e*, riddle G, fan T, and pipe P, operating substantially as described for the purpose specified.

Second, the spreading device consisting of the pivoted valve *n*, elastic fingers *o*, arranged in the spout *m*, substantially as and for the purpose specified.

62,089.—WILLIAM H. TOWERS, Boston, Mass.—*Brick Burner.*—February 12, 1867.—A turntable revolves in a circular kiln. The unburnt bricks are placed upon this turntable, and are by revolution carried over the furnace and delivered when completely burnt.

Claim.—The revolution of unburnt bricks within a circular turret or kiln in such a manner that during the first part of the revolution they shall dry and become gradually heated, then be thoroughly baked during their passage over a furnace, and then gradually cool until, at the completion of the revolution, they shall be delivered perfectly burned and serviceable bricks, using for the purpose the apparatus hereinbefore described, or any other substantially the same and which will produce the desired effect.

62,090.—SAMUEL W. TYLER, Troy, N. Y., assignor to himself, THOMAS M. CLEEMAN, GEORGE P. PRESCOTT, WILLIAM DEYERMAND, EDWARD H. JONES, and HENRY HOLMES.—*Machine for Pulling Flax.*—February 12, 1867.—The endless belts run between pairs of pulleys, the series of which is inclined from the horizontal so as to raise the flax from the ground as the machine progresses.

Claim.—First, for pulling flax and such other crops as require such similar harvesting, the use of a series of two or more belts or bands made flexible so as to ply around pulleys or cylinders and properly arranged to work in conjunction by pairs so as to eradicate or pull the crop from the earth, and this, irrespectively of any pulling or eradicating movement that may be given to the belts, or of any particular form or kind of material employed in the construction of the same, substantially as set forth.

Second, constructing the belts with irregular or corrugated surfaces upon their outer or grasping sides, for the purposes set forth and substantially as described.

Third, constructing pullers with webbing or other comparatively non-elastic foundation, cushioned with india-rubber or other soft material, substantially as described.

Fourth, arranging the belts upon the machine in the position of an inclined plane in such a manner that their grasping sides shall traverse upward and backward at the same time, for the purposes set forth and substantially as described.

Fifth, so imparting motion to the pullers that each section of each pair thereof shall move in a direction around its axis or axes opposite to that of its fellow, so that the conjunctive sides of the two shall move together in one direction, in combination with impinging elastic surfaces, substantially as described.

Sixth, so arranging the belts as to leave an open space between their grasping sides at the point X', substantially as set forth and described.

Seventh, giving to the belts Z and Z' when used in pairs a motion so corresponding to that of the driving wheel that their grasping sides shall traverse backward at the same rate of speed as that at which the

machine is advanced, for the purposes set forth and substantially as described.

Eighth, the intermediate pulleys *u*, or their equivalent, for the purposes as set forth.

Ninth, the revolving fingers *v*, or their equivalent, in combination with the traveling elastic pullers, for the purposes set forth.

Tenth, the brace boards Y, or their equivalent, for the purposes set forth and substantially as described.

Eleventh, so constructing that portion of the frame upon which the pullers are situated as to form an open space through which the crop may pass unimpeded to the platform, substantially as described.

Twelfth, attaching the intermediate pulleys *u* in such a manner that they may be so adjusted as to produce any desired degree of pressure upon the crop between the belts, substantially as described.

Thirteenth, an automatic raking or delivering device when arranged in a manner to support the crop in an upright position while it is being conveyed along from the pullers or cutters to the point at which it is delivered from the rake, substantially as described.

Fourteenth, in combination with the pullers a vibrating separator for separating the swath from the standing portion of the crop, substantially as described.

Fifteenth, the separating swords or blades X, for the purposes set forth and substantially as described.

Sixteenth, so attaching the pullers to the machine, in connection with springs, as to secure to them an automatic or self-adjusting pressure upon the crop, substantially as described.

Seventeenth, the adjustability of the tongue E in combination with the traveling elastic pullers, substantially as described.

Eighteenth, so constructing and attaching the deflecting guards N as to allow the crop to approach the pullers at a point upon the opposite side of the line of their axis, for the purposes set forth and substantially as described.

62,091.—SAMUEL C. UPHAM, Philadelphia, Pa.—*Nutritive Medicine.*—February 12, 1867.—Extract of beef 2 lbs. and refined sugar 14 lbs. are dissolved in one gallon of hot water, and when cool tightly bottled for use.

Claim.—A nutritive medicine composed of the within-described ingredients, prepared in the manner and in the proportions substantially as set forth.

62,092.—P. H. VANDER WEYDE, Philadelphia, Pa.—*Lubricating Oil.*—February 12, 1867.—Crude petroleum is filtered and the volatile part evaporated at a temperature of 300° F. or less, till the residue is reduced to a gravity of 28°. The oil is then boiled with animal matter containing fibrine, albumen, gelatine, marrow, &c. A small quantity of resin may be dissolved in it.

Claim.—The manufacture of illuminating or burning oil and a superior lubricating oil from common petroleum, combining the filtering, evaporating at a low temperature, and thickening processes above described.

62,093.—P. H. VANDER WEYDE, Philadelphia, Pa.—*Preventing Incrustation in Steam Boilers.*—February 12, 1867.—Explained by the claim and illustration.

Claim.—The attachment within the upper part of the steam room of a boiler of a number of short rods resembling small inverted straight or curved lightning rods, or their equivalents, intended to carry the positive-electricity of the steam to the bottom of the boiler, where it, discharging in the water, repels the electro-positive deposits, preventing them from settling, and thus protects the boiler from incrustation.

62,094.—P. H. VANDER WEYDE, Philadelphia, Pa.—*Making and Using Nitrous Oxide Gas.*—February 12, 1867; antedated January 30, 1867.—The nitrous oxide generated by the action of nitric acid on moist zinc or iron is liquefied by pressure and employed for medical uses, for the production of artificial cold, and as a substitute for oxygen in producing the Drummond light, &c.

Claim.—First, the new economical method of making nitrous oxide gas, as above described.

Second, the apparatus for compressing and liquefying it, as above described.

Third, the use of the liquefied gas after its re-expan-

sion as an anæsthetic for surgical operations, (and anti-spasmodic,) in cases of typhoid fever, cholera, &c., and other medical operations.

Fourth, the use as a substitute for oxygen for the Drummond or calcium light, or hydro-oxygen blow-pipe for magic lanterns, light-houses, melting of platinum, &c.

Fifth, its use as a bleaching, oxidizing, deodorizing, and disinfecting agent.

Sixth, its use of the liquefied gas as a store of motive power, for driving railroad cars and other contrivances.

62,095.—P. H. VANDER WEYDE, Philadelphia, Pa.—*Gas Generator.*—February 12, 1867; antedated January 30, 1867.—The upper part of the acid chamber above communicates with the generator beneath by tubes, a stopcock shutting off the acid when desired. One of the tubes is connected with a pipe which terminates in a washing bottle. The latter has cocks through which the water and gas may be withdrawn.

Claim.—First, a gas generator when the acid is entirely separated from the substance from which the gas is evolved, brought in contact only in proportion to the pressure and quantity required and adapted to the instantaneous generation, without the application of heat, of the following gases: hydrogen, oxygen, carbonic acid, hydro-sulphuric acid, sulphide of ammonia, nitric and nitrous oxide, and hypo-nitric acid.

Second, the long-necked bell jar A, contracted and expanded below as described above, preventing the absorption of the gas by the liquid.

62,096.—P. H. VANDER WEYDE, Philadelphia, Pa.—*Tubular Still for Continuous Distillation.*—February 12, 1867; antedated January 30, 1867.—A series of zigzag tubes are placed in the flue through which the liquid runs in a small stream, and in which it is exposed to an increasing heat as it approaches the fire. At different distances tubes are provided for the escaping vapors, which are separately condensed.

Claim.—First, a still consisting of a series of tubes situated in the flue, through which tubes the liquid to be distilled is uninterruptedly passed in a small stream and in its downward course submitted to a continually increased heat.

Second, a number of vapor tubes attached at different heights to this tubular still giving exit to vapors of different density and volatility, each exit tube condensing its own vapor separately in a common worm Liebig's condenser, or any other kind, and thus producing liquids of different density by one single uninterrupted operation; also preventing fusi and other oils from contaminating any other part of the apparatus, or of its products, with their vapors.

Third, the manner of connecting the tubes by means of traps for the separation of the different vapors, and by screw caps giving access to their interior for cleaning, repair, or other purposes.

62,097.—P. H. VANDER WEYDE, Philadelphia, Pa.—*Manufacture of White Lead.*—February 12, 1867; antedated January 30, 1867.—The vapors evolved in the destructive distillation of wood are condensed to obtain acetic acid for the manufacture of acetate of lead. Air is passed through the heated charcoal in the retort, after distillation, in order to obtain carbonic acid to decompose the acetate of lead.

Claim.—First, to effect with the same apparatus and one single operation the separation of the products of the distillation of wood, chiefly of the acetic acid, the immediate transformation of the remaining charcoal into carbonic acid, and the use of those two products to the manufacturing of white lead, in the manner described.

Second, the spiral inverted gutter *h h*, intended either to secure a more perfect absorption of the carbonic acid, or any other gas by the liquid, or to charge air or gas more perfectly with the vapor of the liquid through which it passes.

Third, the treatment of the precipitate with a hot alkaline solution of quicklime, or its equivalent, and the washing out of the filters with lime water.

62,098.—R. M. VAN SICKLER, New York, N. Y.—*Elevator.*—February 12, 1867.—The guide posts of the elevating platform rest on gudgeons, and are adjustable in inclination by a lever connected to their lower

ends. The main platform rests upon wheels, and by the movement of a lever other wheels are brought down to sustain the platform and enable a movement at a right angle to the former wheels.

Claim.—First, a portable elevator, consisting of a car or truck mounted on two sets of wheels, substantially as described, with grooved tracks or guide posts mounted thereon, and a carriage or platform supported by and moving in connection with said posts, substantially as herein shown and described.

Second, having the tracks or guide posts made adjustable, substantially as and for the purpose herein shown and described.

62,099.—A. VAN WINKLE, Newark, N. J.—*Soda-Water Stand.*—February 12, 1867.—The sirup cocks are upon one side of the stand. The cans of the upper tier are narrower than the lower, to allow access to the latter from the rear, inside the casing.

Claim.—First, the arrangement of two or more tiers of sirup cans one above the other in a soda-water stand, substantially as and for the purpose described.

Second, making the cans of the upper tier narrower than those of the next succeeding one below, substantially as and for the purpose set forth.

62,100.—GEORGE W. WALKER, Boston, Mass.—*Cooking Stove.*—February 12, 1867.—A flue from the lower heat chamber passes up between the fire plate and the oven, then over the oven and discharges into the diving flue, from which it passes under the oven and returns above the stove bottom to the chimney.

Claim.—The arrangement of the flue *i*, with respect to the oven and the main flue, substantially as described.

62,101.—JAMES WALKER, Cincinnati, Ohio.—*Brewers' Mash Tun.*—February 12, 1867.—The main pipe for admission of water for raising the temperature of the mash, or for allowing the outflow of the wort, has a removable head, from whose chamber radial pipes conduct the liquid to various points to raise the temperature at all parts alike. In drawing off the wort each of these pipes furnishes a place of exit, for the avoidance of any great current which a single outlet causes. A pipe ascending from the central chamber affords exit through the side of the tun when desired.

Claim.—First, the provision in a mash tun of the radiating inlets to the drain pipe or pipes, substantially as and for the purposes set forth.

Second, the elevated drain pipe proper within the mash tun, substantially as set forth.

62,102.—W. T. WELLS, Decatur, Ill.—*Latch for Gates.*—February 12, 1867.—The latch has a guide plate whose upper cross bar limits its movements, so that by changing the position of the plate the play of the latch is regulated.

Claim.—The combination with a latch of a slotted plate, or its equivalent, when the two are so constructed and arranged together as to operate substantially in the manner described and for the purpose specified.

62,103.—JOHN WILDHACK, Pekin, Ill., assignor to himself and R. POPKISS, same place.—*Oil Cup for Steam Engines.*—February 12, 1867.—The cock stem, whose mouth forms an oil-receiving cup, is screwed into the cylinder. The plug handle has, at one end, an oil chamber communicating by a central duct through the plug to the oil passage in the stem at one side, so that when the oil chamber is turned down it may be filled from the oil cup, and when it is turned up it furnishes oil to the cylinder.

Claim.—First, an oil cup for the cylinders of steam engines, in which a chamber C in the handle B is made the reservoir for receiving the oil, substantially as set forth.

Second, the stem A and stopcock B, when so constructed and arranged that the stopcock shall be the receiver for the oil, and the passage of steam through the stem be prevented, substantially in the manner set forth.

Third, so combining the stem A and stopcock B that the pipe C' may be brought alternately into connection with the openings through the stem on each side of the stopcock, substantially as and for the purpose set forth.

62,104.—L. R. WITHERELL, Galesburg, Ill.—*Elastic Marking Roller*.—February 12, 1867.—A handle, perpendicular to the axis of the marking roller, carries arms which give it journal bearings. The arms of another handle are pivoted to the first-mentioned at right angles, and this latter handle is used to raise or depress the roller.

Claim.—The supplementary bail and handle G h, in combination with the bail and handle D F of an elastic printing cylinder, substantially as and for the purpose set forth.

62,105.—J. YERKES, Fox Chase, Pa.—*Making Hammers*.—February 12, 1867.—The hammer is of malleable iron, and cast with a groove where the separation between the claws is to be made. The claws are split apart by a saw, so as to make the edges well defined and sharp.

Claim.—Constructing claw hammers of cast iron, in the manner described.

62,106.—ANDREW ALBRIGHT, Dryden, N. Y.—*Covering Harness Trimmings with Vulcanized Rubber*.—February 12, 1867.—The buckles and other trimmings of harness are coated with raw rubber, which is then vulcanized.

Claim.—Providing metallic trimmings for carriages and harness with a coating of vulcanized caoutchouc or hard rubber, substantially as and for the purposes herein set forth.

62,107.—SYLVESTER E. AMENT, Oswego, Ill.—*Horse Rake*.—February 19, 1867.—The revolving rake has double runners, the only contact of which with the ground is behind the rake head, so as to throw the points of the teeth near the ground. The rear end of the runner is free, the runner being attached at its front end to the rake head. By means of a weight, duplicate pawls and a spring, all of which are connected with the handle of the rake, the latter is made to revolve to discharge the hay. Draw bars are attached to each end of the rake head by means of bolts, tenon plates, and disk pieces, the latter being so constructed as to prevent the rake head from splitting or wearing.

Claim.—First, the formation of a groove or channel H cut within and around the cylindrical part of the bearing D', when employed substantially as and for the purpose herein set forth.

Second, situating the radial or perpendicular faces W X Y Z within the joint rim or parts E D G, substantially as and for the purpose herein set forth.

Third, putting the stops I and J beneath the tangents of the strap G, or in other words, concealing the same within the handle E, substantially as and for the purpose herein set forth.

Fourth, the employment of duplicate pawls I and J, when adapted to operate relatively to one or more pairs of reversed faces W Y, substantially as and for the purpose herein set forth.

Fifth, the employment of a spring K, inserted through a hole in the handle E, and adapted to serve in combination with the duplicate pawls I and J, substantially as and for the purpose herein set forth.

Sixth, the employment of a cam shaft N, having a cam N' and a hook n upon each end thereof, adapted to operate in combination with the locking devices of a single-handled revolving rake A a E, substantially as and for the purpose herein set forth.

Seventh, the employment of a ball or weight M, adapted to slide or to be dragged upon the earth behind the rake head A, and to serve in combination with the locking devices of a revolving rake A a, substantially as and for the purpose herein set forth.

Eighth, the application of the disk pieces C C to the ends of the shaft A, when constructed and employed substantially as and for the purpose herein set forth.

Ninth, the use of the bearing bolts F F, when constructed and employed substantially as and for the purpose herein set forth.

Tenth, in revolving rakes A a the use of one or more chocks or braces T T, when employed to brace the runner in rear of the rake head, substantially as and for the purpose herein set forth.

Eleventh, the wooden runners T T, provided with braces in rear of the rake head, in combination with a revolving rake A a, in such manner that the only point of contact of said runners with the ground shall

be in rear of the rake head, substantially as and for the purpose herein set forth.

Twelfth, in combination with a single-handled revolving rake A a E, when its locking devices do not depend upon the teeth for resistances, except uniformly upon the whole, through the medium of the shaft A. The employment of two pairs of reversed faces W Y and X Z, when arranged relative to each other, and to pawls I and J, or their equivalents, substantially as and for the purpose herein set forth.

Thirteenth, the use of a check chain or connection M', when employed substantially as and for the purpose herein set forth.

62,108.—WILLIAM R. ANDERSON, New York, N. Y.—*Mucilage and Marking Brush*.—February 19, 1867.—The bristles are held in place on the tube, around which they are arranged by means of a cap. A filter at the end of the tube of communication strains the mucilage, which passes through the hollow brush.

Claim.—The combination of the shield tube d with the cemented surface of the brush tube i, for extending moisture and forming a durable shield fastening, substantially in the manner set forth.

Also, in combination with the reservoir, the filtering plate a a, substantially as set forth.

62,109.—JAMES ARMSTRONG, JR., Elmira, Ill.—*Cultivator*.—February 19, 1867.—Improvement on his patent December 26, 1865. The curved lever is pivoted to the tongue or shovel frame, so as to support it by resting its eccentric surface upon the axle. A latch holds the lever at the required adjustment, which is obtainable, whether the machine be at rest or in motion.

Claim.—First, providing a shovel-carrying frame D, which is pivoted to levers C, so as to operate substantially as described, with an auxiliary adjusting lever G, or its equivalent, whereby the driver can regulate the depth of the shovels at pleasure, whether the machine be in motion or at rest, substantially as set forth.

Second, pivoting a lever G, which has an eccentric bearing g upon one end, to the draft tongue of frame D, and providing such lever with a locking device for holding it in any desired position, substantially as described.

Third, supporting an adjustable shovel-carrying frame D upon the axle A, by means of the levers C and an adjusting device G g f h, substantially as described.

Fourth, the use in a cultivator of an eccentric lever g g, for the purpose described.

62,110.—NICHOLAS A. BUILE, New York, N. Y.—*Grinding or Polishing Implement*.—February 19, 1867.—An equal quantity of blood and linseed oil are mixed with sufficient Paris white to bring the compound to the consistency of sirup. Emery, sand, or rotten stone are added according to the fineness of the grit required, and the whole in a plastic state is molded and baked to hardness.

Claim.—First, the composition above described for making, grinding, or polishing stones, wheels, or other implements, substantially as above set forth.

Second, in grinding or polishing implements of artificial stone, making their different surfaces, or portions of their surfaces, of different degrees of fineness, substantially as described.

62,111.—JOHN W. BURNHAM, Winterport, Me.—*Liniment*.—February 19, 1867.—Composed of one part each of the oils of spruce, hemlock, cedar, origanum, rosemary, juniper, saffras, and rectified amber, and the same proportion of aqua ammonia, sweet oil, tincture arnica, fir balsam, spirits turpentine, laudanum, gum camphor, Turkey gum myrrh, dissolved in eighteen parts of alcohol.

Claim.—The liniment, consisting of the ingredients mentioned, combined substantially as described.

62,112.—L. F. CARTER and W. W. CARTER, Bristol, Conn.—*Clock*.—February 19, 1867.—A rod is secured to the case, and when required is thrust or vibrated into contact with the balance wheel to stop the motion of the clock.

Claim.—The employment of the attachment d in combination with a clock movement, substantially as and for the purpose described.

62,113.—ANTOINE GALY CAZOLAT, Paris, France, assignor to himself and JULES DESPECHER, same place.—*Furnace for Converting Iron into Steel.*—February 19, 1867.—The bed of the reverberating furnace is divided into two parts by a fire brick partition, near the fire bridge of the furnace; the partition has a communicating aperture. The small compartment is charged with pigs of spathic iron, and the large compartment with ordinary cast iron. Both metals being melted, the spathic iron is run into the ordinary iron in proper quantities through the aperture in the partition. The waste heat is used to generate steam in a boiler surrounding the chimney of the furnace, and the boiler is connected with a series of passages opening into the furnace on each side just above the bed.

Claim.—First, the arrangement of parts, as above specified, applied on either side of the furnace for introducing steam into or through the molten metal.

Second, the upper reservoir of cast iron, as above described, for the purpose of restoring to the purified iron the requisite amount of carbon for converting the same into ordinary steel.

Third, the conversion of ordinary steel into homogeneous steel by maintaining the liquid metal in a quiet state of fusion, and at a high temperature, by injecting steam in the chimney.

Fourth, the means indicated of submitting steel cast in molds to high gaseous pressure, whereby the blisters are expelled, and the metal close grained and condensed.

62,114.—Cancelled.

62,115.—JOHN P. COWING, Seneca Falls, N. Y.—*Composition for Roofing.*—February 19, 1867.—A composition of fire clay and coal tar is used for spreading upon felt paper or boards for roofing.

Claim.—The simple compound of ground fire clay, rock, and coal tar, as specified.

62,116.—JACOB CREAMER, Jeffersonville, Ohio.—*Mole Plow.*—February 19, 1867.—A portable capstan for mole plows. The frame is supported on bent axles, which by rotation swing it clear of the ground for transportation, or allow it to rest on the ground when in operation; in the latter position the rearwardly inclined anchor bars penetrate the soil. The sweep rests in the crotch of the "horse" when not in use.

Claim.—First, the combination of the rectangular frame A, bent axles B B', and hinged retaining bars i and k, the said parts being respectively constructed and arranged for use substantially in the manner and for the purpose set forth.

Second, the arrangement of the swinging frame A, capstan b'', capstan head b'', parallel bars c, chains e, lever d and "horse" f, substantially as set forth.

62,117.—A. M. CULVER, Bedford, Ohio.—*Lifting Jack.*—February 19, 1867.—In the lever are pivoted two pairs of feet, and the pivotal points of the latter become the alternate fulcrums as the lever is reciprocated. The load is raised by successive movements, the free feet advancing toward each other in the intervals of their duty as fulcrums.

Claim.—The arrangement of the legs B B', pivoted to and in combination with the lever A, in the manner and for the purpose described.

62,118.—R. O. DOREMUS, New York, N. Y.—*Extinguishing Fires.*—February 19, 1867; antedated February 6, 1867.—The liquid or solid gases are contained in a strong vessel, which is placed in the hold of a vessel or communicates by tubes with different parts of the ship or building, so as to be liberated for the extinguishment of fire.

Claim.—The within described method of extinguishing fires by means of sulphurous acid, ammonia or carbonic acid in a liquid or solid state, substantially as set forth.

62,119.—A. E. DOTY, Iliou, N. Y., assignor to J. I. NEW and C. H. DOTY.—*Sleigh.*—February 19, 1867.—Knees are dispensed with, and the runners, which have a bowed shape, are curved upward fore and aft, and then inward to be attached to the benches. Braces from beneath the benches are planted in the middle of the bows.

Claim.—First, a metallic runner, curved and attached to the beam, as seen in Fig. 1.

Second, the compound ox-bow brace, as seen in Figs. 1 and 2.

62,120.—SMITH DYAR, Charlestown, Mass.—*Prepared Leather.*—February 19, 1867.—The surface of the skin is filled with a composition, which will receive a frictional polish. Before undergoing the latter process the surface is printed in design, and is then polished by a burnishing tool.

Claim.—As a new article of manufacture, skins prepared, printed, and polished, substantially as set forth.

62,121.—BELDEN R. EATON, Clifton, Wis.—*Churn.*—February 19, 1867.—The crank attached to the dasher shaft receives a reciprocating motion from the rotation of the handle crank, and two upward and two downward motions are produced by each revolution of the latter.

Claim.—The combination of the two levers g and i, so constructed and arranged on the shaft h that two motions or strokes are produced upon the dash k and l at one revolution of the handle e, all of which will more fully appear and as shown in the drawing aforesaid.

62,122.—NATHANIEL T. EDSON, New Orleans, La.—*Washing Machine.*—February 19, 1867.—The rollers on the periphery of the segment reciprocate against the other rollers, which form a concave suspended by elastic cords, and limited in its expansion by non-elastic cords. A spring connects the axis of the rubber with the side of the box, and assists the return motion.

Claim.—First, the combination of the apron with the rubber and with the segments l and guides e, in the manner and for the purposes substantially as specified.

Second, the combination of the elastic and non-elastic bands b b and c e, substantially as and for the purposes specified.

Third, the springs k, in combination with the rubber B and apron A, for the purposes specified.

Fourth, the manner of hinging and fastening the revolving roller h, in combination with the rubber and the apron.

Fifth, the strips or bands of elastic or non-elastic materials d d, in combination with the apron and with the segments l and guides e e, for the purposes specified.

62,123.—JOHN EGLIN, Manchester, England, assignor to THOMAS ALDRIDGE WESTON.—*Drift.*—February 19, 1867.—The spiral, inclined grooves twist in opposite directions and cut the surface of the tool into diamond shapes.

Claim.—Forming the cutting edges of a series of double-edged diamond cutters by the intersection of two series of spirally inclined grooves in opposite directions, substantially as and for the purposes set forth.

62,124.—G. R. FORSYTH, Pemberton, Ohio, assignor to himself and NICHOLAS LOVET, same place.—*Churn Dasher.*—February 19, 1867.—The square dashers present their edges to the cream when revolved, and drive it upward and downward, the square edges of the shaft assisting the operation.

Claim.—A revolving churn dasher, constructed, arranged and operating substantially as described.

62,125.—SAMUEL GARDINER, JR., New York, N. Y.—*Apparatus for Lighting Gas by Electricity.*—February 19, 1867.—The reciprocating bar has spring keys so spaced in reference to the distance between the burners that by moving the bar they are consecutively brought into connection, each with its own burner, and not simultaneously. By this means the electric current from a small battery is made to light a large number of burners, consecutively but rapidly.

Claim.—First, the arrangement upon a bar of a series of keys so spaced in reference to the burners as to be consecutively brought into electric connection therewith by a single impulse, substantially as described.

Second a sliding bar with an insulating support,

and furnished with keys adapted to a series of gas burners, for the purpose described.

62,126.—CYRUS F. GILLETTE, Sparta, Wis.—*Axle Box for Vehicles.*—February 19, 1867.—The bearing sections are cast in position in the box, and sustained by flanges on the box and studs which enter recesses in the box.

Claim.—First, a cylindrical or conical carriage axle-box cast in one piece, with flanges *a* and *a'* at each of its ends, and with separated Babbett or other soft metal bearing surfaces *b b* cast between said flanges, all substantially in the manner described.

Second, holding the cast soft metal in its proper position by the combined agency of the flanges *a* and *a'* and the sprue lugs which fill the sprue holes *e e*, substantially in the manner described.

62,127.—ABRAHAM GREGG, Forest City, Cal.—*Railway Car.*—February 19, 1867.—A central wheel receives the pressure of the brake, causing the stoppage of the car. This wheel is divided, each half being attached to the inner end of the axle, and forms an axle coupling as well as brake, which clasps both sides of the wheel.

Claim.—First, the method of attachment of the extreme ends of the trucks to the car by king bolts *g'*, so that the brakes can be worked in the center of each shaft; also, the combination and arrangement of the box coupling *D* to the center of the axle, so as to insure the two-fold purpose of a brake wheel and coupling.

Second, the combination and arrangement of the double-acting brake *E E*, with springs *F* and levers *I H* and *K*, so that it will clasp both sides of the wheel at the same time with equal pressure.

Third, the two bearings *a a*, to each section of the axle, to prevent binding in the coupling box, likewise placing the springs *f f* between the trucks, and platform, and carriage, so that each shaft will have bearings near its center.

Fourth, the cross tongue *h* attached to street cars, when operating in parallel slots *i i*, so that when the car passes a curve the outer end of the cross will move back in the slot, bringing the draft on the outer end of said cross or tongue, substantially as described and for the purpose set forth.

62,128.—JULIUS HACKERT, New York, N. Y.—*Artificial Ivory.*—February 19, 1867.—Chloride of zinc, prepared by dissolving 1 part zinc in 3 parts of muriatic acid, is mixed with $1\frac{1}{2}$ times its weight of lime. $4\frac{1}{2}$ parts of the above are mixed with 4 parts of oxide of zinc or lead, to which powdered glass may be added if extra hardness is required.

Claim.—First, the combination of chloride of zinc and lime with oxide of zinc or other metallic oxide, substantially as above set forth, for producing artificial ivory.

Second, the combination of chloride of zinc and lime with oxide of zinc, or other metallic oxide, and pulverized glass, or its equivalent, substantially as and for the purpose above set forth.

62,129.—BENJAMIN HANDFORTH, Chicago, Ill.—*Churn.*—February 19, 1867; antedated February 3, 1867.—The sliding sleeve upon the upper end of the tubular handle, and by which it is operated, upon being raised exposes the side openings for the admission of air into the handle which passes into the recess beneath the dasher. On the return movement the sleeve covers the side openings, and the air is forced through the valves in the dasher.

Claim.—First, the combination of the hollow handle *C*, provided with an opening or openings *c*, and the sliding sleeve *H*, arranged and operating substantially as and for the purposes set forth.

Second, the combination and arrangement of the hollow handle *C*, provided with openings *c*, the sleeve *H* and valve dasher *d d*, operating substantially as described and for the purposes specified.

62,130.—HENRY HANNEN, Philadelphia, Pa., assignor to SAMUEL W. GREENE and S. A. HANNEN, same place.—*Manufacture of Carbonate of Lead.*—February 19, 1867.—A mass of ordinary white lead is placed in a tank, mixed with water, and heated to about 130° F. A stream of carbonic acid gas is then passed through it by pipes.

Claim.—The manufacture of a pure carbonate of lead by subjecting a mass of white lead, (containing the oxide or the acetate of lead,) mixed with water and heated, by the action of carbonic acid gas.

62,131.—JAMES W. HARPER, Xenia, Ohio.—*Instrument for Digging Post Holes.*—February 19, 1867.

—The lower end of the shank is forked, and each horn has a plate riveted to it whose sides are bent round nearly rectangularly to meet those of the fellow plate. In use the spade is inserted into the ground or the earth brought from the hole between the two wings.

Claim.—The spring blades *C C*, of rectangular form and construction and entirely separated, on opposite sides, so that they may be sprung apart or away from each other, substantially as and for the purpose herein specified.

62,132.—JOHN K. HARRIS, Madison, Ind.—*Apparatus for Unhitching Horses from Vehicles.*—February 19, 1867.—The operative parts of the harness center in frames which have pins held by devices upon the shafts. In the said devices an oscillatable block is released by the retraction of a spring catch, which frees the said pin and releases the horse.

Claim.—First, the provision upon each shaft of a carriage of a vibrating hook *J*, adapted to receive and hold a tongue *E* upon the harness and to be released by the driver, through the instrumentality of a strap *U*, and its described or equivalent accessories, substantially as set forth.

Second, the releasable hitching lock, consisting essentially of the vibrating hook *J*, sliding bolt *N*, and springs *O* and *P*, the same being placed under control of the driver by the strap *U* and its accessories, as set forth.

62,133.—WILLIAM H. HART, Medfield, Mass.—*Ice-Water Receptacle.*—February 19, 1867.—A revolving annular disk around the stem of the urn for holding drinking vessels.

Claim.—The above-described ice-water receptacle, consisting of the urn *A* and the revolving disk or plate *c*, for holding drinking utensils, substantially in the manner and for the purpose as above described.

62,134.—HIRAM HERRICK, Boston, Mass.—*Piano-forte Action.*—February 19, 1867.—A pivoted lever upon the key has a vertical wire connected by a string to the pivot block of the hammer. The lever end rests against an adjustable padded button, by which its movement is regulated.

Claim.—The combination of the arm *D* and its connecting cord *b*, or the equivalent or equivalents thereof, with the piano-forte action, consisting principally of the key *A*, hammer *B*, and jack or fly *C*, as described.

Also, the combination as well as the arrangement of the lever *E* and the adjustable stop *e*, or the equivalent thereof, with the arm *D* and its connection cord *b*, combined with the piano action as described.

62,135.—G. H. HOWARD, South Braintree, Mass.—*Cap for Coffin Screws.*—February 19, 1867.—The cap has a notch upon its edge which receives the catch on the base piece.

Claim.—An improved arrangement of the latching devices *c d* of the coffin screw, cap cover and base, with respect to such cover and base, substantially as described, viz: so that the cover by its inherent diametric elasticity may be caused to operate as a spring to connect or engage the latching devices together and keep one of them in connection or engagement with the other, or prevent their accidental disengagement, as specified.

62,136.—S. E. JAMES, Smithfield Station, Ohio.—*Gate Fastening.*—February 19, 1867.—The interdental cavities of a free spur wheel upon the post receive a fixed latch pin upon the gate, which by the turning of the wheel is carried up under a plate that prevents its elevation from the cavity. A pawl acts on the cogs to prevent back rotation of the wheel.

Claim.—First, the combination of the pin or latch *c*, the toothed support *C*, and retaining device *b*, substantially as described and for the purpose set forth.

Second, the block *d*, arranged over the toothed

wheel C, substantially as and for the purposes described.

62,137.—JOHN JOHNSON, Saco, Me.—*Pipe Tonge*.—February 19, 1867.—The eccentric is adjustable in one cheek of the tongs so as to render the same applicable to various sized pipe by varying the position of the eccentric around the pivot attached to the other cheek.

Claim.—The combination and arrangement of the eccentric *a*, set into one of the arms of gas pipe tongs, with *c*, spring *d*, and the bolt *b*, operating as and for the purpose set forth.

62,138.—W. J. JOHNSON, Newton, Mass., assignor to himself and H. A. HILDRETH, Lowell, Mass.—*Carpet Stretcher*.—February 19, 1867.—The head of the tack is placed against the end of a bar within a cylinder attached perpendicularly to the stretcher plate. This bar is driven down by a hammer and withdrawn by a spring.

Claim.—First, a carpet stretcher with a piston, or its equivalent, magnetically charged, for the purpose substantially as described.

Second, a carpet-stretching device, in combination with a magnetic tack-driving arrangement, for the purpose substantially as described.

62,139.—ARTHUR KNOWLES, JAMES KNOWLES, and JOSHUA BARRACLOUGH, Bristol, England.—*Apparatus for Extracting Wool from Mixed Articles and Furbies*.—February 19, 1867.—The material, after it has been steeped in acid in the usual manner, is placed in a slowly revolving wire cylinder over a fire. A series of back-turned spikes within the cylinder prevent the material from entangling. In order to prevent the heat from injuring the wool, water or steam is injected into the cylinder.

Claim.—The means or apparatus shown and described, for the purpose of extracting wool from cotton and other vegetable substances contained in mixed fabrics.

62,140.—CHARLES W. LAWRENCE, Milton, Ind.—*Spring Hinge*.—February 19, 1867.—Explained by the claims and illustration.

Claim.—First, the combination, with the leaves of a hinge of otherwise ordinary or suitable construction, of one or more compression springs placed at right angles and transversely to such leaves, and connected by a flexible and elastic steel or brass band, under the arrangement and for operation as herein shown and described.

Second, the combination of the tubular sheath or sheaths and the spiral spring with the elastic and flexible rod or band, substantially as shown and set forth.

62,141.—J. J. E. LENOIR, Paris, France.—*Telegraphing Apparatus*.—February 19, 1867.—The apparatus consists of a despatching instrument and a receiver at the respective ends of the line. The message is written with a non-conducting ink on a sheet of foil, which is then lapped around the roller, and a sheet of white paper is wrapped on the receiving roller and covered by a sheet of transfer paper. The electric circuit being established, so long as the point of the lever of the despatcher is in contact with the metallic surface of the paper, the armature of the receiver is attracted by its magnet, and the stylus of the receiver elevated. When the stylus of the despatcher crosses the non-conducting ink the circuit is broken, the stylus of the receiver drops upon the transfer paper and imprints a mark upon the paper beneath.

Claim.—First, the revolving rollers H and H', in combination with the revolving screws F F', traversing frames I I', their magnets K K', levers J J', and armatures *e e*', the whole being constructed, arranged, and operating as described.

Second, the shafts G G' and the rollers H H', screws F F', frames I I', magnets K K', and levers J J', in combination with the trains of wheels E E, or the equivalent to the same, the whole being arranged and operating substantially as and for the purpose set forth.

Third, a sheet of transfer paper and a sheet of plain paper, combined with the roller H, and arranged to

be operated on substantially as and for the purpose specified.

Fourth, the combination of a receiving roller or holder H', having an inked surface, a lever or pencil J' and a sheet of transparent paper, or its equivalent, for the purpose described.

Fifth, the magnets O O', connected electrically with each other and the arms *l l*, in combination with two instruments, A B, when the latter are constructed and operate together as described.

Sixth, the shaft L with its disk N, and the shaft L' with its arms *q q*, in combination with the driving mechanism of two instruments, A and B, and with the arm *j* and the electro-magnet P, the whole being constructed and operating substantially as and for the purpose set forth.

62,142.—HENRY C. LULL, Montpelier, Vt.—*Machine for Scouring Marble*.—February 19, 1867.—The metallic block has a handle by which it is moved backward and forward over the marble floor to be scoured. Sand is carried in the recessed top which has holes communicating with the lower face. A box on the handle contains water, which is supplied to the working face through a nose and a perforated funnel.

Claim.—In the said marble scourer, the combination of the handle, the troughed block, and the water vessel, constructed, arranged, and applied together substantially in manner and so as to operate as specified.

Also, the combination, as well as the arrangement, of the perforated tunnel with the troughed block, the handle, and the water vessel, constructed, arranged, and applied together substantially in manner and so as to operate as specified.

62,143.—GEORGE F. LYNCH, Milwaukee, Wis.—*Railroad Box and Journal*.—February 19, 1867; antedated February 4, 1867.—The conical axle end revolves upon surrounding anti-friction rollers, which are kept in place by revolvable rings occupying annular grooves in the box.

Claim.—Combining, with a box or bearing for an axle or journal, a series of rollers or rings, not positively fastened to each other or to the box or bearing, but so controlled as to be kept in proper working position, and free to move with or independent of each other, and with or independent of the journal or shaft, substantially as and for the purpose set forth.

62,144.—G. B. MASSEY, New York, N. Y.—*Leakage Alarm for Vessels*.—February 19, 1867; Improvement on his patent August 11, 1857.—The water rising in the hold elevates the float, permitting the spring drum to revolve and wind up the chain. This rings the alarm bell, and moves the index which signifies the depth. As the water falls the float winds the spring.

Claim.—First, the drum D, having the plate G attached thereto by the pins *c*, or an equivalent device, in combination with the jointed arm E of the hammer, when arranged to operate as and for the purpose set forth.

Second, the combination of the drum D, having the plate G and pinion *u* attached, with the wheel H, index *h*, and dial I, the drum being operated by the rising and falling of the float F, as shown and described.

62,145.—THEODORE McPHERSON, Burlington, N. J., assignor to JOHN McPHERSON, same place.—*Fastening for Carriage Curtains*.—February 19, 1867.—The projection upon the sleeve of the screw Shank passes through a gain in the curtain plate, so that a turn of 90° or less fastens it.

Claim.—The combination of the screw, revolving barrel, and flange, as represented in Fig. 3, when the same are arranged and operate substantially as described for the purpose specified.

62,146.—F. MICHAEL, Gratis, Ohio.—*Apparatus for Granulating Sugar*.—February 19, 1867.—A series of troughs surround the inner walls of a granulating room, through which the heated sirup is allowed to flow slowly. The temperature of the room is raised to a proper degree, and the sirup flows from trough to trough in the descending series.

Claim.—The conduits *f c h L K d*, and trough *m*,

Claim.—The swinging frame C C in combination with the standards A A and supporting bars B B, when constructed and operating as and for the purpose set forth.

62,160.—HENRY M. STOW, San Francisco, Cal.—*Rock Chamber Drill.*—February 19, 1867.—The chisels are pivoted at their upper ends in the lower end of the handle. The handle has a slot for the guide pin which connects the upper ends of the side guides. At the lower ends these guides have a wedge piece to spread the chisels in their downward movement. The handle can be so turned on the side guides as to expose the chisels for removal.

Claim.—The chisels B connected with handle C, in the manner described and for the purpose specified.

62,161.—JAMES B. STUART, Bunker Hill, Ill.—*Metallic Hub for Wheels of Vehicles.*—February 19, 1867.—One of the circumferentially projecting flanges is cast upon the hub and has radial side projections whose outer ends are so enlarged as to form concave sided recesses for the reception of the spokes. These recesses enlarge from the disk to allow of the compression of the spokes on insertion. The spokes are held in place by a loose disk held to the former disk by screw bolts.

Claim.—A metallic hub for the wheels of vehicles, cast with a collar B having lateral flanges or projections a, of the form shown and described, so that the spaces between the flanges which receive the spokes will be of wedge or taper form longitudinally, or in a direction parallel with the hub and of double taper form in a radial direction, in combination with a loose collar C fitted on the hub and secured to the fixed collar B by bolts, substantially as and for the purpose herein set forth.

62,162.—J. W. SUMMERS, Sandy Hill, N. Y.—*Steam Generator.*—February 19, 1867.—The generator is of a conical form with the apex turned down. The part near the fire is of increased thickness. The water supply pipe has an air chamber and loaded escape valves, so that when the pressure of steam is below the point desired the water will be forced into the boiler, but when raised above that point will be thrown back on the valves and escape thereby. The water enters the generator under a spring valve, by which it is spread out for quick conversion to steam.

Claim.—First, the generator H, when constructed as and for the purpose herein described.

Second, the air chamber D, for the purpose of governing and controlling the pressure of steam in the generator, as and for the purpose set forth.

Third, the valve I for the purpose of dispersing the water, in the manner and for the purpose specified.

Fourth, the combination of the valves L K and O, the air chamber D, and generator H, the whole constructed, arranged, and operating as and for the purpose herein set forth.

62,163.—JOHN RUSSELL SWANN, Edinburgh, Scotland.—*Safety Valve.*—February 19, 1867.—The end of the lever is pivoted in a spring stem, and a rest is placed under the lever between the valve and weight, so that an increase of the weight will raise the pivoted end and cause an escape of steam. These devices are contained in a drum, so as to be out of reach of the engineer.

Claim.—The combination and arrangement of the spring k and stud k with the lever d, fulcrum g, and its stem g', substantially as described.

62,164.—WM. A. TORREY, Mont Clair, N. J.—*Manufacture of Elastic Rolls.*—February 19, 1867.—The rollers are formed of two different vulcanizable gums, such as india-rubber and gutta percha. The gutta percha is secured to the shaft in the ordinary manner and the rubber placed around it. The gums are then vulcanized in the ordinary manner.

Claim.—Securing rollers constructed of india-rubber and other vulcanized elastic gums to shafts or spindles by the use and application of the compounds and cement, substantially as and for the purposes set forth.

62,165.—GEO. E. VAN DERBURGH, New York, N. Y.—*Composition for Artificial Stone.*—February 19, 1867; antedated February 14, 1867.—Sand or other

silicious matter is combined with fluid, semi-fluid, or gelatinous silicate of lime, and the mass molded into proper form, after which it is allowed to harden.

Claim.—An artificial stone or composition for various useful and ornamental purposes, formed of siliceous matter in combination with silicate of lime, with or without other ingredients, when produced before the composition has been molded or allowed to dry and harden, substantially in the manner herein set forth.

Also, the production of silicate of lime in combination with siliceous matter, by excluding atmospheric air from a formed or molded mass, block or device composed of caustic lime and sand, with or without other ingredients, and subjecting the same to moisture with or without heat, substantially in the manner and for the purpose herein set forth.

Also, the application of steam to a composition containing siliceous materials and lime, in any form or in any proportions, for the purpose of producing an artificial stone, substantially as herein set forth.

62,166.—GEO. E. VAN DERBURGH, New York, N. Y.—*Artificial Stone for Building.*—February 19, 1867; antedated February 14, 1867.—Caustic lime is mixed with moist sand in an air-tight vessel in the proportion of one part of lime to eight parts of sand. The mixture is protected from the atmosphere until the lime is partially converted into silicate of lime. The mixture is then formed into blocks and exposed to the atmosphere, by means of which the remaining lime is converted into carbonate.

Claim.—A finished block or stone of any desired form for building or ornamental purposes, produced substantially in the manner herein set forth.

62,167.—ISAAC VAN HAGEN, Chicago, Ill.—*Foot Rest.*—February 19, 1867.—The post rests on the bottom of the tub and is hooked to its margin. It forms a support for the foot while washing.

Claim.—A foot rest, constructed substantially as and for the purpose described and set forth.

62,168.—RICHARD WALKER, Milford, Mass.—*Let-off Motion for Looms.*—February 19, 1867.—The warp on the yarn beam is let off when at a proper tension by means of a positive motion imparted by the backward motion of the lay. A sliding bar is provided with two pawls, one fixed to it and the other vibrating on it at its opposite end, and so arranged that one pawl will hold a ratchet wheel which is placed between the two while the other is passing over a tooth of the ratchet, the pawls acting alternately. On the shaft that carries the ratchet is a pinion that engages with a gear wheel on the yarn beam.

Claim.—First, a let-off motion in looms, effected by means of a horizontal sliding bar R provided with pawls, as described, in connection with a ratchet wheel P, the said sliding bar being operated by the hammer u on the lay, which in its backward movement strikes the horizontal intermediate bar M.

Second, the combination of the pivoted pressure bar C, located as described, with a series of adjustable levers and rods in such a manner that the tension of the warp upon the pressure bar will cause a bar M to be brought in a position to be operated by the backward movement of the lay, and thus operate the escapement slide H, substantially as described.

Third, regulating the degree of tension which will determine the position of the bar M by means of the series of adjustable bars, levers, and rods operated by the pressure bar C located below the warp, substantially as described.

62,169.—THOS. C. WALTER, San Francisco, Cal.—*Cooking Range.*—February 19, 1867.—The ovens in vertical series and the oven at the side are heated by the caloric current in or around them, the dampers regulating the course as may be necessary for the purpose. Dampers in the ash pit regulate the access of air.

Claim.—First, the furnace A and the ovens D and E, with the flues K F f and h, with their regulating dampers, constructed as described for the purpose set forth.

Second, the compartment C in combination with the furnace A, arranged as described.

Third, the register N with the damper m and the damper B combined with the furnace A, as described.

Fourth, the arrangement of the furnace A with the damper B and the register N, the ovens D and E with their flues and compartment C, all operating together, substantially as and for the purpose set forth.

62,170.—BENJAMIN R. WATSON, New Bedford, Mass.—*Horseshoe*.—February 19, 1867.—The dovetail tenon is entered at the wider part of the mortise and jammed by a screw into the narrower part.

Claim.—Securing calks in metallic shoes by fitting them with tapering dovetail tenons to tapering dovetail mortises cut through the shoes and tightening them by screws, or their equivalents, as set forth and described.

62,171.—WILLIAM J. WAUCHOPE, Brookfield, Ill.—*Ditching and Grading Machine*.—February 19, 1867.—For grading roads by removing earth from the gutters and depositing it on the track. The plow raises the earth, which is received upon transversely traveling belts, by which it is carried and deposited. The lower end of the belt is vertically adjustable by a winch, and the motion is derived from the ground wheels. The plow also has a vertical adjustability.

Claim.—First, supporting one end of the transversely-arranged endless conveyor G upon a roller, arranged in the main frame of the machine, and the other end upon a roller having a vertically-adjustable supporting frame independent of the main frame, arranged and operating as and for the purposes specified.

Second, the arrangement of the longitudinally-adjustable beveled bars J within the endless apron G, and with the roller I, operating as and for the purposes set forth.

Third, the combination and arrangement of the plow S, the transverse conveyor G, stationary roller H, adjustable roller I, bars J, and rollers K, operating as and for the purposes described.

62,172.—JOSEPH DAVID WESTGATE, San Francisco, Cal.—*Sad-iron Heating Apparatus*.—February 19, 1867.—The face of the smoothing iron rests upon a plate above the fire chamber of the stove; a cap on the iron retains the heat.

Claim.—An ironing apparatus consisting of the sad-iron B and stove A, constructed as herein described, lined with non-conducting material, substantially as and for the purpose set forth.

62,173.—THOMAS WESTLEY and THOMAS RICHARD BEAUMONT, Preston, England.—*Spinning Flyer*.—February 19, 1867.—The flyer has solid legs, and at about the top of the straight part of each is a collar supporting a bearing capable of revolving around the leg. The bearing carries the upper part of a split tube, and its motion around the leg of a flyer is limited by a notch in the bearing working against a projection on the collar.

Claim.—Attaching split tubes to the legs and presser-arms of solid leg flyers, substantially in the manner and for the purposes hereinbefore set forth.

62,174.—LORIN WETHERELL, Boston, Mass., assignor to himself and JOHN H. WELLS.—*Dies*.—February 19, 1867.—The upper and lower dies have grooves formed of the shape of the article to be produced, and are so constructed that the article being hammered can be turned around and the surplus metal forced into a bulge made for the purpose in the dies; this surplus gradually disappears in the operation instead of appearing as a "flash" which has to be afterward trimmed off.

Claim.—The use in the trip hammer of dies constructed as described for the purpose of forging articles of the description specified.

62,175.—ELI ZIMMERMAN, Pamela Four Corners, N. Y.—*Lifting Jack*.—February 19, 1867.—The lever is linked to the stand and its inner end acts upon the notches of the sliding ratchet bar, the position of the latter, during the intervals of the impulses, being retained by a pawl.

Claim.—First, in a jack for raising fences and for other purposes, the swinging lifting hook arranged so as to be adjusted to different heights on and relatively to the sliding bar by which it is actuated, substantially as set forth.

Second, the combination with the sliding ratchet bar, the actuating lever, and the spring latch and pawl

of a slotted lifting hook suspended from said bar and adjustable thereon, substantially as shown and described.

62,176.—W. M. BAKER, Fortville, Ind.—*Table, Cupboard, and Clothes Rack*.—February 19, 1867.—The table is arranged as cupboard, beneath has a rack for clothes, one for tin ware, a rolling board, and drawers and trays for various purposes.

Claim.—First, a combined table, cupboard, and clothes rack or frame, substantially as and for the purpose described.

Second, in combination with the above the rack or frame N, for tins, rolling board P, and tray O, when arranged together and within the body of the table, substantially as described.

62,177.—JOHN BALMORE, New York, N. Y.—*Pipe Cutter*.—February 19, 1867.—The movable jaw is hinged to a nut which traverses the threaded shank and operates in opposition, either to the socket end of the shank or to a cutter inserted therein.

Claim.—The cutter D and groove *d*, in combination with the shank C, nut B, and hook A, constructed, arranged, and operating substantially as described and for the purposes set forth.

62,178.—P. M. C. BÉZIEL, Paris, France.—*Forming the Parts, Links, &c., of Chains, Bracelets, &c.*—February 19, 1867.—A design is engraved in two hollow corresponding dies whose edges are shaped to cut out the margin and openings. A sheet of malleable metal, soluble in acid, is placed between two sheets of gold and the pack swaged between the dies. The baser metal is removed by acid.

Claim.—The method, substantially as herein set forth, of forming links, leaves, or other similar articles of gold or silver for ornamental or useful purposes.

62,179.—D. O. BLAIR, Abington, Ill.—*Churn*.—February 19, 1867.—The dashers receive a rotary reciprocation from a cord wound around an enlargement on the dasher shaft and alternately pulled in either direction by an oscillating lever to which it is attached on opposite sides of the center of vibration.

Claim.—First, the combination of the lever E, cord c, pulleys *d*, socket drum C, and dasher shaft B, with each other and with the frame D, constructed as shown, and operating substantially in the manner herein set forth.

Second, in combination with the above the vertical dashers F, beveled toward their outer ends, for the purpose described, substantially as specified.

62,180.—DANIEL CAMPBELL, Elizabeth, N. J., assignor to HENRY SKYMOUR, New York, N. Y.—*Pruning Shears*.—February 19, 1867.—The curved shank of the knife moves in guides which give it a draw cut while the blade advances upon the stationary knife. The motion is given by a draw rod operated by toggle lever and pivoted handles.

Claim.—First, the combination of the curved shank *c* of the movable blade C with the grooved plate *f* and stationary blade A, substantially as and for the purpose herein shown and described.

Second, the application to pruning shears of the double set of toggle levers D and arms *d*, made and operating substantially as herein shown and described.

62,181.—MOSES CHANDLER, Corinth, Me., and JOHN B. NICKLES, Kenduskeag, Me., assignors to V. S. PALMER and J. B. NICKLES.—*Horse Hoe*.—February 19, 1867.—The frame has two slotted, transverse bars to which the winged shares are adjustably attached so as to regulate their obliquity to the line of draft. Their vertical obliquity is regulated by a toothed clutch connection to the standards. Adjustable toothed terminal blades on the inward ends of the shares operate in the immediate vicinity of the plants in the row.

Claim.—First, adjustably attaching the wings or blades H, when formed as described, to the uprights G, substantially as and for the purpose set forth.

Second, the combination of teeth or cogs with the blades H and uprights G, substantially as herein shown and described, and for the purpose set forth.

Third, the combination of the pivoted rake heads K with the blades or wings H, substantially as herein shown and described, and for the purpose set forth.

Fourth, securing the uprights G to the caps C and to the slotted cross bar B by means of angular bolts E and steady pins I, substantially as herein shown and described.

Fifth, the combination of the stay braces J with the uprights G and adjustable caps C, substantially as herein shown and described.

Sixth, the combination of the adjustable slotted caps C and slotted cross-bars B, having bands D around their slotted ends, with each other and with the draft beam A, substantially as herein shown and described.

62,182.—O. O. CHAPMAN, Seneca, Wis.—*Wheelwrights' Machine.*—February 19, 1867.—For boring the hubs and fellos and tenoning the spokes. The adjustable head block carries and revolves the auger. The stuff is held in place and fed to the operating tool by a spring clamp and sliding carriage.

Claim.—The head block G, bearing the wheel H, pinion I, movable table C, lever T, treadle Q, rod P and lever N, when constructed, arranged, and operating substantially as herein set forth.

62,183.—H. M. CLIFFORD, Philadelphia, Pa.—*Stove Pipe Joint.*—February 19, 1867.—The adjacent ends of the sections of pipe have outward-turned flanges, which are embraced by a grooved band fastened by set screws.

Claim.—The band b, constructed and applied substantially as described for the purposes herein set forth.

Also, the lip or flange a on the end of the pipe, in combination with the band b, as and for the purposes specified.

62,184.—WESLEY A. COE, Greensboro', N. C.—*Apple Parer, Corer and Cutter.*—February 19, 1867.—The apple is impaled on the fork, and the paring removed by the knife during the rotation of the fruit. A lever then simultaneously advances the ring on the fork and the cutting and coring tool: the circular edge of the latter cuts out the core, which is received in the cylinder, and the radial flanges divide the peeled apple, the ring forcing the core from the fork.

Claim.—First, the tubular bar C, having its opening continuous throughout for cutting out the core and discharging it beyond the working parts of the device, in combination with the shaft M, cross-bar N and bar D, in the manner represented and described.

Second, the sliding bar D, provided with the bar L, in which is the ring i, substantially as shown and described.

Third, the shaft M and cross-bar N, in combination with the bars C and D, for the purposes as shown and described.

62,185.—J. W. CONNELLY, Charleston, Ill.—*Cultivator.*—February 19, 1867.—The two forward plow beams are pivoted to arms, which descend obliquely rearward from the forward transverse bar of the frame. The standards of the rear outside plows are pivoted to the frame and suspended by chains. The frame is supported on wheels, and the plows are all vertically adjusted by a single lever and branching connecting chains.

Claim.—First, the machine, in combination with a cultivator of the several parts as arranged and described.

Second, the arms O O, made either of wood or iron, and manner and place of attachment to bar or double tree on forward end of hounds of frame, as described and shown.

Third, the flexible connecting beams F F, with arms O O, either by bolts, pins or clevis, as shown and described.

Fourth, the bar B, arms O O, beams F F and stocks T T, as constructed and shown and described.

62,186.—E. H. CRAIGE, Brooklyn, N. Y.—*Work-supporting Plate of Sewing Machines.*—February 19, 1867.—Explained by the claims and illustration.

Claim.—First, a cloth plate of the Wheeler & Wilson sewing machine, constructed in three or more parts, the parts to be removed being tongued and grooved, substantially as and for the purpose set forth.

Second, the throat piece f, constructed as described, so as to be inserted in the cloth plate in the direction

in which the fabric is fed, substantially as and for the purpose described.

Third, holding the throat piece f in place by the movable part b of the cloth plate, substantially as and for the purpose set forth.

62,187.—HENRY G. DAYTON, Maysville, Ky.—*Refrigerator and Water Cooler.*—February 19, 1867.—As the water is drawn from the cooler an equal quantity is admitted into the latter from the outer reservoir by the double cock, which operates in each pipe.

Claim.—First, the combination with a water cooler A and reservoir or supply chamber F of the double cock D' G', or its equivalent, substantially as and for the purpose specified.

Second, the perforated pan E, arranged and employed in combination with the pipes G and D, in the manner and for the purpose set forth.

62,188.—H. FASSMANN, New Orleans, La.—*Cotton Bale Tie.*—February 19, 1867.—Explained by the claim.

Claim.—The plate a having a slot or opening b provided with serrated or toothed sides to receive the end C of the hoop, and prevent the slipping or withdrawing of C from b, substantially as shown and described.

62,189.—DAVID F. FETTER, New York, N. Y.—*Bushing for Barrels.*—February 19, 1867.—The bushing forms a lining for the bung hole, and prevents the wear of the staves. It is secured by barbed creases on the outer periphery of the bush, which catch upon the wood. The peripheral plate may be fastened by screws.

Claim.—The bush constructed with the angular ridges presenting an inclined or wedged-shape surface to the wood, while the bush is being driven into place, and a flat surface opposed to the wood when a power is exerted to withdraw the bush, substantially as described and represented.

62,190.—FRIEDRICH FISCHER, Garabaldi, Iowa.—*Rotary Steam Engine.*—February 19, 1867.—The annular cylinder has a piston, whose advancing conical end separates the halves of the abutment, which close behind it, the inclined planes in the rear of the piston preventing slapping shut. Steam is excluded during the passage of the abutment. The hinged end of the valve stem can be vibrated out of contact with the cam and the valve dropped, shutting off steam, or turned back, taking on steam and starting the engine.

Claim.—First, the abutment H H, which opens from the middle, in combination with the toe i on the advancing end of the piston B, constructed and operating substantially as and for the purpose described.

Second, the inclined planes k on the piston head, in combination with the abutment H H, opening from the middle, substantially as and for the purpose set forth.

Third, the hinged or jointed valve stem N, cam M, and starting bar O, in combination with the piston valve I, abutment H H, piston B, and cylinder A, constructed and operating substantially as and for purpose described.

62,191.—CHARLES FLESCHE, Rochester, N. Y.—*Permutation Lock.*—February 19, 1867.—The stem of the bolt, which is thrown in or out to lock, or not to lock or unlock the door, is engaged by a pair of pivoted jaws, whose retraction is governed by the coincidence of the projection on the dog plate with the depression in the head. The dog plate falls to allow the dog to enter the notches of the permutation wheels, when the fly is centered in the slot. At other positions of the fly it acts as detent by engaging in indentations of the dog plate.

Claim.—First, the combination of two jaws G G, connected by the toggle levers r r, or equivalent, operating substantially as and for the purpose herein set forth.

Second, the combination of the dog plate F with the jaws G G, operating substantially as and for the purpose specified.

Third, the combination of oscillating fly g, with the dog plate F, or equivalent, operating in such a manner as to allow said plate to fall when centered, but to hold it elevated at all other times, as specified.

Fourth, the combination of the rollers or cams *b b* of the head *a*, with the oscillating plate *E*, operating substantially as and for the purpose set forth.

Fifth, so connecting the head *a* with the dog plate *F*, or equivalent, that in turning from the bolt said plate will only touch the cam points *j j*, but in turning toward the bolt the dog will be allowed to fall to unlock the device, substantially as set forth.

Sixth, clamping the center of the combination wheels in place, by means of a rim *y*, tightened or loosened by a screw *a'* or equivalent as set forth.

Seventh, connecting the screw *a'*, with the rim *y*, by means of the shoulders *b' c'* or equivalent, and the slot *d'*, in such a manner that the rim is attached to and raises with the screw, substantially as specified.

62,192.—JOHN M. GLEICHMAN, Evansville, Ind.—*Stump Extractor.*—February 19, 1867.—The frame is mounted on wheels, and supports a lever, which is vibrated by tackle and windlass on the forward part of the carriage. The suspended stump may then be transported. For heavy lifting a second lever is employed, with a fulcrum on the ground, and its lifting chain passing around the upper lever.

Claim.—The lever *G*, tackle *H* and windlass *I*, arranged, combined, and applied to a mounted frame *A* to operate in the manner substantially as and for the purpose set forth.

Also, the supplemental lever *N*, in combination with the lever *G*, tackle *H* and windlass *I*, substantially as and for the purpose specified.

Also, the windlass *J*, in combination with the lever *G*, tackle *H* and windlass *I*, substantially as and for the purpose set forth.

62,193.—SAMUEL GULICK, Klines Grove, Pa.—*Lifting Jack.*—February 19, 1867.—The notched bars slide in vertical grooves in the frame, and are operated by the pawls, which are pivoted in the front and rear ends of the slots in the lever, and held to their work by springs.

Claim.—The bars *B C* sliding in opposite directions, pawls *D F* and *F G*, lever *H*, and springs *I*, constructed and arranged and operating as herein set forth.

62,194.—WILLIAM B. HAYDEN, Columbus, Ohio.—*Wire Rein Snap.*—February 19, 1867.—Explained by the claim and illustration.

Claim.—The application of a guard or shield *B* to a rein snap, which is made of wire, substantially in the manner and for the purposes described.

62,195.—CHARLES E. HAYES, Lancaster, Pa.—*Money Drawer.*—February 19, 1867.—A tongue is attached to the side of the drawer, and moves in a groove on the drawer slide. The groove is bifurcated, and the drawer has to be pushed in till the tongue clears the point at the bifurcation, when it is depressed to cause the tongue to follow the other groove, which allows it to come open.

Claim.—The tongue and groove pieces, with spring attachment, to be made of wood or other material, and for the purpose set forth in the specification.

62,196.—CHARLES HERMAN, Schuylerville, N. Y.—*Gate Hinge.*—February 19, 1867.—The gate is carried on two rollers, one of which traverses the base piece, and the other is attached to a leaf of the gate hinge, and is traveled by the top bar of the gate.

Claim.—First, the construction of a gate hinge of a leaf *a* and plates *b b*, the latter having a wheel *c* between them and an eye on one side for receiving the pintle on the leaf *a*, substantially as described.

Second, in gates which are allowed to move in a direction with their lengths, and also to swing about on axes, providing for elevating or depressing such gates at pleasure, so as to adapt them for both summer and winter use, substantially as herein described.

62,197.—CHARLES L. HEYWOOD, Boston, Mass.—*Railway Safety Guard.*—February 19, 1867.—A light horizontal arm is attached to an upright, by yielding springs, for the purpose of warning persons on the top of cars, by touching them on the approach of the train to bridges, &c.

Claim.—A railway guard, arranged and operating as described and for the purpose specified.

62,198.—AARON HIGLEY, South Bend, Ind.—*Car Brake.*—February 19, 1867.—When the speed of the cars is checked friction clutches upon the axles are put in action, which contract a spiral spring upon a bar between the two axles. The draft upon the draw head in starting frees a pawl and allows the spring to assist in moving the cars.

Claim.—In a car brake and starter for railroad cars the combination of clutch coupling *D*, pulley *F*, ratchet *g*, and pulley *E*, substantially as and for the purpose set forth.

62,199.—AARON HIGLEY, South Bend, Ind.—*Car Brake.*—February 19, 1867.—A device similar to the preceding, in which the power exerted in stopping the cars is stored in a spring, which is automatically freed to assist in starting.

Claim.—In a car brake and starter for railroad cars clutch lever *G*, spring *H*, dog *I*, swivel *J*, and chains *c c* and *o*, in combination with clutch coupling *D*, ratchet *g*, pulleys *F* and *E*, substantially as and for the purpose set forth.

62,200.—W. J. HOBSON, Savannah, Mo.—*Corn Planter.*—February 19, 1867.—The serrated wheel has anti-friction rollers, which impinge against one arm of an oscillating yoke, having connections to the seed slides. A marker arm revolves with this wheel. The said wheel and the seed hopper are on a frame, which is connected to the main frame by springs at its fore end, to insure steady movement of the slides in rough ground. This frame may be raised by a pivoted treadle.

Claim.—First, the wheel *I*, provided with a sharp serrated edge, and fitted between bars *H H*, attached to a shaft *G*, to which the seed boxes *F* are secured, substantially as and for the purpose specified.

Second, the operating of the seed-distributing bars *K* from the wheel *I*, through the medium of the rollers *b b* attached thereto, the *g*-shaped lever *N*, attached to the rod *M*, the spring *O*, and right angular levers *L L*, all arranged to operate substantially in the manner as shown and described.

Third, the marker *J* attached to the axis of the wheel *I*, when used in combination with the seed dropping mechanism, constructed and arranged as set forth.

Fourth, the treader *R*, applied to the rear parts of the bars *H H*, and arranged in relation with the driver's seat, substantially as and for the purpose specified.

62,201.—LEWIS HOVER, Chicago, Ill.—*Sad-iron Holder.*—February 19, 1867.—The two sections of the holder are held together by springs, and have plates to protect the fingers from radiated heat.

Claim.—The combination of the springs *D*, semi-cylindrical holders *A*, and deflectors *B*, when the parts are constructed substantially as and for the purpose set forth.

62,202.—JAMES S. HUGG, Philadelphia, Pa.—*Broom Head.*—February 19, 1867.—The head has end slits and double lanceolate openings along the sides to allow the passage of the edge of the elongated washers, by which and the indrawn sides of the head the corn brush is clamped in place.

Claim.—The combination of the broom head *A*, with slitted ends, the partition plate *E*, and socket *D*, secured thereto, and the armed washers *f*, substantially as described.

62,203.—ERNST V. JEINSEN, New York, N. Y.—*Car Coupling.*—February 19, 1867.—The coupling link is dropped over upward projections of the draw bar, which are formed so as to allow uncoupling in case of accidents. The inner end of the draw bar has annular springs with nuts for adjustment.

Claim.—First, the hinged coupling pins *C C'*, provided with shoulders *b b'*, in combination with lips *a a'*, and with the shackle bar *B*, constructed and operating substantially as and for the purpose described.

Second, the adjustable springs *c c'*, in combination with the coupling pin *C*, shoulder *b*, and lip *a*, constructed and operating substantially as and for the purpose set forth.

62,204.—BARTON H. JENKS, Bridesburg, Pa.—*Index Chain for Looms.*—February 19, 1867.—These

chains are designed for operating drop shuttle boxes; and the mode of connecting the links by pins and hooks may be applied to the card patterns of jacquard looms. The openings through the links are designed for receiving the teeth of a revolving drum. The projections on the links are to enter depressions in the periphery of a wheel. The lateral projections are intended to actuate spring levers.

Claim.—First, constructing the links of index chains for looms, with hooks and eyes or pins in such manner that the links can be readily separated from each other without removing said pins, substantially as described.

Second, the construction of hooked links of index chains for looms with teeth upon them for entering spaces between the teeth of a wheel or rack for moving the links, substantially as described.

Third, the construction of hooked links of index chains for looms, with fast or movable studs *a*, whether such studs be applied to the outer or upper surfaces, or to the sides of the links, substantially as described.

62,205.—GEORGE JOHNSON, Detroit, Mich., assignor to himself, FRANCIS BROSSY and ABOLPHUS CADRON, same place.—*Sawing Machine.*—February 19, 1867.—The wood to be sawed is clamped in the buck by means of a lever having a cam upon its lower end, which is brought in contact with the wood to hold it firmly in place, and is adjustable by means of the sliding frame and ratchet bar.

Claim.—The ratchet bar *a* and sliding or adjustable frame *Y*, with the dog *X* and lever *I* attached thereto, and arranged to operate as shown and described for holding the wood.

62,206.—DANIEL A. JOHNSTON, Memphis, Tenn.—*Printing Apparatus for the Blind.*—February 19, 1867.—The disk has a circular series of vertical plungers with raised letters on their lower ends to imprint the paper, which is properly fed beneath. Corresponding with the series of vertical plungers are horizontally moving plungers whose raised letters are exposed on the periphery to the touch of the operator. The letter being selected is pressed inward, and the rotation of the disk brings it to the stopping place, at which an impulse is given to the vertical corresponding plunger. Each selected letter is brought to the same spot, being arrested by engagement with a depression in the stationary ring.

Claim.—The wheel *W*, provided with the circular series of plungers *a*, provided with impressional characters on their faces, and the plungers *b*, provided with characters for the touch of the operator.

Also, the stationary ring *g*, provided with the depression *h*, in combination with the plungers *b* *b*, as and for the purpose set forth.

62,207.—JAMES J. JOHNSTON, Allegheny City, Pa.—*Brick Machine.*—February 19, 1867.—The intermittently moving horizontal disk containing the molds passes beneath the clay hopper to receive the clay, which is afterward ejected by a plunger, and deposited upon the off-bearing table. The actions of filling and ejecting are simultaneously executed upon bricks at different parts of the disk, while the latter is temporarily stationary.

Claim.—First, a brick machine provided with a revolving disk *C*, filling and discharging the molds or brick upon a bearing-off table *D*, the whole operating substantially as described and for the purpose set forth.

Second, the bearing-off table *D*, in combination with mold disk *C*, plunger or press *f*, lever *J*, cam *m*, constructed, arranged, combined and operating substantially in the manner herein described and for the purpose set forth.

Third, the locking pin *V*, provided with arm *q* and spring *l*, when used in combination with the cam *9* and openings *6* in the mold disk *C*, as herein described and for the purpose set forth.

62,208.—JOHN JOSLYN, Canton, N. Y.—*Crimping Machine.*—February 19, 1867.—The leather to be crimped is drawn between two counterpart plates, having a series of circular depressions or cavities in their opposite and parallel faces; the leather is drawn down by means of a suitably shaped former, which moves between the said circular depressions working the leather, stretching or condensing it into the required shape.

Claim.—Crimping boots by passing or drawing the

leather down and between two stationary or fixed plates having their surfaces opposite to each other, or with which the leather comes in contact, corrugated or formed with a series of circular or other suitable shaped cavities or depressions, substantially as herein described.

Also, so arranging the corrugated plates *E E*, or their equivalents, that they can be adjusted to any degree of pressure upon the leather being crimped, substantially as and for the purpose described.

62,209.—THEODORE E. KING, Painesville, Ohio.—*Fence.*—February 19, 1867.—The frame foundation for the post has cast-iron horizontal and vertical pieces, and brace screw bolts with an upper disk, to which the post is attached.

Claim.—First, a base for fence posts composed of the sole figures 6 and 9, short standard *A*, cap figures 1 and 7, made separate and detachable, and formed into a rigid body by means of the adjustable braces figures 1 and 9, used and operating in a pair or pairs, substantially as herein shown.

Second, attaching the post *K* to the said base by means of the said braces passing through the flange *K* thereof, and secured thereto by the nuts *J J*, substantially as and for the purpose specified.

62,210.—W. A. LAVERTY, Philadelphia, Pa., assignor to JOSEPH NICHOLSON, same place.—*Necktie.*—February 19, 1867.—The holding plate has side wings and downward projections; the latter are perforated for attachment of an elastic cord, which passes over the button and springs the holder plate into the angle made by folding over the lap of the collar.

Claim.—The plate provided with an elastic cord *E*, secured to the arms *D*, which form the crotch *C*, retaining the plate against the neck, and allowing the button to protrude through the crotch while resting on the elastic, substantially as described.

62,211.—W. P. LONG, Wheatland, Ind.—*Making Ploes.*—February 19, 1867.—The land side and mold board are made of a single plate of metal, by rolling, cutting and swaging it into shape.

Claim.—Forming the land side and mold board from one plate of metal, in the manner substantially as described for the purpose specified.

62,212.—JAMES MAGUIRE, Trenton, N. J., assignor to JOHN B. BRUSHER, same place.—*Bedstead Fastening.*—February 19, 1867.—The side bars have end plates with a round perforation to admit the passage of the head of the post pin. The pin shank slides in an inclined slot by the descent of the side bar, which tightens the joints.

Claim.—The plate *D*, provided with the inclined slot *d'*, so as to pass over the head of the pin *E*, whereby the rails *A* are drawn against the posts *C*, and the said plate and screw proportionately relieved from strain, as herein set forth.

62,213.—DAVID MANUEL, Boston, Mass., assignor to himself and WILLARD MANUEL, same place.—*Bed Bottom.*—February 19, 1867.—The part of the spring wire which enters the groove of the slat and on which it rests is covered by a rubber tube.

Claim.—The roller-covered loop of the springs moving in the notches of the slats for the purpose described, as specified and shown.

62,214.—H. H. MASON and JOSEPH MESSINGER, Springfield, Vt.—*Mop Head.*—February 19, 1867.—The upper clutch bar is adjusted by the screw on the handle end. The handle is prevented from back rotation by its spring catch, which engages the ratchet socket of the frame.

Claim.—The fixed screw *B* on the handle *A*, in combination with the ratchet *D* on the ferrule *C*, the pawl *E*, the jaw *G*, provided with a tube or socket having an internal screw thread to work on the screw *B* and the jaw *F*, connected to the ratchet *D* and fitting in the ends of the jaw *G*, substantially as and for the purpose herein set forth.

62,215.—JOHN T. MILLER, Iowa Falls, Iowa.—*Ditching Plov.*—February 19, 1867.—The short, forwardly-inclined cutter divides the sod centrally as to the ditch. This is followed by a backwardly-inclined cutter, passing from the beam to the solo plate. Two

inclined blades cut the side of the ditch, and the earth is raised upon the wings on each side of a central mold-board, and thrown laterally on the surface by wings at the rear of the plow.

Claim.—First, a ditching plow, constructed, arranged, and operating substantially as herein described.

Second, the sole B, with its plate *b*, supporting the sward colter *c*, cutters *c'* *c''*, secured to the cross-frame C, the inclines *e* and mold-board D, combined and arranged substantially as described for the purpose specified.

62,216.—PETER OLLOM, Muncie, Ind.—*Well-Boring Auger.*—February 19, 1867.—This auger, in other respects like an ordinary carpenters' auger, has, in lieu of a screw point, a triangular projection. A vertically-adjustable sweep is attached for rotation.

Claim.—The improved auger or well borer, constructed and operated substantially as described.

62,217.—L. S. PACKARD, West Stockbridge, Mass.—*Railroad Switch.*—February 19, 1867.—The parallel switch rails are pivoted, at a common point, at their mid-length. By them a car is directed from the main to either one of the switch tracks, each switch rail serving as a leader from the main to one of the others.

Claim.—First, the arrangement of a set of parallel tracks A, moving on pivots B, and kept in a parallel position by means of the bars C, when constructed and operating substantially as herein set forth.

Second, the combination and arrangement of the rails A, parallel bars C, slotted lever D, pusher N, springs L, rod F, lever E, lever G, pin H, and spring J, as herein shown and described, and for the purpose specified.

62,218.—JOSEPH C. PAINE, Dubuque, Iowa.—*Revolving Bread Toaster.*—February 19, 1867.—A slice of bread is placed in each holder and set before the fire. All are turned at once by moving the thumb piece.

Claim.—The plate A, with slots or guides *c c c c*, thumb piece F, slide bar B, with flutes or rests D D D, and holders E E E, or their equivalents, substantially as and for the purposes herein specified.

62,219.—JULIUS PARKER, Meriden, Conn., assignor to CHARLES PARKER, same place.—*Hinge.*—February 19, 1867.—One leaf has a pivot on its projecting flange, and the other a corresponding socket. The two form the hinging axis. The socket rises on the pivot to permit the catch hooks to pass each other, and then gravitates into position again, the blind being locked.

Claim.—The combination of the socket E upon the plate A, with the pivot C upon the plate B, when constructed, arranged, and operating substantially as herein set forth.

62,220.—CHARITY PENDLETON, Iowa City, Iowa.—*Washing Machine.*—February 19, 1867.—One compartment forms a wash tub, and the other a boiler. The contents of the latter are heated by a furnace beneath and admitted to the tub by a grated opening.

Claim.—The water-tight compartments E and F, formed by the partition D provided with the hole G and sliding gate H, when constructed and arranged as herein set forth, for the purpose specified.

62,221.—P. PHILLIPS, Beardstown, Ill.—*Axle Box.*—February 19, 1867.—By the described arrangement the wheel is secured upon and readily removed from the axle, the lubricant retained, and the dust excluded.

Claim.—The box B, fitted in the hub A, and provided with a nut C on its outer end, in connection with the thimble D, provided with the screw, which is screwed into the inner end of the box, and the annular plate or flange F, secured in the outer side of the flange *a* of the thimble, with the collar *b* of the arm between the shoulder *a'* and the annular plate or flange, substantially as and for the purpose herein set forth.

62,222.—W. ALERIAN PITROWSKI, New York, N. Y.—*Painting and Varnishing Wood and Metals.*—February 19, 1867.—Instead of the successive coats of paint, the surface is coated with a composition of

linsed oil with asphaltum, which serves as a basis for the finishing painting.

Claim.—The new mode of preparing the surface of wood and of metals ready for the reception of finishing colors and varnishes, substantially as herein described, for the purpose of simplifying, shortening, and cheapening the whole process of painting wood and metals for carriages, &c., and to obviate, in a great measure, the cracking of the coat of paint when exposed to the influences of the weather.

62,223.—JONAS POTTS, Bridgeport, West Va.—*Cultivator.*—February 19, 1867.—To each beam is attached a share standard. By the use of all, or the removal of parts, the beams in the case of side plows, and the standard in the case of the middle plows, the implement is convertible into a treble, double, or single shovel plow.

Claim.—First, a cultivator, provided with movable uprights D D¹ D², and their arms *d d'* *d''*, to enable it to be changed to a double or single shovel plow, substantially as and for the purposes described.

Second, the yoke C, provided with a plate C¹ having hooks *f* fastened to it, to hold and support the arms *d' d''*, substantially as described.

Third, the plow beam A, provided with the projection *a*, and tapering at its end, substantially as and for the purpose set forth.

Fourth, the combination of the plow beam A, projection *a*, yoke C, plates C¹, hooks *f*, uprights D D¹ D², with their arms *d d'* *d''*, substantially as and for the purposes described.

62,224.—M. S. RAWSON, Winhall, Vt., and C. B. RAWSON, South Londonderry, Vt.—*Machine for Raking and Loading Hay.*—February 19, 1867.—The series of rakes is attached to endless chains, and used in connection with a guide box, a rake, and a grating or shield, whereby the hay may be raked up from the windrows and elevated upon the wagon to which the device is attached.

Claim.—First, the combination and arrangement of the pinions B, racks G, pawl I, and box D, in the manner as and for the purpose specified.

Second, the notched pulley J, fitted in the draft pole C, in combination with the rope M and pawl L, all arranged and applied substantially as and for the purpose specified.

Third, the rake heads Q, attached to the endless chains P P, and provided with the bars *k*, having pins *l* passing transversely through their ends, in combination with the guide tube R and box D, in which the teeth *j* of the rake heads Q work in the passage of the rakes upward, as shown and described.

Fourth, the spring *m m'* at the upper and lower ends of the guide tube R, in combination with the flap S, having the spring *n* bearing upon it, substantially as and for the purpose set forth.

Fifth, the combination and arrangement of box D, shield N, teeth *h*, in the manner as and for the purpose specified.

62,225.—R. RENIFF and WILLIAM W. BUTTOLPH, Bloomington, Ill.—*Railroad Car Ventilator.*—February 19, 1867.—A screen at the mouth of the hood excludes cinders. The air ascends an incline, passes through a perforated plate, and over the surface of the water contained in the tank, whose partitions prevent its washing over.

Claim.—The use of the vertical screens J covering the mouths of the receiving caps H, in combination with the inner perforated plate K and water tank R, having the partitions *s*, constructed substantially as and for the purpose set forth and described.

62,226.—J. ALSTON REYNOLDS, Savannah, Ga.—*Machine for Sowing Rice.*—February 19, 1867.—The seed is carried from the hopper to the discharge tube by an endless conveyor screw. The opener forms a shoe around the foot of the discharge tube, and is vertically adjustable by a lever.

Claim.—First, the screws *c*, fitted in grooves *b* in the bottom *a* of the seed box E, and operated from one of the wheels B by gearing arranged substantially in the manner as and for the purpose herein set forth.

Second, the sliding or adjustable furrow openers I, applied to the tubes H, and arranged substantially as and for the purpose specified.

62,227.—RICHARD H. RYNE, New York, N. Y., assignor to WILLIAM S. HICKS, same place.—*Pen and Pencil Holder.*—February 19, 1867.—The penholder is attached to a sliding collar, and is projected at the same end as the pencil. The latter is projected by the rotation of the extension handle.

Claim.—The combined pen and pencil holder, having pen and pencil both located at one end, and having the extension handle B arranged to operate as shown and described.

62,228.—TURNER SAUNDERS, Memphis, Tenn.—*Cotton Scraper.*—February 19, 1867.—The landside bar is extended backward farther than usual, and a scraper is attached to its rear end.

Claim.—The combination of the scraper and plow, the parts being constructed and arranged to operate in the manner substantially as and for the purpose herein set forth.

62,229.—WILLIAM K. SHORT, J. W. ALLEN, and JOHN CRAIG, Mount Pleasant, Iowa.—*Washing Machine.*—February 19, 1867.—A frame carrying octagonal rollers is reciprocated upon the clothes which lie upon a corrugated bottom.

Claim.—The horizontal rubber B, consisting of the frame b¹, octagonal rollers b², projections b³, and cross bar C, when constructed and arranged as herein set forth.

62,230.—J. H. SPRINGER and W. M. BARTRAM, Philadelphia, Pa., assignors to HENRY STELLWAGEN, trustee.—*Low-water Alarm for Steam Generators.*—February 19, 1867.—An improvement on their patent June 19, 1866, No. 55,732.—A bucket is suspended in the try cylinder by a rod, which connects to a valve in such a manner as to open it and to sound the steam whistle when the water sinks too low. An oscillatable weighted arm is connected to a valve stem to close communication between the lower end of the try cylinder and boiler, when the latter is longitudinally inclined by the position of the vessel, but to allow free communication when horizontal.

Claim.—First, the arrangement of the balance valve f with reference to the monitor and whistle, substantially as and for the purpose set forth.

Second, the combination and arrangement of the pendulum attachment with the stem of the water valve, substantially as and for the purpose set forth.

Third, the arrangement of the test cock d of the cylinder, the cup D, and the valve stem M, substantially as and for the purpose specified.

62,231.—JOHN S. STEELE, Rockingham, Vt.—*Sand Box for Carriage Axles.*—February 19, 1867.—The hub socket is extended over the butting-ring so far as to allow a chamber between the latter and a sand ring.

Claim.—The sand collar C and chamber E, in combination with the extended pipe box F, for the purpose set forth.

62,232.—CHARLES H. STOCKBRIDGE, Whately, Mass.—*Brace for Bits.*—February 19, 1867.—As the sleeve is screwed upon the socket, the dogs in the former are brought against the shoulder of the tool to fasten it in position.

Claim.—The combination of the nut B, secured on the exterior of the socket of a brace or bit stock, with the dogs C d C d and cams b b, all constructed, arranged and operating substantially as and for the purpose herein set forth.

62,233.—JAMES E. STRODE, Litchfield, Ill.—*Grain Dryer.*—February 19, 1867.—Air ducts for ventilation traverse the bin. Their sides consist of inclined overlapping slats, between which the air passes.

Claim.—The grain ventilator and dryer consisting of the inclined slats a, with spaces b between them, when constructed and arranged as herein set forth, and for the purpose specified.

62,234.—DANIEL B. TAYLOR, Avon, Mich.—*Ladder.*—February 19, 1867.—The ladder has a movable carriage with a step and seat, and is moved up and down by means of a crank, ratchet wheel and belt, and retained at its elevation by a pawl.

Claim.—The application to ladders of a movable frame B, having a step D and seat I, attached to-

gether with friction rollers I, band M, crank K, ratchet wheel F, and pawl G, constructed and operated substantially as above described.

62,235.—L. A. TRIPP, Middletown, N. Y., assignor to himself and C. H. HOITON, same place.—*Curtain Fixture.*—February 19, 1867.—The uncoiling of the spring winds the shade on the roller and conversely, and the desired position of the shade is maintained by the engagement of the shouldered catch with one of the radial arms on the axis of the roller.

Claim.—An improved window shade fixture, formed by the combination of the spring catch F f, one or more radial arms G, the coiled spring E, and the journal e' of the roller C, with each other, substantially as herein shown and described, and for the purpose set forth.

62,236.—R. SANDS TUCKER, Brooklyn, N. Y.—*Compound for Coating and Insulating Telegraphic Wires.*—February 19, 1867.—The yarn of hemp is saturated with a compound of pounded glass, oils and resins, and then closely wound around the conducting wire. The wire thus insulated is protected by wire or tarred hempen yarn.

Claim.—Application of glass, finely ground or pulverized, and mixed or incorporated with linseed oil, tar, or other oleaginous and resinous substances, to insulate metallic wires or conductors in telegraph cables.

62,237.—BURK VAN ALSTINE, Channahon township, Ill.—*Mop Wringer.*—February 19, 1867.—The fixed/squeezing jaw is secured to the side of a common pail, and the movable jaw is hinged thereto and operated by a lever.

Claim.—The hinged jaws a a, furnished with the prongs c c and lever b, when fastened to the side of a pail, all as and for the purpose herein set forth.

62,238.—SAMUEL B. WAIT, Mariner's Harbor, N. Y.—*Propeller.*—February 19, 1867.—A pair of submerged blades at the stem are attached to an oscillating, vertical shaft and brought broadside to the water and feathered, alternately, so as to make an effective and a return stroke. The horizontal shaft of the blades receives an oscillation in a vertical plane, while the sleeve to which its hub is secured is oscillated in a horizontal plane, so that it receives a double oscillation, once around its own axis and also around the axis of the vertical shaft.

Claim.—The arrangement herein shown and described for propelling vessels, consisting of the paddles h, shafts E and B, rod d, pin f, and sleeve g, substantially as set forth.

62,239.—SAMUEL WARD, Amsterdam, N. Y.—*Take-up Mechanism for Circular Knitting Machines.*—February 19, 1867.—In this rotating mechanism for circular knitting frames, when the tension of the knitted goods acting on the roller supported in the lever arms, exceeds that of springs, the latch is pulled downward so as to bear upon the projection on the rod and swing it so as to prevent its pawl from acting on as many teeth of the ratchet; thus decreasing the amount of take up.

Claim.—First, the rollers F, geared together at one end and hung in a revolving frame A, ratchet-wheel H, pawl I, lever arm J X, rocker-shaft M, with crank arms L and N, and stationary cam disk Q, when all arranged together so as to operate substantially as and for the purpose described.

Second, in combination with the above, the tension roller S, so arranged in the frame A and with regard to the lever-carrying pawl I, as to operate substantially in the manner and for the purpose specified.

62,240.—W. G. WARD, Scranton, N. Y.—*Clothes Pin.*—February 19, 1867.—Explained by the claim and illustration.

Claim.—The arms A pivoted to each other at their centers, having notches a at both ends on their inner faces, forming openings C, when the arms are closed, adapting either end of the pin to be used, substantially as described.

62,241.—JAMES W. WELLS, St. Joseph, Mo.—*Shingle Band.*—February 19, 1867.—The slat which

is to form a band is notched upon its inner side at the bending points, so 'ba' it can be bent around the pack; one end then being passed through a hole in the other, the band will clamp the pack of shingles.

Claim.—An improved binder, made of a single piece of wood, notched and formed at the points where the corners of the bundle will come, substantially as shown, and operating as described.

62,242.—CASSIUS M. WERNER, Rockford, Ill.—*Horseshoe.*—February 19, 1867.—The shoes are secured to the feet by edge clips, which extend upward against the walls of the hoof and are there fastened by clinching nails, which are tightened by nuts below the shoe on the screw shanks of the nails.

Claim.—First, the clip F, formed with a shoulder at its base, and a hole at its top, substantially as and for the purpose set forth.

Second, securing the shoe to the hoof by two nails clinched over or through side clips, substantially as and for the purpose set forth.

Third, grooving the top of the clip, or punching the clip, to clinch the nails and protect the hoof, substantially as set forth.

Fourth, the combination of the clip, whether grooved or punched, with the plate by a nail clinched over or through the clip, and tightened by a screw nut under the plate, substantially as and for the purpose set forth.

62,243.—R. J. WHEATLEY, St. Johns, Ill.—*Plow.*—February 19, 1867.—A sharp scraper, bow-shaped, is secured by a bar to the beam and follows in the wake of the plow to break up the subsoil.

Claim.—A subsoil attachment for plows, constructed, arranged and applied to admit of being adjusted at a greater or less degree of inclination, and also adjusted higher or lower to penetrate the earth at a greater or less depth, as may be required, substantially as herein shown and described.

62,244.—NORMAN L. ARCHER and CHARLES DEAVS, New York, N. Y., assignors by mesne assignments to ALEXANDER J. WALKER, same place.—*Lamp Burner.*—February 19, 1867.—Designed to be used without a chimney. The skirt below the deflector is in the form of a series of rings connected by alternating supports, to increase the distance traveled by the heat in passing through the deflector to the oil reservoir.

Claim.—A lamp burner, the cone or deflector of which is supported by a skirt or jacket in which are two or more ranges or slots alternating, substantially as and for the purposes specified.

62,245.—DANIEL BULL, Amboy, Ill., assignor to J. B. BOOKER and W. S. BEST.—*Table Leaf Supporter.*—February 19, 1867.—A curved spring-bar is placed beneath the leaf, and when the latter is extended engages a notch in the table frame. For lowering, it is vibrated out of the notch by pressure on the plate to condense the spring which maintains the engagement.

Claim.—The bar *c b*, in combination with the strip *d*, as constructed, and the plate *a*, when said plate is constructed so as to protect the end of bar *c*, over which it rests, and is provided with an opening through which the pad *y* is operated, substantially as and for the purpose specified.

62,246.—JOHN W. BARTLETT, Harmar, Ohio.—*Machine for Digging Potatoes.*—February 19, 1867; antedated February 9, 1867.—Improvement on his patent May 30, 1865. The roots are dug by the shovel, delivered onto the endless slatted apron, through which the dirt falls. The apron is driven by pulleys, and has slats to prevent the tubers running down. The roots fall onto the grated shaker, where they are cleaned of soil, sorted and delivered into separate receptacles.

Claim.—First, in combination with the shovel A the track clearer D, when formed and attached substantially as and for the purpose set forth.

Second, the revolving cylinder V, when used in combination with the endless apron M and shovel A, substantially in the manner and for the purpose set forth.

Third, the adjustable shield V', when used in combination with the cylinder V, substantially as and for the purpose set forth.

Fourth, the adjusting levers H and easter wheels G' and arms G, when used in combination with the shovel A, substantially as and for the purpose set forth.

Fifth, the combination and arrangement of the crank W and system of levers W' X X' and X'', for giving a vibratory motion to the grates Q and S, substantially as set forth.

Sixth, in combination with the vibrating grate Q the receptacle R and lever R', the latter being operated substantially in the manner set forth.

Seventh, in combination with the vibrating grate S the box T, door T' and rod T'', said parts being arranged substantially as set forth.

62,247.—JOHN BEAN, Hudson, Mich.—*Pump.*—February 19, 1867.—The hollow box of the plunger has a dividing diaphragm, and the chamber on each side of the latter forms a water way with a valved opening. Extending upward and downward from the chambers of the box are tubular stems, which work in the valved plates in the pump cylinder.

Claim.—First, the box C, constructed as described, and provided with the pipes E and D, substantially as and for the purpose specified.

Second, the box C with its pipes, when used in combination with the valve plates F and *d* substantially as and for the purpose specified.

62,248.—CHARLES E. BEST, Jordan, N. Y.—*Bed Bottom.*—February 19, 1867.—The slats rest upon spiral springs and are secured by transverse and diagonal straps; the ends of the former are attached to the under surface of the yielding pins, so as to maintain their tension when the plungers of the springs yield to pressure.

Claim.—Attaching the ends of the straps D D to the lower ends of the pins H of a bed bottom, when arranged in combination with the diagonal straps C C and slats B B, in the manner and for the purposes set forth.

62,249.—GEORGE C. BOVEY, Cincinnati, Ohio.—*Brick Machine.*—February 19, 1867.—The clay is crowded downward by corrugated rollers and received in the molds on the peripheries of two revolving cylinders. The latter have alternate mold and surfaces of intervening "land," which they each present in opposition to those on the opposite cylinder, the mold to the solid portion, and conversely, and parting at a middle dividing ridge on each cylinder; after which the brick is brought in opposition to one of the faces on an octagonal roller beneath. An eccentric on the shaft drives puncturers into the brick, and the latter are excluded by the followers, which are driven radially by a cam.

Claim.—First, the provision in a brick machine of the two feeding rollers J J', having longitudinal corrugations *j j'*, geared together to turn in the same direction as the respective mold wheels, and so as not to mesh into each other, and operating substantially as shown.

Second, the puncturating points *h h'*, operating within a hollow plunger, and operated by a grooved stationary cam, in combination with the pressing devices, as shown and described.

Third, the solid parts of the mold wheels, pressing the bricks as shown in the drawings; also the mold wheel, when arranged with stationary grooved cam, hollow plungers, grooved friction rollers, with puncturer operating or sliding through it, with shaft of mold wheel passing through the cam, all arranged and operating in the manner described.

Fourth, the dividing tongue L, when placed between the mold wheels B and C, and when used for the purpose described.

Fifth, in combination with the mold wheel B the hexagonal or other square-faced pressure roller, when made and used in the manner described and for the purposes set forth, or any other polygonal spring roller, for the purpose of squaring the faces of the brick without scraping or cutting the clay or the face of the brick.

Sixth, the combination of the mold wheels B C, feed rollers J J', dividing tongue L, pressure rollers M M', and aprons N N', when made and used substantially as shown and described.

62,250.—ELIJAH CASH, Brooklyn, N. Y.—*Pipe Tongs.*—February 19, 1867.—The pipe lies in the angle of the fixed jaw, and is nipped by the tooth of the movable jaw, which is pivoted to a link fixed by rack and cam to the serrated shank at the required adjustment.

Claim.—The pivoted biting jaw D and toothed adjustable slide B, in combination with each other and with the serrated shank of the fixed jaw A and the locking cam C, substantially as herein set forth for the purpose specified.

62,251.—SAMUEL A. CHAPMAN, Waterbury, Conn.—*Machine for Burnishing Plated Ware.*—February 19, 1867.—The two polishing rollers revolve in reverse directions on opposite sides of the ware; a reciprocating feed motion is given to the tool-holder by its pitman connection to a horizontally-revolving wheel.

Claim.—The rollers A and B, revolving to operate in reverse directions on opposite sides of the work, as described, in combination with a longitudinal reciprocating feed motion to the work, at a less velocity than the periphery of the rolls, substantially as and for the purpose herein set forth.

62,252.—JAMES COLLINS, Guelph, Canada.—*Harvester.*—February 19, 1867.—The endless discharging apron, behind the finger beam, moves parallel therewith, and discharges the gavel at one side of the platform; a swinging cut off is operated by the same shipping lever by which the apron is stopped and started, so as to be interposed to support the grain while the apron is in motion, and withdrawn while the apron is at rest to permit the grain to fall on the platform.

Claim.—First, the combination of the intermittently moving endless apron moving parallel to the finger beam, to effect a side delivery with the vibrating cut off.

Second, the combination substantially as described of the cut off and intermittently moving endless apron with the driving mechanism and shipping lever, for the purpose of enabling the driver simultaneously to stop the apron and withdraw the cut off, or to start the apron and interpose the cut off as set forth.

Third, the combination of the suspended endless apron, with the tension pulleys, driving bands, driving pulleys and shifting gear, as described.

62,253.—HIRAM CONDERMAN, Haskinville, N. Y.—*Coupling for Carriages.*—February 19, 1867.—The king bolt attaches the bolster to the axle or sand-board below, and the outer ends of the bolster rest upon branching plates attached to the lower piece.

Claim.—The bar C, provided with the sections F F and annular box E, when used in combination with the bed piece A, as and for the purpose specified.

62,254.—CHARLES C. CONVERSE, Brooklyn, N. Y.—*Apparatus for Heating Cars and other Vehicles.*—February 19, 1867.—The furnace and boiler are beneath the bed of the car, and impart heat through the grated floor. The steam condenses in a chamber beneath the seat and returns to the well of the boiler.

Claim.—First, heating cars and vehicles by heat derived from hot water, substantially as described.

Second, the boiler A, constructed substantially as described, with a well A', extending downward from its bottom into an inclosing furnace.

Third, the combination of boiler A, furnace G, steam condensing chamber B and pipe E, arranged substantially as shown for heating cars and vehicles by means of hot water.

Fourth, the use of a boiler or water receptacle in heating cars and vehicles, whose ends are flattened substantially as shown.

62,255.—JACOB COVERT, New York, N. Y.—*Propeller.*—February 19, 1867.—The vertical blades are bolted to a parallel bar and connected to cranks, by whose revolution they are alternately immersed to make the effective stroke and raised clear of the water on the return stroke.

Claim.—A series of vertical floats or blades b b, secured to parallel sides E, and so arranged as to form a series of water compartments, in combination with the crank C C, substantially as described and specified.

62,256.—J. C. CROSMAN, Boston, Mass.—*Coating Sheets of Paper and other Materials with Solutions.*—February 19, 1867.—The sheet of paper to be coated is first wetted by immersion in a liquid, and then placed on a hard slab or table, and pressed so as to remove any excess of moisture. The coating solution is then applied.

Claim.—The described process for coating sheets of material with fluid substances or compounds.

62,257.—COMMODORE DANIELS, Fremont, Ohio.—*Harness.*—February 19, 1867.—The straps pass over the back of the horse and are fastened to the thills and belly band; the neck yoke is arranged for attaching another horse; a pulley with a strap is attached to the fore-legs of the horse.

Claim.—The kicking straps q r, U and V, the strap P, the rod T, the neck yoke a and the bars Y, the whole arranged, constructed, and operated substantially as herein described.

62,258.—J. W. DOUGHTY and B. F. OLMSTED, Newburg, N. Y.—*Boiler Feeder.*—February 19, 1867.—When steam is admitted through the short leg of the siphon into the chamber above, the weight ceases to balance the float, and the latter sinking opens the water supply, which ceases as the water rises in the boiler above the opening of the said leg of the siphon. The water level in the boiler at which steam shall be so admitted is regulated by adjusting the said leg.

Claim.—First, the combination and arrangement of the float F with the leg of the siphon S¹, links U¹ U, lever U² U³, weight W, link U¹ U⁴, lever U², and valve v, with the chamber E and S², substantially upon the principle and in the manner as herein set forth.

Second, the arrangement of the short siphon leg T, whereby to lower or raise it, substantially in the manner as herein set forth.

62,259.—ANDREW R. EGGLESTON and CHARLES F. SWAIN, Ripon, Wis.—*Seeding Machine.*—February 19, 1867.—A revolving scatterer below the grain box distributes the seed broadcast. The scatterer receives the seed from an intervening series of boxes in which it is agitated, and two sides of which are formed by the axle. The size of the triangular openings in the floor of the hopper is regulated by a gauge. The drag bars are formed of sheet metal strips and are united nearly centrally in pairs, the right plate of one share and the left of its neighbor being fastened by one bolt to the axle, while the standards of the covers are secured to their outer ends.

Claim.—First, a scatterer placed below the axle, and arranged and operated substantially in the manner and for the purpose set forth.

Second, the arrangement of a series of seed boxes between the grain box and scatterer, substantially as and for the purpose set forth.

Third, the axle so constructed as to form the frame supporting the seed box and cultivators and the boxes between the seed box and scatterer.

Fourth, the combination of a gauge plate, triangular openings in the bottom of the seed box, and feeding pinions with the seed trough, substantially as and for the purpose set forth.

Fifth, the drag bars, when formed substantially as described and combined with the axle and cultivators, substantially as and for the purpose set forth.

62,260.—HENRY ELLIG, Bridgeport, Conn.—*Match Case.*—February 19, 1867.—The triangular block above the match tray is lapped with a strip of sand paper, and its edge being placed beneath the jaws is forced upward by springs and a set screw.

Claim.—The combination of the triangular block C with the block A and jaws d, when constructed and arranged substantially in the manner and for the purpose herein set forth.

62,261.—LEWIS ELLIOTT, JR., New Haven, Conn.—*India-rubber Whip Socket.*—February 19, 1867.—The ring of metal is enclosed in the material of which the socket is made and maintains the shape.

Claim.—The india-rubber whip socket, formed with the metallic ring or band around its mouth or open end enclosed within the india-rubber, in the manner and for the purposes set forth.

62,262.—P. H. FREYLINGHOUSE, Jonestown, Pa.—*Bedstead Fastening.*—February 19, 1867.—Plates project from the faces of the posts for the attachment of the side rails. These plates enter mortises at an angle of 90° with each other and are dovetailed together at their intersection. Tenons on the ends of the rails are mortised into the posts, and enlargements on the ends of the projecting plates are secured by keys behind cross-pieces on the rails.

Claim.—First, the plates *a a'*, dovetailed and recessed at the ends and adapted to each other and to the posts, substantially as specified.

Second, the combination of the post *A*, plates *a a'*, secured permanently to the post and the rail *B*, with its recess *h*, cross-piece *d*, and projections *i i*, as described.

62,263.—ALEXANDER N. GOW, Mt. Vernon, Ohio.—*Combined Corn Planter and Cultivator.*—February 19, 1867.—The cultivator or the planter devices are attachable to the carriage, and their special devices are explained by the claims and illustration.

Claim.—First, the frame *A*, axle *h*, windlass *D*, with cultivator frames *B* and *B'*, all constructed, arranged, and used as herein fully described.

Second, the hook *g*, when constructed as described, and used for connecting the shovel bars to the beams by means of the block *b'*, as herein set forth.

Third, the guard *M*, as constructed and used for the purposes set forth.

Fourth, the arrangement of the lever *n* with rod *s* and rod *q* for shifting the cultivators, when used in the manner and for the purposes specified.

Fifth, the arrangement of the bars *C* with their adjustable braces *J*, as constructed, in combination with the frames *B B'*, when used as and for the purposes set forth.

Sixth, the arrangement of the rails *G* with the board *E*, rollers *F F*, and seed boxes *H H*, in the manner and for the purposes set forth.

Seventh, the shafts *F*, arms *m m*, and rods *e e*, for operating the seeders when arranged as specified.

Eighth, the seed boxes *H H* with spouts *u u*, all constructed and operating as herein set forth.

Ninth, the arrangement of the furrow openers *R*, rollers *F*, and arms *t* with the seed boxes *H H* with their spouts *u u*, rubber blocks *y*, and screws *w*, when constructed as herein described and used as specified.

62,264.—LEWIS F. HAKE, Salem, Ohio.—*Land Conveyance.*—February 19, 1867.—Explained by the claims and illustration. The rear or main driving wheels have radial arms whose ends may be projected from the rim by toggle joints upon the hubs.

Claim.—First, in combination with the frame of a land conveyance which is mounted upon springs and adapted for sustaining the motive power and driving gear, the use of gimbal-jointed shafts for transmitting motion to the axles of the transporting wheels, substantially as described.

Second, the use of the gimbal-jointed and extensible shaft *G* for communicating motion to the forward axle of the guiding wheels, substantially as described.

Third, supporting the forward part of the frame *A* upon the guiding axle by means of springs, when said axle is sustained in part by a sliding segment, and operated by means substantially as described.

Fourth, the arrangement of the jointed driving shafts *G h h* beneath the spring frame *A*, substantially as described.

Fifth, the application of extensible rods *l l* to the transporting wheels of a land conveyance, said rods being so applied that they can be made to protrude beyond the circumference of the wheels or drawn within the same at pleasure, substantially as described.

Sixth, constructing the inner ends of the hubs of the transporting wheels with recesses which are adapted for receiving the clutch plates *s t*, substantially as described.

62,265.—LEWIS F. HAKE, Salem, Ohio.—*Grate for Stoves.*—February 19, 1867.—Explained by the claims and illustration.

Claim.—First, providing for contracting the exit passage for the products of combustion from an open fire box by means of a pyramidal or conical cap, substantially in the manner and for the purpose specified.

Second, the application of a door, or its equivalent, to the cap *G*, substantially as described.

Third, perforating the cap *G*, when applied to an open fire box, substantially as described.

62,266.—GUSTAVUS P. HARDING, Chiswick, England.—*Manufacture of Ordnance.*—February 19, 1867.—A cylinder receives a reinforce breech piece and trunnion piece and then a lining tube which is expanded by a traversing mandrel. A series of tubes are placed consecutively within the bore and similarly expanded.

Claim.—The combined arrangement of the parts *a b c. c' c'' c'''*, the interior parts *c c' c'' c'''* being formed as explained and expanded by a mandrel *f*, substantially as herein described.

62,267.—ANSON HATCH, New Haven, Conn.—*Apparatus for Tapering Measures.*—February 19, 1867.—For measuring tapers. The fixed arm is pivoted to the moving arm at one end and has connection to it by an adjustment screw at the other. This screw is moved by a disk upon its end, which has a scale and spaced gains with an indicating finger catch to show the parts of revolutions of the screw. A scale with finger plate upon the arms shows the whole revolutions of said screw. The straight-edge jaws are laterally adjustable on the arms to enable the measuring of inclination in a smaller or larger body.

Claim.—First, the combination of the two arms and jaws with the index wheel and screw, when they are constructed, arranged, and fitted for measuring tapers, substantially as herein described.

Second, the combination of the two jaws with the index wheel and screw, when they are constructed, arranged, and fitted for measuring the diameter or sides of prisms or articles whose opposite sides are parallel, substantially as herein described and set forth.

62,268.—WILLIAM G. HERMANCE, Albany, N. Y.—*Lifting Jack.*—February 19, 1867.—The hand lever has an end roller which engages a recess in the sliding part, and when at its full elevation a part of the roller enters a recess in the standard and prevents the descent of the slide.

Claim.—The lever *K*, constructed as described, in combination with the standard *B* and sliding piece *E* and their slots *g* and *h*, opening together in the manner and for the purposes set forth in this specification.

62,269.—FREDERIC HEWITT, Newark, N. J.—*Windmill.*—February 19, 1867.—The sails are pivoted to radial arms upon the hub and have a projection upon the face connected to a longitudinally sliding block, which is so connected to a weighted lever as to keep the sails at a working inclination to the wind. The weighted lever is connected to a hand lever upon the main post, by which it may be raised and throw the sails' edge to the wind to stop the mill.

Claim.—First, the sliding block *G*, collar *R*, rod or rods *s*, and spider *F*, arranged and operating in relation with each other and with the loaded lever *I* and sails *E*, substantially as herein set forth for the purpose specified.

Second, the annular sliding block *M* and rod *N*, arranged with reference to each other and with the loaded lever *I* and shaft or rod *J*, substantially as herein set forth for the purpose specified.

62,270.—MAURICE C. HULL, New York, N. Y.—*Cooking Range.*—February 19, 1867.—An improvement on his patent November 14, 1865. The range has an elevated oven and passages for the circulation of air around the fire pot and ash chamber for warming purposes.

Claim.—First, the descending flue or flues *i i* in combination with the air-heating spaces *c''* and *c'''* and flues *m*, passing to an elevated oven, substantially as specified.

Second, the arrangement of the flues *i i l* and *m* for the products of combustion in combination with the air-heating spaces *c''* and *c'''* and air flues *o o'*, as and for the purposes specified.

Third, the arrangement of the air flues *r s* and smoke flue *s' 4* and *5*, in combination with the elevated oven *q*, substantially as specified.

Fourth, the escape damper *t* and pipe *l* for the fumes from cooking in combination with the elevated oven *q*, as set forth.

Fifth, the water vessel *g*, fitted as specified, in com-

traversing box II with movable washboard Q and stationary washboards G G, constructed to operate in the box on vat as described.

portion rounded or convex and furnished with breaking cutters *b*, substantially as herein set forth for the purpose specified.

Second, the shovel plow, constructed with its rear portion rounded or convex and furnished with breaking cutters *b*, substantially as herein set forth for the purpose specified.

Third, the supplementary side shares F and curved rearwardly extending rods G, arranged with reference to each other and to the shovel plow, substantially as herein set forth for the purpose specified.

Fourth, the supporting braces C, constructed with curved portions *a'* and arranged in relation with the runners B, shovel plow A, and the raking blades E, substantially as herein set forth for the purpose specified.

62,272.—S. W. JACKSON, Baldville, Ohio.—*Shovel Plow*.—February 19, 1867.—The standards are laterally adjustable by set nuts in screw bars that connect them to the beam. The braces are pivoted in the beam and standards and the handles vertically adjustable at their forward ends.

62,273.—WILLIAM W. JOHNSON, Harrison, Me., assignor to N. FAUNCE, Hollis, and W. BOLSTER, Harrison, Me.—*Road Scraper*.—February 19, 1867.—The forked link instead of being attached to one place on the scraper board is made to slide up and down by means of the slotted pieces. A bolt passes through a slot in the end of the forked link and through a slot in the sides.

62,274.—JOHN M. D. KEATING, New York, N. Y., assignor to E. KEATING, same place.—*Envelope Machine*.—February 19, 1867.—Improvement on his patent June 30, 1863. The paper blanks are placed on the reciprocating feeder plate and carried forward under the plunger by small hooks or projections. The plunger descends, doubles the blanks by their contact with the creasing rollers, and leaves the blank on a flat hinged bed, where the flap folders are actuated to fold consecutively. The auxiliary presser operates upon the gummed portion, starting directly after the gum flap folder, which is cut away to allow its passage and rises a little in advance of it. The counting apparatus is a ratchet and pawl arrangement.

62,275.—JAMES W. INNIS, Newburg, N. Y.—*Potato Digger*.—February 19, 1867.—The side earth is removed from the rows by the two side shares; the vines pass up inclined bars and the potatoes and earth are separated by the rear projections.

62,276.—JOHN C. KLEIN, Birmingham, Pa.—*Flesh Fork*.—February 19, 1867.—The tang of the cast-fork is riveted to the wrought iron handle.

62,277.—JOHN E. LAUER, New York, N. Y.—*Acid Compound for use in Baking and Cooking*.—February 19, 1867.—7 lbs. of boneblack is dissolved in 10 lbs. muriatic acid diluted with 20 lbs. water. The precipitate is mixed with 5 lbs. sulphuric acid, and the product dried. It is used in place of cream of tartar.

62,278.—F. C. LOTHROP, Trenton, N. J.—*Truss Frame Bridge*.—February 19, 1867.—The casting constructed for the reception of the diagonals forms an intermediate piece between the upper and lower vertical columns. It has two plates strengthened by ribs, and enclosing webs separated from each other by an opening, through which pass the diagonal and center-diagonal pieces. The upper and lower terminals of the casting are plates, which are bolted to the flanges of the respective columns.

62,279.—G. B. MASSEY, New York, N. Y.—*Boat Detaching Tackle*.—February 19, 1867.—A longitudinal rod is supported by posts rising from the keel of the boat, and has right and left threads on its respective ends. These threads are engaged by the hook of the davit fall-block, and simultaneously cast off the hooks when the rod is rotated by the arm amidships.

62,280.—HENRY MAXELL, Canton, Ohio, assignor to himself and LEVI LONGBAUGH.—*Corn Planter*.—February 19, 1867.—For attachment to a hoe handle. The seed slide is framed on a metallic case containing torn, and connecting with a sack above. The slide is drawn up by a finger ring, and returned by a spiral spring.

62,281.—ENRIQUE A. MEJIA, Mexico.—*Many-Barreled Gun*.—February 19, 1867.—Explained by the claim and illustration.

62,272.—S. W. JACKSON, Baldville, Ohio.—*Shovel Plow*.—February 19, 1867.—The standards are laterally adjustable by set nuts in screw bars that connect them to the beam. The braces are pivoted in the beam and standards and the handles vertically adjustable at their forward ends.

62,273.—WILLIAM W. JOHNSON, Harrison, Me., assignor to N. FAUNCE, Hollis, and W. BOLSTER, Harrison, Me.—*Road Scraper*.—February 19, 1867.—The forked link instead of being attached to one place on the scraper board is made to slide up and down by means of the slotted pieces. A bolt passes through a slot in the end of the forked link and through a slot in the sides.

62,274.—JOHN M. D. KEATING, New York, N. Y., assignor to E. KEATING, same place.—*Envelope Machine*.—February 19, 1867.—Improvement on his patent June 30, 1863. The paper blanks are placed on the reciprocating feeder plate and carried forward under the plunger by small hooks or projections. The plunger descends, doubles the blanks by their contact with the creasing rollers, and leaves the blank on a flat hinged bed, where the flap folders are actuated to fold consecutively. The auxiliary presser operates upon the gummed portion, starting directly after the gum flap folder, which is cut away to allow its passage and rises a little in advance of it. The counting apparatus is a ratchet and pawl arrangement.

62,275.—JAMES W. INNIS, Newburg, N. Y.—*Potato Digger*.—February 19, 1867.—The side earth is removed from the rows by the two side shares; the vines pass up inclined bars and the potatoes and earth are separated by the rear projections.

62,276.—JOHN C. KLEIN, Birmingham, Pa.—*Flesh Fork*.—February 19, 1867.—The tang of the cast-fork is riveted to the wrought iron handle.

62,277.—JOHN E. LAUER, New York, N. Y.—*Acid Compound for use in Baking and Cooking*.—February 19, 1867.—7 lbs. of boneblack is dissolved in 10 lbs. muriatic acid diluted with 20 lbs. water. The precipitate is mixed with 5 lbs. sulphuric acid, and the product dried. It is used in place of cream of tartar.

62,278.—F. C. LOTHROP, Trenton, N. J.—*Truss Frame Bridge*.—February 19, 1867.—The casting constructed for the reception of the diagonals forms an intermediate piece between the upper and lower vertical columns. It has two plates strengthened by ribs, and enclosing webs separated from each other by an opening, through which pass the diagonal and center-diagonal pieces. The upper and lower terminals of the casting are plates, which are bolted to the flanges of the respective columns.

62,279.—G. B. MASSEY, New York, N. Y.—*Boat Detaching Tackle*.—February 19, 1867.—A longitudinal rod is supported by posts rising from the keel of the boat, and has right and left threads on its respective ends. These threads are engaged by the hook of the davit fall-block, and simultaneously cast off the hooks when the rod is rotated by the arm amidships.

62,280.—HENRY MAXELL, Canton, Ohio, assignor to himself and LEVI LONGBAUGH.—*Corn Planter*.—February 19, 1867.—For attachment to a hoe handle. The seed slide is framed on a metallic case containing torn, and connecting with a sack above. The slide is drawn up by a finger ring, and returned by a spiral spring.

62,281.—ENRIQUE A. MEJIA, Mexico.—*Many-Barreled Gun*.—February 19, 1867.—Explained by the claim and illustration.

62,272.—S. W. JACKSON, Baldville, Ohio.—*Shovel Plow*.—February 19, 1867.—The standards are laterally adjustable by set nuts in screw bars that connect them to the beam. The braces are pivoted in the beam and standards and the handles vertically adjustable at their forward ends.

62,273.—WILLIAM W. JOHNSON, Harrison, Me., assignor to N. FAUNCE, Hollis, and W. BOLSTER, Harrison, Me.—*Road Scraper*.—February 19, 1867.—The forked link instead of being attached to one place on the scraper board is made to slide up and down by means of the slotted pieces. A bolt passes through a slot in the end of the forked link and through a slot in the sides.

62,274.—JOHN M. D. KEATING, New York, N. Y., assignor to E. KEATING, same place.—*Envelope Machine*.—February 19, 1867.—Improvement on his patent June 30, 1863. The paper blanks are placed on the reciprocating feeder plate and carried forward under the plunger by small hooks or projections. The plunger descends, doubles the blanks by their contact with the creasing rollers, and leaves the blank on a flat hinged bed, where the flap folders are actuated to fold consecutively. The auxiliary presser operates upon the gummed portion, starting directly after the gum flap folder, which is cut away to allow its passage and rises a little in advance of it. The counting apparatus is a ratchet and pawl arrangement.

62,275.—JAMES W. INNIS, Newburg, N. Y.—*Potato Digger*.—February 19, 1867.—The side earth is removed from the rows by the two side shares; the vines pass up inclined bars and the potatoes and earth are separated by the rear projections.

62,276.—JOHN C. KLEIN, Birmingham, Pa.—*Flesh Fork*.—February 19, 1867.—The tang of the cast-fork is riveted to the wrought iron handle.

62,277.—JOHN E. LAUER, New York, N. Y.—*Acid Compound for use in Baking and Cooking*.—February 19, 1867.—7 lbs. of boneblack is dissolved in 10 lbs. muriatic acid diluted with 20 lbs. water. The precipitate is mixed with 5 lbs. sulphuric acid, and the product dried. It is used in place of cream of tartar.

62,278.—F. C. LOTHROP, Trenton, N. J.—*Truss Frame Bridge*.—February 19, 1867.—The casting constructed for the reception of the diagonals forms an intermediate piece between the upper and lower vertical columns. It has two plates strengthened by ribs, and enclosing webs separated from each other by an opening, through which pass the diagonal and center-diagonal pieces. The upper and lower terminals of the casting are plates, which are bolted to the flanges of the respective columns.

62,279.—G. B. MASSEY, New York, N. Y.—*Boat Detaching Tackle*.—February 19, 1867.—A longitudinal rod is supported by posts rising from the keel of the boat, and has right and left threads on its respective ends. These threads are engaged by the hook of the davit fall-block, and simultaneously cast off the hooks when the rod is rotated by the arm amidships.

62,280.—HENRY MAXELL, Canton, Ohio, assignor to himself and LEVI LONGBAUGH.—*Corn Planter*.—February 19, 1867.—For attachment to a hoe handle. The seed slide is framed on a metallic case containing torn, and connecting with a sack above. The slide is drawn up by a finger ring, and returned by a spiral spring.

62,281.—ENRIQUE A. MEJIA, Mexico.—*Many-Barreled Gun*.—February 19, 1867.—Explained by the claim and illustration.

62,272.—S. W. JACKSON, Baldville, Ohio.—*Shovel Plow*.—February 19, 1867.—The standards are laterally adjustable by set nuts in screw bars that connect them to the beam. The braces are pivoted in the beam and standards and the handles vertically adjustable at their forward ends.

62,273.—WILLIAM W. JOHNSON, Harrison, Me., assignor to N. FAUNCE, Hollis, and W. BOLSTER, Harrison, Me.—*Road Scraper*.—February 19, 1867.—The forked link instead of being attached to one place on the scraper board is made to slide up and down by means of the slotted pieces. A bolt passes through a slot in the end of the forked link and through a slot in the sides.

62,274.—JOHN M. D. KEATING, New York, N. Y., assignor to E. KEATING, same place.—*Envelope Machine*.—February 19, 1867.—Improvement on his patent June 30, 1863. The paper blanks are placed on the reciprocating feeder plate and carried forward under the plunger by small hooks or projections. The plunger descends, doubles the blanks by their contact with the creasing rollers, and leaves the blank on a flat hinged bed, where the flap folders are actuated to fold consecutively. The auxiliary presser operates upon the gummed portion, starting directly after the gum flap folder, which is cut away to allow its passage and rises a little in advance of it. The counting apparatus is a ratchet and pawl arrangement.

62,275.—JAMES W. INNIS, Newburg, N. Y.—*Potato Digger*.—February 19, 1867.—The side earth is removed from the rows by the two side shares; the vines pass up inclined bars and the potatoes and earth are separated by the rear projections.

62,276.—JOHN C. KLEIN, Birmingham, Pa.—*Flesh Fork*.—February 19, 1867.—The tang of the cast-fork is riveted to the wrought iron handle.

62,277.—JOHN E. LAUER, New York, N. Y.—*Acid Compound for use in Baking and Cooking*.—February 19, 1867.—7 lbs. of boneblack is dissolved in 10 lbs. muriatic acid diluted with 20 lbs. water. The precipitate is mixed with 5 lbs. sulphuric acid, and the product dried. It is used in place of cream of tartar.

62,278.—F. C. LOTHROP, Trenton, N. J.—*Truss Frame Bridge*.—February 19, 1867.—The casting constructed for the reception of the diagonals forms an intermediate piece between the upper and lower vertical columns. It has two plates strengthened by ribs, and enclosing webs separated from each other by an opening, through which pass the diagonal and center-diagonal pieces. The upper and lower terminals of the casting are plates, which are bolted to the flanges of the respective columns.

62,279.—G. B. MASSEY, New York, N. Y.—*Boat Detaching Tackle*.—February 19, 1867.—A longitudinal rod is supported by posts rising from the keel of the boat, and has right and left threads on its respective ends. These threads are engaged by the hook of the davit fall-block, and simultaneously cast off the hooks when the rod is rotated by the arm amidships.

62,280.—HENRY MAXELL, Canton, Ohio, assignor to himself and LEVI LONGBAUGH.—*Corn Planter*.—February 19, 1867.—For attachment to a hoe handle. The seed slide is framed on a metallic case containing torn, and connecting with a sack above. The slide is drawn up by a finger ring, and returned by a spiral spring.

62,281.—ENRIQUE A. MEJIA, Mexico.—*Many-Barreled Gun*.—February 19, 1867.—Explained by the claim and illustration.

or detachable magazines may be exploded and discharged in rapid succession by the backward and forward movement of said winch handle *x y z*, substantially as set forth and described.

62,282.—ABEL MESSEK, Waynesboro', Ga.—*Medicine*.—February 19, 1867.—For the cure of small-pox: composed of a decoction of galium trifidum, 1; holly root, 1; decoction chany-brier root, 1; and decoction of sassaparilla root, 8 parts.

Claim.—The composition, mixture, or medicine above described, for the cure of small-pox, which is made by following substantially the directions and descriptions above set forth.

62,283.—ISAAC M. MILBANK, Greenfield Hill, Conn.—*Priming Metallic Cartridges*.—February 19, 1867.—An annular anvil piece is soldered inside the cartridge base, and an axial cup and tube contain the fulminate. The hammer strikes the cap, the tube carries the fire forward into the charge; case, cap, and tube may be recharged.

Claim.—The bar *c*, soldered or brazed into the cartridge case *a*, and covered by the base *e*, in combination with the fulminate tube *t*, and head *o*, setting within a countersink in the base *c*, as and for the purposes set forth.

62,284.—GEORGE MURRAY, Cambridgeport, Mass.—*Stilts*.—February 19, 1867.—The ratchet projections on the stilt permit the adjustment of the step to the height required. The step block is pivoted in a sleeve which slips on the stilt, and a spring throws it into engagement with the ratchet teeth.

Claim.—The movable step, as described, in combination with the standard, for the object specified.

62,285.—LEWIN A. PECK, Newton Corner, Mass.—*Thimble with Guarded Cutter*.—February 19, 1867.—The sewing thimble has a grooved knife case on one side. Within is a lever knife whose handle projects beyond one end of the case and rests against a spring. It is thrown out as required by pressure on the handle.

Claim.—The combination as well as the arrangement of the lever knife and its operative spring with the thimble or finger clasp, as set forth.

Also, the combination as well as the arrangement of the knife and its case or guard, with the thimble or clasp, as explained.

62,286.—D. R. PRINDLE, East Bethany, N. Y.—*Seed Sower*.—February 19, 1867.—The seed bar has grooves on its faces which lead the seed to the discharge openings. It is reciprocated by a rod actuated by cams on the face of one of the driving wheels. The extent of reciprocation is adjusted by changing the point of attachment of the spring rod on the rocking arm of the agitator.

Claim.—First, The seed bar, constituted as described, and used in the manner and for the purposes set forth.

Second, the hopper *D* with rod *G*, and spring with index *H* and rest *b*, all constructed, arranged, and operating in the manner substantially as herein set forth.

62,287.—T. K. REED, East Bridgewater, Mass.—*Sewing Machine*.—February 19, 1867. An improvement on Reed's patent, No. 60,241. The wheel on the lever, in its normal position, is thrown outward by a spring, so as not to enter the aperture in the race, and so come in contact with the tension nut on the shuttle. When the tension needs altering, the operator, taking hold of the thumb piece, presses the wheel into contact with the nut in the shuttle, and by turning the wheel rotates the nut.

Claim.—In combination with a sewing-machine shuttle race, an aperture or provision for insertion of an instrument or device through one of the walls or plates thereof, so that when the shuttle is brought to rest at a fixed position connection can be made between such instrument or device and the tension mechanism of the shuttle, and the stress upon the shuttle thread may be regulated by such connection, substantially as described.

Also, combining with such provision a device fixed to or forming part of the machine, and so located that it may be thrown into and out of connection

with the tension mechanism of the shuttle, when the shuttle is at rest, and be made to operate such tension mechanism, substantially as set forth.

62,288.—T. K. REED, East Bridgewater, Mass.—*Tension Mechanism of Sewing-machine Shuttles*.—February 19, 1867.—The thread passes lengthwise between the pad and the inside of the shuttle. The pad can swing inward; its pressure is varied by turning the nut, which increases or diminishes the pressure of the spring upon the pad to which it is attached.

Claim.—Combining with the screw shaft the spur or toothed wheel or nut, or its equivalent, through rotation of which the movement of the shaft is effected, to regulate the stress of the tension spring, substantially as set forth.

Also, the combination of the hinged pad or plate *c* and the adjusting spring *h*, when constructed and arranged to operate substantially as set forth.

62,289.—SAMUEL ROOT, New Haven, Conn., assignor to himself and W. H. CLARK, same place.—*Peat Machine*.—February 19, 1867.—The peat from the hopper passes to the mashing cylinders, and is thence carried by an apron to cylinders which express the water. The scraper removes the peat from the carrier, and it drops upon the heated table, where it is dried ready for compressing.

Claim.—The combination of the two grinding cylinders *A* and *B* with the apron *F*, scraper *S*, and table *L*, constructed and arranged to operate together, substantially as and for the purpose set forth.

62,290.—DANIEL RUPPART, Nimisilla, Ohio.—*Corn Planter*.—February 19, 1867.—The opener throws a furrow both ways; the rakes remove weeds, &c., from the new furrows; the seed pockets in the axle take seed from the hopper and drop it into the furrow, and the scoop-shaped scrapers cover the seed with earth.

Claim.—First, the above-described construction and arrangement of axle *L*, provided with feed hole *M*, in combination with the lock lever *N* and arm *O*, substantially as set forth.

Second, the rakes *H*, in combination with the coverers, substantially as described.

62,291.—JULIUS B. SAVAGE, Southington, Conn.—*Wrench*.—February 19, 1867.—The collar in which the screw is stepped, and the barrel by which the screw is operated, both enter a recess in the handle. The collar is slipped on the handle, and the ferrule has a lunate projection which passes inside the collar and draws it into the recess in the handle.

Claim.—The collar *F*, and ferrule *I* provided with a tongue *f*, with the bar *A*, when constructed and combined to secure the collar to the bar, substantially as herein set forth.

62,292.—SHUBEL M. SHATTUCK, Cambridge, Ill.—*Sugar Evaporator*.—February 19, 1867.—Plates of cast-iron are interposed between the furnace and the evaporating pans. The front radiating plate is made in sections connected together by dovetailed transverse grooves in which a bar slides. Dampers near the center furnish means to set the caloric current either above or below the rear radiating plate.

Claim.—First, the radiator *B*, constructed substantially as described and for the purpose set forth.

Second, the dampers *D* and *d*, substantially as and for the purpose set forth.

Third, the plate *C*, in combination with the dampers *D* and *d* and radiator *B*, substantially as described.

62,293.—H. A. SHIFMAN and A. B. HENDRYX, Ansonia, Conn.—*Machine for Extending Tubing*.—February 19, 1867.—The pipe is intermittently fed through the dies, which act upon its exterior in alternation with the action of an axial punch forced down through the pipe. The action is to compress and then dilate, and the effect is to extend the pipe in length and diminish its thickness.

Claim.—Extending metallic tubing and reducing the thickness thereof by first applying external pressure to the tube, which shall reduce its diameter, and then internal pressure, which while restoring, or partially so, the previous internal diameter of the tube, shall attenuate and elongate the metal, in the manner and by means substantially as herein set forth.

62,294.—JOHN B. SICCARDI, New York, N. Y.—*Hair Crimper*.—February 19, 1867.—A series of round bars, of semicircular form, are pivoted at their ends to another series of similar form, but of different diameter. They are so connected that the bars of one series enter the spaces between those of the other.

Claim.—The arrangement of two series of round bars or rods A and B, of different diameters, in such a manner that one series of bars shall fit between and into the recess formed by the other series, said bars being hinged or fastened together at their ends, substantially in the manner and for the purpose as set forth and described.

62,295.—W. B. SMITH, Lafayette, Ill.—*Apparatus for Saturating Timber*.—February 19, 1867.—The water-tight sack is confined on the end of the timber by an encircling elastic band, and sustained by a ring and supporting dog bars, whose ends are driven into the timber. The saturating liquid is poured into the sack and percolates through the pores of the wood.

Claim.—The sack A, constructed and applied substantially in the manner and for the purpose set forth.

62,296.—S. W. STOCKTON, Philadelphia, Pa.—*Artificial Teeth*.—February 19, 1867.—The rectangular-projecting plates of the tooth, by which it is attached to the vulcanite, have cylindrical perforations in the directions of their lengths, which perforations connect with each other at their inner ends and are connected along their whole lengths by a slot of smaller diameter.

Claim.—The two holes *b* and *c*, in combination with the slot *d*, the same being constructed in the body A of a porcelain or artificial tooth or block of teeth, substantially as and for the purpose set forth and described.

62,297.—H. STONEBRAKER, Baltimore, Md.—*Pain Killer*.—February 19, 1867.—Compound of alcohol, 1½ gall.; balsam of Peru, 1½ lb.; Venice turpentine, 6½ oz.; olive oil, 1½ oz.; sulphuric ether, 4-1-5 lbs.; camphor, 8½ oz.; laudanum, 5½ oz.; tinct. cayenne, 8½ oz.; tinct. myrrh, 8½ oz.

Claim.—The above-described pain killer, when composed and used substantially as and for the purposes set forth.

62,298.—H. STONEBRAKER, Baltimore, Md.—*Liniment*.—February 19, 1867.—Composed of alcohol, 1½ gall.; turpentine, 4 gall.; oil origanum, ¼ lb.; cayenne pepper, 1 oz.; Barbadoes tar, 4 oz.; ammonia, 2½ lbs.; linseed oil, 10 oz.; oil succini, 5 oz.; oil juniper, 5 oz.; oil seneca, 1½ oz.; and castile soap, 1½ lb.

Claim.—The within-described liniment, when mixed and used substantially as and for the purposes set forth.

62,299.—BENJAMIN F. TAYLOR, Philadelphia, Pa., assignor to himself and GEORGE TAYLOR, Camden, N. J.—*Photographing Engravers' Blocks*.—February 19, 1867.—A right impression on a negative plate is produced by a reflector attached to the camera; the plates are subsequently brought into contact with the sensitized surface of a block of wood, stone, or metal, to give a reverse impression for engraving purposes.

Claim.—The use of a reflector, with a photographic camera, for obtaining a reverse photographic impression on blocks of wood, stone, or metal, for the use of engravers, the said blocks or plates being coated with the solution above specified, or its equivalent, to receive the impression from the negative plates, substantially in the manner hereinbefore described.

62,300.—GEORGE C. THOMAS, Brooklyn, N. Y.—*Baggage Check*.—February 19, 1867.—The check has a detachable piece to indicate destination, by direction or color, the said piece being temporarily attached to the check, preferably by the check strap.

Claim.—First, the combination with a railroad or express check, having the number of the check indicated thereon of a detachable piece, forming an addition to or supplementary part of said check, and attached directly to the check or to the check strap, which shall indicate the destination of the baggage.

Second, the combination with a railroad or express check, having the number of the check indicated thereon, of a detachable piece forming an addition to

or a supplementary part thereof, and attached directly to the check or the check strap, and so made as to be capable of indicating, by its color or shape, the direction in which the baggage is to be sent, or the road or branch road over which it is to go.

Third, the combination with a railroad or express check of a detachable piece forming an addition to or a supplementary part thereof, and indicating the direction or the destination of the baggage, when the said detachable piece is secured in position either in part or wholly by the check strap, substantially as herein set forth.

62,301.—JAMES CLIFFORD TREDWAY, Buffalo, N. Y.—*Horse Collar*.—February 19, 1867.—The collar staple has lugs, which divide it into sections, to which the tug is attached at the height required. For light work the tug may be attached to a headed projecting bolt. The sides of the collar are united below by a curved bar, to which one of them is hinged so as to allow the collar to be spread before putting it on over the head of the horse.

Claim.—First, the staples M, provided with lugs *n n*, draft iron O, having eyes *p p* and notches *q q*, in combination with the tug Q and collar A A, as constructed and arranged, substantially as set forth.

Second, the manner of attaching a light tug L to the collar or hames by means of the projecting standard J, provided with the head K, which is secured in the end of the tug, substantially as described.

Third, the curved bar B, rigidly attached to the collar frame on one side and jointed to the other, in combination with the padded frame of the collar, when the latter is so constructed as to preserve ample space for the windpipe, substantially as and for the purposes described.

62,302.—LEWIS G. TUTTLE, North Haven, Conn.—*Cultivator*.—February 19, 1867.—The plow beams are expandible laterally to vary the width of furrow; the shafts are adjustable vertically to vary the depth of furrow; the handles are adjustable vertically to suit the operator.

Claim.—The combination of the shafts G and H, when made vertically adjustable, with the beams C and D, when made horizontally adjustable, and the whole is constructed and arranged substantially as herein described.

62,303.—A. A. WILDER, Detroit, Mich.—*Railroad Car Starter*.—February 19, 1867.—A cam-shaped pawl acts upon a wheel fixed to the midlength of the car axle; the pawl is supported by arms which have the axle for their pivot, and is operated by the draw bar in such a manner that the force of the draft is applied directly to rotate the wheels.

Claim.—First, in a device for starting cars, the eccentric dog *h*, wheel G, arms *f* and *g*, spring *j*, links *c* and *d*, in combination with axle B, when constructed, arranged, and operating in the manner substantially as shown and described, and for the purpose set forth.

Second, in a device for starting cars the combination of the eccentric dog *h* and stop H, when operating in the manner substantially as shown and described, and for the purpose set forth.

62,304.—AUGUSTUS S. ARMSTRONG, St. Bernard Parish, La.—*Starting Street Cars*.—February 26, 1867.—Pressure on the treadle when the car is stopped drops the catch and releases the draft bar, which is thrust rearward by the coiled spring. The pawl catches on the ratchet attached to the axle, and the draft on the bar in starting acts directly upon the wheel until the catch again engages the bar and restores the normal condition.

Claim.—The combination of helical spring D, foot bar C, lever B and catch *b*, with draft bar A, provided with helical spring *c* and slot *a*, clutch E, movable standards G, and pinion F, when these several parts are constructed and arranged for conjoint operation, substantially as described for the purpose set forth.

62,305.—HENRY O. BAKER, New York, N. Y.—*Ladder*.—February 26, 1867.—The ladder and its support are pivoted together at a point between their ends, so that a platform may rest upon and between the upper ends. The elevated structure is braced laterally by struts.

Claim.—The combination of the supporting frame,

the ladder, the platform, and the braces, the whole to be arranged as and for the purpose set forth.

62,306.—ISAAC BANISTER, Newark, N. J.—*Shoe Clasp.*—February 26, 1867.—The tongue is hinged to the stock and is passed first through the lacing holes on the edges of the leather; the tongue is then bent over and engaged with the lip on the stock, fastening like the tongue of a diaper pin.

Claim.—A clasp, when formed substantially in the manner and for the purposes set forth.

62,307.—JOHN S. BARDEN, Providence, R. I., assignor to A. J. PERRY & Co., Boston, Mass.—*Steam Generator.*—February 26, 1867.—The generator is composed of sections so formed that when the sections are united diving flues are formed next the fire-box and ascending flues communicating therewith outside the generating surface.

Claim.—The improved construction, substantially as described, of each of the sections or generators A A, so as to cause them to form with the internal and casings G D the triangular sectional diving flues F and ascending flues E, arranged in manner and so as to open into each other as explained.

Also, the combination as well as the arrangement of the casings D D and G G with the generators, made as described, the same being so as to form triangular sectional diving and ascending flues E F, as specified.

Also, the arrangement, as described, of the smoke recess *f* in the external side or surface of each generator, the same being as and for the purpose specified.

62,308.—JOHN S. BARDEN, Providence, R. I., assignor to A. J. PERRY & Co., Boston, Mass.—*Steam Generator.*—February 26, 1867.—Two sets of vertical flues surround the fire-box, the connection between such flues being in the lower portion of the boiler. An air escape pipe passes up through the steam dome of the boiler. The water occupies the space between the series of flues.

Claim.—The arrangement as well as the combination of the series of flues *a*, the series of flues *b*, the connections *c*, the water-holding spaces *c*, the furnace A, and the water and steam chamber C.

Also, the arrangement as well as the combination of the escape pipe D and damper G, the series of flues *a*, the series of flues *b*, the connections *c*, the water-holding spaces *c*, the furnace A, and the water and steam chamber C.

Also, the arrangement as well as the combination of the conduits *d*, the series of water spaces *c*, the series of flues *a*, the series of flues *b*, the furnace A, and the water and steam chamber C, the whole being substantially as specified.

62,309.—ASA M. BEARD, Hillsboro', N. H.—*Saw-mill Dog.*—February 26, 1867.—The dog has a swivel joint to permit the point to be turned in any direction.

Claim.—The improved saw-mill dog, consisting of the shank *c*, provided with the spur *a*, attached to the hook *b* by a swivel joint, substantially as herein shown and described.

62,310.—GEORGE D. BLOCHER, Indianapolis, Ind.—*Corpse Preserver.*—February 26, 1867.—The inner case has double walls and a circulation through perforations in its floor. The outer chamber is tight, and furnished with a refrigerant. The water of condensation from vapors arising from the body is withdrawn from the coffin.

Claim.—The double ventilated case B, constructed and operating substantially as and for the purpose set forth, in combination with the external case or ice box A.

62,311.—STEPHEN B. BOWLES, Brooklyn, N. Y., assignor to W. G. CREAMER.—*Car Seat Lock.*—February 26, 1867.—A pivoted lever is in the side piece which supports the brace; the end of the lever has a stop which is forced by a spring into a corresponding hole in the arm, locking the same. The bolt is withdrawn by a key which draws inward one end of the lever, and throws outward that which bears the stop.

Claim.—The combination of a railroad car seat lock and stop, all constructed substantially as described and for the purposes mentioned.

62,312.—J. WARREN BROWN, Washington, D. C., assignor to NORTON P. CHIPMAN, A. A. HOSMER, C. D. GILMORE, and J. C. SMITH.—*Manufacture of Pearl Ashes.*—February 26, 1867.—Carbonaceous matters are mixed with the potashes or common house ashes of commerce, and are burnt out to carbonate the potash; or the carbonic acid from the fire used to evaporate the solution of potash may be passed into or over the solution to carbonate it.

Claim.—First, the manufacture of pearl ashes from potash or house ashes by means of charcoal, coke, coal peat, saw dust, and other substances rich in carbon, excepting black muck, in the manner herein set forth, substantially as described.

Second, passing carbonic acid over or into the solution of potassa or the lye of house ashes from the fire, by which the same is being evaporated, substantially as herein specified.

62,313.—CLARK W. BRYAN, Springfield, Mass., assignor to himself, S. BOWLES, B. F. BOWLES, and J. F. TAPLEY.—*Calendar.*—February 26, 1867; antedated December 11, 1866.—A number of calendars are held by clasp, and are removed as soon as they become useless, exposing the next in order.

Claim.—First, as a new article of manufacture, a calendar constructed of several sheets, united together in the manner described, and having the piece B arranged for the purpose of readily tearing off the sheets, substantially as set forth.

Second, in combination with the above, the attachment of the counting-house calendar upon the back of the last leaf, substantially as described.

62,314.—MELZER BURT, Norton, Mass.—*Ladder.*—February 26, 1867.—The platform is supported by brackets which hook over two adjacent rounds of the ladder.

Claim.—The ladder addition as composed of the board B, and furcated and hooked brackets C C, constructed, arranged, and applied together, substantially as set forth.

Also, the combination of above described ladder addition, made as described, with a ladder.

62,315.—J. B. CAMPBELL, Cincinnati, Ohio.—*Bed Bottom.*—February 26, 1867.—The slats have end pins similarly headed on both sides; the pins are engaged by rubber loops that take over the headed pins on the rails.

Claim.—The two-sided slat, and the wooden pins running through it, equally on both sides, and the elastic rubber ring ready to be attached to the bedstead, as above described.

62,316.—JAMES C. COCHRANE, Rochester, N. Y.—*Grate.*—February 26, 1867.—The grate is somewhat sunk toward the center and the two central bars are turned down to form a coffer and to give support to the pivot pin.

Claim.—First, the coffer, constructed in the center of the grate, and extending below it, substantially as and for the purposes described.

Second, the combination of the coffer with the grate, substantially as described.

Third, the combination of the coffer, grate, and depressed yoke, substantially as described.

62,317.—M. D. CONE and A. N. DOUGLASS, Port Gibson, N. Y.—*Garden or Hand Cultivator.*—February 26, 1867.—Explained by the claims and illustration.

Claim.—First, suspending the cultivator frame from a wheeled truck or barrow, by which it is drawn, substantially in the manner and for the purposes herein shown and described.

Second, the jointed or hinged draft rods, or their equivalents, and the cultivator frame, either with or without the guide bars B, in combination with wheeled truck, substantially as and for the purposes set forth.

Third, providing the pivoted arm of the wheel stock S with a slot *a*, as shown and for the purposes set forth.

Fourth, the arrangement of the revolving colter wheels and their vertically adjustable hangers upon the pivoted or adjustable stock S.

62,318.—JAMES B. CRANE, Dalton, Mass.—*Covering for Bottles, Steam Pipes, &c.*—February 26, 1867.—

Vegetable fibers are beaten and saturated with water until a pulp is formed, which is spread over the article and allowed to harden in place.

Claim.—The use of paper pulp for the purpose of obtaining an air-tight, non-conducting, and protective covering, substantially in the manner set forth.

62,319.—PETER CROWL, Brownsville, Pa., assignor to himself and H. H. FINLEY, same place.—*Visc.*—February 26, 1867.—The outer jaw is carried on a sliding ratchet bar which is engaged by a pawl upon a pivoted lever to hold the jaws closed.

Claim.—The combination of the stationary jaw C, adjustable jaw D, and stock D', pawl F, and lever E, and springs F' and E', all of said parts being respectively constructed and arranged for use substantially in the manner and for the purpose set forth.

62,320.—HENRY DECKER, Lebanon, Ohio.—*Churn.*—February 26, 1867.—Explained by the claim and illustration.

Claim.—The dash consisting of the vanes J made in a tapering and slightly twisted or spiral form and attached to a central hub in combination with the gathering board K located immediately over the dasher and cream box I when the several parts are constructed and arranged to operate in the manner and for the purpose set forth.

62,321.—JOSEPH DE LA MAR, Brooklyn, N. Y., assignor to GRISWOLD and SHELDON.—*Hat Blocking Machine.*—February 26, 1867.—The jointed frame is supported on a vertical arbor in a frustal form with an inverted conical depression at the apex. The frame assumes the flanged cylindrical form of a hat by the depression of a compound treadle.

Claim.—The combination of the expansible bars *e*, ring *l*, and clamp *h*, constructed substantially as and for the purpose specified.

62,322.—LUCIUS H. DWELLEY, Dorchester, Mass.—*Machine for Making Horseshoe Nails.*—February 26, 1867.—The nail is gradually drawn out by rollers upon a revolving disk in combination with a former plate. Between the action of the separate rollers the rod is subjected to the side blows of two converging hammers.

Claim.—First, the combination of the rolls upon the disk E with the former F and hammers G, when so combined and arranged that the blows of the hammers are given between the action of the separate rolls upon the article being wrought, substantially as described.

Second, cutting off a portion of the blank previous to the nail being finished, by means of the cutters described, and for the purpose set forth.

Third, the combination of the cams M, hammers G, and cutters *k' l'*, when such cams are so formed as to hold the hammers apart and out of action when the cutters sever the nail from the rod.

Fourth, vibrating the conductor O by means of the arm *a'* with its spring *b'* operated by the projections *a' d'* on the wheel L, substantially as described.

62,323.—GEO. F. FESSENDEN, West Cambridge, Mass.—*Apparatus for Rolling and Spreading Dough.*—February 26, 1867.—The dredge box scatters flour upon the roller as the latter passes over the dough.

Claim.—The combination and arrangement of the dredge box and roller or rolling pin.

Also, the combination as well as the arrangement of the dredge box, the brackets, the handles and the roller or rolling pin, as described.

62,324.—EDWARD FITZHENRY, Boston, Mass.—*Machine for Dressing Leather.*—February 26, 1867.—An improvement on his patent January 15, 1867, No. 61,182. In this case the tablet for receiving the skin is supported on anti-friction rollers which are within recesses of its sustaining frame.

Claim.—The employment of the anti-friction balls or their equivalents, substantially in the manner and for the purpose as hereinbefore described.

62,325.—CHARLES L. FLEISCHMANN, New York, N. Y.—*Plow.*—February 26, 1867; antedated February 14, 1867.—The angular cutters and the mold board make a trench and are stocked on a frame furnished with runners.

Claim.—The use of runners herein described, in combination with angular or curved cutters and a mold board, substantially as above described.

62,326.—CHARLES S. GWINNUP, Milroy, Ind.—*Cultivator.*—February 26, 1867.—The handles are pivoted at their forward ends to the frame and are regulated as to height by adjustment on their supporting post. The standards are adjustable laterally to vary the width of tilth by means of slotted bars, segment bars, and adjustable draw rods.

Claim.—First, the stanchion *d*, constructed and operating as and for the purpose herein set forth.

Second, the standards E in combination with plate G, rods I, plates *m* and *n*, and curved plate T, the whole constructed, arranged, and operating in the manner and for the purpose herein specified.

62,327.—SAMUEL HALL, New York, N. Y.—*Machine for Bending Metals.*—February 26, 1867.—Upon a strong bed is arranged an overhanging box frame, in the projecting portion of which is suspended a roller which is adjustable vertically by means of screws; on the bed below this roller is a pair of rollers which are adjustable to or from the suspended upper rolls. Between these two lower rollers are two slides having vertical rollers between which the bars is guided when it is to be rolled or bent edgewise.

Claim.—First, the box frame B B, constructed substantially as shown for the purpose set forth.

Second, in combination with the bending roller held and adjusted substantially as described, the rollers X, when the same shall be combined, constructed and operated substantially as shown for the purposes set forth.

Third, in combination with the same, the use of the sliding boxes constructed as shown for the purposes specified.

62,328.—WM. H. HARRIS, Corry, Pa.—*Hair Restorative.*—February 26, 1867.—Composed of water, 1 qt.; tincture of capsicum, $\frac{1}{2}$ oz.; grape wine juice, 4 oz.; sulphur, 1 dr.; sulphate cadmium, 30 gr.; bay rum, 1 gill; tincture of cantharids, $\frac{1}{2}$ oz.; burnt sugar $\frac{1}{2}$ oz.; alcohol, 1 gill; glycerine, $\frac{1}{2}$ oz.; oil of egg, 10 drops.

Claim.—The compound within described when the same is compounded in the proportions described for the purposes set forth.

62,329.—JAIRUS HASKEL, Lisbon Me.—*Cultivator.*—February 26, 1867.—The frame traverses on three wheels, whose holders are vertically adjustable so as to regulate the depth of the furrow cut by the plows, which are adjustable laterally as to relative distance.

Claim.—First, the combination of the three wheels *h j k*, having their gauges *i*, pivots *m*, and clamps *n*, with the elongated teeth M N P, when the same are arranged in positions relative to each other on a cultivator frame of the described form, in the manner and for the purposes set forth.

Second, the combination of the splice beams H I with the two rear wheels *j* and *k*, attached and adjustable as set forth, when the two beams H I are connected with the beams B C, in the manner and for the purposes set forth.

62,330.—GEO. HENINGER, Lena, Ill.—*Suspending Pendulums of Clocks.*—February 26, 1867.—Suspended concentrically with the verge of the escapement of a pendulum clock is a balance lever having the pendulum attached to one end and a counterbalancing weight to the other, to allow the clock to be set out of plumb without disturbing the regular movement of the pendulum.

Claim.—First, rendering pendulum clocks capable of keeping accurate time when out of plumb by the method described, suspending a balance lever concentrically with the escapement wheel, to operate the pendulum as set forth.

Second, balancing the pendulum by a weight, substantially as and for the purpose set forth.

Third, the combination of the lever D with the weight and pendulum, substantially as and for the purpose set forth.

62,331.—DAVID HESS, Pittsburg, Pa.—*Washing Fluid.*—February 26, 1867.—Composed of soft water,

3 galls.; soda ash, 24 lbs.; lime, $\frac{1}{2}$ lb.; ammonia, 1 oz., alcohol, 1 gill; and borax, 1 oz.

Claim.—The combination of ingredients in the proportions as herein described and for the purposes set forth.

62,332.—A. V. HEYDEN, Milwaukee, Wis.—*Bag Holder.*—February 26, 1867.—As the bag is filled its weight operates upon the platform and raises the expanding and sliding ring hooks that hold the mouth of the bag in position for filling.

Claim.—A bag-holder when made with platform D connected to standard C, in combination with arm E, expanding jaws F, and ring H, substantially as and for the purpose described.

62,333.—HENRY HOLL, Philadelphia, Pa.—*Bottle Stopper.*—February 26, 1867.—It can be manufactured of metal or other suitable material; the strainer is removable when the sections are detached, and the globe valve gravitates open or shut, according to the position of the bottle.

Claim.—The sieve straining the liquid as it passes through, supplied with or without a handle, so that it is easily taken out and the whole stopper cleaned without trouble, the air-tight spherical hinge stop, which opens and closes with its own weight according to the manner in which the vessel is held, the mode of connecting the upper and lower parts by means of a screw and a combination of these several inventions in a compact, secure, neat, and convenient stopper.

62,334.—ARTHUR HOLMES, Cortland, N. Y.—*Preserving Wood from Decay.*—February 26, 1867.—To the wood is applied a composition which fills the pores and hardening upon its surface forms a coating which excludes air and moisture. The composition may consist of 1 part each of boiled tar, slacked lime, water lime, and mineral paint, and 10 parts of ground stone or fine sand.

Claim.—The mode of preparing and preserving wood and timber from decay by the application of a composition, and the composition itself, or any other, substantially the same as hereinbefore substantially set forth.

62,335.—GEORGE HOMFRAY, Halesowen, England.—*Machine for Preparing Rods for Chain Links.*—February 26, 1867.—The rod passes through the head and its end is dogged to the mandrel; the latter is then revolved while the carriage passes down the bed, and the rod is thus coiled upon the mandrel. The rod being all wound on, the stripping collar is moved along the mandrel, shoving off the coil, which is cut into sections, with a proper scarf or lap for welding.

Claim.—The rotating mandrel H, in combination with the carriages M and J, or any construction substantially the same, arranged and operated substantially as described, for the purpose of laying and stripping the coil of rod or bar.

62,336.—O. L. HOPSON, Waterbury, Conn., and H. P. BROOKS, Walcottville, Conn.—*Machinery for Pointing and Reducing Wire.*—February 26, 1867; antedated Feb. 15, 1867.—Improvement on their patent August 9, 1864; reissued December 12, 1865. The dies are arranged in the end of the shaft which rotates them, and are regulated by the points of conical screws which pass through them and into cavities in the bottom of the dovetail cross groove. The tappets are arranged in a stationary frame.

Claim.—First, the dies *b b* and die holders *c c*, introduced in an undercut groove at the end of the shaft *a*, in combination with two or more pairs of tappets, or equivalent mechanism, for closing said dies two or more times each revolution, substantially as set forth.

Second, the tapering pointed screws *d d* and set nuts *e e*, in combination with the dies and the tapering screw sockets in the shaft at the back of the dies, the parts being arranged substantially as and for the purposes set forth.

62,337.—WILLIS HUMSTON, Meriden, Conn., assignor to himself and L. H. HALL, same place.—*Blind Fastening.*—February 26, 1867.—For opening, closing, and fastening a blind in position from the inside of the window. The blind is opened by raising the rod from the hook and pressing on the lever, and closed by raising the rod and drawing upon the lever.

Claim.—The combination of the rod D, hinged to the blind with the hook *a*, upon the blind and the guide F and inclined stop *d* on the sill, constructed and arranged so as to operate substantially in the manner described.

62,338.—WILLIAM E. JERVEY, New Orleans, La.—*Burner for Petroleum Stoves.*—February 26, 1867.—The petroleum flows from an upper tank into the fluid chamber, from which the gas escapes through the central perforation of a cap which is of a metal more expansible by heat than that of the chamber. This chamber is connected by metal rods to a retort above, which has a central perforation below to receive the gas and a series of holes near the periphery for its discharge during inflammation. The central perforation has radial extensions to receive the heat-conducting support arms, which are intermediate between the upper plate and the fluid chamber.

Claim.—The combination of the upper retort or furnace E, the supporting arms and conductors D, and the fluid chamber A, when the parts are constructed and arranged and co-operate in the manner shown and described, and for the purpose set forth.

62,339.—WILLIAM E. JERVEY, New Orleans, La.—*Burner for Petroleum Stoves.*—February 26, 1867.—Similar to the foregoing except that the lower retort or fluid chamber is cast in one piece, and a wire gauze surrounding the current of gas protects it from wind.

Claim.—First, the lower retort or fluid chamber A, when constructed substantially as described, for the purpose set forth.

Second, the combination of heater caps B, wire protecting gauze F, and lower retort A, constructed and arranged in the manner substantially as shown and described and for the purpose set forth.

62,340.—EVAN F. JOHNS, Philadelphia, Pa.—*Apparatus for Applying Springs to Cushions.*—February 26, 1867.—The mattress frame is placed in the operating frame and the springs depressed by the levers while being tied in place.

Claim.—A frame A, with lever B and hooks *c*, or their equivalents, constructed and adapted for the reception of the frame X of a cushion, and for the compression of springs on the same, substantially as described.

62,341.—MOSES W. KIDDER, Lowell, Mass., assignor to himself and H. R. BARKER, same place.—*Damper.*—February 26, 1867.—The steam chamber has within it a vertical series of concavo-convex disks alternately connected together at their outer and inner edges. The ends of the series are connected respectively to the cylinder bottom and to a rod which has free play through both ends of the cylinder. The pressure of steam operates on the disk to move the rod which is connected to the fire damper.

Claim.—The employment of one or more metallic disks or plates, corrugated or plain, in the manner and for the purpose specified.

62,342.—SUSAN M. KIRK, Camden, N. J., and E. J. HOWLETT, Philadelphia, Pa., assignors to E. J. HOWLETT, Philadelphia, Pa.—*Tool for the Manufacture of Paper Bags.*—February 26, 1867.—The bag tubes are placed beneath the metallic blade with their tops against the adjustable slide. Their bottoms are then folded back upon the blade and then raised and the edges brought together longitudinally, and the part projecting from under the blade flattened down. The free corners of this part are then pasted and folded down and the upper side laid over on the other. The bag is then withdrawn.

Claim.—First, the construction of the board or blade B and adjustable strip D, the whole being arranged substantially in the manner described.

Second, the combination of the board A, the permanent strip *a*, and adjustable blade B.

Third, the combination of the board A, the guide plate E, and adjustable strip D.

62,343.—WILLIAM A. L. KIRK, Hamilton, Ohio, assignor to OWENS, LANE, DYER & CO., same place.—*Governor.*—February 26, 1867.—The raising or falling of the governor stem brings the lugs on the driver in contact with the lugs on one of two inclined bevel

wheels, which are connected to the screw gear shaft, whose rotation serves to partially open or close the governor valve. While working evenly at a given speed the lugs on the driver revolve without contact with those on the bevel wheels, but by acceleration or retardation of speed the engagement is brought about to open or close the valve, as the case may be.

Claim.—The arrangement of two wheels A A, or their equivalents, on any angle varying from a right angle from the pinion B, in which they work, the same being provided each with a lug K K, working in connection with similar lugs I I I, on the intermediate driver E, substantially in the manner and for the purpose specified.

62,344.—W. B. LANE and W. COULTOR, Organ Spring, Ind.—*Cultivator.*—February 26, 1867.—The plows are laterally adjustable on their frame, which has a vertical movement by a lever upon the wheel frame, to which it is hinged in front.

Claim.—First, combining with a two wheel carriage a shovel carrying frame which is adapted for carrying five shovels a a b b and d, and which is composed of vertically-vibrating beams H H I I, connected together by transverse braces J, so as to be laterally adjustable, substantially as described.

Second, arranging a vertically and laterally adjustable shovel frame, which is constructed as described, upon a two wheel carriage, in such manner that the shovels will be located beneath, and in a vertical line, or nearly so, with the axle A, substantially as described.

62,345.—WILLIAM LEIB and GREEN B. HORNBEEK, Winchester, Ill.—*Car Coupling.*—February 26, 1867.—The link in coupling is projected by a slide on one draw-head, and is engaged by a spring pin in the other head. The slide and pin are operated from the top of the cars by levers.

Claim.—The levers A and H and the link or slide B, when arranged and operated as herein described and for the purpose set forth.

62,346.—HIRAM LEMM, Leonidas, Mich.—*Stump Extractor.*—February 26, 1867.—The chains extend from the stump to a windlass worked by pull and push pawls on a rocking lever. The additional chain furnishes means to remove the stump after extraction.

Claim.—The ratchet wheels C, separated by a flange F of a common windlass shaft B, pawls G, hung to a common rocking cross bar operated through lever J and chains M, in combination with each other, substantially as and for the purpose described.

Also, the combination with the above of the chain N, passing over beam P of the framework A, substantially as and for the purpose specified.

62,347.—W. B. LINK, Taberg, N. Y.—*Mop Cloth.*—February 26, 1867; antedated February 14, 1867.—The strings forming the mop are woven together at their mid-length.

Claim.—As a new article of manufacture, a mop constructed as herein shown and described.

62,348.—FREEMAN LITTLE, St. Louis, Mo.—*Slat for Window Blinds.*—February 26, 1867.—The upper slat is pivoted in the frame, and the other slats have edge flanges which combine to shut out all light when required.

Claim.—The application of flanged slats with the above described upper slat to Venetian window blinds, which will produce the intended effects, substantially as described.

62,349.—SAMUEL LLOYD, Washington, D. C., assignor to himself and ROBERT C. STEVENS.—*Reversible Lounge.*—February 26, 1867.—The arm is changeable from one end to the other, and the back and seat have the necessary movements to form either a right or left hand lounge.

Claim.—First, the metal plates F F with the angular slots h h, wrist pins i i, in combination with the supporting plates g g, as described and set forth.

Second, the mode of securing the seat frame B to the frame A by means of the metal ribs e e, and hooks f f, so that the seat frame B can be moved longitudinally, and when in proper position be taken out and reversed, so that the back of the sliding frame B can

be brought to the front, as and for the purposes herein set forth.

Third, constructing lounges so that the movable arm may be placed at either end of the frame, in combination with the sliding seat and back shifting to conform to the head, so that the appearance is the same whether right or left.

62,350.—HIRAM W. MAPES, Jr., Ripon, Wis.—*Spring Seat for Vehicles.*—February 26, 1867.—The inclined boards rest on the sides of the wagon box, and their upper ends between their side joints are supported by rubber bands connected to the seat at its mid-length. The eyes of the side joints are slotted to allow the necessary play.

Claim.—First, supporting a seat upon two inclined boards B B', which are jointed together at their inner ends, and connected to the seat by means of springs e e, substantially as described.

Second, connecting the inner ends of the inclined supports B B' by means of interlocking tongues, and sliding joints g g', in combination with spring connections e e and pivot connections e e, substantially as described.

62,351.—CHELTON MATHENY, Greensburg, Ind.—*Hand-Spinning Machine.*—February 26, 1867.—The object of the obliquity and stated adjustability is to give a more convenient relative position of the spindle carriage track and the driving wheel, so that the operator may bring the path of the spindle point in a line with his left hand. The machine is convertible into a wool or flax spinning machine.

Claim.—First, the spindle carriage track, arranged obliquely to the plane of the drive wheel, as and for the purpose set forth.

Second, in combination with the elements of the clause immediately preceding, making said track adjustable about a vertical axis, and securable at any desired obliquity, as set forth.

Third, the combination and arrangement of the frame A B, wheel E e e', crank E, treadle Y, pitman Z, and spindle X, to adapt the machine for spinning flax, as explained.

62,352.—MCCULLOUGH, Richmond, Ind.—*Cut-off of Electro-Magnetic Engines.*—February 26, 1867.—Four pairs of spool magnets are supported in a frame, and a vertical oscillating shaft has armatures upon it, which are alternately brought in connection with the magnets by the completion and breaking of the galvanic circuit automatically, accomplished by the lower end of the oscillating shaft. The upper end of the latter is connected to the wrist pin of the rotating wheel.

Claim.—The compound rods T T, cross-head R, and posts 1 2 3 4, constructed and operated substantially as herein set forth and described.

62,353.—CHARLES H. MILLER, Frederick, Pa., assignor to himself and ISAAC S. DENGLER, Perkiomen, Pa.—*Padlock.*—February 26, 1867.—The locking plate has two curved arms turning toward each other, and the perforated end of the locking arm passes between their ends. In unlocking, the key is twice rotated. The turning of a pivoted spring plate on the back of the lock frees the locking arm from a catch within. An additional keyhole, with a spring to engage the key, acts as a blind. The true keyhole is exposed by turning a guard plate.

Claim.—First, the case A and arm B, with its opening x, in combination with the lever D, plate C, its arms i v, projections n n' n'', and recess S, the whole being constructed and operating substantially as and for the purpose described.

Second, the combination of the above and the plate E, and its arm r, for the purpose specified.

Third, the plates I and H, with their openings z z' and cover plate J, in combination with the case A and its keyholes q q', substantially as and for the purpose set forth.

62,354.—E. L. MOESCHLER, Rochester, N. Y.—*Machine for Gauging the Size of Loaves of Bread.*—February 26, 1867.—The dough is carried forward on an endless belt through a throat, which is adjustable in size by side blocks. A guillotine knife descends at intervals to sever loaves from the mass.

Claim.—The employment of one or more gauging

or graduating slides N, either with or without a graduated throat piece or plate, in combination with a revolving belt and reciprocating knife, for the purpose set forth.

62,355.—J. A. MONTGOMERY, Columbus, Ohio.—*Machine for Sharpening Fence Pickets.*—February 26, 1867.—An oscillating plate, carried on the frame on which the pickets are placed, has a cutter attached to either the upper or under part of its face, according as a convex or concave cut is to be made. Concentric scores on the face of the cutter block indicate the place of attachment of the cutter to cut a certain curve.

Claim.—First, a machine for producing curved points on the ends of fence pickets, constructed and operating substantially as described.

Second, a machine which will both point and score the ends of fence pickets, constructed and operating substantially as described.

62,356.—FRANCIS E. MORAN, Millburn, Ill.—*Cotton Planter.*—February 26, 1867.—The seed is separated and conveyed to the dropping spouts by series of radial teeth in transverse rows on a feed wheel. The seed spouts are enlarged below the hoppers to prevent clogging. The markers and coverers are carried by a hinged frame, with which they are swung clear of the ground.

Claim.—First, the arrangement and combination of the diagonal shovels D, marking shovels C, rods L L I, slotted bars J J K, and pipes E E', substantially as set forth.

Second, the hoppers P with enlargements X, in combination with the separators Q and pipes E E', substantially as set forth.

62,357.—E. A. MORE, St. Louis, Mo.—*Cover for Oil Cans.*—February 26, 1867; antedated February 15, 1867.—The oil can is encased in a wooden box having one corner of the top cut away for the mouth of the can. A pivoted plate swings round to close this opening.

Claim.—The lever C, when constructed and employed substantially as herein described.

62,358.—GABRIEL NEUDECKER, St. Louis, Mo.—*Removing Tobacco Plugs from Molds.*—February 26, 1867.—The tobacco molds are fitted into a box whose cover is studded with plungers which fit the cells and remove the tobacco therefrom when the cover is depressed.

Claim.—First, the cover A', when armed with the plunger a', which are so fitted and arranged that they may be employed for the purpose of simultaneously forcing the plugs of tobacco from the molds B.

Second, the combination and arrangement of the box A, the mold B, and the cover A', substantially as described and set forth.

62,359.—S. H. PERKINS and THOMAS S. GILBERT, New Haven, Conn.—*Machine for Making Hoop Skirts.*—February 26, 1867.—The covered wire, preparatory to being formed into hoops, is automatically fed, measured, printed at the points for securing the tapes, and cut off at the required length. The regulation for length is made by adjusting the gauge and clamp relatively to the cutter.

Claim.—First, the combination of a feeding cylinder A, a printer or indicator F, with a gauge and clamp to secure the ends of the wire to the cylinder, substantially as herein set forth.

Second, the combination of the feeding cylinder A, provided with a clamp for securing the ends of the wire to the cylinder, in combination with the cutters I and P, substantially as herein set forth.

Third, the combination of the feeding cylinder A, provided with a clamp for securing the ends of the wire to the cylinder, the printer or indicator F, and the cutters P and I, substantially as herein set forth.

62,360.—JOSEPH B. POTTMAYER, Pittsburg, Pa., assignor to himself and NICHOLAS WINTER, same place.—*Steam Pump.*—February 26, 1867.—The knocker arm on the piston rod actuates the rod of a valve which admits steam to the main valve, governing the admission of steam to the cylinder. Steam is admitted to the ends, alternately, of the plug valve, and the circumferential grooves in the latter are

brought into communication with the induction ports of the cylinder. The central depression in the valve connects alternate ends of the cylinder with the exhaust.

Claim.—First, the arrangement of the plug valve F, with its steam passages c c' and its exhaust channel d, substantially as described and for the purpose as set forth.

Second, the arrangement of the valve V and auxiliary valve F, as described and for the purpose set forth.

Third, the arrangement of the throttle m with reference to the steam chest E and valve F, in the manner and for the purpose as set forth.

62,361.—DANIEL R. PRATT, Worcester, Mass.—*Pin.*—February 26, 1867.—Explained by the claim and illustration.

Claim.—A common pin for clothing or wearing apparel, turned from a straight line by corrugations or flexures, as herein shown and described.

62,362.—ALONZO C. RAND, Union Mills, Pa.—*Still.*—February 26, 1867.—The object is to cool the still rapidly after the charge has been "run off," in order that it may be entered and cleaned.

Claim.—Surrounding and enveloping a still with an adjustable double covering or jacket filled with a non-conducting substance, substantially as described and for the purposes herein set forth.

62,363.—ALONZO C. RAND, Union Mills, Pa.—*Manufacture of Illuminating Gas.*—February 26, 1867.—Air is driven by a pump into a vessel which is divided into four compartments, containing liquid hydrocarbon and communicates with an upper chamber by means of pipes, the said chamber discharging by pipes into a gas holder. The chamber above the carburetter has a burner by which the gas is tested during the process of manufacture.

Claim.—First, so arranging the gas generator or carburetting apparatus with a series of compartments or generators with stop-cocks that the air may be driven through the liquid contained in one or more compartments, for the purpose and in the manner herein described.

Second, the combination of the test light G and its connection with the series of compartments or generators a¹ a² a³ a⁴, substantially as and for the purpose herein described.

Third, the employment of the cock or cocks I, arranged on the lower part of the generators to connect or disconnect the same, substantially as and for the purpose described herein.

62,364.—ALONZO C. RAND, Union Mills, Pa.—*Apparatus for Carburetting Air.*—February 26, 1867.—Explained by the claim and illustration.

Claim.—Placing the tank B, surrounded by water within the gasometer A A in the earth below the frost point, so that the vapors shall be generated at a low temperature, thereby preventing their condensation in the pipes leading to the burners, as herein set forth.

62,365.—JACOB REESE, Pittsburg, Pa.—*Cotton Bale Tie.*—February 26, 1867.—One end of the hoop has a slot, and the other has a jointed section, with a button; the latter is capable of entering said slot when the said section is bent at right angles to the hoop, and is crosswise to the slot when the hoop is in continuous line.

Claim.—The combination of the T-head c and slots a a in a hoop or tie for cotton bales, with a movable arm b or strap b', to which the button is attached or constructed and arranged, as that when the tie is fastened the head of the button shall tie across the slot, substantially as and for the purposes described.

62,366.—WILLIAM OSCAR REIM, Springfield, Ohio.—*Apparatus for Ascertaining Tonnage, &c.*—February 26, 1867.—The duplex scales are placed on opposite sides and ends of the vessel for the measurement of the displacement and the determination of the result by the average of all. It is an improvement on Amory Amsden's patent, in which a single scale was placed at the dead point. The stems rise through the deck, and terminate at bottom in floats,

which rise in the chambers when water is admitted thereto.

Claim.—First, the use of a duplex system of hydrostatic scales for the admeasurement of the displacement of vessels when said scales are respectively placed in relation to the vessel and one another, substantially as set forth.

Second, the combination of the cylinder C, pipe B and plunger valve, actuated by the rod B', when arranged to operate substantially as and for the purpose set forth.

Third, in combination with the cylinder C, float B and graduated stem E, the revolving head E' and balanced indicator H, substantially as and for the purpose set forth.

62,367.—M. L. ROBERTS, Smithfield, Canada.—*Plow.*—February 26, 1867.—The mold board has a gang of anti-friction rollers to turn over the furrow slice. Instead of a prolonged landside or sole is an inclined wheel, with a double miter face, whose angle runs in the corner of the furrow just made.

Claim.—The friction wheel G, having its axis inclined at an angle of 90° or thereabouts, one bearing being attached to the beam, and the other to the heel of the mold board, so that the two faces of said wheel bear against the side and bottom of the furrow, with nearly equal force, in combination with the other parts of a plow, arranged and operating substantially as and for the purposes set forth.

Also, constructing a plow without the land plate or side, when the same is provided with a friction roller or rollers, which track in the furrow angle, which is cut by the share, substantially as set forth.

Also, the combination of the inclined wheel G, with the anti-friction mold board, composed of the series of rollers e e, or their equivalent, arranged and operating substantially as set forth.

62,368.—IRA A. SALMON, Boston, Mass.—*Dentists' Tool Rack.*—February 26, 1867.—The tray has a series of projections between or upon which the tools belonging to the dental mallet are placed so as to be readily detached from the stock of the mallet, and be retained in a convenient position for being again attached.

Claim.—A tool rack or instrument rack, made of steel pins, beveled on one side, in the manner and for the purpose hereinbefore described.

Also, as an improvement on the United States patent No. 54,883, or any such rack, the construction of the teeth beveled wedge, or chisel-shaped, substantially as and for the purposes and objects as hereinbefore specified.

62,369.—BENJAMIN SAUNDERS, Nashua, N. H., assignor to himself and ALBERT H. SAUNDERS, same place.—*Friction Apparatus for Yarn Beams of Warp Dressers.*—February 26, 1867.—The claims and illustration indicate the details of this invention; the object is to let-off uniformly as the amount of yarn on the beam diminishes.

Claim.—The combination as well as the arrangement of the friction wheel a, or its equivalent, the brake b, the slide rod c, the spring g, and the lever h, the whole being applied together, and to the yarn beam A, substantially in the manner and for the purpose set forth.

Also, the combination of screw e and nut f with the slider c, the brake b, the friction wheel a, and the lever h, the whole being applied together and to the yarn beam, substantially and for the purposes as described.

62,370.—BENJAMIN SAUNDERS, Nashua, N. H., assignor to himself and A. H. SAUNDERS, same place.—*Device for Imparting a Lateral Reciprocation to the Raddle of Warp Dressing Machines.*—February 26, 1867.—A slow reciprocating lateral motion is given to the raddle, so as to prevent the wear of the cloth covering of the sizing rollers by the warps, and prevent the sizing from accumulating and drying on the portions of the surface of the roller which are between the warps.

Claim.—The combination as well as the arrangement of the grooved cam H, the arm c, the two shafts G G and the cranks F' E', the whole being applied to the raddle and the dresser frame and its shaft, sub-

stantially in the manner and so as to operate as specified.

62,371.—RICHARD SAVAGE, San José, California.—*Thermo-Alarm Gauge.*—February 26, 1867.—The air in the two hollow bulbs is expanded by heat, and presses upon the mercury in the pipes, which unite with a single outside pipe, whose column of mercury is raised thereby. A float on the mercury moves a band upon a dial plate, and causes an alarm to be sounded when the pressure becomes extreme.

Claim.—The above described thermo-alarm gauge, in combination with a steam generator.

62,372.—HENRY A. SEYMOUR, Bristol, Conn.—*Roof.*—February 26, 1867.—The joint between the adjacent roof boards is spanned by a plate, bent into an angular shape, the edges being inserted into the boards.

Claim.—The employment of the Δ -shaped metal piece d, when inserted into grooves formed in the upper side, and near the edge of the board a, when said grooves are formed about an angle of 45°, substantially as and for the purpose described.

62,373.—JUDSON W. SHAW, Concord, N. H.—*Mop Head.*—February 26, 1867.—The stirrup clamps the mop against the head, and is itself secured by the engagement of the shank hooks with a rack in the handle. A collar holds the hooks in the rack.

Claim.—The rack bar d, in combination with the mop constructed with the bearer yoke and collar, as and for the purpose described and set forth.

62,374.—WILLIAM SIEFERT, New York, N. Y.—*Pinch Bar for Removing Heavy Weights.*—February 26, 1867.—The point has a roller to prevent the friction of the end of the bar upon the object lifted.

Claim.—The application of a roller to the end of the short arm of a pinch bar.

62,375.—JAMES SMITH, Richmond, Ind.—*School Desk.*—February 26, 1867.—Two wooden bars are placed parallel, and at a short distance apart, and run centrally along the series of desks, where they are secured so as to be detachable. The space between them becomes a receptacle, and has lids. The shelf below each desk has a closing door to exclude dust.

Claim.—First, the combination of the connecting bars D D' with a series of desks and seats A A' and the receptacles a a', so constructed that the bars and desks may be easily separated at pleasure.

Second, the combination of the book box K and doors P, when the latter are arranged substantially in the manner described.

62,376.—HENRY SOGGS, Columbus, Pa.—*Combined Corn Planter and Hoe.*—February 26, 1867.—At the upper end of the hollow handle is a seed hopper; a spring plunger actuates the feeding device at the hopper, and uncloses the valve at the lower end of the handle simultaneously.

Claim.—The arrangement of the seeding devices E J K and M in the hollow handle of the hoe, with the hopper and seeder at the end of the handle, when arranged and combined as herein described and for the purposes set forth.

62,377.—JOHN STEVENS, New York, N. Y., and JOHN JOHNSON, Saco, Me.—*Preparing Mica for Tablets and other Purposes.*—February 26, 1867.—The surface of the lamina of mica is roughened by grinding with emery, the edges are bound or varnished, and the sheets framed or bound.

Claim.—The use of mica for the purposes herein specified, viz: for tablets, books, and for record.

62,378.—J. L. and G. W. STEVENS, San Francisco, Cal.—*Case for Transporting Eggs.*—February 26, 1867.—The box has tin divisions, in which the eggs are separately packed for safety in transportation.

Claim.—A case for packing and transporting eggs, constructed with compartments substantially as and for the purpose herein described.

62,379.—HENRY C. STOLL, Mokena, Ill.—*Revolving Harrow.*—February 26, 1867.—One side of the triangular frame is used as a draft bar, and sup-

ports an inner friction roller, traveling on a track above the harrow frame. The angle of the other two sides supports a weighted box resting upon a friction roller, traveling upon an outer track, and by depressing the teeth beneath it causes the harrow to revolve when it is drawn forward.

Claim.—The frame A, in combination with the tracks C B, friction rollers E and D, and the triangular frame G G', when constructed substantially as and for the purpose set forth and described.

62,380.—JOHN P. VAN VLECK, Rock county, Wis.—*Hand Corn Planter.*—February 26, 1867.—The jaws are hinged just above the openers. The act of closing the handles drives the curved seed-slide into the hopper and makes the hole in the ground by spreading the openers. The return move drops the seed.

Claim.—First, curved seed cup bar H, in combination with the hopper E, when both are constructed and operated substantially as and for the purposes described.

Second, a general arrangement of the parts A B E F C D H and G, when the whole are constructed, combined, and operated substantially as and for the purposes described.

62,381.—E. C. WALKER, Newark, N. J.—*Hoop Skirt.*—February 26, 1867.—Two pieces of flat spring steel are centrally attached to the lowest hoop in front and diverge as they ascend to the hoop next to the bustle hoop; from these points coiled wire springs descend and are attached to the bottom hoop. The object is to prevent the skirt tilting when a person sits down.

Claim.—Bracing the front of a skirt by affixing thereto the springs a and b, when combined with and arranged upon the skirt in the manner and for the purpose specified.

Also, the use of the spirals c and d, in combination with the braces a and b, for the purposes set forth.

62,382.—C. P. S. WARDWELL, Lake Village, N. H.—*Knitting Machine Needle.*—February 26, 1867.—The claim and illustration explain the invention. Its object is to equalize the strain at the bend and give greater durability by diminishing the liability of the barb to break at that point.

Claim.—A needle for knitting machines, flattened on the outside of its barb, substantially as and for the purpose herein specified.

62,383.—HENRY WATERMAN, Hudson, N. Y.—*Weather Strip.*—February 26, 1867.—A wire forcibly driven into the kerf along with the strip of rubber holds it in position.

Claim.—The arrangement and mode of fastening a strip of india-rubber or cloth in a groove in the edge of a door or window sash, by means of a wire forced down into the groove by the side of or within the folds of the rubber strip, so as to hold it firmly in its place, substantially in the manner and for the purpose hereinbefore set forth.

62,384.—ALBERT E. WING, Battle Creek, Mich.—*Machine for Shrinking Tires.*—February 26, 1867.—Depressing the treadle drives the two biting levers against the two upper jaws and thus clamps the tire in two pieces. One pair of jaws remains stationary and the other is driven toward it by an eccentric, shortening and upsetting the tire.

Claim.—First, the jaws H I, biting levers G' G', levers G G, foot levers E, constructed and operating as described, and for the purposes set forth.

Second, the stationary block D, sliding block D', hand lever F, constructed and operating as described, and for the purposes set forth.

Third, the frame C and blocks D and D', in combination with the jaws H I, levers G' G', foot lever E, and hand lever F, the whole constructed and operating as set forth, and for the purposes described.

62,385.—DANIEL R. ALLEN, Cumberland, Me.—*Cultivator.*—February 26, 1867.—Explained by the claims and illustration.

Claim.—First, the relative arrangement and position of the teeth c and d, viz., upon their respective cross bars a and b, in the manner and for the purposes described.

Second, the combination and arrangement of the

slots and holes in the cross bars, the shoulder, flange, and lip on the teeth, with the bolt and nut, for the purpose of securing the teeth.

Third, in combination with the shoulder, lip, and flange on the teeth, the additional slots and holes in the third cross bar, for the purpose of rendering the teeth e and f adjustable, as described.

Fourth, the combination of the slots p and t, bolts r and u, and nuts, with the slides secured to the mold boards s s, for the purpose of rendering the mold boards adjustable, as described.

Fifth, in combination with the diverging upper ends of the teeth c and d, the scooped parts m m of the beam A, in the manner and for the purposes set forth.

Sixth, the combination and arrangement of the scorer w, constructed as described, with the hooks v and pin z.

Seventh, in combination with the subject of the first and fifth claims, the rounded top l of the teeth projecting above the frame of the cultivator, as and for the purposes specified.

Eighth, the concave shape to the upper part of the forward edge of the tooth 3, when the said tooth is attached as described, for the purposes specified.

62,386.—WILLIAM J. ANDREWS, Columbia, Tenn.—*Cultivator.*—February 26, 1867.—The broad-edged shares are attached to the frame at the desired obliquity to the line of draft, and are succeeded by harrow teeth attached to the same frame.

Claim.—The combined plows and harrows G H applied to the standards F F, substantially as and for the purpose specified.

62,387.—OMAR J. ARNOLD, Mount Ida, Wis.—*Cultivator.*—February 26, 1867.—The plow frame is hinged to the tongue hounds and is vertically adjusted by a pivoted lever, which is connected to the plow frame by a bent lever passing through a slot in the tongue.

Claim.—First, the axle C, inclined downward from its center outward in both directions, in connection with the extended draft pole A and brace rods b b, substantially as and for the purpose set forth.

Second, the beams D' D', extending in front of the joints d and connected by a cross bar F, substantially as and for the purpose set forth.

Third, the lever G, provided with the pin or rod f, in combination with the beams D' D' and cross bar F, all arranged substantially as and for the purpose specified.

62,388.—EDWIN A. BARROWS, Willimantic, Conn.—*Permutation Lock.*—February 26, 1867.—The lock has a combination mechanism operated by finger pieces in a prescribed order. The sliding bar has a number of holes to receive an equal number of stops and corresponding finger pieces. By manipulating the finger pieces in the proper order the bar is freed, but a variation in the order causes detent dogs to fly up. A key restores the former position of the bar.

Claim.—First, the sliding bar B, provided with a series of holes d d' d² d³ and pins e e' e² e³, more or less, in combination with the spring arms f f' f² f³, finger pieces h h' h² h³, latch C and bolt D, constructed and operating substantially as and for the purpose set forth.

Second, the safety dogs i i' i² i³, in combination with the sliding bar B, pins e, e arms f, and finger pieces h, constructed and operating substantially as and for the purpose described.

Third, the rod s and lever t, in combination with the sliding bar B and with a suitable key, constructed and operating substantially as and for the purpose set forth.

62,389.—JACOB BATES, Salineville, Ohio.—*Medical Compound.*—February 26, 1867.—For bronchial and pulmonary affections, influenza, &c. Composed of elecampane, 8 lbs.; comfrey, 3 lbs.; spikenard, 3 lbs.; horehound, 1 lb.; lady's slipper, ½ lb.; sugar, 4 lbs.; honey, 1 lb.; and essence of winter green, 1 oz.

Claim.—The medical compound composed of the ingredients herein described, for the purpose specified.

62,390.—LEANDER BURNS, Port Chester, N. Y.—*Tool for Turning Bolts.*—February 26, 1867.—The dies act upon opposite sides of the bolt and are each

composed of three pieces secured together by screw bolts. The thickness of the central piece regulates the distance between the inner edges of the outer plates according to the diameter of the bolt under treatment; one edge being sharpened to shave the bolt and the other adapted to hold it.

Claim.—The cutter or dies B, formed in three parts or sections C D and E, secured together and constructed substantially as and for the purpose described.

62,391.—JOHN H. BUSH, Bone Creek, W. Va.—*Folding Table.*—February 26, 1867.—The legs are hinged to an oblique brace, which crosses the diagonal girder. The usual side pieces of the frame are dispensed with. The notched leg shuts within a rabbet of the end piece and the legs are secured by a catch when open.

Claim.—First, the frame constructed with diagonal girder E and oblique piece F, to which the legs are hinged, substantially as described.

Second, the combination of the spring catch K and movable leg H, arranged and operating substantially as described.

Third, constructing the leg H with a notch at its upper end, in combination with the notched end piece D of the frame, substantially as described.

62,392.—JOHN W. CAMPBELL, New York, N. Y.—*Ice Box or Cooler.*—February 26, 1867.—The ice chamber is within a larger chamber and has a pipe for the passage of drinking water laid in a horizontal worm at its bottom to support the ice. A drain pipe from the ice chamber has an S-bend in a vertical plane which forms an air trap.

Claim.—The arrangement of an ice box and cooler for fluids, consisting of an external case A, internal case B, pipe C, for conducting fluids through the same, and a discharge pipe E, said parts being respectively constructed, combined, and arranged in the manner and for the purpose set forth.

62,393.—G. W. CATON, Canandaigua, N. Y.—*Water-proof Cement.*—February 26, 1867.—Composed of white fish glue, 1 lb. 10 oz.; white lead, 12 oz.; rain water, 34 pts.; alcohol, 1 pt.; gum camphor, 1/2 oz.; linseed oil, 1/2 oz.; and gum shellac, 1/2 oz.

Claim.—A water-proof glue or cement composed of the articles above named and in about the proportion described.

62,394.—JOHN G. CLIFTON, Middletown, Ohio.—*Mortising Machine.*—February 26, 1867.—The lower guides of the chisels are pivoted so as to admit side oscillation and are adjustable in distance from each other. The upper guides have similar adjustment, but simultaneous movement by a cog wheel which engages their slide racks. The chisels may be used in conjunction or singly.

Claim.—First, the hinged guides *c c* of the chisel bars *b b*, rack frames *d d*, and adjusting frames *e e*, in combination with their actuating mechanism, arranged and operating substantially in the manner and for the purpose herein described.

Second, the arrangement of the forked lever *m* upon the stud *l*, on treadle *k*, operated in the manner described, for connecting with either or both the treadle blocks *j*, for actuating the chisels, substantially as and for the purpose set forth.

62,395.—H. A. COATES, Wellsville, N. Y.—*Bed Bottom.*—February 26, 1867.—The slats have a guide pin at each end, and a supporting spiral spring separate therefrom.

Claim.—The combination of the slats D, having notched ends fitting on guide rods C, retained by the cross bars E, with elastic blocks F between them, and resting on springs B, independent from the rods, in the manner described for the purpose specified.

62,396.—RODOLPHUS CONWAY, Volga, Ind.—*Gate.*—February 26, 1867.—The gate is double, and balanced on a central post on which it turns. The latches are moved simultaneously by transverse wires from the top of the rear end of each latch to the bottom of the other. One end is hinged to form a gate, which has a rubber band to close it.

Claim.—First, an improved gate B, formed in two parts *b¹* and *b²*, hinged to each other, and which is

hinged at its center to a central post A, substantially as herein shown and described.

Second, the combination and arrangement of the wires G H, with the latches E F, substantially as herein shown and described, and for the purpose set forth.

Third, the combination of the spring J with the parts *b¹* and *b²* of the gate B, substantially as herein shown and described, and for the purpose set forth.

62,397.—GEORGE M. COPELAND, Brooklyn, N. Y.—*Combination of Air and Steam Jets to Promote Combustion.*—February 26, 1867.—The air pipe discharges upwardly within the chimney, and has a central steam pipe which discharges within the air pipe.

Claim.—First, the combination of an air and steam jet or jets with each other, and their introduction into a chimney, smoke flue, or other passage way, substantially as herein described and for the purpose set forth.

Second, the combination of an air pipe D, single or branched, and the steam pipe or pipes F with each other, and with the smoke flue chimney or other passage way in which they are placed, substantially as herein described, and for the purpose set forth.

62,398.—CHARLES COUSE, Belleville, N. J.—*Indicator for Rope and other Machines.*—February 26, 1867.—The half nut of the indicator is set upon a screw shaft, which receives rotation from a shaft whose revolutions are to be determined. The finger traverses a scale bar and indicates the number. The set screw admits a precise adjustment of the pointer opposite any given figure of the scale.

Claim.—First, the combination of the screw shaft E with the half nut C, weight D, and pointer *b* and scale E, substantially as and for the purpose herein shown and described.

Second, the combination of the half nut C with the hand *b*, set screw *c*, and scale E, substantially as and for the purpose herein shown and described.

62,399.—HENRY DALE, Boston, Mass.—*Device for Regulating the Revolution of Propellers of Steam Vessels.*—February 26, 1867.—A cylinder with an open end is placed in the ship's bottom, near the propeller, so that the pressure of water on a piston in said cylinder shall raise a brake operating on the propeller shaft when the stern is thrown out of water; the descent of the piston puts the brake in operation to check speed.

Claim.—The automatic regulation of the motion of the propeller shaft of a steam vessel by means of devices operated by the resistance or varying pressure of the water.

62,400.—ROBERT DILLON, New York, N. Y.—*Bale Hoop Fastening.*—February 26, 1867.—A quadrangular plate with an opening of the same form is bent in the direction of its length. One end of the hoop is passed around the two sides which lap together, and the other end is passed around a pin which is held by the two loops of the plate.

Claim.—The construction of the plate B, with cross pieces *d* and wings *e e*, in combination with the pin *b*, substantially as and for the purpose described.

62,401.—WILLIAM EADES and WILLIAM THOMAS EADES, Birmingham, England.—*Apparatus for Raising Weights.*—February 26, 1867.—The hoisting chain pulley has end recesses, and the inner gears of the rims engage differential gear wheels within the recesses which have a revolving movement by rotating eccentrics, but are prevented from rotating by projections which engage vertically and horizontally sliding frames. The number of teeth upon the inner gear wheels is one or more smaller than that of the inner gears of the chain pulley, so that a revolution of the gear wheels will rotate the pulley one or more cogs.

Motion is communicated to the eccentric from an outer wheel by an endless rope or chain.

Claim.—The within-described improved apparatus for raising weights, such apparatus consisting of a pulley block, constructed as herein described, or any mere modification of the same construction, whereby a single chain having two loose ends is carried to work over a pulley driven by self-sustaining gearing, in manner herein more fully set forth and specified.

62,402.—CHARLES F. ELLIOTT, Great Falls, N. H., assignor to himself and O. O. BENNETT.—*Wheel*

for Vehicles.—February 26, 1867.—Explained by the claim and illustration.

Claim.—Securing the fellos C to each other by means of the curved plates D, inserted and pivoted in channels formed in the face or rim of said fellos, as herein set forth for the purpose specified.

62,403.—JOB GIFFORD, Smithport, Pa.—*Liniment.*—February 26, 1867.—Composed of spirit of camphor, 1 part; saltpeper, 2; alum, 2; salts, 3; vinegar, 32; boil, filter, bottle and cork.

Claim.—The liniment composed of the ingredients mixed together in or about the proportions described for the purpose specified.

62,404.—T. M. GILE and W. COCHRAN, Mansfield, Pa.—*Apparatus for Drawing Well Tubes from Wells.*—February 26, 1867.—The stand is supported upon jack screws, and lifts upon a device for drawing tubes from wells. The lifter consists of a rod with a spear head and a hinged dog which engages the tube when raised.

Claim.—The stand B supported upon jack screws C, and having dogs I, rod E, in combination with the dog G, on the end F of the rod, so as to operate substantially in the manner and for the purpose described.

62,405.—JOHN GILPATRICK, Biddeford, Me.—*Cultivator.*—February 26, 1867.—The triangular frame has transverse bars having pointed projections at their ends, to which the shares are attached.

Claim.—The iron cross-bars B, provided with tongues a a, and the cast-iron teeth C, when constructed and arranged as herein set forth and for the purpose specified.

62,406.—JOHN W. GOSLING.—Cincinnati, Ohio.—*Combined Step Cover and Wheel Fender for Carriages.*—February 26, 1867.—In the open position the plate fends from the wheel the dress of a person stepping into or alighting from a carriage, and in its closed position forms a cap over the step.

Claim.—A combined step cover and wheel fender for carriages, consisting of the flexible plate E, whose upper end is attached to the carriage door, and whose lower end is connected d h to the step or other fixed object, the whole being arranged to operate substantially as herein described and for the purpose set forth.

62,407.—ALFRED J. GRAINGER, Wilmington, Ill.—*Forging Apparatus.*—February 26, 1867.—The rod connects the power end of the hammer helve with the crank of the driving shaft, which has a weight to counterbalance that of the hammer. The hinge in the helve permits the hammer to adjust the length of its stroke to the thickness of the metal under treatment.

Claim.—First, the connecting rod g, crank shaft F f, and counterbalance I, in combination with the hammer A B, substantially in the manner and for the purpose set forth.

Second, the hammer A, spring-jointed helve B' B, connecting rod g and crank shaft F f, substantially as and for the purpose described.

62,408.—NOBLE W. GRAVES, Winnebago, Ill.—*Machine for Sawing Wagon Fellos.*—February 26, 1867.—In this machine for sawing wagon fellos a cylindrical saw is employed, and the described contrivances are for holding and feeding the block to be sawed, and delivering the fellow after it is sawed.

Claim.—First, so arranging the adjustable saw table E and slotted dogs e' and e'', in relation to the concentric saws a and b, that the piece to be cut shall project beyond the table and be supported by the dogs alone after being separated, and fall when the dogs are retracted, substantially as set forth.

Second, the arrangement of the adjustable table E, vertical guides h, supporting rods l l, and plate thereto attached, sliding upon the depending guide h and lever Q, substantially as set forth.

62,409.—DAVID GREEN, Brookfield township, Ohio.—*Composition for Roofing.*—February 26, 1867.—The bituminous coal is ground fine and mixed with coal tar to the consistency of mortar. It is applied to roofing boards, felt or paper.

Claim.—Reducing bituminous coal to flour, and mixing it with coal tar, and using it for roofing and

other purposes for which the composition may be useful.

62,410.—WILLIAM B. GUERNSEY, Norwich, N. Y.—*Butter Box.*—February 26, 1867.—The two end portions are boxes having outer closed ends. The middle portion is a double cover into which the others slip half way, their contents (if full) coming against the diaphragm in the middle portion. The edges of each portion meet and those of the boxes are united by an inner longitudinal strip, and those of the outer one by an outer strip. The boxes have a double shell over one half their length and an outer strip to secure it.

Claim.—The combination of three cylindrical parts or sections A B C made of thin strips of wood or pasteboard united flush at the edges and fitted together to form a butter box having two compartments, substantially as herein described.

62,411.—WILLIAM B. GUERNSEY, Norwich, N. Y.—*Packing and Preserving Butter.*—February 26, 1867.—The fatty and oily matters of the butter are excluded from the fibers and pores of the wood. The packing cases are made by saturating the wood with paraffine instead of merely coating it.

Claim.—First, a wooden box or containing vessel saturated with paraffine, substantially as described.

Second, the use of paraffine to protect the glued or cemented joints of wooden boxes or packages from the effects of moisture from the atmosphere or from contained substances.

62,412.—DAVID HAGUE, Balville Township, Ohio.—*Gate.*—February 26, 1867.—The gate is unlatched and slipped so as to clear the post and then raised by depressing the lever of the cam. It may then be pushed half open and rotated, or it may be rotated at right angles without raising.

Claim.—First, a sliding, rotating, and raising gate constructed and operated in the manner substantially as shown and described and for the purpose set forth.

Second, the combination of lever cam j, sliding bar i, guide pieces or slats h h, and the gate or its bars a a, constructed, arranged and operating in the manner substantially as shown and described and for the purpose set forth.

62,413.—C. P. HALE, Calhoun, Ky.—*Cane and Sorghum Stripper.*—February 26, 1867.—Each jaw has a concave-edged knife, the movable one being closed against the other by a spring to decrease the opening through which the stalk is pushed and drawn. A knife on the stock is used for topping.

Claim.—First, an improved cane stripper formed by the combination of the hollow or concave knives B and D and the jaws A and C with each other when said jaws and knives are constructed and arranged substantially as herein shown and described.

Second, the combination of the spring G with the movable jaw C, substantially as herein shown and described and for the purpose set forth.

Third, the combination of the knife H with the stationary jaw A, substantially as herein shown and described.

62,414.—THOMAS S. HALL, Stamford, Conn.—*Railroad Switch Alarm.*—February 26, 1867.—A continuous alarm is sounded at the station as long as the switch is not in continuity with the main rail; this indicates its temporary connection with a side track and suggests its readjustment.

Claim.—First, the combination of a railroad switch with an electric signal or alarm apparatus, substantially as described, so that the switch in its movement to either side of the line rail shall close the electric circuit and sound the alarm, and when in its proper line shall break and leave the circuit broken, using therefor the mechanical devices set forth, or any suitable mechanical equivalent.

Second, in combination with the switch the slotted lever F, the swivel head C, the plate g, and the metallic connections h h', for operating an electric signal apparatus.

62,415.—HENRY HAMMOND, Hartford, Conn.—*Cartridge Pouch.*—February 26, 1867.—Several branch tubes connect with a common discharge tube; the lower cartridge in the latter is sustained by pawls

beneath its flange. The mouth piece is pulled down and released, which double motion drops one cartridge and catches the next in series. When one pocket is empty the case is partially rotated to bring its inlet aperture in correspondence with another magazine tube.

Claim.—First, the arrangement of the valve tube with one or more openings *ff'*, which can be turned to admit the cartridges from one cartridge tube at a time, having also a ratchet or catch fastening capable of being turned through the proper angle and of being held in the proper position by a spring, substantially as herein described.

Second, the valve *p* for preventing the cartridges from passing the proper tube and clogging the discharge pipe.

Third, the peculiar manner of securing the pawls *g g'* and *h h'* in the tube *c* by placing them in properly formed sockets and then slipping over the whole the shell *d*, substantially as herein described.

Fourth, the peculiar mode of attaching the cartridge tubes to the branches of the discharge pipe by means of a screw thread and ferrule, substantially as herein described.

62,416.—D. JONES HAPPERSETT, Coatesville, Pa.—*Heating Stove.*—February 26, 1867.—The calorific current passes in a spiral course around the central chamber which communicates with the exterior atmosphere by pipes.

Claim.—The combination with the central air chamber *C* and winding flue *D* of one or more pipes *B* for conducting the air into the air chamber at a point above the fire chamber, substantially as and for the purpose set forth.

62,417.—GEORGE HASECOSTER, Richmond, Ind.—*Window Shade.*—February 26, 1867.—The slats are formed of paste-board or card-board and are united by a warp of colored threads.

Claim.—A window shade composed of slats or strips of paper and woven in the manner described.

62,418.—ISAAC HENDERSON, Philadelphia, Pa.—*Fire Escape Ladder.*—February 26, 1867.—The frame is suspended from the window and has a rope ladder whose steps are secured steadily in place by cords which tie them to the strands of the rope.

Claim.—The cords *D* passing through the side holes of the steps *B* and between the strands of the rope *A* above and below the steps, securing the steps to the ropes and preventing them from turning beneath the feet, substantially as described.

62,419.—ROBERT HENEAGE, Buffalo, N. Y.—*Propelling Car Brake.*—February 26, 1867.—A friction wheel is fixed on the axle with an arm on each side, these arms being bent at the rear ends and pivoted to a rod which is pressed forward by a spring coiled upon it. The arms are capable of alternate or united application to the wheels and are pressed into connection by levers operated by treadles which have rollers at their points of contact with their arms. The power of the momentum is stored in this spring and used to overcome the inertia of the car in starting, or both arms can be applied at once to stop the car suddenly.

Claim.—First, the combination of the friction wheel *D*, curved brake bars *E E'*, pivoted to the spring rod *F*, sliding rollers *e e'*, with their actuating rods and foot levers *h r*, arranged and operating as and for the purposes set forth.

Second, the double-acting brake consisting of the two pivoted brake bars *E E'* capable of alternate and conjoint application to a friction wheel *D*, substantially in the manner and for the purpose set forth.

Third, the rollers *e e'* provided with movable boxes *j* when used in operating the brake bars *E E'*, for the purpose and in the manner specified.

62,420.—A. E. HOVEY, West Waterford, Vt.—*Truck.*—February 26, 1867.—The devices are particularly adapted to what is known as the "California crane-neck trucks," and are explained by the claims and illustration.

Claim.—First, the annular plate *B* provided with a pendant flange *g* and connected to the front ends of the crane-necks *A* in combination with the annular plate *F* provided with the bars *b b* and the pin *G*, the

joke *E*, with the axle *D* fitted within it, all constructed and arranged substantially as and for the purpose herein set forth.

Second, the india-rubber springs *I* when combined and arranged with the parts above specified, substantially as and for the purpose set forth.

62,421.—ORADIAH HOPKINS, Hackensack, N. J.—*Road Scraper.*—February 26, 1867.—The angle of presentation of the shod foot of the scraper is regulated by the draft chains. The driver stands on the platform, holds on by one handle and dumps by the other when desired.

Claim.—A road scraper made in manner and for the purpose substantially as described.

62,422.—WILLIAM R. IDLE, Urbana, Ohio.—*Quilting Frame.*—February 26, 1867.—The rollers on which the quilt is wound are journaled in the side pieces and have metallic collars whose flanges are perforated to engage a hook to prevent rotation. The sides of the quilt are extended by sliding hooks on inner side bars which carry an adjustable guide bar to direct the course of the needle. The frame is supported on rollers.

Claim.—The cross slides *C*, the ratchet and pawl *k i*, the gauge *D*, the thumb screw *m*, the rods *A*, and the head pieces *B*, constructed, arranged, and operating substantially as described for the purposes specified.

62,423.—LEMUEL P. JENKS, Boston, Mass., assignor to EDWIN A. EATON, same place.—*Water Meter.*—February 26, 1867.—Cannot be briefly described other than substantially in the words of the claims. The motions of the piston are governed by valves and recorded by an indicator.

Claim.—First, the arrangement of a meter or a motor of two valves, each one being both for induction and ejection, the said valves being connected together and acting alternately, in separate chambers or valve tubes, when the same are used in reciprocal action with a piston, and actuated by percussion, all substantially as and for the purpose described.

Second, actuating the valves of a meter or of a motor by the alternate percussion of two hammers upon inclined planes connected with the valves, the hammer being operated by the motion of a piston, all substantially as and for the purpose described.

Third, the arrangement in combination with the hammers of the pawls or latches with their respective springs to retain the hammers at their highest elevation when the same are actuated by the piston discharging said pawls, all substantially as and for the purpose described.

Fourth, with a meter or motor, the device of the horns or projecting inclined planes attached to the piston for the purpose of raising the hammers when the same operate substantially as and for the purpose described.

Fifth, the arrangement in a meter or in a motor of a piston containing cylinder and a valve containing cylinder when the valves are operated by percussion, all substantially as and for the purpose described.

Sixth, the general arrangement and construction of the machine represented, all substantially as and for the purpose described.

62,424.—ALVA F. JENNINGS, Sherman, N. Y.—*Refrigerator for Milk.*—February 26, 1867.—The sheet metal pan is supported in a wooded trough and has a longitudinal supporting slat which is gained transversely for the passage of the air or water which the trough contains. An end leg is pivoted to the trough which furnishes means for lowering that end to discharge the contents of that and the pan through the bottom, the trough being balanced on legs at mid-length.

Claim.—First, the combination with the sheet metal pan *E* and its enclosing wooden case *A* of the bar *I I* attached to the bottom of the said pan and removable therewith, constructed and arranged substantially as and for the purposes set forth.

Second, in combination with the pan *E* and refrigerating case *A*, the cover *O*, provided with a transparent center *m* of double thickness, in the manner and for the purposes described.

Third, the combination of the adjustable leg *D* with the milk-pan receptacle *A* and stationary legs *D C*, the

arranged and operating as and for the purpose specified.

Fourth, in combination with the pan E and its receptacle A, the removable slide k and plug orifices *j j* of the cover H for forming a passage for the circulation of air under and around the pan after the milk is sufficiently cooled with ice or water, substantially as set forth.

62,425.—HOWARD C. KEITH, Ancona, Ill.—*Beehive*.—February 26, 1867.—The hive is adjusted in height by eccentric cams on which it rests, and is fixed by a screw pin on the hive which enters the slot of a plate on the stand.

Claim.—The body A provided with eccentrics D and screws *d* in combination with the bottom C and slotted plates F for the purpose described, substantially as specified.

62,426.—JARED KELSEY and JOHN McLAIN, St. Mary's, Ohio.—*Farm Gate*.—February 26, 1867.—The drop bar has holes by which the gate may be held shut or open to a slight extent for the passage of an animal. A vertical series of slide bars in the frame furnish means to limit the opening to suit the size of stock to pass through. The drop bar has a rope attached for convenience of equestrians.

Claim.—The drop guide bar K, stock divide and hog lock O P Q, horseman's arrangement N, gate guide D, the washers E and F, and the mode and manner in which the different parts are combined, as herein described for the use set forth.

62,427.—GEORGE H. KIRK, Philadelphia, Pa.—*Ice Sled*.—February 26, 1867.—A "dog" is reciprocated by means of its connection to a wrist on a pulley which is rotated by the rider to propel the sled.

Claim.—The combination and arrangement of the toothed arm L, crank wheels J, and pulleys G I, and band K, or equivalent, with each other and with the frame of the sled, substantially as herein shown and described and for the purpose set forth.

62,428.—BERNHARD KOECHLING, New York, N. Y.—*Folding Chair*.—February 26, 1867.—The seat is pivoted in the metallic side pieces and the gudgeon of the pivot pin has catches which are so shaped as to stop the seat in its vertical or horizontal position against an abutment on each side of the pivot. Sufficient play is allowed to fit the device for seats in a curved line.

Claim.—First, the arrangement of the stop pins *c c* which fit into the mortise *d*, as seen, and by which the seat C is supported both in rear and in front of the pin *b* on which the seat is hung, substantially as herein shown and described.

Second, the straps *f* fitted in oblong slots in the side pieces A in combination with the backs D, substantially as and for the purpose herein shown and described.

62,429.—LEWIS A. LIPP, Coatsville, Pa.—*Ice Cream Freezer*.—February 26, 1867.—The dasher has vertical reciprocation by the play of a crank pin in a horizontal slot of its cross-head. The vertical and pivoted scrapers have rotary and reciprocating motions respectively to clear the can sides. The paddles throw the cream outward. The can may be rotated or the dasher reciprocated singly if desired.

Claim.—First, an improved dasher or stirrer formed by the combination of the vertical scraper S, pivoted scraper T, and pivoted paddles V, with the dasher handle, substantially as herein shown and described.

Second, an ice-cream freezer in which a vertical motion is imparted to the dasher and a rotary motion to the receiver to be operated either simultaneously or separately, substantially as described.

Third, the combination and arrangement of the gear wheels D E K and shafts F J with each other and with the receiver B, crank L, and frame G, substantially as herein shown and described for the purpose of enabling the receiver B to be revolved and the dasher operated at the same time or separately as set forth.

62,430.—C. H. LITTLEFIELD, Turner, Me.—*Sulky Plow*.—February 26, 1867.—The plow beam is so connected to the upper beam as to allow transverse vibration by a handle at its rear and is adjustable

vertically. The fore end of this beam may be raised by a hand lever.

Claim.—The slotted iron guide *g*, made fast to the cross-bar D, and the vibrating iron guide *g'*, connected with the axle B, in combination with the rod *h* and plow beam G, arranged and operating substantially as and for the purposes herein described.

62,431.—JOHN A. W. LUNDBERG, San Francisco, Cal.—*Automatic Fan*.—February 26, 1867.—The device is suspended from the ceiling and the fan rotated by the clock work attached.

Claim.—The frame B, bearing the shaft R, to which is attached the fan C, having metallic frame *c'*, when constructed and arranged to operate with the clock work, as herein set forth.

62,432.—JESSE K. MARSH, Terre Haute, Ind.—*Preserving Eggs*.—February 26, 1867.—The eggs are placed in a tight cask and any effective preservative solution poured in. The cask is then rolled to coat the eggs, and occasionally reversed afterward to prevent the heavier parts of the eggs from settling.

Claim.—Applying a composition or solution for the preservation of eggs, substantially as herein described, and agitating the same, as and for the purposes set forth.

62,433.—HENRY MATTHEWS, Brooklyn, N. Y.—*Life-Preserving Seat*.—February 26, 1867.—The watertight case is fixed to the floor as a seat, and may be removed to act as a life preserver. Loops on the waist of the support afford means for the attachment of straps for securing it to the person.

Claim.—The ring *e*, in combination with the hollow chamber *b*, having seat *a* and loops *g*, substantially as described, for the purpose specified.

62,434.—H. MORRISON, Steubenville, Ohio.—*Foot Rest and Kneeling Board*.—February 26, 1867.—The foot board is pivoted to the ends of the pew and is cushioned below. It is reversed to serve as a kneeling board. In the latter service a rubber spring is brought into operation.

Claim.—The combination of the rubber springs F and bearings *e' e'*, with foot rest and kneeling board D, and with the end boards C of the pew, substantially as herein shown and described, and for the purpose set forth.

62,435.—J. H. NONAMAKER, Middletown, Pa.—*Reversible Dumping Sled*.—February 26, 1867.—The sled projects above and below the floor and the runners are rounded at each end. It is drawn by a chain looped on to a hook, which is disengaged to bring the dumping chain into action.

Claim.—First, the draft hook D, constructed substantially as herein shown and described, and for the purpose set forth.

Second, making the sled reversible by forming runners B upon both sides of its bottom or floor A, substantially as herein shown and described.

Third, rounding off both ends of the runner, so that the sled may be drawn with either end forward, substantially as herein shown and described.

Fourth, the combination and arrangement of the chains E and C with the ends of the sled and with the draft hook D, substantially as herein shown and described.

62,436.—WALTER B. NOYES, Dorchester, N. H.—*Saw Mill*.—February 26, 1867.—Traveling ahead of the circular saw is a revolving cutter hung upon an adjustable frame, and operating to ross and clean the log in advance of the saw. The roser is journaled in a frame and is adjusted vertically by a wheel whose points rest upon the bark.

Claim.—The cutter wheel *f*, cutters *g*, guide wheel *k*, provided with points, when constructed and arranged to operate as and for the purpose specified.

62,437.—JAMES T. PAGE, Rochester, N. Y.—*Gridiron*.—February 26, 1867.—Explained by the claim and illustration.

Claim.—As a new article of manufacture, an open bottom sheet metal utensil having its lower edge turned up to form the annular groove or channel *d*, provided with the wire grating *a* and cover *b*, com-

bined and arranged substantially as and for the purposes set forth.

62,438.—ALEXANDER PARSONS, Portland, Me.—*Lamp Burner.*—February 26, 1867.—A spring loop is hinged to the burner and rests upon the flanged foot of the chimney. By it the glass is held when tilted back to expose the wick. A clutch holds the ends of the loop together. A similar loop may hinge the burner to the collar on the reservoir.

Claim.—First, the helix C, in combination with the ring E, loop F, and shoulders D, as and for the purposes specified.

Second, the ring L, when employed as and for the purposes set forth.

62,439.—WILLIAM PERRY, North Bridgewater, Mass.—*Steam Digester for Treating Bones.*—February 26, 1867.—For the treatment of animal bones with steam to soften and prepare them for grinding into a fine powder for use as a fertilizer. The bones are exposed to the direct action of steam for eight or ten hours. The contents of the retort are constantly drained and the water of condensation is blown off with the fatty and gelatinous matter in the bones which are dissolved by the steam; the bones themselves remaining in the retort till rendered friable.

Claim.—First, the combination of the suspended retort or digester A and the hinged steam-tight caps *d d'* on the charging and discharging openings, substantially arranged and employed as and for the purposes herein described.

Second, the stopper *m* and the diaphragm *n*, in combination with the discharging cap *d'* and the ejection pipe *p*, arranged and operating substantially as and for the purposes specified.

Third, the steam-tight couplings *c* and *c'* on the pipes *b* and *p*, respectively in combination with the suspended retort A, for disconnection therewith, as and for the purposes herein described.

62,440.—EDWARD PORTER, Clinton, Ill.—*Apparatus for the Manufacture of Sugar and Sirup.*—February 26, 1867.—The saccharine juice is purified by passing it through a series of boxes, with filters attached connected by tubes, to pass the juice to the evaporator without agitation. The granulating boxes are placed in tiers and connected by perpendicular tubes.

Claim.—First, the adjustable tubes F F, filter E, and vats C C, substantially as and for the purpose set forth.

Second, the granulating boxes *e e e* and tubes *c*, when arranged substantially as shown and for the purpose set forth.

62,441.—MOSES POWE, Mount Bethel, Pa.—*Tuyere.*—February 26, 1867.—The tuyere has a dome-shaped top, a cruciform blast opening through the grate piece, an air chamber with a spherical bottom and conical top and a tapered channel for the admission of air.

Claim.—The box A, having a spherically-formed top, hemispherical chamber *a*¹, tapering channel *a*², and grate B, formed with a cross-shaped slot *b*¹ and cone-shaped cavity *b*², constructed and operating as herein shown and described.

62,442.—GEORGE RACE, Norwich, N. Y.—*Lifting Jack.*—February 26, 1867.—The frame is run beneath the axle; the movable block adjusted upon the tapering block and the latter vibrated upward by an eccentric.

Claim.—First, the eccentric operated by a hand lever in combination with the inclined tapering lever and adjustable leveling block, substantially as and for the purposes herein set forth.

Second, the arrangement of the movable block D as secured to the taper lever C, for regulating the height of the jack to operate in the manner herein described.

62,443.—CHARLES B. ROGERS, Plainfield, N. J.—*Clothes Dryer.*—February 26, 1867.—Attached to the central stem are collars with sockets at their corners for the arms which connect at their outer ends with the posts. The latter are drawn outward from the central stem to bring the arms into effective position, or thrust in to bring the dryer into smaller compass.

Claim.—A clothes horse having its arms D attached to or connected with the standard A by means of the notched metal plate C, provided at each corner with an inclined projection *a*, horizontal pins *b*, and grooves *d*, substantially as herein set forth, for the purpose specified.

62,444.—CHARLES H. SANBORN, Roxbury, Mass.—*Coffer Dam.*—February 26, 1867.—The coffer dam is sunk by removing the soil and sand from beneath it by a current of water carried through and ejected below it.

Claim.—A coffer dam or cylinder or box so constructed that a stream of water may be directed through it, or so arranged that an artificial current of water may be directed under it, as and for the purposes described.

62,445.—JAMES SARGENT, Rochester, N. Y.—*Securing Lock Spindles in the Doors of Safes, &c.*—February 26, 1867.—Explained by the claim and illustration.

Claim.—The spindle B, provided with the enlargement or swell *c* and bearings *f f*, when imbedded directly in the safe without intermediate parts, so as to form a fixture of the door, substantially as herein set forth.

62,446.—JAMES SARGENT, Rochester, N. Y.—*Spindle of Safe Locks.*—February 26, 1867.—When struck by the sledge, the shoulders cut into the metal and oppose a more effective resistance than a conical spindle without shoulders.

Claim.—The combination of the series of steps or offsets *g g* with the conical spindle B, when applied in safes substantially as and for the purpose herein set forth.

62,447.—JAMES P. SELSOR, Shelbyville, Mo.—*Cotton Planter.*—February 26, 1867.—The grooved rims of the wheels gather and press the earth upon the seed. The carriage is tilted by changing longitudinally the position of the seat, which thus raises or depresses the forward frame, which contains the seed hoppers, droppers, markers, and covers, and suspends or starts the motion work. The frame is hinged at its rear to the carriage, and supported by the team forward.

Claim.—First, the combination with the frames A and H, which are hinged together as described, of the grooved transporting wheels B B, turning shaft C, spur wheels D D' E' j, removable shaft *h*², screw-distributing shaft *h k*, seed hoppers L, markers J, and covers *c e*, all arranged and operating substantially as described.

Second, in combination with the hinged frames A and H, the arrangement of the spur wheels upon said frames in such manner that the two wheels *j* and *E'* will be disengaged by the upward movement of the front end of frame A, substantially as described.

Third, the application of independently-adjustable covers *e e* to a frame H, which is hinged to a frame A, in combination with the grooved pressing wheels B and the adjustable clearers or scrapers *b b*, all arranged and operating substantially as described.

Fourth, the combination of the socketed distributing screw shafts *h k* with the intermediate removable driving shaft *h*² and spur wheel *j*, applied to the hinged frame H, substantially as described and for the purpose specified.

62,448.—WINFIELD S. SIMS, Newark, N. J.—*Tobacco Pouch.*—February 26, 1867.—The plug being removed, the nozzle is inserted in the pipe bowl, and the tobacco struck into the latter by the plunger, whose end is secured in the bottom of the flexible bag.

Claim.—A tobacco pouch provided with a rod E, or its equivalent, substantially as and for the purpose described.

62,449.—DANIEL E. SOMES, Washington, D. C.—*Processes and Apparatus for Curing and Packing Meat, and for other purposes.*—February 26, 1867.—Curing, packing, and other operations are carried on in houses artificially cooled, dried, and purified, and provided with non-conducting walls and devices for controlling the circulation of air.

Claim.—First, the process for preserving animal

and vegetable substances, substantially as herein described.

Second, construction of buildings, fixtures, and apparatus, substantially as and for the purpose set forth.

Third, compressing air, gas, and liquids, substantially as described and for the purposes specified.

Fourth, the combination of the buildings, apparatus, and devices, substantially as set forth.

Fifth, the buildings and apparatus, in combination with process, substantially as described and for the purposes set forth.

Sixth, as forming part of an establishment for curing and packing meat, the following three classes of devices and processes in combination, viz: means and devices for cooling, for drying, and for purifying, substantially as described.

Seventh, means for excluding warm air, dust, insects, &c., in combination with means for cooling the air admitted, substantially as described.

Eighth, means for excluding warm air, dust, and insects, &c., in combination with means for purifying the air admitted.

Ninth, means for excluding warm air, dust, insects, &c., in combination with the means for drying the air admitted, substantially as described.

Tenth, salting and packing meat in buildings constructed for the exclusion of warm air, substantially as described.

Eleventh, the use of deutoxide of nitrogen, sulphurous acid, alkaline sulphites, or other equivalent deoxidizing substances in salting and curing meat, substantially as described.

Twelfth, curing meat by means of gases under pressure, substantially as described.

Thirteenth, curing meat by means of materials in fine powder by pressure, substantially as described.

Fourteenth, utilizing the offal and other waste products from slaughter and packing houses by means of cooling, drying, and preservative agents, substantially as described.

Fifteenth, the use of pressure and agitation in salting meat, substantially as described.

Sixteenth, apparatus for carrying the cattle to the slaughter house, substantially as described.

Seventeenth, the construction of a sugar house, with means herein specified for excluding heat, dust, and insects.

Eighteenth, cooling cane juice by the employment of the means substantially as herein described.

Nineteenth, lowering the temperature of air in sugar houses, substantially as set forth.

Twentieth, purifying the air admitted to sugar houses, substantially as described.

Twenty-first, constructing sugar houses with walls, roofs, floors, windows, screens, and ventilators, substantially as described.

Twenty-second, preventing fermentation, by means substantially as herein described.

62,450.—WILLIAM SPILLMAN, Columbus, Miss.—*Apparatus for Making Lead Pipe.*—February 26, 1867.—In connection with a common apparatus for making lead pipe is a funnel and stop-cock, for the purpose of admitting within the cylinders anything that will generate gas or steam, to assist in the expansion of lead from the cylinder.

Claim.—The funnel D and stop-cock E, arranged as described, in combination with the cylinder A, tube C, and water tank G, substantially as and for the purposes set forth.

62,451.—JOHN H. STONE, Philadelphia Pa.—*Manufacture of Pepper Boxes.*—February 26, 1867.—The catch pieces projecting from the bottom of the cylindrical portion are passed within the slits in the molding of the base.

Claim.—A sheet metal pepper or dredging box, having its bottom B detachably secured to its body A by means of the projections $a^2 a^2$ left on the body, and the angular catches $b^2 b^2$ formed on the bottom, the same being arranged to operate together, substantially as and for the purpose described.

62,452.—J. M. SWAIN, Howard, Ind.—*Harvester.*—February 26, 1867.—The grain may be dropped in gavels from the platform of the machine by the movement of a lever by the driver; or the attachment may be moved into a horizontal position, and the grain

raked from it by a person occupying a seat in rear of the driver.

Claim.—The grain platform Q, provided with journals $e e'$, adapted to be fitted in bearings in bars f or plates f' , in combination with the seats G and H, all constructed and operated substantially as described.

62,453.—LEONHARDT UTTING, Philadelphia, Pa., assignor to CONRAD LIEBRICH, same place.—*Hasp for Trunk Locks.*—February 26, 1867.—The upper portion is secured to the front of the trunk lid. The lower portion has a staple for entering the lock and receiving the bolt, and passes through a slot in the upper, in which it is journaled without a pinle.

Claim.—A trunk hasp, composed of the two portions A and B hinged together, substantially as and for the purpose herein set forth.

62,454.—JOSIAH V. WALDRON, New York, N. Y., assignor to himself and GEORGE OBERLANDER, same place.—*Rosette.*—February 26, 1867.—A central screw enters the cup, which secures the covering of the rosette and affords a point of attachment for the streamers.

Claim.—The combination with the rosette frame of the inner cup-shaped plate H and screw J, or its equivalent, substantially as and for the purpose described.

62,455.—JAMES T. WALKER, Palmyra, N. Y.—*Wrestling Toy.*—February 26, 1867. The figures are connected by their arms, at whose mid-length the suspending rod is pivoted.

Claim.—Each pair of arms constructed of one piece, which is pivoted at both ends to the bodies of the figures, operating in the manner described and for the purpose specified.

62,456.—HERVEY WATERS, Boston, Mass.—*Blank for Hoes.*—February 26, 1867.—This blank is a bar of iron with a shank, integral therewith, projecting from each end. The bar has such proportion that, when rolled out, two hoe blades, each with its proper shank, shall be formed thereof. The two blades are connected by those portions which when separated will constitute the cutting edges.

Claim.—A blank, made substantially as described, and as shown in fig. 1.

62,457.—J. V. WEITZ, Cleveland, Ohio.—*Steam-Engine Governor.*—February 26, 1867.—The hollow cylindrical steam valve is moved by a rock shaft, and the steam port at its lower side is brought into connection with the two steam induction ports alternately. The stirrup of the governor adjusts the anti-friction rollers in the slot of the lever, so as to give a greater or less degree of vibration to the valve. In case of the falling of the balls by the slipping of the belt, the steam is shut off by devices not describable in brief.

Claim.—First, the tubular shaft H' , stem or rod a' , in combination with the screw sleeve F' , links J' , cross-head I' , arranged in the manner and for the purpose as described.

Second, the steam-balance valve F' , ports J H, and K, as arranged in combination with the chamber A and auxiliary chamber A' , for the purpose and in the manner set forth.

Third, the levers $M M'$, rollers $d e f$, and stirrup E, as arranged in combination with the shaft G and valve F, for the purpose and in the manner as herein described.

Fourth, the shaft H' , screw sleeve F' , levers M and M' , and rollers $d e f$, as arranged for the purpose and in the manner specified.

Fifth, the screw sleeve F' , wheel G' , and rod a' , as arranged in combination with the stirrup E, levers $M M'$, for the purpose and in the manner as set forth.

62,458.—JOSEPH E. WEST, Georgetown, Ky.—*Corn Planter.*—February 26, 1867.—The draft frame has a single wheel, and is connected by hounds to the tongue. It is arranged to plant three rows at once, having a marker, seeder, and coverer to each. The bar which actuates the seed slide in each box is vibrated by a hand lever in the rear.

Claim.—The combination of the sliding valve bar H, operating levers K, and handle M, with each other and with the seed boxes F, substantially as herein shown and described.

Second, the combination of the blocks I and springs J with the seed boxes F, and with the sliding-valve bar H, substantially as herein shown and described and for the purposes set forth.

Third, an improved corn planter, formed by the combination and arrangement of the roller or wheel D, draft bars B, frame C, seed boxes F, springs J, blocks I, sliding-valve bar H, levers K, handle M, beams G, uprights O, shovel plows N, and bull tongues or coverers P with each other, substantially as herein shown and described.

Fourth, forming the bull tongues B with long, bent iron shanks and adjustably securing them to the beams G by the keys R, substantially as herein shown and described.

62,459.—CASSIUS A. WHITE, Fairfield, Vt.—*Washing and Wringing Machine.*—February 26, 1867.—The heater is made in two parts, one sliding upon the other, receiving a vertical and lateral motion by means of cranks. Combined with this device are feeding aprons and wringers.

Claim.—First, the washer, formed by the combination of the frames E and F with each other and with the shafts G and I, substantially as herein shown and described.

Second, the roller R fitted in stationary bearings, and the roller S mounted on adjustable bearings on the cross-bar T, operated by the eccentric *w*' on the cam shaft U, in the manner described, for the purpose specified.

Third, the combination of the washer E F and conveyor L M N O, with each other and with the wringer R S, substantially as herein shown and described.

62,460.—M. P. WILKINS and C. D. ROGERS, Jersey City, N. J.—*Manufacture of Brushes.*—February 26, 1867.—Each bunch of bristles is secured to the holder by means of a star-shaped plate whose prongs are driven into the socket.

Claim.—In the manufacture of brushes the pronged cap D, made of metal or other suitable material, substantially as and for the purpose described.

62,461.—ROBERT B. WRIGHT, Vermillion, Ill.—*Planting Machine.*—February 26, 1867.—The front plows open the furrow into which the seeds falls from the spouts. The seed slides are actuated by pins on a wheel which is rotated by a band from a drum on the revolving axle. The seed is covered by the rear plows, which work one on each side of each furrow.

Claim.—First, the two shafts D D', connected by the rod E, and provided with standards F G, having plows *b b'* respectively attached whereby the plows of both standards may be simultaneously raised by the operator or driver, substantially as set forth.

Second, the rotating of the shaft Q from the axle by means of a belt R, arranged in connection with a friction roller S, substantially as and for the purpose specified.

Third, the seed slides M M, in combination with the springs N N, and the wheels P P, provided with the pins *ff*, all arranged to operate in the manner substantially as and for the purpose set forth.

62,462.—S. W. WRIGHT, Ellsworth, N. Y., assignor to himself and S. J. WRIGHT, same place.—*Bolt-cutting Shears.*—February 26, 1867.—The levers have blades between the respective pivoted points at which they are connected to the cross-bar.

Claim.—The cutting levers A A and the cross-piece B, constructed, arranged and combined substantially as herein shown and described, and for the purposes set forth.

62,463.—ALBERT M. ZABRISKIE, Bergen Point, N. J.—*Joint Groover for Brickwork.*—February 26, 1867.—The plate has a handle on its back, a rounded front end and a dovetailed projecting rib beneath, whose purpose is to make receding grooves in brickwork to enable stucco to form a bond therein.

Claim.—The said new tool or implement made substantially as described, viz., of the tapering and dovetailed blade C, the plate A, and the handle B, arranged substantially as specified, and to be used in manner and for the purpose as hereinbefore explained.

62,464.—DAVID ALTER, Freeport, Pa.—*Apparatus for the Manufacture of Bromine and Iodine.*—

February 26, 1867.—The retort for the distillation of iodine and bromine is made of solid stone, with a leaden flue passing through it from side to side, and heated by a furnace supported on wheels for convenience of removal.

Claim.—The stone box and lid with the leaden flue, as above described, to be employed as a retort for the manufacture of bromine and iodine.

62,465.—ALEXANDER J. BERGEN, Brooklyn, N. Y.—*Breech-loading Fire-arms.*—February 26, 1867.—The barrel is thrown forward and back to allow it to tilt or secure it against the breech by an eccentric actuated by a lever. The bearing block intervenes between the eccentric on the forward side and a hook block at the rear which projects from the under side of the barrel and engages a recess in the breech block.

Claim.—The block *l*, in combination with the eccentric *k*, and hooked block *g*, substantially as and for the purposes specified.

62,466.—ALEXANDER J. BERGEN, Brooklyn, N. Y.—*Metallic Cartridge.*—February 26, 1867.—Explained by the claims and illustration.

Claim.—First, the cartridge case *a*, formed of sheet metal, with a dome-shaped end *b* and a central teat *c* for the fulminate, in combination with the flange *e*, surrounding the case, as and for the purposes set forth.

Second, the movable flanged teat *i*, in combination with the said flanged, dome-shaped sheet metal cartridge case, as and for the purpose set forth.

62,467.—ALEXANDER J. BERGEN, Brooklyn, N. Y.—*Priming Metallic Cartridges.*—February 26, 1867.—A depression in the dome-shaped rear plate receives the open end of the fulminate nipple.

Claim.—A movable fulminate nipple, projecting from the rear end of, and in combination with, a cartridge case, formed with a cavity in the rear end for the reception of said nipple, substantially as set forth.

62,468.—LEANDER W. BOYNTON, Hartford, Conn.—*Apparatus for Drying Wool.*—February 26, 1867.—The wool is placed in a rotary cylinder having closed ends and a wire cloth periphery and a hollow axis, through which steam is admitted. The steam passes from the cylinder to the annular chamber within the case, and is ejected by the fan.

Claim.—The combination of the internal cylindrical vessel D, and its induction part *a* with the cylindrical case A, &c., fan *c*, eduction port *d*, when the whole is constructed and arranged and made to operate and produce the result, substantially as herein described and set forth.

62,469.—LEANDER W. BOYNTON, Hartford, Conn.—*Apparatus for Preparing Peat for Fuel.*—February 26, 1867.—The cast-iron frame has at one end a hopper containing tearing rollers, and below the hopper two pressing rollers, between which the peat is compelled to pass to the traveling band, which delivers it to a hopper placed directly against the molding cylinder. The blocks of peat are expelled from the molds and fall upon an endless band which travels in a drying chamber heated by steam pipes.

Claim.—First, the combination of the grinding cylinder *c* and *b* with the spurred rollers, or roller and spurred apron and hopper B, and when they are constructed, arranged, and fitted for use, substantially as herein described and set forth.

Second, the combination of the perforated pipe *j* for the high steam with the apron *d d*, and the exhaust fan C, when they are constructed, arranged, and fitted for carrying and drying the peat, substantially as herein described and set forth.

Third, the molding and pressing cylinder D, as described in my patent issued December 27, 1864, in combination with the apron F and zig-zag pipe *p*, when they are constructed, arranged, and fitted for molding and drying peat, substantially as herein described and set forth.

62,470.—T. I. BURHYTE, Fond du Lac, Wis.—*Churn.*—February 26, 1867.—The churn is placed in a box which contains water to temper the cream. The box oscillates on bearings, and has a pendulum weight.

Claim.—First, the churn A, provided with the water chamber B at its bottom, and the removable

grate *b*, and having the tubes *a c* and *n*, arranged as shown and described.

Second, in combination with the platform *L*, pivoted to the supports *E*, the pendulum rods *C* and the adjustable box *D*, or its equivalent, arranged to operate as set forth.

62,471.—*J. T. CARPENTER, Harrisburg, Pa.*—*Broom Head.*—February 26, 1867.—The serrated clamping jaws have eyes on their inner sides to receive the taper end of the handle, by which they are drawn and held together.

Claim.—The jaws *B B*, constructed as described, with their loops *a a'*, when used in combination with the case or head *A* and tapering handle *D*, the whole constructed and used as and for the purposes specified.

62,472.—*MATTHEW T. CHAPMAN, Galcsburg, Ill.*—*Knife and Scissors Sharpener.*—February 26, 1867.—The central cutter plate has variously inclined edges, which in combination with the cutter jaws forms the proper angles for sharpening different articles.

Claim.—The sharpener plate *B*, having a V-shaped end terminating with parallel edges, and thence angularly and inwardly with parallel edges again, and operating in combination with the angular open metallic box *a*, constructed in the block *A*, substantially in the manner and for the purpose as herein described.

62,473.—*ROCKWELL CHAPMAN, Buchanan, Mich.*—*Water Wheel.*—February 26, 1867.—The wheel revolves in a vertical plane on a horizontal shaft. It receives water at the periphery, which after impinging against the radial buckets, has side escape. The hinged water gates are opened by chains connected to a roller. The central core has wedge-formed blocks whose thin projections are toward the upper side of the buckets when receiving water.

Claim.—First, a water wheel having the radial buckets *c* extending in a straight line across the face of the wheel, with the solid triangular projection *d*, in rear of said buckets, and the curved passages *b*, formed by the overlapping plates, the whole constructed and arranged as herein shown and described. Second, the combination of the hinged gates *n*, chains *l*, and roller *H*, arranged and operating as set forth.

62,474.—*GEO. E. CHENOWETH, Baltimore, Md.*—*Feed-water Regulator.*—February 26, 1867.—A close vessel, preferably transparent, is counterpoised by a weight and suspended at the altitude of water surface in the boiler. It communicates by pipes with the steam and water within. The weight of the vessel is varied by the change of water level in the boiler, and it is so connected to a cock in the supply pipe as to regulate the amount of water supply.

Claim.—The high and low water indicator for steam boilers furnished with a hollow ball at one end, which communicates with both the steam and water spaces in the boiler, and the counter or overpoise at the other end, and attached to the stop-cock on the supply pipe, so that the rising or falling of the water in the boiler, and the consequent increased or diminished quantity of water in the globe or ball shall close or open the supply cock, substantially as and for the purpose described.

62,475.—*WILLIAM COOK, Belvidere, Ill.*—*Car Coupling.*—February 26, 1867.—The entrance of the link into the draw head raises a sector-shaped pivoted spring catch by which it is held. The catch may be raised by a lever connected to it.

Claim.—First, the combination of the center enlarged link, with the segment catch and bumper, arranged and operating substantially as and for the purpose set forth.

Second, the combination of the segment catch, with a coiled spring placed in a recess in the catch, and acting between the bumper and catch, with a horizontal pressure to hold the catch in the link, substantially as set forth.

62,476.—*DANIEL G. COPPIN and GILBERT H. CLEMENS, Cincinnati, Ohio.*—*Lock up Safety Valve.*—February 26, 1867.—The operating parts of the valve are inclosed in two cases, from the lower

one of which the steam issues from the non-coinciding holes of two annular inclosing plates. The weight is an annular block, and loosely surrounds the valve stem. The two weight levers are attached to the weight at one end, and are pivoted to the main case at the other. They act on the valve through pins on which they rest, and are adjustable in the longitudinal slots of a cross-head of the valve stem. The valve may be raised by a cam on a hand-crank shaft, which traverses the encircling plates of the steam chamber.

Claim.—First, the body of case *A* and cap *B* to inclose the mechanism of the steam safety valve, in combination with the steam chambers *A'* and *A''*, with openings *a'*, bottom flange and guard below, with openings *a*, in the manner and for the purposes set forth.

Second, the arrangement of levers *C*, graduating arms *D*, steel points *d*, standards *E*, weight *F*, screw lugs *G* and saddle *I*, when constructed to operate with each other in the manner and for the purposes set forth.

Third, the arrangement of the steam chambers *A'* and *A''*, and openings *a'* and *a''*, as shown in the manner and for the purposes set forth.

Fourth, the ring projecting from the bottom face of flange, provided with openings *a*, as shown in Fig. 5, as set forth.

Fifth, the arrangement of the horizontal eccentric spindle, with reference to the fixed collar *h* on valve stem, as set forth.

62,477.—*DANIEL G. COPPIN and GILBERT H. CLEMENS, Cincinnati, Ohio.*—*Lock-up Safety Valve.*—February 26, 1867.—The weight levers are pivoted to an arched bar, which forms a guide to the upper end of the valve stem. The levers have graduated connection to the weight by links, having clamps to embrace and traverse slide lugs on said weight. The levers are connected to the cross head of the valve stem by pins near their pivoted ends. A ring bolt at its upper end enables the raising of the valve stem, but is not available for loading the same.

Claim.—First, the arrangement of the body *A* and cap *B* of the inclosing case for the mechanism of the safety valve, with the tube *A'*, valve *D*, ports *A' A'*, series of V-rings, hook lug *J*, lug *l*, guard *M*, and escape ports *A' A'*, in the manner and for the purposes set forth.

Second, the arrangement of the notched levers *C C*, valve and stem *D D*, graduating arms *D' D'*, with slots *d d*, steel points *I*, guide *E*, weight *F* with T-lugs *f f*, saddles *H H*, clamps *G G*, slotted pin and eye bolt *N*, in the manner and for the purposes set forth.

Third, the arrangement of the V-shaped rings with reference to openings *a* and chamber *A''*.

Fourth, the arrangement of the weight *F* with reference to the vertical tubular chamber *A''* and levers *C*, as herein set forth.

Fifth, the construction of the arch guide *E*, whereby to guide the valve stem, in the manner and for the purposes set forth.

62,478.—*GEORGE R. CRAMER, Cincinnati, Ohio.*—*Dumping Wagon.*—February 26, 1867.—The rear end of the box when raised rests upon rollers attached to the rear bolster. The body is tilted by a roller on a crank, the shaft of which is operated by a lever.

Claim.—The combination of the crank shaft *D*, roller *E*, lever *d*, and body *F*, or their equivalents, when the same are arranged and operating substantially as above described.

62,479.—*JOHN J. CROOKE, New York, N. Y.*—*Machine for Finishing Butt Hinges.*—February 26, 1867.—The hinges are fed between two files, so secured to a sliding bed piece that they may be adjusted to suit different widths or lengths of hinges. The file teeth are so inclined, that if extended downward they would meet in a center to the rear of the line dropped from the mid-length of the files.

Claim.—First, the files *C C*, constructed substantially as described.

Second, the combination with the files *C C* of the sliding bed piece or carriage *D* and stop *L*, substantially as and for the purpose set forth.

62,480.—*C. O. CROSBY, New Haven, Conn.*—*Leather Sole.*—February 26, 1867.—The insole has its

edge beveled, and a ridge raised upon it near the rim to enable the attachment to it of the "upper" and welt by means of a straight needle.

Claim.—The herein described sole as a new article of manufacture.

62,481.—CHARLES C. CROSSMAN, Portland, Me.—*Fishing Net Gear.*—February 26, 1867.—The net attached to the vessel's side has a flanged edge, which is raised when the net is "drawn" to prevent the escape of fish. The net is drawn up on pivoted booms by lines running through blocks on the masts.

Claim.—The flange D, in combination with and when attached to the net or bag C, suspended and operated in the manner herein described, as and for the purposes set forth.

62,482.—GEORGE P. GANSTER, New York, N. Y.—*Steam Engine.*—February 26, 1867; antedated February 22, 1867.—The steam cylinder has two piston heads, one on each side of a crank shaft passing transversely through the cylinder. The valve is moved by an arm. The guides hold the boxes in place in the pistons.

Claim.—First, the combination of D D', crank shaft E, arm G' and valve I.

Second, the combination of D D', guides G G', box F F', crank shaft E, arm G', and valve I, arranged and operating substantially as described and for the purpose set forth.

62,483.—JAMES H. GRIDLEY, Washington, D. C.—*Locking Washer for Nuts.*—February 26, 1867.—The washer is made of two parts, connected by a hinge joint. After the nut is screwed down upon one part of the washer, the hinged portion is turned down against one or more sides of the nut, securely fixing it in its position.

Claim.—A hinged or pivoted plate, which folds or falls against one or more edges of a nut to prevent its rotation.

62,484.—ROBERT HAMILTON, Franklin, Ind.—*Head Rest for Railway Cars.*—February 26, 1867.—The sack is suspended from a hook above; its lower edge is buckled around the waist, and forms a support for the arms, while the head rests against a cushion inside the sack.

Claim.—The suspended sack A, when constructed and used as a support for the arms and head, substantially as set forth.

62,485.—STEPHEN E. BOOTH, New Haven, Conn., administrator of the estate of SHELDON S. HARTSHORN, deceased, West Haven, Conn.—*Buckle.*—February 26, 1867.—One end of the strap is sewed to one bar of the buckle; the loose end is passed under the other bar, through the slot of the sliding tongue, and is then again passed below the same bar, being jammed against the latter by the sliding tongue.

Claim.—A buckle made with a wire frame, and a sheet metal sliding bar, when the two parts are constructed, locked together, and the whole fitted for use substantially as herein described and set forth.

62,486.—JONATHAN HATCH, South Windham, Conn.—*Paper Trimmer.*—February 26, 1867.—The steel blades of the rotary cutters are of a dish form, their outer edges being in a plane at right angles to the axis of revolution of each, in which position they sharpen each other. They are secured in their respective stocks by beveled washers and screws parallel to their axles.

Claim.—First, the self-sharpening dish-shaped cutters A A', with their sides and front edges a A' constructed as described, and arranged for operation relatively to each, substantially as and for the purpose or purposes herein set forth.

Second, the combination with the dish-shaped cutters A A', constructed as described, and their recessed stocks B B' of the wedge-shaped or beveled edged rings D D' for holding the cutters to their stocks, all arranged essentially as specified.

62,487.—JOHN H. HEPPELY, Elmira, Ill.—*Combined Hedge Trimmer and Mower.*—February 26, 1867.—The adjustable carriage frame is adapted for sustaining an elevated cutting apparatus for trimming hedges, or the same apparatus in a lower posi-

tion for mowing; the same gearing operating the sickle in either case.

Claim.—First, the combination with a carriage having a hinged frame C C', and rear adjusting device H I, of a cutting apparatus and means for sustaining the same in an elevated position for trimming hedges, and also in a position for mowing, substantially as described.

Second, the elevated frame C', in combination with the depressed hangers E E', adjustable frame C C', and means by which the cutting apparatus can be operated, whether in an elevated or depressed position, substantially as described.

Third, the arrangement of the lever I, support J, standards H K, the latter having a wheel j attached to it, in combination with the combined hedge trimmer and mower shown, all substantially as and for the purpose set forth.

62,488.—GEORGE HOMFRAY, Halesowen, Eng.—*Machine for Cutting Coiled Bars for Chain Links.*—February 26, 1867.—The coiled bar (see patent No. 62,335, of even date herewith,) is cut into sections by a pair of shears, of which the lower one is so constructed as to allow the several links to drop from the machine. The coil is fed obliquely in a trough, so as to receive a scarfed cut suitable for welding. The feeding pawls are actuated by a system of slides, links, rocker arms and shafts.

Claim.—Guiding, directing, and feeding up the bent coil in a line oblique to the cutting edges of the cutters, so that the links or sections may be cut off with scarfed edges, when said grinding, feeding, and cutting off are accomplished by an arrangement of devices, substantially as described.

Also, in combination with the trough and mandrel, a pawl or pawls for feeding the bent rod to the cutters, and holding it in proper position against the action of the cutters, substantially as described.

Also, the grooving or sloping of the under cutter and its stock or part to which it is attached, so that the cut off blank link or section will drop, or be free to be removed from the place where it is cut off, substantially as represented and described.

62,489.—THOMAS HOPKINS, Cincinnati, Ohio.—*Cant Hook.*—February 26, 1867.—This grappler is especially adapted for raising and assisting in emptying barrels. The chain has a central ring and of its branches one has one end hook and the other a ring and a running hook. A supplementary chain has hooks at its ends and is used as an elongating section.

Claim.—First, the combination of the rings A C, chain B, rod D, hook F, and sliding hook G, when arranged and adapted for use in either of the positions represented in figures 1 and 2, as and for the purposes described.

Second, in combination with the elements of the preceding clause, the use of the auxiliary chain I, and its appurtenances, for the purpose stated.

62,490.—WILLIAM C. HURD, New York, N. Y.—*Manufacture of Paints.*—February 26, 1867.—Pulverized quartz is treated with a mixture of acid, salt, and potash to remove its impurities. The quartz so prepared is mixed with ordinary paint.

Claim.—The process of manufacturing paint by mingling with oil, lead, zinc, and other materials ordinarily employed in the manufacture, pulverized quartz, which has first been subjected to the action of an acid, saline or alkaline solution, or all or any of them, substantially as and for the purpose set forth.

62,491.—JOSEPH ISENBERG, McConnelstown, Pa.—*Boring Machine.*—February 26, 1867.—The bars containing guide holes for the auger are adjustable on the frame, which is clamped upon the timber.

Claim.—The arrangement of the jaws C C, two or more, the clamps E E F, lever H, catch I, and adjustable bar G, constructed and operating substantially as described and represented.

62,492.—G. E. KING, New York, N. Y.—*Fluting Machine.*—February 26, 1867.—The machine is for the manufacture of the fluting patented to him September 26, 1866, and consists of two rollers meshing together in certain portions of their periphery, and having guides to present the material in proper manner, and

pressing arms which fit depressions in the rollers. The upper roller is depressed by a spring.

Claim.—The guide E, constructed with one or more curved or arched portions *a'*, in combination with suitable fluting rollers, substantially as herein set forth, for the purpose specified.

62,493.—CARL LEHNERT, Boston, Mass.—*Window Shutter Fastening.*—February 26, 1867.—The hing^e pintle has a crown rack upon it which meshes with a spur rack of a wheel upon a spindle which traverses the frame and has a knob within. Radial projections at the ends of the said racks engage each other when the shutter is at its extreme points of movement. A cam on the spindle wheel holds the shutter when in the said positions.

Claim.—The hinge C D, constructed as described, and used with the wheels E and F, with their arms and cam operated by the knob G and shaft *m*, the whole constructed, arranged, and operating in the manner and for the purposes herein fully set forth.

62,494.—JOSEPH A. MILLER, New York, N. Y.—*Steam Generator.*—February 26, 1867.—The sides of each furnace consist of series of vertical pipes connected to each other at top and bottom by longitudinal pipes, which are connected to the steam and water spaces of the boiler. Vertical diaphragms in the pipes insure circulation of the water.

Claim.—The boilers A A, one or more of them, their fire chambers D and the boxes or pipes I, with their diaphragms forming steam generating spaces *d* and return water passages *e*, and pipes or boxes J K, when arranged in relation to each other and to the fire grate, also to the steam and water spaces of the boiler or boilers, and in communication with the latter, substantially as specified.

62,495.—G. LIVINGSTON MORSE, Harrison, N. J.—*Croquetrie.*—February 26, 1867.—Numbered clips are attached to the crown of each arch. The handle of the mallet is furnished with a tally scale and a flexible sliding ring by which the score of the player is recorded.

Claim.—First, the pins or clips B, or their equivalents, marked as specified, in combination with the wickets or arches of croquet, substantially as set forth.

Second, the combination with such pins or clips, marked as specified, of a registering tally for recording the game, substantially as described.

62,496.—W. A. MORSE and J. G. POWELL, Philadelphia, Pa.—*Eraser and Pen Handle Combined.*—February 26, 1867.—The concavo-convex or spoon-shaped plate is contracted at its point of attachment to the handle; the edges are sharpened by flat grinding upon the concave side.

Claim.—First, the eraser and burnisher B, with its parallel face edges *e e*, for sharpening its concave surface *s* and convex surface *m*, extending its whole length, in combination substantially as described and shown, and for the purpose set forth.

Second, constructing the craser B of such form that it can be inserted at either the top or the tip of the pen handle A, substantially as specified, and for the purpose set forth.

62,497.—JOHN PARKER, Milroy, Ind.—*Plow.*—February 26, 1867.—The iron clamp is bolted to the handles and has a socket to receive the hind end of the beam.

Claim.—The clamp D, with its attachments, constructed as described, and used with a plow operating as and for the purposes herein specified.

62,498.—HENRY T. POTTER, Norwichtown, Conn., assignor to himself, EDWIN ALLEN and ELISHA H. HOLMES.—*Drawing and Twisting Heads for Spinning Machinery.*—February 26, 1867.—In addition to the revolving drawing rollers within the revolving twisted tube, the tube gearing, with the worm on the shaft, (which may be driven or not in either direction as desired,) affords a means for increasing or diminishing the draft relatively to the twist to adapt the same to different conditions, or kinds of fiber.

Claim.—The combination with the twisting tube D and drawing rollers *e e* of the socketed screw head C and revolving screw E, in gear therewith, for operation together, the whole being constructed and ar-

anged substantially as and for the purpose or purposes herein set forth.

62,499.—D. J. POWERS, Madison, Wis., assignor to BUFFALO AGRICULTURAL MACHINE WORKS, Buffalo, N. Y.—*Sugar-Cane Mill.*—February 26, 1867.—The strap bolts pass over the grooved bearings of the upper roller and through the timbers of the bed, where they are secured by nuts; elastic washers confer elasticity. The turn plate keeps the canes in their course, preventing their passing down between the lower rollers, and is adjusted by nuts on the outside. The widened aperture in the journals of the upper roller gives them a certain degree of play when unequal amounts of cane pass over the two rollers with which it is allied.

Claim.—First, the combination of trap bolts M M and india-rubber blocks or springs, when applied to the journals of the pressure rollers, substantially as and for the purpose herein specified.

Second, the laterally widened journal apertures *d d* of the bearings L L, in combination with strap bolts M M and india-rubber springs, for the purpose of allowing a side play to the top roller G, substantially as herein specified.

Third, the adjustments of the turn plate Q by the means substantially as specified.

62,500.—CHESTER PURDY, Bedford, Ohio.—*Self-lubricating Journal Box and Bearing.*—February 26, 1867.—The circumferential projections on the axle are embraced by the soft metal boxes of corresponding shape which are enclosed by the sections of pipe which are bolted together within the outer casing. Oil is led by a wick from a reservoir to the axle.

Claim.—First, a plain or corrugated journal box fitted with soft metal lining and provided with a chamber around its sides and ends, as and for the purpose specified.

Second, the employment of wicks or other equivalent for conveying oil from the chamber beneath the axle to the journal box, as and for the purpose set forth.

Third, the combination of the cap and lower part of the box, provided with grooves and chambers as set forth, with the pipe D, suspended and connected by lugs *a a*, or equivalents, as and for the purpose specified.

62,501.—JOSEPH ROBISON, Johnson's Creek, N. Y.—*Tire Shrinker.*—February 26, 1867.—Improvement on his patent September 23, 1862. To the outside of the segmental base plate is a disk connected to two sliding clasps whose eccentrics bite the tire. By revolving the disk the clasps are approached and the section of tire upset.

Claim.—The clasps C and C' and the eccentrics E and E', when made as specified, and used in combination with the other parts, as herein set forth.

62,502.—ALBERT A. ROSE, Binghamton, N. Y.—*Churn.*—February 26, 1867.—The churn is suspended from pivots and oscillated by treadles and connecting rod. The vertical dasher rod is held by a button in its opening in the frame.

Claim.—The manner of operating the pendulum or vibrating churn with the feet, by means of the treadles G G, and the mode of inserting, securing, and removing the dasher from the churn, substantially as described and for the purpose set forth.

62,503.—CHARLES SAFFRAY, New York, N. Y.—*Manufacture of Artificial Leather.*—February 26, 1867.—Any vegetable or animal fiber is cleaned, reduced to fine particles, carded and formed into sheets, which are pressed, dried, and placed between wire gauze. The sheet thus formed is saturated with a solution of gum galbanum or gum ammonia and gutta percha, to which, for a common article, Canada balsam and other resins may be added, as also pigments or mineral powders. The sheet is then pressed and dried and finished by calendaring with hot rolls.

Claim.—In the manufacture of artificial leather, with vegetable or animal fibers, prepared substantially as aforesaid, and united by means of the agglutinating solution herein described, the use of wire cloth protectors to keep immovable the fabric during some of the processes to which it is submitted, and also the

mode of saving the solvents used in the preparation of the solution.

62,504.—IRA A. SALMON, Boston, Mass.—*Dental Instrument.*—February 26, 1867; antedated February 7, 1867.—The plunger has a pushing tool at one end and a hook-shaped pulling tool at the other, each operated upon by a hammer subject to the action of a spiral spring and other mechanism enclosed within the case.

Claim.—First, a combination composed of the hook, or its equivalent, the spindle, the hammer, and mechanism substantially as described, or its equivalent, for operating such hammer as and for the purpose aforesaid.

Second, the combination as well as the arrangement of the direct pressure and back action plungers with the hammers, its case and mechanism for operating such hammer, substantially as and for the purpose specified.

62,505.—THOMAS SIMMONS, Chicago, Ill.—*Vacuum Filter.*—February 26, 1867; antedated February 15, 1867.—Attached to the exit pipe of the filter is a closed reservoir into which steam may be admitted from a generator connected with it below. Upon the entrance of liquid from the filter the steam is condensed and the vacuum thus formed hastens the operation of the filter by atmospheric pressure.

Claim.—First, the combination and arrangement of the filtering vessel A, receiver B, and removable generator E when connected by tubes C D, provided with stop cocks a b c, and operating substantially as herein specified and for the purposes set forth.

Second, the combination of the press P, vessel A, receiver B, generator E, tubes C D, provided with stop cocks as shown, arranged and operating as and for the purposes shown and set forth.

62,506.—JOSEPH STEGER, New York, N. Y., assignor to himself and W. HAUFF, same place.—*Whip Socket.*—February 26, 1867.—An annular groove near the head of the whip stock is engaged by a spring catch to prevent the withdrawal of the whip till released by a cord.

Claim.—The arrangement of a spring catch in the interior of a whip socket in combination with a suitable recess in the whip handle, substantially as and for the purpose described.

62,507.—CHARLES STICHT, Paris, France.—*Imitation of Pearl on Solid Substances.*—February 26, 1867.—Solutions of salts, by preference acetates or sulphates, are combined with gelatinous or resinous substances and applied to the object. The compound may be applied on a colored ground, or its color changed by the application of gases capable of acting upon the metallic salts.

Claim.—First, the process herein described for producing surfaces in imitation of mother of pearl on paper and other material.

Second, paper or analogous material coated in imitation of mother of pearl, substantially as herein specified.

62,508.—ESAU D. TAYLOR and WILLIAM H. BALLOU, Hornellsville, N. Y.—*Tube Driving or Boring Wells.*—February 26, 1867.—The lower well tube has apertures for the admission of water and a set of jointed plugs for the purpose of closing the apertures when desired.

Claim.—The combination of the head or cap C, chain B, wire rope or cord with a series of jointed plugs a, and barrel A, substantially in the manner as herein described for the purposes set forth.

62,509.—O. C. TAYLOR, Rome, Penn.—*Wagon Brake.*—February 26, 1867.—The blocks are secured to springs which are attached to pivoted levers actuated by the back thrust of a bar which is operated by the neck yoke in descending a hill.

Claim.—The arrangement of the blocks and springs upon the outer ends of the separate levers F F when used in combination with the bar E, rods d d, and rod e, substantially in the manner and for the purpose specified.

62,510.—WILLIAM TRACY, Chicago, Ill.—*Railway Switch.*—February 26, 1867; antedated January

6, 1867.—The switch bar is connected by an intermediate link to the angle of the bent portion of the lever, so as when thrust laterally by the passing train, to give the shifting lever a determination upward.

Claim.—First, the construction of the intermediate link C in combination, the arrangement of the pivot e, on the support d, and the pivot c, on the lever D, whereby a thrust or a pull upon the switch when the lever is adjusted to the positions shown in figs. 1 and 2 of the drawings, tends to cause the lever D to retain its position, substantially as described.

Second, the combination of the locking pin g with the lever D and links C, all constructed and arranged substantially as described.

62,511.—J. W. TYSON, Lower Providence, Pa.—*Cultivator.*—February 26, 1867.—Improvement on his patent August 14, 1866. The plows are suspended by chains from rollers on a shaft and braced laterally by chains attaching them to the frame.

Claim.—In combination with the adjustable cultivator frame, the use of the chains n and o when arranged to operate as and for the purpose set forth.

62,512.—SAMUEL C. UPHAM, Philadelphia, Pa.—*Nutritive and Curative Preparation.*—February 26, 1837.—Improvement on his patent January 26, 1867. To one gallon of hot water, add four ounces hypophosphite of soda, three ounces hypophosphite of lime, fourteen pounds of sugar, two pounds Tourtelot's extract of beef, and two drachms of "phenol sodique." Intended especially for diseases of the throat and lungs.

Claim.—First, a nutritive and curative preparation, consisting of extract of meat, sugar, water, and "phenol sodique," combined in the manner and proportions substantially as described.

Second, the combination of the above and the hypophosphites of soda or lime, or either of them.

62,513.—SETH WARD, Princeton, Ind.—*Back-Band Hook.*—February 26, 1867.—The back band near its ends has hooks from which the traces or side straps are suspended.

Claim.—The within described hook, formed and used with the harness, substantially in the manner herein set forth, whereby the harness acts as a keeper as described.

62,514.—J. E. WIGGIN, Stoneham, Mass.—*Boarding Machine.*—February 26, 1867.—The leather is drawn in between two endless aprons, the upper one of which is in a reciprocating frame, whose pressure and the length of whose stroke is adjustable; the revolving motions of the aprons are intermittent, and the action is to draw in "board," and discharge the leather automatically.

Claim.—First, the endless apron S, actuated by the ratchet R and gears R' R', or their mechanical equivalents, made substantially as described and for the purpose set forth.

Second, the endless apron T', in combination with the device of the pawl lever Y, the ratchet V, and the gears U W, or their mechanical equivalents, for the purpose set forth.

Third, the device of the movable pivot box H upon the lever G, for the purpose of regulating to amount of vibrating motion given to the apron T'.

Fourth, the combination as well as the arrangement of the two endless aprons S and T', with actuating devices, substantially as described and for the purpose set forth.

Fifth, so arranging the frame 2 3 4 5, that a vibrating motion as well as a revolving motion may be given to the endless apron T'.

Sixth, the general combination as well as the arrangement of the several parts of my machine, made substantially as described and for the purpose set forth.

62,515.—CHARLES WRIGHT, New York, N. Y.—*Store House.*—February 26, 1867.—The claims and illustration indicate the arrangement. Each floor of the iron building connects by a tube with the office to give notice of the fire by an alarm blast of air, and can be flooded with water from a tank, and the water carried off.

Claim.—First, the flooding means, arranged as herein represented relatively to the several compartments; that is to say, the tank F, the conducting pipes

V I, &c., the valve *i* and distributing pipes J¹ J², &c., substantially as specified.

Second, the within described provisions for discharging the water from the compartments; that is to say, the gratings K¹, gutters L, leaders N and and valve *n*, substantially as herein specified.

Third, the concrete bed L, arranged under the gratings K¹ and gutters L, and having its upper surface inclined, all substantially as and for the purpose herein set forth.

Fourth, the means for indicating the existence of fire in each compartment at the office M, the same consisting of tubes O¹ O², &c., arranged as specified with or without the uptake flue *m*.

Fifth, the valves S¹ or their equivalents, in combination with the flues H H¹, &c., for admitting and controlling the circulation of cold air through each compartment of a fire proof-warehouse, substantially as and for the purpose herein specified.

62.516.—H. ZOEGER, New York, N. Y.—*Medical Compound*.—February 26, 1867.—Medicine for piles, composed of alcohol, 68 parts; rhubarb, $\frac{1}{2}$; gentian, $\frac{1}{4}$; blessed thistle, 2; centaury, 2; aloes, $\frac{1}{2}$; ginger, $\frac{1}{2}$; angelica, 1; elecampane, 1; licorice, 2; sugar, $\frac{1}{2}$; digested in the alcohol, and diluted with water to make 5 quarts.

Claim.—The within described compound made of the ingredients herein specified and mixed together, substantially as and about in the proportion herein set forth.

62.517.—WILLIAM ADAMSON, Philadelphia, Pa.—*Apparatus for Washing Fibrous Substances*.—March 5, 1867.—The trough is divided into two compartments, which communicate with each other at opposite ends of the trough. A paddle wheel placed in one of the compartments keeps the water moving around the trough. In the other compartment is an agitator, and a revolving belt armed with spikes, which seize the fibers, and drop them into another trough, where they receive a final washing.

Claim.—First, the use for washing fibrous material of two troughs and one supply of water, which first passes into and through the trough where the last washing is conducted, and thence into the trough where the first washing takes place, all substantially as set forth for the purpose specified.

Second, the adjustable pipe *j*, arranged for the withdrawal of the dirty water from the trough beneath the perforated shield F, substantially as described.

Third, the trough B, with its rollers P.

Fourth, the combination of the said rollers P, with the endless band T of slats.

Fifth, the endless band T, in combination with the rollers *y y*.

62.518.—WILLIAM ADAMSON, Philadelphia, Pa.—*Sand, Emery and other like Paper*.—March 5, 1867.—The back of sand paper is saturated with a solution to render it tough, flexible, and water-proof.

Claim.—Sand or emery paper, saturated with a solution of gum elastic or gutta percha and naphtha, or other equivalent solvent, as and for the purpose described.

62.519.—EDWARD ATKINSON, Brookline, Mass.—*Peat Machine*.—March 5, 1867.—The cylinder revolves in the box, and has a series of propelling blades and cutting blades. A screw drives the peat to the delivery aperture, which is made of elastic material.

Claim.—First, the combination of plowshares *a*, cutting blades *c* and conical screw, constructed and arranged to operate substantially as and for the purpose set forth.

Second, the yielding or expanding outlet or delivery tube, arranged to operate substantially as and for the purpose set forth.

62.520.—W. B. BARTRAM, Norwalk, Conn.—*Button Hole Sewing Machine*.—March 5, 1867.—The invention adapts the Willcox and Gibbs class of machines to the stitching of button holes. The cloth plate has an adjustable lateral movement, which may be by the pressure downward of a spring and its wedge, be doubled to stitch across the end of the button hole. The feed-dog is pivoted upon its reciprocating bar, so that when the latter moves forward and back, the

dog may move on its pivot in obedience to the transverse movements of the table and its actuating jog bar.

Claim.—First, reciprocating the plate E on a straight line at right angles to the line of movement of the forward feed by means of the switch cam A, switch B and jog bar D, constructed, arranged, and operating as and for the purpose set forth.

Second, in combination with the sewing mechanism of a "Willcox and Gibbs" sewing machine, the switch cam A, switch B, arm C, jog bar D, or their equivalents, and the plate E for the purpose set forth.

Third, the combination of the switch cam A, switch B, switch bar C and jog bar D, substantially as and for the purpose set forth.

Fourth, the combination of switch B, jog bar D, shoulder I and set stop screw H, or its equivalent for the purpose set forth.

Fifth, the combination of the switch B and jog bar D, with the set screw H and stud L, or their equivalents, for the purpose set forth.

Sixth, the feeding dog O, pivoted to the feed bar, as described, in combination with the reciprocating plate E, substantially as and for the purpose set forth.

Seventh, the guide plate U, in combination with the straining slide W and the serrated plates V V', substantially as and for the purpose set forth.

62.521.—SYLVESTER BISSELL, Hartford, Conn.—*Composition for Building Material*.—March 5, 1867.—Composed of hydraulic cement or quick-lime, iron shavings or filings, and gravel or sand, in proportions of about one-third each, mixed with water and molded.

Claim.—A composition for building material as and in the proportions as described.

62.522.—JOHN W. BLANCHARD, Rutland, Wis.—*Feed Raek*.—March 5, 1867.—The shutters which form the roof open for the admission of feed, and the inwardly inclined boards beneath the eaves direct the feed into the manger.

Claim.—The arrangement of the board *n* for covering the feed and the roof boards *a* and *p*, opening in the manner described, in connection with the racks *e* and *f*, and trough *g*, for the purposes described.

62.523.—N. W. BONNEY, Lewiston, Me., assignor to himself and O. DAVIS, same place.—*Barber's Chair*.—March 5, 1867.—The extension leg-support is attached to one arm of a bell crank, whose other rests beneath the seat, when the leg piece is turned down, but catches in a notched spring, and retains the leg piece when in its horizontal position.

Claim.—The frame *b c* having the arm *a*, projections *e*, and pivots upon which the same is made to swing, as described, in combination with the spring *g*, constructed as set forth, all arranged and applied in the manner and for the purpose specified.

62.524.—WILLIAM L. BOSTWICK, Ithaca, N. Y.—*Horse Raek*.—March 5, 1867.—The teeth are lifted to dump the load by means of staples secured to the pressure bar, which is attached by a bell crank and connecting rod to the hand lever on the carriage.

Claim.—First, the combination of the three-forked lever I, connecting rod H, and hand lever G, substantially as and for the purposes set forth.

Second, the pressure bar F, provided with the hanging staples P, three-forked lever I, connecting rod H, and hand lever G, all arranged and operating substantially as and for the purpose set forth.

62.525.—J. HAMILTON BROWN, Watertown, Mass.—*Hand-pecking Machine*.—March 5, 1867.—The portable pecking machine is operated by hand, and fed around the shoe, the operator holding the machine in a vertical position, and turning a crank which sets all its working parts in motion.

Claim.—Operating all the moving parts of the machine, as well as the machine itself, when periodically fed along or over the shoe, from a single cam shaft, by which said movements are timed and regulated, substantially in the manner and for the purpose set forth.

Also, so combining and arranging an awl and peg driver as that both shall operate in a vertical line without lateral motion, and through separate holes in a nose piece at the base of the machine, and at separ-

rate times, by means of cams and springs so arranged that the greatest resistance or force of the separate springs shall not be exerted at the same time, substantially as and for the purpose herein set forth.

Also, feeding the machine over the shoe, and cutting off the peg from the strip or bolt of peg wood by one and the same vibrating instrument, so that these two operations may be perfectly timed and regulated, as and for the purpose set forth.

Also, the feeding mechanism for moving the machine over, on, or around the shoe or boot, composed of foot, through which a nose piece furnished with separate holes for the awl and peg driver passes, in combination with a pivoted lever and point, working through the awl hole to draw the machine along, substantially as described.

Also, moving back or setting the feeding device preparatory to its feeding the machine along, and whilst the awl is in the sole, and allowing the feed to take place after the awl is withdrawn from the sole and is still rising, so that the force exerted in withdrawing or raising the awl shall aid in bringing the feeding foot close to the sole, and thus, by impact, make the feed more certain and accurate, substantially as described.

Also, the arrangement by which the feeding of the machine along the sole takes place after the awl hole is made, and before the peg driver descends, substantially as and for the purpose described.

Also, the arrangement by which the driving of the peg takes place whilst the awl is ascending, and the machine close down upon the sole, so that the peg shall be driven entirely down, and not project above the surface of the sole, substantially as and for the purpose set forth.

Also, combining with a portable hand-pegging machine, that moves around the boot or shoe that is being pegged by it, a cup or box for carrying around with the machine a bolt or coil of peg wood that is fed into the machine by drawing upon the end of the strip or ribbon, and without the use of any pushing device, substantially as described.

62,526.—ROBERT H. BROWN, Detroit, Mich.—*Toilet Glass.*—March 5, 1867; antedated February 20, 1867.—The glasses are hinged in a folding frame so as to be used single or as a double-reflecting glass, showing the front face, the back of the head, and both sides of the face and person.

Claim.—The combination and arrangement of glass 3, the folding frame 2, and the folding glass 1, operating as and for the purpose specified.

62,527.—JOSEPH F. CHUSE, Litchfield, Ill.—*Metallic Stuffing Box Packing.*—March 5, 1867.—In a lower series of rings the packing to the piston rod is effected by steam admitted behind them from the cylinder. Two outer rings have their outer contiguous corners beveled off to leave an annular space to contain hemp packing.

Claim.—First, the packing *b* and its enclosing casing *b*², when constructed substantially as and for the purpose set forth.

Second, the combination and arrangement of the packing rings *b* and *b*², and the spring *c*, substantially as set forth.

Third, the packing rings *b* *b*² in combination with enclosed perforated casing *B*, substantially as set forth.

Fourth, the packing rings *D* *D*¹, when constructed and arranged substantially as set forth.

62,528.—JAMES MADISON CLARK, Chester, Conn.—*Twine Cutter.*—March 5, 1867.—The head for attachment to a twine receptacle has a fixed knife and a spring tongue, between which the twine is passed for severing.

Claim.—The knife *K*, in combination with the tongue *I* and spring *S*, for the purpose herein set forth.

62,529.—H. C. COVERT, Fayette, N. Y.—*Washing Machine.*—March 5, 1867; antedated February 23, 1867.—A lower roller frame and an upper frame, with an opposing grooved board, reciprocate upon the cloth between. The further ends of the frames are pivoted to the contrary ends of the arms of a rock bar.

Claim.—In combination with the rubbers *BC* having opposite reciprocating motions, and having plain

rubbing surfaces, the arrangement of the jointed arms *a* *h* and levers *k*, made to be inserted or removed from the box *a* at pleasure by means of the bearings *n* and buttons *o*, the whole arranged and operating as herein set forth.

62,530.—CYRUS CROPPER, Cincinnati, Ohio.—*Paper Cutter.*—March 5, 1867.—The eccentric by which the draw movement is given to the knife works in a rectangular yoke, having a simple reciprocating motion. The rods connecting the knife frame to its actuating racks are adjustable in length by swivel nuts.

Claim.—First, the knife, operated laterally to and fro at the same time it is descending, by means of a cam or eccentric working in a slot in one end of the knife bar, substantially and for the purpose herein set forth.

Second, the rack and pinion for the purpose of drawing down and raising the knife, substantially as herein set forth.

Third, the adjustable joint *a* in the rod *O*, for the purpose of regulating the position of the knife *C*, substantially as herein set forth.

62,531.—JOHN DECKER, Sparta, N. J., assignor to himself and CHARLES W. WARDWELL, Brooklyn, N. Y.—*Clock Alarm.*—March 5, 1867; antedated March 1, 1867.—The spring is attached to the arbor of the minute hand, and the end loop of the cord is passed over a pin upon the cylinder attached and wound round once for each hour between the times of setting and waking. The latter is accomplished by the freed weight striking a pan placed beneath.

Claim.—The spring with the cylinder attached, in connection with the cord and weight, all arranged so as to be capable of being applied to a clock, to operate substantially in the manner and for the purpose specified.

62,532.—JOHN DECKER, Sparta, N. J., assignor to himself and CHARLES W. WARDWELL, Brooklyn, N. Y.—*Door Fastening.*—March 5, 1867; antedated February 20, 1867.—The shank is inserted with its points in the line of the crack between the door and frame, and is turned till its further point engages the frame, and its nearer one the door.

Claim.—The door fastener herein described, the same consisting of the rod *A*, spurs *a* *a*¹, semi-circular continuation *B*, continuations *C* and *D*, constructed and operating substantially as described for the purpose specified.

62,533.—THOMAS B. DE FOREST, Birmingham, Conn.—*Buckle.*—March 5, 1867.—The frame has a sliding plate, through whose perforation the band passes, and draws against its outer rib to bind the band by the other side of said plate.

Claim.—The combination of the clasp *B*, constructed with the slot *d* and bar *f*, with the frame *A*, when the clasp *B* is above and the bar *f* below, or vice versa, so that the strap or band, drawing against the bar *f*, draws the clasp *B* upon and so as to hold the strap, substantially in the manner herein set forth.

62,534.—A. M. DUBURN and J. KEITH, Chicago, Ill.—*Frame for Supporting Stoves on Vessels.*—March 5, 1867.—The stove is pivoted to a frame to allow lateral oscillation. Catch arms turn up from the foundation to prevent a too extreme movement.

Claim.—The combination of the standards *B*, suspenders *C*, platform *E*, and arms *I*, substantially as and for the purpose set forth.

62,535.—C. C. ELLIOTT, Escanawba, Mich.—*Snow Scraper for Locomotives, &c.*—March 5, 1867.—This scraper is intended for attachment to a locomotive "cow catcher," and is so connected to the same by springs as to admit of a lateral or vertical movement.

Claim.—The springs *C*, arm *D*, and notched bar *E*, and spring *F*, in combination with the scraper-carrying shaft *B*, when applied and operating substantially as described for the purpose specified.

62,536.—JOHN J. ESHLEMAN, Philadelphia, Pa., assignor to himself and JAMES RILEY, same place.—*Attaching Stoppers to Bottles.*—March 5, 1867; antedated February 16, 1867.—The coil spring ring which

is slipped on the bottle neck has a chain attachment to the metallic cork cap.

Claim.—An expanding or elastic ring D, and a chain *a*, in combination with the stopper B, substantially as and for the purpose described.

62,537.—R. FICKEN and F. L. WILLIAMS, Philadelphia, Pa.—*Machine for Cleaning and Purifying Boneblack.*—March 5, 1867.—The dust is blown through a sieve into the gradually-contracting tube, and into a box from whose bottom rises a pipe with an inverted conical cover above its top. The dust passes into the pipe and comes in contact with a steam jet, to moisten it in its passage to a box below, from whose top the air from the blast issues.

Claim.—First, the box B, with its diaphragm screen K, openings *g* and *d*, in combination with the blower E and trunk I, when constructed and arranged substantially as described.

Second, the dust-collecting boxes M and N, constructed and arranged substantially as described.

Third, the combination of the blower E, diaphragm box B, trunk I, and collecting boxes M and N, constructed and arranged substantially as described.

62,538.—HENRY FLAD, St. Louis, Mo.—*Filter.*—March 5, 1867.—The feed water receptacle is annular and removable from the top of the filter. A ball valve in the center supply tube is hung on a chain by which it is operated. The siphon is connected to a float by which its mouth is kept a proper distance beneath the water surface to regulate the feed.

Claim.—Improved filtering apparatus, constructed of a removable feed tube *c*, and inclined or conoidal supporting plate *b*, a removable feed reservoir B, and outer inclosing vessel A, combined and operating substantially in the manner herein set forth.

Also, the combination of a check valve *e*, chain and supporting bar *c*, with the upright feed tube *c*, of a self-feeding filtering apparatus, constructed and arranged substantially as herein described.

Also, a siphon *d* and float *z*, in combination with feed tube *c*, of an improved filtering apparatus, constructed and operating substantially in the manner herein set forth.

62,539.—F. F. FOWLER, Upper Sandusky, Ohio.—*Ice Crusher.*—March 5, 1867.—The lever pestle forces the ice through the perforated bottom.

Claim.—An ice crusher composed of a box, with holes or openings in its bottom, formed by transverse ribs, a follower, guided to work therein, and a lever to operate said follower, the whole being combined to operate substantially in the manner and for the purpose herein described and represented.

62,540.—WILLIAM B. GEDDIS, Rochester, N. Y.—*Cresset or Barrel Heater.*—March 5, 1867.—The air heater in the stove top has radial exit pipes calculated to give out equal heat to that radiated from the sides below.

Claim.—First, the cresset stove A, having an air chamber B, flues *c*, and supply pipe or pipes *b*, for giving the sides of the stove a uniform heating power, in connection with a single smoke pipe I F² F³ F¹, *f*, or *e*, E F, *f*, or both, substantially as and for the purpose herein set forth.

Second, in connection with the stove A, the barrel cover H, and adjustable pipe F², constructed in one piece, and making suitable connection with the section I and pipe F², substantially as and for the purpose herein specified.

Third, the stove A B b c c, pipes E F F¹ F² E³, *f*, cover H, and counter balances K K, all constructed and arranged substantially in the manner and for the purpose set forth.

Fourth, the construction and arrangement of the pipe F F¹ F² and F³, in such a manner as to perform the double office of a smoke pipe and crane, as herein set forth.

62,541.—ADOLPH H. GLOSE, Philadelphia, Pa.—*Child's Sleigh.*—March 5, 1867.—The spring arms have inclined blades, by whose depression and engagement of the track the sleigh may be turned.

Claim.—A board or platform A, having two parallel runners, in combination with the arms D D', and their blades *e*, when the latter are inclined as described for the purpose specified.

62,542.—JOHN A. HOOPER, South Berwick, Me.—*Nutmeg Grater.*—March 5, 1867.—The nutmeg in the tube of the stock is pressed by the spring against the grater, which is reciprocated in the transverse opening.

Claim.—The combination of the reciprocating cylindrical grater B C, provided with flanges *a*, the holder A A', the follower F, and spring *m*, when constructed and operating substantially as and for the purpose specified.

62,543.—JOHN M. and EUGENE INGOLD, Allegheny, Pa.—*Spring for Carriages.*—March 5, 1867.—Explained by the claims and illustration.

Claim.—First, making elliptic or ellipsoidal springs of one or more leaf or leaves, each leaf extending all around the springs, until the extremities nearly or quite touch each other, so as to form an unbroken curve around the extremities of the major axis of the ellipse, and thus dispense with the welding of the leaf or leaves, substantially as hereinbefore described.

Second, the arrangement of the leaves of an elliptical or ellipsoidal spring, consisting of two or more leaves, and constructed as hereinbefore described, without welding, so that the joint at the extremities of each leaf of the spring shall be lapped or curved by the next contiguous leaf of the spring, the joints of the leaves being alternately placed at or near one or other of the extremities of the inner axis of the ellipse, substantially as and for the purposes hereinbefore described.

62,544.—JUDSON F. JONES, Washington, D. C.—*Switch.*—March 5, 1867.—The lock holds the switch upon the main track, except when forcibly held upon the turn out, and when released a spring returns it to the main track, the locking bar engaging a tooth of the rack bar. The locking bar is disengaged by a key.

Claim.—The combination of the switch lever F, cog wheel E, cogged bar D, with incline *d*, gravitating locking bar K, removable key J, and trigger L, operating substantially as described and represented.

62,545.—FRANK F. LANDIS, Lancaster, Pa.—*Door Lock.*—March 5, 1867.—This forms a latch and lock, applicable for a right or left hand door. For use as a latch the twin bolts are thrown out of engagement with the main bolt. To fasten it against being opened, by key or otherwise, a temporary detent hook is used. Details of construction are cited in the claims.

Claim.—First, the two-legged twin bolts, one upon the other, held by a pivot F, each having a raised flange C and D, and projecting feet *x* and *y*, and *c* and *d*, in combination with the double acting spring *e*, all arranged in the manner and for the purpose specified.

Second, the guard chamber J j, surrounding the key-hole, with its perforations, for the headed pins *z*, in combination with the flanges C and D, on the lower leg, of the twin bolts, arranged and operating in the manner and for the purpose specified.

Third, the twin bolt fastener or lever U, in combination with the prolonged flange D, on the lower twin bolt, when applied in the manner and for the purpose set forth.

Fourth, the construction of the key N, with its projecting pins *n*, in combination with the headed pins *z*, and guard chamber J j, all arranged and operating in the manner specified.

62,546.—JOHN LIPPENCOTT, Pittsburg, Pa.—*Tempering Circular Saws.*—March 5, 1867.—Explained by the claims.

Claim.—First, a platform for sustaining circular saws above the floor of the tempering furnace, constructed to support by contact the central portion of the saw, only thus leaving the marginal portion of the saw free from contact with the platform, or with the floor of the furnace, substantially as described.

Second, the iron carriage, constructed substantially as hereinbefore described, for introducing the saw plate into the furnace, supporting and adjusting the same during the process of drawing the temper, and for withdrawing it from the furnace when the tempering process is completed.

62,547.—DANIEL S. LOY, Gracem, Md.—*Tuyere.*—March 5, 1867.—The air from the bellows

entering the blast chamber acts upon a wing and causes the valve to close the lower aperture of the chamber. When the blast ceases, the valve rises and the cinders are discharged. The shield plate wards off the falling cinders from the operative mechanism.

Claim.—First, the valve E, in combination with the weighted lever F and wing H, substantially as and for the purpose described.

Second, the vibrating wing H, arranged and supported in the manner described, in combination with the valve E and blast pipe B, as and for the purpose explained.

Third, in a tuyere constructed as herein described, the cap plate or shield K, formed and applied in the manner and for the purpose specified.

62,548.—H. B. LYON and G. M. HOPKINS, Albion, N. Y.—*Clamp for Making Brooms.*—March 5, 1867.—The jaw is opened, the corn brush laid in, the jaw closed and the brush, after being pressed by the follower actuated by the set screw, is then wired, removed and the handle driven in. It is now replaced in the jaws with a side clamp, and is flattened by a screw acting at right angles to the former. It is then sewed to preserve its flatness.

Claim.—The screw B, the follower D, and the recess J, in combination with the jointed frame O, having the slot F, the screw K, and the clamp G, as and for the purpose specified.

62,549.—HENRY MALLEY, Chicago, Ill.—*Hoisting Machine.*—March 5, 1867.—Two reciprocating platforms are suspended on ropes coiled on spirally grooved drums, which have wheels gearing into a pinion between them. This latter is on a shaft carrying a central fast pulley with loose pulleys beside it. A straight and crossed belt may either of them be brought in connection with the fast pulley to raise or lower either platform.

Claim.—First, the general arrangement and combination of the reverse pulley 15, standards *i*, shaft *o*, with the wheels P, Q, tie *n*, and shaft *r*, when used to operate the ratchet S and rack *t*, and slide X, as and for the purpose set forth.

Second, the sectional guides J', in combination with the cross-tie H and elbows *m*, substantially as described and set forth.

62,550.—THOMAS W. MANN, Holyoke, Mass.—*Paper-wearing Apparel.*—March 5, 1867.—The paper is folded into plaits and re-enforced by a plain piece behind.

Claim.—Articles of paper-wearing apparel, when folded or plaited, and backed or strengthened throughout its entire surface, substantially as herein described and set forth.

62,551.—THOMAS C. MARIS, Athens, Ohio.—*Attaching Hubs to Axle Boxes.*—March 5, 1867.—The box has a radially ribbed flange with a flattened circumferential ring. The oil hole traverses one of the ribs centrally. The hub cap screws on the box.

Claim.—First, the cap A, with its ribs *b b*, substantially as above described and set forth.

Second, the cap E, in combination with the box C and screw thread, as substantially described.

Third, securing the hub to the box C by means of caps A and E, when one of said caps is rigidly attached to the box and the other adjustable, substantially as described.

Fourth, constructing the cap A, with one or more of its ribs hollow, for the purpose of introducing oil to the spindle, substantially as described.

62,552.—DAVID W. MARSTON, Lebanon, N. H.—*Uniting Scythe and Snath.*—March 5, 1867.—The heel of the scythe is received in the recess of a plate, and the two are traversed by a bolt, which fastens them to the heel plate and heel of the snath. On this bolt they vibrate as a pivot when the point of the scythe is drawn in or out to "hang" it according to the requirement of the mower. A set bolt holds it at the desired adjustment.

Claim.—A straight scythe shank when the said shank is connected to the heel of a snath by means of the transversely recessed and slotted plate A, the shanked ferule B B', the pivot bolt C, and the holding bolt D, substantially in the manner herein described and set forth.

Also, the combination of the transversely recessed and slotted plate A and the shanked ferule B B' with each other, and with the heel of a snath, by means of the pivot bolt C and the holding bolt D, substantially as herein represented and described.

62,553.—WM. W. MARTIN, Allegheny City, Pa.—*Spike Machine.*—March 5, 1867.—The rolls carry dies by which the heated rod is pressed into spikes as it passes between them. One side of the dies of the larger roll is movable, and held to place while the spike is being formed, but sprung out subsequently for the release of the same.

Claim.—First, the slide clamps *i* and *i'*, when used in combination with the dies 2 on the roll B, as herein described and for the purpose set forth.

Second, the friction roller *e*, when used in combination with the side clamps *i* and *i'*, as herein described, and for the purpose set forth.

Third, the flanges J and X, on the roll C, when used in combination with the roll B and side clamps *i* and *i'*, as herein described, and for the purpose set forth.

62,554.—JAMES B. MARTINDALE, New Castle, Ind.—*Hook and Eye.*—March 5, 1867.—The middle loop of the hook is turned in sufficiently to form a spring catch for the eye.

Claim.—The hook A, when constructed and arranged to operate in combination with the eye B, substantially as set forth.

62,555.—GEORGE MERRITT, New York, N. Y.—*Pencil Point Protector.*—March 5, 1867.—Explained by the claims and illustration.

Claim.—First, the metal piece A A¹ A², and the spring B, adapted to operate together upon the end of an ordinary wood pencil, substantially as and for the purpose herein specified.

Second, the combination of a rubber eraser D, with the metallic portion A A¹ A², so as to give the proper erasive property to the exterior, and also to contribute by its contractile force to the clasp of the metallic portion upon the wood of the contained pencil, substantially as herein specified.

Third, the scalloped and flaring mouth *a b* on the wings A¹ A², of the metallic pencil point protector, substantially as herein specified.

62,556.—JOHN H. MILLS, Boston, Mass.—*Steam Engine.*—March 5, 1867.—The steam from the smaller cylinder exhausts through a pipe which traverses the fire box to the larger cylinder. The generator is made in sections which are bolted together. The pipes which surround the furnace connect with the bent pipes which pass through the interior of the generator. The two inner trunnions upon which the cylinders oscillate are arranged so that the steam exhausted through one shall be admitted to the other through its trunnion.

Claim.—First, the combination with a series of sectional boilers of the steam cylinders under the arrangement herein described, so that either cylinder alone, or both together, may be used with the full power of steam generated by the said boilers, or so that the smaller cylinder shall exhaust into the larger, substantially as set forth.

Second, the pipe for connecting the two cylinders, arranged so as to pass through the combustion chamber or fire pot of the boilers, substantially as shown and specified.

Third, the arrangement of the boiler B, consisting of the bent pipe H and connecting pipes *e* operating together as shown and described.

Fourth, the arrangement of the inner trunnions of the steam cylinders in such a manner that the steam may pass directly from one cylinder to the other through the said trunnions, as and for the purposes set forth.

62,557.—GEO. R. MOORE, Lyons, Iowa.—*Damper for Flat Iron Heaters.*—March 5, 1867.—An improvement on his patent August 8, 1864.—The segmental damper partially surrounding the upper end of the fire chamber has openings which are brought more or less in connection with the similar openings in the side of said chamber.

Claim.—The application of the damper D, or its mechanical equivalent, to the fire chambers of heaters having an annular chamber for a flue from the fire

chamber to the smoke pipe, and substantially in the manner and for the purposes herein set forth.

62,558.—DANIEL B. NEAL, Mount Giload, Ohio, assignor to himself and KINGSLAND, ALLEN, and CLARK.—*Apparatus for Defeating Sorghum and other Liquids.*—March 5, 1867; antedated February 17, 1867.—The liquid runs through a vertical series of inclined troughs whose deep ends are placed in opposite directions alternately, and their shallow ends slightly elevated. To the shallow end of each trough is attached a conductor of fibrous material to lead the sirup into the trough next below.

Claim.—First, a series of trays or shallow troughs B arranged with one end of each tray or trough deeper than the other, and otherwise constructed so that the fluid find into the deeper end of the topmost trough will find an exit at the shallow end, and so through the whole series.

Second, the construction and combination of the trays B and the windlasses C c and C' c', substantially as described.

Third, the reservoir D when constructed as herein described, and combined with the trays B.

62,559.—WILLIAM V. PERRY, Burnett, Wis.—*Stove Pipe Damper.*—March 5, 1867.—The usual damper has a central hole closable by a pivoted plate whose operating handle projects at the opposite side to that of the damper aforesaid. Flanged deflecting plates are supported on legs at each side of the central hole.

Claim.—The damper herein described, consisting of plate A, intermediate between the flange plates B B provided with the revolving valve E, the whole arranged and operating in connection with handle F and rod C, substantially as set forth.

62,560.—JOSEPH W. PETTY, New Orleans, La.—*Cotton Bale Tie.*—March 5, 1867.—The band near each end is slit on opposite sides and the ends are brought into lateral engagement and then slipped a little longitudinally, preventing retraction unless previously loosened.

Claim.—The combination of the two ends of an iron band when used for banding cotton, when provided with the openings a b, substantially as described for the purpose set forth.

62,561.—GEORGE E. PEVEY, Lowell, Mass.—*Direction Label.*—March 5, 1867.—The fibrous material is placed inside the lap which encloses the cord at its bend.

Claim.—Inserting a fibrous material substantially as described and for the purposes fully set forth.

62,562.—F. P. PFLEGHAR and WILLIAM SHOLLHORN, New Haven, Conn.—*Oiler.*—March 5, 1867.—An improvement on their patent February 28, 1865. The sides and tube are made of cast iron which may be rendered malleable; the bottom is made of flexible plate metal soldered in a rabbet of the sides.

Claim.—The method substantially as described of constructing oilers.

62,563.—RICHARD W. PITMAN, West Point, Iowa.—*Insect Trap Lantern.*—March 5, 1867.—The lantern has metallic sides, through slots in which the insects pass, singing their wings and dropping into a receptacle of water surrounding the lamp.

Claim.—An insect trap composed of a framework of slats encircling a light and constructed substantially in the manner and for the purpose herein set forth.

Also, the combination of a water receptacle with the slotted framework encircling a light substantially in the manner and for the purpose herein set forth.

62,564.—W. P. PREWITT, Elkton, Ky.—*Fire Escape Ladder.*—March 5, 1867.—A frame with a stop at its mid-length is connected by chains at its inner end to the floor, and to its outer end is hung a jointed ladder. In use, the ladder and one-half the frame is put outside the window, and it is supported by the window sill in connection with the chains and stop.

Claim.—First, a fire-escape ladder composed of H-shaped sections, jointed or connected together by links, substantially as and for the purposes shown and set forth.

Second, the combination with the top section of the ladder of the combined cross brace and round or handle projecting from the face of said section, as shown and described.

62,565.—JOHN C. REED, Cincinnati, Ohio, assignor to SAM'L E. HUTCHINSON, same place.—*Bolt and Rivet Machine.*—March 5, 1867.—One of the clamp blocks is fixed and the other is operated by the driving shaft by cams and a toggle joint. The slide block on which the cam directly acts is extensible by a wedge key in its rear, which device regulates the stroke of the clamp. The heading punch is actuated by a cam on the driving shaft and its stroke regulated by means of a wedge-formed key adjusted by a screw bolt. The slides of the moving clamp-block are adjustable by screws beneath.

Claim.—First, the block R in combination with the sliding head Q, cam C, and screw-shanked wedge S, arranged substantially as described.

Second, the described arrangement of stationary and movable clamp jaws G and H', cross-head I, toggle K K' k, screw-shanked wedge M, and tightening nut N, for the purpose set forth.

Third, in the described combination the screw-threaded heading gauge 2, the screw-shanked wedges X and 11, and set screws v and 12, for adjustment of the length of stroke of the heading punch, substantially as set forth.

Fourth, the arrangement of sliding head W, knuckle w, sliding step 4, and vibrating shoe 7, substantially as described.

62,566.—ASA R. REYNOLDS, Auburn, N. Y.—*Machine for Grinding Metal Plates.*—March 5, 1867.—The ways of the bed piece are concave to correct the tendency of the stone to grind the surface convex. The bed piece is adjustable vertically to suit it to the wearing away of the stone.

Claim.—First, moving a bed that carries an article to be faced to a grinding stone upon concave ways for the purpose of preventing the rounding off of the edge first brought into contact with the stone, as set forth.

Second, adjusting a bed, at both of its ends, to the wear of a grinding stone by means of the journals and bearings a b at one end and set screw c at the other end, substantially as described.

62,567.—L. F. ROLLINS, Bangor, Me., assignor to himself and JAMES NEALEY, Jr., same place.—*Mop Wringer.*—March 5, 1867.—The end of the mop cloth is attached to the crank rod on the handle and a rotation of the said rod wrings the mop.

Claim.—The wringer, as constructed, with cranked rod a, the adjustable clamp e, and connection b, all constructed and arranged to operate substantially as and for the purposes specified.

62,568.—PETER SCHOFIELD, Philadelphia, Pa.—*Steam Gauge.*—March 5, 1867.—The disk with its elastic diaphragm and a cross-piece for holding them in position are detachable from the outer casing of the gauge, so that they may be used in any other of the same construction in case of injury to the one in which they are first placed.

Claim.—The detachable disk D', its elastic diaphragm F, and cross-piece E, in combination with the outer casing A, the whole being constructed and arranged as described.

62,569.—F. B. SHAW, Boston, Mass., assignor to SILAS S. SHAW, Bath, Me.—*Carriage Guard.*—March 5, 1867.—The piece on the carriage against which the wheel grinds in turning short is made of india-rubber.

Claim.—A carriage guard made of india-rubber, or its equivalent substance, as and for the purpose specified.

62,570.—ISAAC A. SMITH, Connelville Pa.—*Sewing Horse.*—March 5, 1867.—The clamping jaws of the horse are extended below the seat and are provided with a treadle lever which is adjustable to suit varying thicknesses of articles to be sewn.

Claim.—The adjustable lever D provided with the screw m and used in connection with the extension B' and C' of clamping jaws, said lever and jaws being

constructed, arranged, and operating substantially as herein described and for the purpose set forth.

62,571.—JOST STENDEL, Croton, Mich.—*Washing Machine.*—March 5, 1867.—Two pendent rubber boards are suspended from arms on a rock shaft so as to be vertically reciprocated in the suds box. A string of rollers is suspended from the ends of the rubber boards.

Claim.—First, the pendent wash boards B provided with alternate rubbers D and spaces and hinged or pivoted to the shafts E, in combination with the adjustable rubbers G and case A, arranged and operating conjointly as and for the purpose set forth.

Second, the shafts B E and arms F, in combination with the side pieces C, rubbers D G, and case A, arranged and operating as and for the purpose set forth.

62,572.—CHARLES TAYLOR, St. Johns, N. B., assignor to himself, JAMES HARRIS, BARTLET LINGLEY, and HENRY C. LOVELL.—*Machine for Sharpening Saws.*—March 5, 1867.—The revolving grinder is combined with a clamp plate and hinged to a holder which can be adjusted to any angle of tooth.

Claim.—First, a vibrating carriage with a movable fulcrum in combination with a clamping plate hinged horizontally to hold the saw and permit it to be turned on edge with facility for examination and pointing of the teeth without removing it from the clamping plate.

Second, the arrangement of the forked lever X, traversing carriage Z, and lever b, for moving the saw and adjusting it to the grinding stone, substantially as described.

Third, making the fork of the lever X adjustable to adapt it to the size of the operator or attendant.

62,573.—JAMES THOMPSON, Vevay, Ind.—*Washing Machine.*—March 5, 1867.—The surface of the roller is armed with alternate wooden and metallic ridges, and it is rotated by the treadle, while the pressure of the board below is adjustable to give an optional rubbing stress upon the clothes.

Claim.—The combination of the yielding rollers B O, fly arms D, treadle F, and controllable pressure board H, all constructed and arranged to operate as and for the purposes set forth.

62,574.—THEODORE R. TIMBY, Saratoga Springs, N. Y.—*Hoe.*—March 5, 1867.—The blade has an angular cutting edge, and the handle has a lug which assists the grasp.

Claim.—First, as an article of manufacture, a hoe with an angular cutting edge, as herein described and represented.

Second, the hook-shaped abutment C, in combination with handle B and hoe A, as set forth.

62,575.—JOHN B. TINKER, Buffalo, N. Y., assignor to himself and J. L. BEAZAN, same place.—*Sash Lock.*—March 5, 1867.—The device has two cam stops, with rounded faces on the outer ends for pressing against the sash, and on their inner ends with teeth which mesh into corresponding teeth in inclined faces. The two steps are held together by a coiled spring, and opened by a slide and knob.

Claim.—First, a sash lock having two stops A A', with cogs or teeth b on one end, which mesh with corresponding cogs or teeth c' made in the case C, and standing upon an incline, constructed, arranged, and operating in the manner and for the purpose substantially as herein described.

Second, the combination and arrangement of the spring D with the stops A A', in the manner and for the purpose substantially as set forth.

Third, the combination of the projecting pin h, made on the stops A A', with a groove h', made in the case, for the purpose substantially as described.

62,576.—H. A. TOWNE, Chicago, Ill.—*Hand-hole Plate for Steam Generators.*—March 5, 1867.—The hollow nut screws into the shank of the T-headed bolt, and its lower portion is made convex to fit into a concave recess in the cap which covers the aperture through the socket, which is screwed into the boiler.

Claim.—The arrangement and combination of the T-bolt E, hollow nut G, and hand-hole cap C, substantially as described and set forth.

62,577.—CHARLES W. TROTTER, Rochester, N. Y.—*Hot Air Furnace.*—March 5, 1867.—The partition divides and regulates the draft in connection with the segmental perforated plate, which opens or closes the apertures, and the damper which opens or closes the communication between the opposite sides of the partition.

Claim.—The peculiar construction of the radiator e, with center partition x, the sliding plate p, and also the damper w.

62,578.—FRIEDRICH VILLARD, Mount Eaton, Ohio.—*Revolving Chimney Top.*—March 5, 1867.—The spindle of the cowl is stepped in a socket, its collar revolving in flanges upon the upper side of the cap plate, which is anchored to the brick work of the chimney.

Claim.—First, the arrangement and combination of the plate A, constructed substantially as described, with the rods B and anchors C, when used on the masonry of a flue or chimney for the purpose of giving stability to the same, as set forth.

Second, the combination of the spindle G and collar H with the step F and socket E, constructed, arranged, and operating substantially as and for the purpose set forth.

62,579.—BENJAMIN WAINWRIGHT, East Boston, Mass.—*Rib Knitting Loom.*—March 5, 1867.—An automatic, intermittent, lateral motion of the rib-needle frame causes the waved or serpentine rib or "shogged work" to be made. When the rocker frame with the needle frame are moved downward the piece attached to the latter presses the lever and operates the pawl, ratchet, pattern cam wheel, and connected parts, to shift laterally the rocker frame.

Claim.—The combination, substantially as described, for effecting the endwise movements of the needle frame B, such combination consisting mainly of the ratchet D, its series of cams g g g, or cammed wheel F, the lever K and its pawl m, the lever E, the connection rod G, the spring N, the weight P, and the arm L, and its T-piece M, the whole being applied to the frame B, its carrier C, and the loom frame A, substantially in the manner and so as to operate as and for the purpose specified.

62,580.—CHRISTOPHER H. WAKEFIELD, Montpelier, Vt.—*Machine for Shrinking Tires.*—March 5, 1867.—The tire is clamped at two points by jaw blocks, which are then drawn together by the rotation of a disk to wrists, on which they are severally attached.

Claim.—The combination as well as the arrangement of the movable carriers B B, connected as described, and their operative mechanism or rods o o, with the self-adjusting jaws d e, cammed lever C, and the slider D, the whole being to operate together substantially in the manner and for the purpose as hereinbefore specified.

62,581.—GEORGE WALLACE, Cincinnati, Ohio.—*Apparatus for Fermenting Malt and other Liquids.*—March 5, 1867.—Three tanks communicate with each other by pipes. Two of them are formed with double walls, between which a current of water circulates. When the pressure of gas in these tanks is too great, the cocks may be turned to allow it to escape through the water in the other tank.

Claim.—First, the water chamber D, by which the temperature of the liquor in vats or tanks A and B can be regulated during fermentation.

Second, the application of the two-way cock H, by which the fermentation of each vat or tank may be regulated, or if a surplus amount of gases is generated, allows it to escape through pipes G.

Third, the open tubs or vat C, containing water, which allows the non-condensing gases to escape, yet prevents the atmosphere from getting in the vats or tanks A and B.

62,582.—JAMES C. WHITEHILL, St. Louis, Mo.—*Filter and Cooler.*—March 5, 1867.—The water from the reservoir above passes into a tube whose mouth is vertically adjustable, and is introduced below the filter bed, through which it passes upward into the ice chamber.

Claim.—First, the arrangement of the removable reservoir A, having a non-conducting bottom a, the clear water and ice chamber K, the adjustable tube

B, the joint or coupling C, and tube D, the whole constructed and operating substantially as shown and described.

Second, the arrangement of the chamber K, surrounded by non-conducting material, the removable filter bed H I, the chamber E, the tube D, the coupling C, the adjustable tube B, and removable reservoir A a, the whole constructed and operating substantially as shown and described.

62,583.—S. LLOYD WIEGAND, Philadelphia, Pa.—*Obtaining Oil from Paraffine, &c.*—March 5, 1867.—The gas generated by decomposing steam by passing it through incandescent carbon, is then passed through heated paraffine, &c., and the vapors carried over by the gas are condensed.

Claim.—The process of treating bituminous substances by means of the gases as hereinbefore described, or in any equivalent manner, and subsequently extracting the oil and paraffine by pressure or displacement, in the manner hereinbefore set forth and described, irrespective of the particular form of the apparatus in which the operation may be conducted.

62,584.—JAMES WILLIAMS and ISAAC SHORT, Amelia, Ohio.—*Swage.*—March 5, 1867.—Particularly adapted for making the "fifth wheels" of carriages. The upper and inner faces of the jaws are recessed. The jaws are recessed from the anvil block by the coiled springs and forced toward it simultaneously by the cam lever. The anvil face is tapered. The spaces between the jaws and anvil are occupied by the clips projecting from the piece forged.

Claim.—First, a swage consisting of the bed plate A, fixed anvil B, movable jaws C D, and grooves E e F f, all arranged and operating in the manner herein set forth.

Second, in combination with the anvil B and movable jaws C D, we also claim the bars G H, cam I, and springs K k K' k', or their mechanical equivalents, as and for the purpose set forth.

62,585.—LEVI WILSON, Springfield, Ohio.—*Cider Mill.*—March 5, 1867.—Two sets of grinding apparatus are connected with the driving mechanism and may be driven simultaneously or separately. A sliding floor beneath the hoppers determines the discharge of ground fruit into the presses; the press heads have slatted prismatic faces, and are advanced and retracted alternately by the revolution of the screw to whose opposite ends they are attached. The press has falling doors. The connecting shaft and mill are arranged to slide on the press, to reciprocate the press follower in either direction.

Claim.—First, the combination with a mill for grinding fruit and a press placed below the same, the intermediate sliding board K, arranged to operate independently of the motion of the press and substantially as set forth.

Second, the mill for grinding fruit and a press for the same, when the two are built with separate frames, and the mill placed over the press in such manner that the mill frame and mechanism may be moved on the press frame, connecting or disconnecting the mechanism of the mill and that of the press, substantially in the manner set forth.

Third, the arrangement of the adjustable shaft A, bevel pinion O, wheels N', sleeves N, screw M, and press heads L, substantially as set forth.

Fourth, the heads L and beds L' of the press, when respectively constructed with correspondingly inclined faces and with open slats in each, through which the juice may freely flow with the action of the press, substantially as set forth.

Fifth, the combination of the screw M, intermediate sliding frame M, springs P, and press heads L, arranged to operate substantially in the manner and for the purpose set forth.

62,586.—THOMAS H. WOOD, Monroeville, Ohio.—*Attaching Carriage Thills.*—March 5, 1867.—The wrists of the thill iron are caught by the hooks of the thill and fastened therein by a key piece, which is secured by springs.

Claim.—The key C, springs D, in combination with the arms F, wrists E, and link A, constructed and arranged substantially as and for the purpose set forth.

62,587.—JOSEPH C. ADAMS, New London, N. H.—*Boot and Shoe.*—March 5, 1867.—The heel is of metal and hollow; its under plate constitutes the treading surface and is secured by a screw to a post in the main portion of the heel, and removed therefrom to allow the shell of the heel to be secured to the sole by means of screws.

Claim.—The parts A B, supporting post D, and shank H, made or cast in one piece, in combination with the independent bottom plate C, as and for the purpose specified.

62,588.—WILLIAM T. ADAMS, Baltimore, Md.—*Revolving Waist Block.*—March 5, 1867.—The bulwark sheave is journaled in a disk, which is permitted to revolve to keep the axis of the sheave at right angles to the direction of the rope.

Claim.—The waist block sheave E, journaled within the rotating disk B, and projecting from its opposite faces, for the purpose and substantially in the manner described.

62,589.—ALEXANDER ADAMSON, Washington, D. C.—*Adjustable Runner, to be attached to chairs, &c.*—March 5, 1867.—The chair is fitted for being run upon the ice by setting its feet in the sockets of the runners.

Claim.—The construction of the adjustable metallic runners, in combination with the sockets and brace rod, to be attached to a chair or small carriage, for the purpose herein set forth.

62,590.—JOHN ASKWITH, Chicago, Ill.—*Piston Packing.*—March 5, 1867.—A ring or flange projects longitudinally from the disk which composes the central portion of the piston, and has set screws which bear upon the interior of the packing rings. A ratchet piece is placed directly over the joint of the ring to prevent the passage of steam through the same, and to keep the ring extended by means of the spring, which falls into notches upon the ratchet piece.

Claim.—The ratchet piece E, the spring f and the set screws h, in combination with the ring C, as and for the purpose set forth.

62,591.—ELIAS C. ATKINS, Indianapolis, Ind.—*Machine for Tempering Saws.*—March 5, 1867.—Arranged upon a drop slide are a series of plates, constituting a tempering plate, made in sections to overcome the liability to warp.

Claim.—The sections H H H H H H, in combination with the sliding bar G and bed I, constructed and operated substantially as set forth.

62,592.—IRA AVERY, Tankhanock, Pa.—*Washing Machine.*—March 5, 1867.—The suds box is pentagonal in its vertical cross-section, and corrugated internally. The suspended oscillating beater has movable rubber blocks, between which the clothes are secured.

Claim.—First, the hollow-chambered beater B, with its adjustable rubbers m so applied that portions of the fabric may be contained within the beater while the remaining portions thereof are being subjected to the rubbing and beating action thereof, substantially as set forth.

Second, the rod i, arranged in a semicircular groove formed in the under side of the bottom bar h of the beater, in combination with the hollow-chambered beater, substantially as herein set forth for the purpose specified.

62,593.—ANDREW C. BARNES, Albia, Iowa.—*Securing Tires on Wheels.*—March 5, 1867.—The tires are secured upon the rim by projections on the felloes, which fit into sockets in the inner periphery of the tire.

Claim.—The combination of the lug C and felloe B, as described, operating correspondingly with the groove a in the tire A, in the manner substantially as and for the purpose specified.

62,594.—THOMAS BEALE, New Milford, Ill.—*Agricultural Fork.*—March 5, 1867.—Explained by the claim and illustration.

Claim.—A fork for agricultural purposes, provided with a supplemental handle C, applied or attached to the main handle B by means of a swivel connection, substantially as shown and described.

62,595.—A. BENNETT, Rockford, Ill.—*Seed Planter*.—March 5, 1867.—The seat supports rest on the journals of the covering rollers. One driving wheel has a series of adjustable inclines, which work the seed slides, the latter being connected by levers and a rock shaft, so that their motion is simultaneous. The frame is tilted by a lever pivoted to the tongue and secured to a segment rack.

Claim.—First, the arrangement of the seat D, the supporting rods *b b* and the covering rollers *c c*, combined and operating as and for the purposes described.

Second, the seed boxes E E, combined with the adjustable feeding slides *i i*, the plows *e e*, and the levers *l n p* for operating the feeding slides, substantially as herein described.

Third, the shifting concentric rim *w* with the cams *q q*, in combination with the rim *w'* and the shifting devices connected with them, arranged substantially as and for the purposes herein set forth.

Fourth, the lever bar H, in combination with the draft pole G, for raising and lowering the hind end of the frame A, arranged substantially as and for the purposes herein described.

62,596.—JAMES S. BODLE, Mecklenberg, N. Y.—*Instrument for Marking Animals*.—March 5, 1867.—The legs of the frame are attached in the dovetail notches in the backs of the letters, and the screwing of the handle into the threaded lugs of the frame spreads the legs and makes their hold on the letters secure.

Claim.—First, a stamp or brand formed with an adjustable frame, and movable letters, combined and arranged to operate substantially in the manner set forth.

Second, the combination of the frame A A¹ with lugs A² and A³, threaded stem B², and notched movable letters C, substantially as set forth.

62,597.—SPENCER C. BOND, Farmersville, N. Y.—*Wool Press*.—March 5, 1867.—The hinged sides are thrown up and held by cord connection to the treadle. The ends are then mutually advanced, by strap connection to the drum beneath, which is rotated by a crank and sustained by a pawl.

Claim.—First, a wool press composed of two hinged wings C and two sliding heads G G', in combination with the lever D and windlass H, all constructed and operating substantially as and for the purpose set forth.

Second, the slotted slide E with its head G, in combination with the single slide F with its head G', constructed and operating substantially as and for the purpose described.

62,598.—HENRY W. BRADLEY, New Berlin, N. Y., assignor to himself and B. VAN HORN, Bennettsville, N. Y.—*Paint*.—March 5, 1867.—Composed of sugar of lead, 1 part; water, 32; boiled oil, 32; mineral paint, 60. Rice mucilage may be substituted for a portion of the oil.

Claim.—First, as an improved article of manufacture, a paint compound which is composed of the ingredients, or their respective equivalents, and in the proportions herein set forth.

Second, the substitution for a certain quantity of oil in paints of boiled rice, substantially as and for the purpose herein set forth.

62,599.—CHARLES B. BRISTOL, New Haven, Conn.—*Attaching Door Knobs to their Spindles*.—March 5, 1867.—One end of the spindle has an inclined plane, in which the end of the binding screw rests. This permits the adjustment to locks of doors of varying thicknesses, as the knob is held by the binding screw at the point of adjustment.

Claim.—The use of the inclined plane *g*, in combination with the screw *h* and the neck of the knob A, when they are constructed, connected, and made to secure the knob A in the desired position on the spindle, substantially as herein described and set forth.

62,600.—BENJAMIN BRITTEN, Galena, Ill.—*Clothes Drier*.—March 5, 1867.—The standard is made in two telescopic sections. One rank of arms is contained in the inner tube, and the other in the annular space between the tubes. The arms are hinged for horizontal radial display.

Claim.—The combination of the tubes A U with the flanged rings F T and arms G S, as herein set forth for the purpose specified.

62,601.—THOMAS S. BROWN, Poughkeepsie, N. Y., assignor to himself and JOHN P. ADRIANCE, same place.—*Lubricating Device*.—March 5, 1867.—A tube extends through the bearing from the shaft to a plug in the oil cup. The oscillations of the shaft cause portions of the oil to flow through the transverse grooves in the plug into the tube, and thence to the shaft.

Claim.—The chamber D in the part *b* of the bearing C, through which extends the tube F, communicating with the passage *c*, in combination with the plug E and journal A, arranged and operating substantially as herein described and for the purpose specified.

Further, the plug or stopper E of the oil chamber D, grooved at its under side, in combination with the tube F and passage *c* in the bearing, substantially as and for the purpose specified.

62,602.—P. S. BUCKMINSTER, Gold Hill, Nevada.—*Shaking Table for Concentrating Ores*.—March 5, 1867.—The bed is supported on cross-bearers, which slide in the slots of the upright posts, and receives an oscillating longitudinal motion. The grooves are made diagonally across the bed, and at the ends are openings in the sides, which are provided with adjustable slides. The lighter portions are carried away and washed off, while the heavier portions are detained, settling, according to their specific gravity, in the grooves.

Claim.—The riffles *b b*, running diagonally across the bed of a shaking table, in combination with openings *c c* at one end and the adjustable slides *d d*, for concentrating gold and other ores, arranged and operating substantially as herein described.

62,603.—G. W. BUFFINGTON, Mechanicsburg, Ohio.—*Fruit Jar*.—March 5, 1867.—The edge of the cover is turned over the edge of the rubber band. When the jar is filled with hot fruit, the cover is placed upon it, and the band turned down so as to embrace the neck of the jar. After the fruit has cooled, the band is turned up over the cover, which is held in position by the pressure of the atmosphere.

Claim.—The combination and arrangement of the plate A, elastic band E, mouth of jar D, curved inward so as to form a seat for the cover A, substantially as herein set forth for the purpose specified.

62,604.—RUSSELL BUNKER, Hindson, Wis.—*Burglar Alarm*.—March 5, 1867.—The spindle of the knob has a cross bar connected at each end to the bell crank trigger which acts as a detent to the escapement of the alarm. Turning the handle in either direction releases the escapement and springs the alarm.

Claim.—Combining an alarm mechanism, substantially as described, with a door latch in such manner that by moving such latch the cord *c* will release the trigger *d* from the 'scape wheel and cause the alarm to strike, substantially as herein set forth.

62,605.—MICHAEL CARPENTER, Moscow, Iowa.—*Water Wheel*.—March 5, 1867; antedated February 25, 1867.—The wheel is formed in two parts: the upper portion has buckets set vertically and radially; the lower part comprising the hub of the wheel, has spiral channels terminating in orifices in the rim of the lower or main part of the wheel. The two parts are attached together and adapted to receive both the percussion and reaction of the water which is received above.

Claim.—In combination with the guides D and gates E, the wheel with the vertical and radially disposed buckets I and hub G and orifices K, the parts being severally constructed and the whole arranged for use substantially in the manner set forth.

62,606.—F. A. L. CASSIDY, Newmansville, Fla.—*Comb*.—March 5, 1867.—The comb back has side wings pivoted to it with inwardly projecting teeth and coiled springs by which the said teeth are kept engaged with the hair.

Claim.—First, the side or wing combs pivoted to the ends of the body of the main comb, substantially

as herein shown and described and for the purpose set forth.

Second, the combination of springs C with the main comb A and side combs B, substantially as herein shown and described and for the purpose set forth.

62,607.—JONATHAN CHILDS, West Troy, N. Y.—*Carriage Axle Adjuster.*—March 5, 1867.—The bar is clamped to the axle and the spindle set by the ring bolt.

Claim.—A carriage-axle adjusting instrument formed of the bar G in combination with the block F, the adjusting screw S, with its nut levers J and K and the clamps M and N, substantially in the manner set forth in this specification.

62,608.—GEORGE R. CLARK, New York, N. Y.—*Metallic Blind Slat Clasp and Pivot.*—March 5, 1867.—A metallic clasp and journal for attachment to the ends of window-blind slats.

Claim.—The metallic clasp *a* and pivot *h* combined for blind slats, as a new article of manufacture.

62,609.—JOHN J. CLYDE, Williamsburgh, N. Y.—*Life-Preserving Berth.*—March 5, 1867.—Explained by the claim and illustration.

Claim.—The combination of the removable berth D having keel *d*^s and provided with ring bolts G, line H, seat I, and paddle J, secured to the berth and adapted to be used for the purposes described when the berth is launched and forms a raft, substantially as specified.

62,610.—BARRY COLEMAN, Louisville, Ky.—*Cotton Bale Tie.*—March 3, 1867.—Explained by the claim and illustration.

Claim.—The rectangular tie plate A having the square and diagonal-sided slot *a* when applied to bale hoops for securing the ends, arranged substantially as herein described.

62,611.—ISAAC C. COLTON, Buffalo, N. Y., and ALBERT M. HASTINGS, Rochester, N. Y.—*Treating Hides and Skins for Tanning.*—March 5, 1867.—The hides are agitated in a close vessel while surrounded by water or cleansing liquid under pressure to clean and soften them. They are afterward subjected to a similar treatment with tanning liquid.

Claim.—First, the treating and preparation of hides and skins for tanning by the combined action of hydraulic or hydrodynamic and pneumatic pressure, or by either mode of pressure separately, in combination with rotary motion of internal agitation or movement of the contents or materials to be operated upon while under pressure, by the means and substantially as described.

Second, the tanning of hides, skins, and leather by the combined or separate use of hydraulic or hydrodynamic and pneumatic pressure in a closed cylinder in combination with rotary motion or internal agitation or movement of the tanning liquors and hides or skins while under pressure, by the means and substantially as above described.

62,612.—ISAAC C. COLTON, Buffalo, N. Y., and ALBERT M. HASTINGS, Rochester, N. Y.—*Bleaching and Dyeing Yarn, Cloth, and other Textile Fabrics.*—March 5, 1867.—The articles are placed in a tight cylinder and subjected to high pressure while surrounded by the dye liquid. The cylinder is rotated during the process.

Claim.—The bleaching and dyeing of cloths, yarns, and other textile fabrics by the combined or separate use of hydraulic or hydrodynamic and pneumatic pressure in a closed vessel or cylinder in combination with rotary motion or internal agitation or movement of the liquors, cloths, and fabrics while under pressure, by the means and substantially as above described.

62,613.—R. A. COWELL, Cleveland, Ohio.—*Car Coupling.*—March 5, 1867.—An automatic car coupling, in the enlarged head of which is a hook pressed down by a spring above and raised by a cam below, operated by a crank and rod to release the coupling.

Claim.—In the draw head A formed with an enlarged chamber in the upper part, the hook *c* in connection with the ordinary link and the cam *h* operated

by a crank and rods, all constructed and arranged to operate as shown and described.

62,614.—WASHINGTON F. DAVIS, Boston, Mass.—*Center Board for Sailing Vessels.*—March 5, 1867.—Explained by the claim and illustration.

Claim.—A center board composed of two or more sections A' B' C' D' so arranged as to slide within or upon each other in a manner and for a purpose substantially as set forth.

62,615.—O. P. DILLS, Falmouth, Ky.—*Sulky Plow.*—March 5, 1867.—The separate parts are adjustable in respect to each other and so connected as to accommodate themselves to the surface of the ground.

Claim.—The arrangement of the draft pole E and bars F C with the land and furrow wheels D K respectively attached, the brace rods O P and plow beam A, for the purpose of forming a new and improved sulky plow, as set forth.

62,616.—DANIEL DIVER, Boone, Iowa.—*Lifting Jack.*—March 3, 1867.—The claw of the adjustable vertical ratchet bar engages under the rail to raise the track by depression of the lever.

Claim.—First, an improved lifting jack formed by the combination of the ratchet hook E, clevis or loop F, and pivoted block C with each other and with the lever B and fulcrum post A, substantially as herein shown and described.

Second, the combination of the spring G with the pivoted block C and fulcrum post A, substantially as herein shown and described and for the purpose set forth.

62,617.—BENJAMIN K. DORWART, Lancaster, Pa.—*Shutter Bolt.*—March 5, 1867.—The pivoted spring jaws are on a plate attached to one shutter and engage a similar plate upon the other.

Claim.—As a new article of manufacture a shutter bolt when composed of two twin plates A A', each provided with a raised conic flange B notched at the base for the reception of the horizontal bolts D D', in the manner and for the purpose specified.

62,618.—LUCIUS H. DWELLEY, Dorchester, Mass.—*Wood Turning Lathe.*—March 5, 1867.—The blank is bored, turned, and cut off in the lathe automatically and at one operation by the devices described in the claims.

Claim.—First, the combination of the shaft F with the cam M traversing thereon and revolving therewith, lever 19 and sliding spindle K with its tool or tools, substantially as described.

Second, the combination of the shaft F with the cam J traversing thereon and revolving therewith, and the vibrating cutter holder *v* with its cutter *u*, for the purpose set forth.

Third, the combination of the shaft F with the cam J traversing thereon and revolving therewith with the severing cutter *s*, as described.

Fourth, the automatic feed mechanism consisting of the cam E, rocker arm D, spring *i*, or its equivalent, toothed bar C, pawl *k*, and gauge *r*, in combination with the traversing carriage B when such carriage carries all the tools required to turn, bore, and sever the spool from the stick, substantially as described.

Fifth, the combination of the auger 17, slotted cylinder 21, with its cutter 22 on its end, and set screw 24, substantially as and for the purpose set forth.

Sixth, the mechanism consisting of the grooved wheel *s* with its notch *j'* and connections, substantially as described, for the purpose of arresting the motion of the cutting and boring tools at a stated position and also to arrest the feed at the same time, substantially as described.

62,619.—G. L. and C. H. EAGAN, San Francisco, Cal.—*Composition for Roofing.*—March 5, 1867.—Composed of melted pitch, three; and refuse of gas lime, two parts; mixed with dry pulverized clay to a consistency for molding.

Claim.—The composition for the manufacture of drain pipes, moldings, roofing, &c., the ingredients of which are prepared and combined in the proportions and manner substantially as herein described.

62,620.—FRANZ ENGEL, Camden, N. J.—*Blower*.—March 5, 1867.—The revolution of the screw forces air through the nozzle.

Claim.—The screw C, provided with a jacket e at its end, and operating in a case A, from which extends a blast pipe B, substantially as and for the purpose described.

62,621.—HENRY FAUS, Hayesville, Ohio.—*Boot Crimping Machine*.—March 5, 1867.—The jaws have a free hinge below, and a wedge-shaped key, and gain cut in each jaw to allow mobility, and to furnish means of adjustment. The leather is clamped on the lever.

Claim.—The iron rods composing the hinge-like arrangement, providing for the mobility of the jaws, and the wedge-shaped key and gain cut in each jaw, for the purpose set forth.

62,622.—WILLIAM B. FOSTER, Ridgeville, Ohio.—*Medical Compound*.—March 5, 1867.—For bowel complaints, &c., composed of alcohol, 3 qts.; cayenne, 2 oz.; and 1 oz. each of saffras, hemlock, oil of cedar, camphor gum, and laudanum.

Claim.—The medical compound, made of the several ingredients, mixed together in or about the proportions substantially as described.

62,623.—JOHN FRANTZ of JOSEPH, Selbysport, Md.—*Fruit Gatherer*.—March 5, 1867.—The pins projecting radially from the roller are to perforate the fruit sufficiently to carry it up to the detaching arms, which convey it to the basket.

Claim.—The drum or cylinder A, provided with grooves a and teeth or pins b, in combination with the finger bars H and receptacle J, all arranged and operating in the manner and for the purpose specified.

62,624.—S. D. FREET, McCutchenville, Ohio.—*Instrument for Paring the Hoofs of Horses*.—March 5, 1867.—The cutter clamped in one jaw enters the groove of a projection on the other. A set screw on the latter jaw prevents the jaws closing sufficiently to injure the cutting edge.

Claim.—An instrument for paring horses' hoofs, constructed, arranged, adjusted, and made to operate as herein set forth and explained.

62,625.—MERRITT GALLEY, Marion, N. Y.—*Car Coupling*.—March 5, 1867.—The coupling is self-engaging, and the tumblers are so arranged that a backward and forward movement of the lever is required for uncoupling.

Claim.—First, the tumbler T T' T'', with cams, slots, and lever projections, combined and constructed as herein described.

Second, the catch hook R, with lever projection R*, in combination with the angular projection Z of tumbler forming the "compound drop latch" Z R, substantially as herein set forth.

Third, the catch tooth C, in combination with its counterpart mortise C', substantially as described.

Fourth, in combination with the tumbler T T' T'', the fulcrum F, for the purpose herein set forth.

62,626.—JOSEPH W. GARDNER, Shelburne Falls, Mass.—*Attaching Handles to Table Cutlery*.—March 5, 1867.—The shank is prolonged into a loop, which is made to enclose the stock of the handle by being pressed into a groove in the edge of the latter.

Claim.—Securing handles to forks, knives, or other instruments by condensing the metal portion of such articles in a groove formed in the handle, substantially in the manner herein described and represented.

62,627.—GEORGE H. HAMMOND, Oneonta, N. Y.—*Stove Pipe Drum*.—March 5, 1867.—The caloric current is deflected horizontally between the two lower disks, then rises in a sinuous course between the outer cylinders, being deflected by the intervening perforated plates, and thence passes horizontally to the chimney, which it ascends. Air passes in below, is heated in the annular space, and escapes above.

Claim.—The construction, combination and arrangement of the disks A E H K L M I F B with each other, with the interior, intermediate and exterior cylinders G J D, and with the short pipes C,

substantially as described and for the purpose set forth.

62,628.—C. C. HARRIMAN, Warner, N. H., assignor to himself and JOHN DAVIS, 3d, same place.—*Corn Cake Machine*.—March 5, 1867.—The thickness of the sheet of dough is determined by the set screws over the journals of the roller; the dough lies on a board, which is moved by the gear-wheel on the roller shaft. The cutter has a rectangular series of vertical knives, which divide the sheet into squares; followers discharge the adhering cakes from the intervals between the cutters.

Claim.—The adjustable roller C, provided with gear wheels G, slotted supports D, set screw E, sliding board B, cutter I, beam J, sliding between the uprights H H, beam K, and hand screw L, when all are constructed and arranged as herein set forth for the purpose specified.

62,629.—GEORGE HEALEY, East Woburn, Mass.—*Machine for Peeling Willow*.—March 5, 1867.—The willow rods are driven between two jaws, thence passed around a wheel between it and the belt that drives it, and are finished by putting them again through flexible jaws, and over a wheel between it and the band, a repetition of the former process on a duplicate machine, driven by the same motion, and acting in conjunction.

Claim.—The combination of a single wheel, a set of stripping jaws, and an endless belt, its supporting rollers, and a deflector, the whole being substantially as described and for the purpose set forth.

Also, the combination of the two elastic or flexible lips with the single wheel, a set of stripping jaws, and an endless belt, its supporting rollers and deflector, as described.

62,630.—SYLVESTER B. HILL, Chicopee, Mass., assignor to himself and F. E. DRAKE, same place.—*Wrench*.—March 5, 1867.—The movable jaw and its shank are sleeved upon the shank of the stationary jaw, which passes through, and is secured at the end of the handle. The nut on the handle engages the thread of the movable jaw shank, and is the means of moving it.

Claim.—A wrench having the jaws B and C, handle A, and nut D, constructed and arranged substantially as herein described.

62,631.—JEAN and GEORGE HOCHAPFEL, Strasbourg, France.—*Tobacco Pipe*.—March 5, 1867.—The tubes are accessible; the smoke tube from the bowl is received in a passage, in whose lower end the nicotine and saliva are collected.

Claim.—The arrangement of the three passages A a c, in relation to the bowl D, none of said passages or openings going through, and all accessible from the outside, and forming passage, trap, and nicotine chamber, as set forth and described.

62,632.—CHARLES HOLLWEDE and JULIUS PRZEZINSKY, New York, N. Y.—*Block Former for Muffs*.—March 5, 1867.—The hollow cylinder is divided longitudinally into sections, and is expanded laterally by a taper pin to stretch the skin, which has been placed thereupon.

Claim.—A muff block, composed of several pieces, arranged and operated substantially in the manner and for the purpose as hereinbefore set forth.

62,633.—A. B. HUTCHINS, Patchogue, N. Y.—*Churn Dasher*.—March 5, 1867.—Explained by the claim and illustration.

Claim.—The dash C, consisting of the rim a, connected by the oblique arms c to hub b, and vertical plate D, with rounded corners, rim e and opening f, and fitted loosely on the rod B, operating as described substantially as specified.

62,634.—HYAM JACOB HYAMS, New York, N. Y.—*Water Meter*.—March 5, 1867.—Within the case is an eccentric revolving wheel whose wings are hinged to its radial arms and connected by flexible membranes, so as to expand and collapse alternately as they revolve. The water is regulated in its supply by a float valve, and occupies the spaces of known capacity around the wheel, whose revolutions are recorded.

Claim.—First, the combination with a fixed crank S of the revolving diaphragm measuring chambers J, constructed and arranged for operation in connection with a foot valve G, substantially as and for the purpose specified.

Second, the combination and arrangement, substantially as shown and described, of the revolving cylinder with its flexible diaphragms, foot valve, and cistern, provided with a valve controlling the head or pressure to the measuring chamber, as herein set forth.

62,635.—EDWARD M. JUDD, Wolcottville, Conn.—*Curtain Fixture.*—March 5, 1867.—The stock carries a sheave and has a tooth engaging the teeth of a rack on the back of the slide. A sliding clamp holds the tooth in engagement.

Claim.—The stock of the pulley *f*, having a tooth *i*, taking the rack on the inside of the slide *a*, in combination with the sliding clamp *g*, for holding said tooth to its place, as set forth.

62,636.—ZENO KELLY, New Bedford, Mass.—*Sealing Padlock.*—March 5, 1867.—The seal is placed in a loop of the shackle bar which comes in front of the key hole, so that an entering key passes through the seal and the slot of the shackle.

Claim.—First, applying a seal or seals to the end of the shackle suitably constructed therefor, so that to unlock it said seal or seals must be canceled or destroyed by the key, substantially as and for the purpose described.

Second, constructing the shackle in such manner, in combination with any suitable arrangement of locking devices upon the inside of the lock, that the key for unlocking the lock when inserted therein will pass through the said shackle to break the seal, substantially as and for the purpose described.

62,637.—WILLIAM H. KELLOGG, Du Quoin, Ill.—*Gate Latch.*—March 5, 1867.—The flat spring at the hinging side of the gate is twisted in opening and the torsion closes it. The incline of the latch strikes in closing against one of the rollers, by which it is retracted and the latch is then caught between the rollers. A double-headed lever projects on each side of the gate for the withdrawal of the latch.

Claim.—First, the gate latch *c*, in connection with the double bent lever *h h*, the friction rollers *k k* and *g g*, and the springs *f* and *b*, combined, arranged, and operated substantially as and for the purposes herein described.

Second, the latch *c*, in combination with the flat spring *b*, for swinging and closing a gate, substantially as herein described.

62,638.—D. J. KIRKMAN and E. H. GRAY, Winchester, Ill.—*Wagon Brake.*—March 5, 1867.—The blocks at each end of the brake bar are driven against the wheel or withdrawn from it by the lever connected therewith by rods.

Claim.—The bar C, in combination with the serrated plate F, stirrup *e*, the rods K K, the cleat M, furnished with strap *i*, and the bar S, the whole constructed and arranged and operating as and for the purpose herein set forth.

62,639.—MATTHEW LAFLIN, Chicago, Ill.—*Apparatus for Amalgamating Gold and Silver.*—March 5, 1867.—An improvement on the patent of Scoville and Gates, September 20, 1864. The means cited in the claims are for mixing the pulverized quartz with the melted lead, and for excluding the air from the latter to prevent oxidation.

Claim.—First, a kettle with partitions dividing it into compartments in the upper part but leaving it open at the bottom, substantially as described.

Second, the method of excluding the air from the lead by means of the covers, one or all of them, substantially as described.

Third, the improved scroll wheel, with one, two or more spiral plates, substantially as described.

Fourth, the screw and its casing, substantially as described.

Fifth, the combination of a scroll wheel and screw, substantially as described.

Sixth, the combination of a scroll wheel, screw and casing, substantially as described.

Seventh, the combination of a kettle, partitions, and scroll wheel, substantially as described.

Eighth, the combination of a kettle, partitions, scroll wheel, and screw, substantially as described.

Ninth, the combination of a kettle, partitions, scroll wheel, screw, and casing, substantially as described.

Tenth, the combination of a kettle, partitions, and cover or covers, substantially as described.

62,640.—EBENEZER G. LAMSON, Shelburne Falls, Mass.—*Table Fork.*—March 5, 1867.—The wire is looped around the handle and secured by a collar. At the point where the ends separate into tines they are clamped by a ferrule, stamped or soldered upon them, and other intermediate tines, if such are used.

Claim.—A table fork made of wire, substantially as herein described.

62,641.—RANSOM K. LARAWAY and JEROME LARAWAY, Battle Creek, Mich.—*Plow.*—March 5, 1867.—Either the frame with cultivator shares or the beam of the gang plow is attached to the wheeled frame by a pivotal connection. Either, when occupying this position, is vertically adjustable by means of the hand lever and chain.

Claim.—First, the manner herein described of attaching the frame B', with gang plows attached, to the frame B attached to driving wheels, and of attaching to the same plow H, as described and set forth.

Second, the manner herein described of raising and lowering the frame B', with plows attached, or single plow, by means of lever C', pawl and ratchet D and E, and flap *n* and chain G, in the manner set forth and described.

62,642.—A. T. LARGE, Chicago, Ill.—*Seed Dropping Attachment for Hoes.*—March 5, 1867.—Improvement on his patent November 27, 1866. The seed box is attached above the hoe handle, near its lower end, and the hand trigger operates a spring slide which drops the seed in regulated quantity.

Claim.—The seed box B, with the box C attached, and provided respectively with the openings *b d*, in combination with the slide D placed within the box C, provided with the opening *c*, and operated by the spring I and lever G, all arranged and applied to the handle of a hoe, substantially as shown and described.

62,643.—W. LAW, New York, N. Y.—*Refrigerator.*—March 5, 1867; antedated December 31, 1866.—The moisture which rises from the provision chamber into the ice chamber is condensed, collected, and conducted to the exit pipe.

Claim.—The construction and arrangement within the walls A of the corrugated inclined plates C and bottom H, in such a manner as to prevent the air that rises from the provision chamber I from having its moisture condensed by contact with the bottom of the plates C, and dropping back into the said provision chamber, as herein set forth.

62,644.—WILLIAM H. LAWES, Somerville, N. J.—*Liniment for Cure of Foot Rot in Sheep.*—May 5, 1867.—Composed of nitric acid, 2 oz.; acetate of copper, 1 oz.; sulphate of copper, 1 oz.; nitrate of potash, 1 oz.

Claim.—A liniment made of the chemical ingredients herein specified, and in about the proportions specified.

62,645.—ADAM LEICH, Brooklyn, N. Y.—*Door Lock.*—March 5, 1867.—The three checks are protected by a division plate from being tampered with by instruments, and require to be operated simultaneously and held clear of the bolt when the latter is to be moved by the key.

Claim.—First, the catches or checks C F G, applied to opposite sides of the bolt B, in combination with the partition plate E, arranged in relation with the bolt and the bar D, of the catch or check C, substantially as and for the purpose set forth.

Second, the wards *g*, placed in line with or applied to the outer key hole *f*, in combination with the partition plate E and the catches or checks C F G, all arranged substantially as herein shown and described.

62,646.—ALFRED LEIGHTON, London, England.—*Apparatus for Printing on Uneven Surfaces.*—March

5, 1867.—Especially intended for ornamenting or lettering curved or irregular surfaces. The printing surface is a flexible, elastic sheet, with the device raised upon it, and the latter being inked is pressed by fluid pressure against the article to be printed.

Claim.—The combined arrangement of a flexible elastic printing surface *a*, with a chamber or vessel containing fluid which, on being subjected to pressure, is caused to act on the printing surface, substantially as described.

62,647.—A. R. LEMEN, Kalamazoo, Mich.—*Hoisting Apparatus.*—March 5, 1867.—Power applied to the crank is communicated by the train of gearing to the hoisting drum, and by dislocation of the connection the chain is rapidly run off the latter.

Claim.—The combination and arrangement of the gear wheels as shown and described, in combination with the frame, when constructed substantially as described and for the purposes set forth.

62,648.—ISAAC LEVINE, New York, N. Y.—*Cuff.*—March 5, 1867.—Instead of being a closed cylinder, the wristlet has one open side, and is clamped against the wrist by an interior coiled spring; a cord limits its motion in unclosing.

Claim.—A cuff *A*, provided with spring *B*, and elastic retaining cords *a*, substantially as described.

62,649.—R. L. LEWIS, Worcester, Mass.—*Boot Tree.*—March 5, 1867.—The pin is attached to an arm of a stretching rod, and traverses upon two inclined planes attached to the front and back of the tree; the adjustable heel piece is operated by a right and left screw.

Claim.—First, a boot tree distended by means of a pin *b*, attached to an arm *G* of the stretching rod *D*, which traverses upon two inclined planes, or slotted inclines, attached respectively to the front and back of the boot tree, substantially as and for the purposes herein shown and described.

Second, a mounted swiveling boot tree, which is provided with an adjustable heel piece *I*, substantially as and for the purpose herein shown and described.

Third, the manner of operating the adjustable heel piece, by means of a differential screw *i* and plates *h h*, substantially as herein shown and described.

62,650.—ANN LOOSLEY, Philadelphia, Pa.—*Medicine.*—March 5, 1867.—For the cure of whooping cough. Composed of West India molasses, 180 parts; pulverized rosin, 60; and tincture of wild cherry bark, 10.

Claim.—The combination of the said ingredients, in the said proportions, thereby producing the said medicine, and which I propose to manufacture and sell as "Loosley's Infallible Cure for Whooping Cough."

62,651.—O. HIGLEY and S. TOOTHAKER, Fredonia, Ohio.—*Wagon Tongue Supporter.*—March 5, 1867.—The wagon hounds are connected beneath the tongue hounds by a spring which forms a rest for the tongue-supporting spring. The eye on the rear end of the latter is passed over the end of the king bolt, and its forward end is slipped into staples beneath the tongue.

Claim.—The springs *a* and *c*, constructed as described, in combination with the tongue or thills *C*, hounds *E E* and axle *B*, for the purposes set forth and specified.

62,652.—THEODORE MACE, New York, N. Y.—*Molasses Gate.*—March 5, 1867.—The valve plate has an outer cup which receives one end of a spiral spring whose other end abuts against the lever to keep said plate to its face.

Claim.—The screw *r*, passing through the lever *e*, in combination with the spring *d* that surrounds the screw *e*, and is within a cup on the outside of the gate *c*, the parts being constructed and applied in the manner and for the purposes specified.

62,653.—DAVID MANUEL, Boston, Mass., assignor to himself and WILLARD MANUEL, same place.—*Bed Spring Fastening.*—March 5, 1867.—The upper rectangularly-bent arm of the spring is held by a metallic plate having end claws for attachment to the slat.

Claim.—The cross-bar holder *c*, consisting of the

hooks *d d*, eye or bridge *e*, hooks *g g* and *h*, constructed as described for the purpose of securing the base of the spiral wire bed spring *B* to the slat *A*, as herein set forth.

62,654.—THOMAS C. MARCH, London, England.—*Ornamenting Mirrors.*—March 5, 1867.—The objects named in the claim are attached by transparent cement.

Claim.—The ornamentation of mirrors, &c., by affixing to the surfaces of the same by cement, glass knobs, beads, or moldings prepared by grinding the face to be attached, substantially as set forth.

62,655.—MOSES S. MARSHALL, Melrose, Mass., assignor to himself and R. WENDELL, Salem, Mass.—*Stove Pipe Damper.*—March 5, 1867.—The damper plate has a central opening spanned by a bar which forms a bearing for a bolt on which a valve plate plays. The bolt also forms means of connection to the two cup-shaped side plates. The inversion of the damper operates the valve.

Claim.—First, the combination in a damper of the concave cups *B B'*, central annular plate *A*, and circular plate *C*, substantially as and for the purpose set forth.

Second, the combination of the damper spindle and key when said parts are respectively constructed and the whole arranged as and for the purpose set forth.

62,656.—W. C. MARSHALL, New York, N. Y.—*Blind Fastening.*—March 5, 1867.—The shutters are drawn to by a weighted cord, and are kept open by a button on a shaft which extends to and is operated from the inside.

Claim.—The latch *e* and releasing lever *g*, in combination with the self-closing shutter *A*, constructed and operating substantially as and for the purpose described.

62,657.—CHARLES F. MARTINE, Boston, Mass., assignor to SOLETTA OIL COMPANY.—*Lamp Wick.*—March 5, 1867.—The wick has a core of wood twine or some firm substance that will consume with the wick; the addition gives stiffness to the wick, and enables the teeth of the elevating wheel to operate upon it more effectively.

Claim.—The combination of a straight stiffish, hand non-conducting core or thread with the loosely woven wicking used for lamps, substantially as and for the purpose described.

62,658.—JOHN MATTHEWS, Jr., New York, N. Y.—*Box for Holding and Transporting Bottles.*—March 5, 1867.—The box is partitioned into pockets for the bottles, the lower edges of the partitions are enlarged, forming shelves upon which the shoulders of the inverted bottles rest.

Claim.—The lower extensions or strips *E* or *E'*, arranged below the upper compartments *a*, and constructed so as to form shelves or projections *c* or *c'*, on opposite sides, and to constitute lower compartments *d*, in combination with the cross strips forming the upper compartments of the box or case, substantially as specified.

62,659.—W. MAY, Binghamton, N. Y.—*Pressing Leather Seams.*—March 5, 1867.—The seam is placed on the fixed support, clamped down by side bars, and pressed by a spring foot, actuated by a treadle, which is re-raised by a spiral spring attached at one end to a short arm of the treadle.

Claim.—First, the application of a treadle to a machine for pressing leather seams, substantially as herein shown and described.

Second, the arm *c'* on the treadle *E*, in connection with the spring *c* and roller *C*, substantially as and for the purpose herein shown and described.

Third, the spring *I*, and the manner of regulating its pressure by means of the screw *g*, substantially as herein shown and described.

Fourth, the rest *h* and clamp *h'*, in connection with the pin *l* and spring *i*, made and operating substantially as and for the purpose herein shown and described.

Fifth, the removable "clamp and holder" *H*, in combination with the fixed supports *G*, substantially as and for the purpose herein shown and described.

Sixth, the sliding bar *F*, to which the spring *I* is

secured, when made and operating substantially as herein shown and described.

Seventh, the rest *h*, which is so constructed that its lower edge will be parallel with its upper surface, substantially as and for the purpose herein shown and described.

62,660.—W. McCracken, Bainbridge, Ind.—*Cotton Cultivator*.—March 5, 1867.—The share has dovetail projections, which are held between cleats on the moldboard. The ground wheel is attached to, and vibratable on, the beam for vertical adjustment. The hoe vibrates laterally by the action of a cam wheel.

Claim.—First, the scraper *I*, in combination with the plow, the former being placed at the rear of the latter and arranged relatively therewith, substantially as and for the purpose set forth.

Second, the connecting of the share *F* to the moldboard *E* by means of the dovetail arms *c*, cleats *d*, and keys *e*, substantially as described.

Third, the manner of attaching the wheel *C* to the beam, so that it may be adjusted higher or lower to regulate the depth of the penetration of the plow, as set forth.

Fourth, the combination of the hoe *O*, pivoted rod *P*, pendant arm *i*, secured to the colter bar, and cam *L*, operating in the manner and for the purpose specified.

62,661.—THOMAS MCGRAH, Sheffield, England.—*Cutlery*.—March 5, 1867.—The circumferentially corrugated tang is fastened with sulphur in the longitudinally-grooved bore of the handle.

Claim.—The securing of handles to the tangs of cutlery by means of sulphur, substantially as set forth.

62,662.—J. MCKIBBEN, Lima, Ohio.—*Combined Bridle and Halter*.—March 5, 1867.—The cheek pieces of the bridle and halter to which the bit and lower ring of the halter are attached are connected by snaps to the centering rings of the brow, crown, and throat straps.

Claim.—The combination and arrangement of the cheek pieces *G*, of the halter, cheek piece *F*, of the bridle, attached to the rings *D* by means of the snap hooks *H*, nose strap *I*, chin strap *J*, brow band *A*, crown piece *B*, and throat strap *C*, as herein set forth for the purpose specified.

62,663.—JOHN M. McMULLEN, West Liberty, Ohio.—*Invalid Chair*.—March 5, 1867.—The back and foot rests are hinged and operated by a windlass placed transversely beneath the seat, to which is fastened the middle portion of a belt, whose ends are attached to said back and foot rest.

Claim.—The combination of the shaft *F*, belt *G*, toothed wheel *a* with its crank *b* and pawl *e*, with seat *A*, back *B*, feet rest *C*, and frame *E*, substantially as and for the purpose described.

62,664.—J. M. MERRYMAN, Indianapolis, Ind., and W. M. DUNN, Gurleysville, Ala.—*Cotton-seed Planter*.—March 5, 1867.—A series of cups are arranged upon an endless and inclined belt which passes in at the bottom of the hopper and out over the front of the same, carrying the seed from below upward. The hopper is mounted on pivots, upon which it oscillates, the agitation keeping the seed toward the bottom of the hopper. A share opens the furrow; the seed drops behind a hood and is covered by a drag bar. The frame is mounted on wheels and guided by handles.

Claim.—First, suspending the hopper *E* upon a pivot, or its equivalent, so that it may be vibrated for the purpose of agitating the inclosed seed.

Second, placing the seed hopper of the seeding machine so that the feeding device, passing in at the bottom and out at the top, shall pass vertically beneath the contained seed.

Third, agitating the seed hopper of the seeding machine by the passage of the feeding device through the same, for the purpose set forth.

Fourth, the cup *M*, constructed and attached as described, so that in passing over the upper roller *J* the seed will be thrown out, as set forth.

62,665.—JAMES C. MERRITT, New York, N. Y.—*Retainer for Neckties*.—March 5, 1867.—The neck-

tie passes through the loops of the metallic plate, and the latter is held down, by an elastic connection, to the button.

Claim.—A retainer for neckties, provided with opening *a* for the reception of the necktie, and having an elastic connection secured to the retainer by means of lip *F*, and provided with the button attachment *e* *g*, substantially as described.

62,666.—I. L. MILES, Charlestown, Mass.—*Apparatus for Printing on Glass*.—March 5, 1867.—The glass is supported on the guide roller, and passes over the type beneath the pressure roller. When a bottle is to be printed, it is supported between rollers and the type cylinder.

Claim.—First, a roller or segment *D*, to which are secured curved ways *a a'* and a form of elastic type *X*, in combination with inking rollers *e e*, and a pressure roller *F*, or their equivalents, the whole being arranged and operating substantially as and for the purpose described.

Second, the roller or segment *D* with its ways and type, in combination with two or more rollers *h h*, substantially as and for the purpose specified.

Third, the adjustable stops or guides *b b'*, in combination with the roller or segment *D*, substantially as and for the purpose set forth.

Fourth, the corrugated bands *F'*, in combination with the roller *F*, for the purpose specified.

Fifth, the roller *J*, with its adjustable guides *c c*, arranged in respect to the roller *D*, substantially as described.

62,667.—LEVI MOREHOUSE, Barton, Wis.—*Bag Tie*.—March 5, 1867.—Two curved arms are pivoted together, one slotted, with a spring rack upon it, and the other arm fitting in the slot, and retained by the rack.

Claim.—A clamp with curved arms, one of them slotted or cratched, and supplied with ratchet bar and spring, substantially as and for the purpose herein set forth and described.

62,668.—WILLIAM NEEMES, Pittsburg, Pa.—*Molding Pulley*.—March 5, 1867.—The box in which the arms and hub are molded is divided at midheight and has segmental slides, which are withdrawn to form the mold for the inner rib of the rim. The mold for the flange of the same is formed in an outer case and has upper and under beveled faces, to coincide with those of the former mold over which it is placed.

Claim.—First, the box *A*, slides *C*, and pattern *B*, in combination with each other, when constructed and arranged substantially as described and for the purpose set forth.

Second, the cast-iron case *D*, for forming the outer side or face of the pulley, constructed as described, and used in conjunction with the sand molds made in box *A*, substantially as herein described and for the purpose set forth.

62,669.—FRANKLIN NELSON, Wyandotte, Mich.—*Straitening Railroad Rails*.—March 5, 1867.—The sliding press drop is operated by a toggle joint whose central pin is connected to a crank by which it is actuated. The roller frames which support the rails are vibratable.

Claim.—The sliding press drop *C*, connected by a toggle joint with the crank *d*, in combination with the vibrating roller frames *K K*, constructed and operating substantially as herein described.

62,670.—MARCUS NEUMANN, New York, N. Y.—*Apparatus for Distilling and Rectifying Spirituous Liquors*.—March 5, 1867.—One or more stills, each having a steam heating apparatus, are so connected with each other and with a concentrator and condenser, as that the vapors formed in one still can be made to pass through the other to heat the contents thereof. The concentrator has conical condensing chambers which receive a jet of water from a pipe.

Claim.—First, the arrangement of the stills *A A'* with heaters *B* and pipes *d d' c c'*, provided with suitable stop cocks, substantially as and for the purpose described.

Second, the condensing chambers *l* and troughs *p*, in combination with the pipe *q*, and condenser *E*, and

still A, constructed and operating substantially as and for the purpose set forth.

Third, the extra injection pipe *t*, in combination with the pipe *q*, chamber *l*, and deflecting plate *o*, in said chamber, substantially as and for the purpose described.

62,671.—LEWIS T. NEWELL, Springville, N. Y.—*Corn Sheller.*—March 5, 1867.—The corn passes between a spring board and two or more corrugated, concave-faced rollers of downwardly decreasing concavity. The face of the spring board has inclined corrugations, and its pressure toward the rollers is caused by an adjustable weighted lever.

Claim.—First, the combination of two or more concave wheels similar to G and G', when one or more of said wheels are made with the toothed concave surfaces deeper than the others, substantially as described.

Second, the weighted lever H, provided with the movable piece I, pin K, and apertures J and L, or the equivalent thereof, substantially as and for the purposes described, and in combination therewith the spring board P, when constructed as described.

Third, the shape and general arrangement of the wheels G and G', by which I combine in one the shelling and gearing teeth.

62,672.—MARK NEWLAND, Dayton, Ohio.—*Washing Machine.*—March 5, 1867.—The segmental rubber is suspended on a cord connected with a vertical treadle slide, and is oscillated by a crank. The tub bottom is transversely grooved, and the face of the rubber has rectangular rollers.

Claim.—The double spring connecting rod D, rubber G, provided with roller K, grooved posts E, cord L, pulley M, and treadle O, when constructed, arranged, and operating as herein set forth for the purpose specified.

62,673.—GEORGE NIMMO, Jersey City, N. J.—*Sash Supporter.*—March 5, 1867.—The rafter is secured to the frame by a plate of metal, the pressure of whose rounded inner sides gives a lateral extension to the rubber, and enables adjustment by the attaching screw.

Claim.—The sash or blind supporter formed of the convex retaining cap *d* and screws *e*, combined with the india-rubber block *c*, in the manner and for the purposes set forth.

62,674.—HARRISON OGBORN, Richmond, Ind., assignor to himself and JOHN W. FREE, same place.—*Straw Cutter.*—March 5, 1867.—The knife is adjustable by set nuts on its holding bolts. The mouth of the box has an adjustable plate outside the knife, to preserve it from outward side pressure. The springs of the straw-pressure board are adjustable in tension by notched eccentrics which engage projection on the springs. A cam block on the fly wheel engages the arm of an oscillating spring plate to move the feed rollers by push and pull paws.

Claim.—First, the adjustable knife H attached to the fly wheel, in combination with the adjustable guide plate G attached to the frame, substantially as and for the purpose set forth.

Second, the combination of the adjustable knife H and adjustable guide plate G with the inclined plate A', substantially as and for the purpose set forth.

Third, the eccentric notched cam N, in combination with the springs M, having projection M', substantially as and for the purpose set forth.

Fourth, the cam G', in combination with the fly wheel G and bell crank K, when respectively constructed and arranged substantially as set forth.

Fifth, the mode of securing the feed hands in their relation to the ratchets, by projections and grooves, substantially as and for the purpose set forth.

Sixth, the devices for actuating and adjusting the feed hands by means of the adjustable cam G', bell crank K, adjustable feed hands P and P', and adjustable plate Q, substantially as described.

62,675.—WILLIAM JOHN OSBORNE and G. B. MASSEY, New York, N. Y.—*Hose Coupling.*—March 5, 1867.—The collar admits of detachment from the lip by a side movement, when screwed back on its pipe. The hose is run over the coupling pipe and

made fast on the inclined circumferentially-grooved part by a screw-threaded ring.

Claim.—First, the tube A, provided with the projecting lip F having a groove *n* formed therein, in combination with the tube B, having the collar E provided with the flange *e* thereon, when said parts are arranged to operate as and for the purpose set forth.

Second, securing the hose to the tubes by means of the inclined surfaces and the rings *b*, constructed and arranged to operate as set forth.

62,676.—JOHN PARK, Joliet, Ill.—*Construction of Houses.*—March 5, 1867.—Box tubes inside the corners of the building conduct air from the cellar to the space between the upper ceiling and the roof. The laths are beveled on the inside to hold the plaster.

Claim.—First, the ventilators F, in connection with the box or tube, for the purposes and substantially as described.

Second, the beveled lath, when applied in the manner and for the purposes herein shown and described.

62,677.—VOLNEY PARKS, Fort Wayne, Ind.—*Adding Machine.*—March 5, 1867.—The numbered disks are moved one space at a time by pawls on spring rods beneath. One disk is marked in the multiples of 3 and the other in units. In adding, the former is moved one space for every time the number 3 is contained in the number to be added, and the remainder is recorded on the unit spaced disk.

Claim.—First, the two intermittingly-rotating disks C and D, furnished on their peripheries with different series of numbers, in combination with each other and with the stationary indices *a*, substantially as herein set forth, for the purpose specified.

Second, the slides F G, pawls H, and ratchet wheels E, arranged in relation with each other and with the disks C D, furnished with the differing series of numbers, substantially as herein set forth, for the purpose specified.

62,678.—ANDREW PATTERSON, Birmingham, Pa.—*Die for Making Bells.*—March 5, 1867.—The circular plate is made to assume the form stated by subtraction to a series of concavo-convex dies.

Claim.—The manner herein described of forming bells out of circular sheets of steel by means of the action of a series of dies of different shapes, constructed and operating on the material, substantially as described, so as to condense or thicken the outer portion of said sheets, thus forming the bells with a gradually increased thickness from their apex or center to the base or mouth, as described and set forth.

62,679.—WILLIAM F. PATTERSON, Vanceburg, Ky.—*Manufacture of Paints and other Compounds from Bituminous Slates, &c.*—March 5, 1867.—Bituminous slate, after subtraction to destructive distillation, is pulverized and mixed with oil, or other cohesives, to form paint or cement.

Claim.—The use of powdered or ground retorted slate with any of the oils, hydrocarbons, or gums, for the purpose of forming a paint, paste, or plastic compound, and this I claim whether other material or colors be mixed with the retorted slate powder or paint, or whether calcined after it is retorted or not, substantially as described.

62,680.—A. PEARSALL, Atlanta, Ga.—*Draft Pipe for Locomotives.*—March 5, 1867.—The draft pipe in the smoke box into which the steam is exhausted has side openings, with outer flanges projecting downward between them, and inner flanges projecting upward from their lower sides.

Claim.—In combination with the exhaust pipe F and the draft pipe B, having downwardly projecting lips D on its outer face, and opening C, the upwardly projecting flanges E on the inner face of the pipe, for the purpose described, substantially as specified.

62,681.—JAMES PINE, Troy, N. Y.—*Harvester.*—March 5, 1867.—The main axle is surrounded with a sleeve, which has journal boxes affording bearings for the axle, and having a rear extension, from which is suspended the gearing and vibrating frame, to which the cutting apparatus is attached. The coupling piece to which the cutting apparatus is hinged is pivoted to the vibrating arm, and is so connected

with levers on the arm and sleeve, that when the vibrating frame is raised or lowered, the cutting apparatus is rocked so as to maintain the same angle of presentation to the grain or grass. The coupling arm and draft power are both attached to a sector plate above the pivotal attachment of said plate.

Claim.—The use of an open sleeve, upon which is suspended the gearing to drive the knife and the attachment to hold the cutting apparatus, when said sleeve is furnished with journal boxes, substantially as and for the purposes set forth.

Also, the use of the swinging arm P, when hinged at its rear end to the projecting portion L of the sleeve, and when said arm supports the gearing and cutting apparatus, substantially as described.

Also, the use of the downward projecting arms or guides Q Q', and the rearward projecting arm piece L, in combination with the open sleeve, substantially as described and for the purposes set forth.

Also, the combination of the hinge V, the coupling piece Y, and the lever X, substantially as and for the purposes set forth.

Also, the use of a graduated sector-shaped draft bar, when both the cord or chain and double tree or team are united to it above its pivoted point, substantially as and for the purposes set forth.

62,682.—A. M. POLSEY, Boston, Mass., assignor to T. H. FULLER.—*Machine for Making Nails.*—March 5, 1867.—The nail is received from the shaping and drawing roller dies between two movable plates, which are forced in by side rollers to straighten the nail. Its point is removed by a cutter at the same time. A spring beneath the head ejects the nail from the dies.

Claim.—In combination with the drawing and shaping die rolls and with the rolls *b c*, between which the nail is passed, the movable blocks or pieces *e f*, arranged to operate against and straighten the opposite edges of the nail, substantially as set forth.

Also, in combination with the rolls *b c* and the edge-straightening blocks *e f*, the throat *l*, operating in connection with the rolls to straighten the broad faces of the nail, substantially as set forth.

Also, in combination with the rolls *b c* and the straightening mechanism, the die projection *m* operating in connection with the edges of the groove *d* to shear or clip off the rough edges of the nail near the point, and also so formed as to chamfer the end of the nail, substantially as set forth.

Also, in combination with the rolls *b c* and straightening mechanism, the cutter *n* for pointing or finishing the point of the nail, substantially as described.

Also, in combination with the rollers *b c* and the straightening mechanism, the spring *i* for throwing the head of the nail from the groove, substantially as described.

Also, the arrangement of the straightening, chamfering, and cutting mechanism described, so as to automatically co-operate with the shaping and drawing die rolls *h*, substantially as set forth.

62,683.—JAMES S. and RUSSEL PORTER, Waterford, N. Y.—*Alarm Lock.*—March 5, 1867.—When the bolt is moved by the key a latch is elevated which releases the hammer, and the latter explodes the cap upon the nipple. The cam at the lower side of the case is turned to engage the bit of the key and prevent its rotation.

Claim.—First, the pistol C, hammer G, latch H, and trigger L, when all arranged and combined within the interior of a lock casing, provided with a cover O and plug F, substantially in the manner and for the purpose described.

Second, the cam P, substantially as and for the purpose described.

62,684.—SILAS S. PUTNAM and LUCIUS H. DWELLEY, Dorchester, Mass., assignor to S. S. PUTNAM & Co.—*Machine for Making Horseshoe Nails.*—March 5, 1867.—The nails are made directly from the rod by a continuous operation, the blank from which the nail is to be made being first cut from the rod and then passed successively through a series of revolving dies operating in pairs, by which it is gradually drawn down and finished.

Claim.—First, the combination of the several pairs of revolving dies, connected by gearing and otherwise arranged to operate successively and alternately on

opposite sides of a nail blank, substantially as described.

Second, in combination with the foregoing, a device for cutting off the blank, substantially as described.

Third, in nail-making machines, having a series of pairs of revolving dies operating substantially as described, constructing the several pairs of dies in the form herein described, for drawing down the blank in a rounded form during the first part of the operation, and afterward to the form proper for the nail, as specified.

62,685.—SILAS S. PUTNAM and LUCIUS H. DWELLEY, Dorchester, Mass., assignor to S. S. PUTNAM & Co.—*Machine for Making Horseshoe Nails.*—March 5, 1867.—The rod is fed from the furnace by corrugated rollers and acted on alternately by vertically and horizontally moving pairs of recess-headed hammers. The lower hammer has positive movement to its place and acts the part of an anvil. The three other hammers are retracted by cams and driven forward by springs. These cams are so formed as to cause lighter strokes as the work progresses.

Claim.—First, the combination of the cams with the spring hammers, constructed and operating substantially as described and for the purpose set forth.

Second, the rolls R and the feed mechanism, constructed substantially as described, in combination with the hammers F G H I, operating substantially as described and for the purpose set forth.

Third, the mechanism, substantially as described, for cutting off the nail, without moving the rod from its normal position.

Fourth, the mechanism, substantially as described, for cutting off the nail, in combination with the hammers K L M N and a device for holding them apart and out of the way of the cutters while the nail is being cut off.

Fifth, the combination with the hammers K L M N, mechanism for cutting off the nail, feed rolls R and furnace O, operating substantially as described for the purpose set forth.

Sixth, the hammer or former N brought up positively to the nail rod in combination with the spring hammers K L M, substantially as and for the purpose set forth.

Seventh, the cam wheels F G H I, in combination with the hammers K L M N and a device for cutting off the nail, substantially as described.

62,686.—GEORGE T. REED, Philadelphia, Pa.—*Broom and Brush Head.*—March 5, 1867.—The corn is placed between the bars of the lower side of the head and those on a separate frame. The bars of each frame are then forced into the interstices of the other and retained by the upturned edges of the lower frame, which engage the upper frame or head.

Claim.—A broom head composed of frame A B C D, strips, wooden or metallic, *a a'* and C, and top piece T, all combined together in the manner and for the purpose above described and set forth.

62,687.—WARREN ROBINSON, Highgate, Vt., assignor to himself, J. H. FAIRCHILD, and H. FARRINGTON, same place.—*Dumping Wagon.*—March 5, 1867.—A series of boxes to receive the load are pivoted to allow their turning for discharge. The boxes have but one end each, which serves as a division between that and the one adjoining.

Claim.—The construction of boxes A, as herein described, and used with the frame B B, in the manner and for the purposes herein set forth.

62,688.—GEORGE ROGERS, Philadelphia, Pa.—*Casting Pipes.*—March 5, 1867.—Two rings of metal are arranged in the mold so as to form the circumferential end recesses for the connecting collars and give a smooth surface to the same. Applicable to the patent of J. M. Bolles, June 19, 1855.

Claim.—The use of the rings or chills A A, in the manner and for the purposes described.

62,689.—HENRY ROPES, Brooklyn, N. Y.—*Pocket Book Clasp.*—March 5, 1867.—The catch engages behind a spring plate, which has a side movement by a thumb plate at bottom.

Claim.—In a clasp for purses, pocket-books, &c., the construction and arrangement of the slot C which takes the catch and catch A, substantially as described,

to allow of automatic expansion and contraction of the purse, in combination with the bar D and spring *a*, or their equivalent, for locking or fastening the catch and holding the two parts of the clasp together, the several parts operating substantially as and for the purposes set forth.

62,690.—O. SAGE, Wellington, Ohio.—*Cheese Vat*.—March 5, 1867.—The cheese vat sets within a tank to which water from a heater is admitted. The flow of water is regulated by a valve operated by a wire from the outside.

Claim.—The arrangement of the valve U and rod 3 in combination with the box B, in the manner and for the purpose herein specified.

62,691.—ELNATHAN SAMPSON, Lansingburgh, N. Y., assignor to himself and E. CHAMBERLAIN, same place.—*Railroad Rail*.—March 5, 1867.—The chair rail is bolted to the sleepers and has an upward flange to sustain the track rail laterally and a foot flange to receive the lower bearing edge of the rail. The rails are laid to break joint.

Claim.—First, the chair rail A, constructed with its sides P C, top *a*, groove *g*, and rib *r*, together with the usual base and flanges, substantially as set forth and described.

Second, the bearing rail B, constructed with its track face *e*, beveled inner edge *i*, sides *h h'*, bearing edge *k*, substantially as set forth and described.

62,692.—JACOB SCHMOLL, New York, N. Y.—*Anti-Rheumatic Compound*.—March 5, 1867.—Composed of extract of rain worms, 4; extracts of ants, 4; camphor dissolved in alcohol, 3; extract of crocus sativus, 1 part.

Claim.—An anti-rheumatic compound made, as described.

62,693.—FRANZIS SCHWEIZER, New York, N. Y.—*Machine for Cutting Threads on Bolts*.—March 5, 1867.—Two dies and die stocks are secured to two horizontal shafts, which are connected by gearing so as to revolve in opposite directions. The bolts are held in two vises, and are fed to the dies. As the latter revolve in opposite directions a thread will cut on one bolt while the other bolt is being released from its die, and conversely. The driving crank is rotated in alternate directions.

Claim.—First, the sliding stocks N and O, in combination with the lever P, arranged relatively with the cutters *a* and *b*, operating as described, for the purpose specified.

Second, the adjustable lever P, which is provided with arms *d* and *e*, substantially as and for the purpose herein shown and described.

Third, the elastic sliding rest *g*, made and operating substantially as and for the purpose herein shown and described.

62,694.—H. H. SEELY, Hudson, Mich., assignor to himself and F. SWIFT, Lenawee county, Mich.—*Grain Separator*.—March 5, 1867.—The angle of inclination of the bottom of the shoe is adjustable. A wrist on the fan shaft is connected to the bell-crank lever, whose rod gives a lateral motion to the shoe, while the other rods give a longitudinal and partial rotary motion.

Claim.—First, the adjustable shoe bottom C, rod *b*, and perforated plate *a* upon the shoe, arranged and used as and for the purpose herein specified.

Second, the arrangement of the rod G, lever H, and rods J and L, with the shoe, for the purpose of giving said shoe three motions, or one, as may be desired, substantially as set forth.

62,695.—JACOB H. SHEAR, Albany, N. Y.—*Ash and Sifting Pan for Cooking Stoves*.—March 5, 1867.—A sloping plate beneath the grate of the fire chamber directs ashes and cinders into a removable tray beneath the hearth. The grated bottom of the tray is oscillated, and the ashes fall into a box beneath.

Claim.—First, the sloping plate under the fire chamber, in combination with a closely-fitted lifting receiver, having an independently-vibrating or oscillating grated bottom for sifting the ashes, substantially in the manner and for the purposes above described.

Second, the detachable lifting receiver, with a vi-

brating or oscillating grated bottom fitting closely to the hearth and to the sloping plate under the fire chamber, for the purposes within described, in combination with the lifting ash pan underneath, to receive the ashes during the sifting of the same.

Third, the detachable receiver with the vibrating or oscillating grated bottom, in combination with the lifting ash pan underneath and the vacant space or chamber F between the receiver and the front of the oven, to give the grate room to vibrate outside of the receiver, substantially as shown and described.

Fourth, the detachable lifting receiver, having a vibrating or oscillating grated bottom, constructed in the manner substantially as and for the purpose above described.

62,696.—FREDERICK SHICKLE and EVERMOND RANDALS, St. Louis, Mo.—*Filter*.—March 5, 1867.—The water poured in above passes by a tube to a sediment chamber below, and thence upward through the filtering material to the chamber whence it is drawn.

Claim.—The water filter, consisting of the annular receiving chamber E, filtering chamber D, supply chamber C, surrounded at its upper part by the partition wall *d*, tube *f f*, air tube *g*, and mud chamber B, when constructed and arranged as herein set forth, for the purpose specified.

62,697.—MICHAEL SIMONS, Middletown, Conn.—*Strainer for Coffee and Tea Pots*.—March 5, 1867.—The strainer is movable in guides, and removable to prevent its becoming rusty in place.

Claim.—The arrangement and combination of movable strainer C with its handle D and guides B, when made of britannia ware and attached to and operating on the inside at the base of the spout of a tea or coffee pot, as herein described, and for the purposes set forth.

62,698.—HENRY C. SNOW, Princeton, Ill., assignor to himself and C. C. LATTIMER, same place.—*Cutter for Trimming Wall Paper*.—March 5, 1867.—The paper is laid with its margin projecting over the edge of the table. A wheel running on the paper communicates its motion to a pair of cutting wheels, between which the paper is passed.

Claim.—An implement or cutter for the trimming of wall or other paper or sheet material, constructed, arranged, and operated substantially as herein described.

62,699.—JOHN G. SORGEN, Kenton, Ohio.—*Stove-Pipe Drum*.—March 5, 1867; antedated January 10, 1867.—The upper and lower deflectors have movable center pieces and marginal flue spaces. The middle deflector has a central aperture.

Claim.—The deflecting cones F and L and the frustum of a cone J, arranged in relation to each other and the cylinder A, as set forth.

Also, making the points of the deflecting cones movable, so that they can be swung from the opening in the cone to let the blaze and smoke pass up in the center of the cylinder.

62,700.—EZRA STAPLES and WILLIAM W. GOULD, Skowhegan, Me.—*Car Coupling*.—March 5, 1867.—The link is held in coupling position by a bent rod operated by a horizontal shaft. The link entering the opposite drawhead displaces the counterweighted catch, and releases the frame to which the coupling pin is attached.

Claim.—The drop slide D, carrying the pin C, forked piece F, book G, counterbalance G', drawhead A having its bottom plate, slotted lug *a*, bent lever J, horizontal rod *k*, and handles *m m*, when all are constructed and arranged as herein set forth, for the purpose specified.

62,701.—CARLOS SWIFT, Mt. Carroll, Ill.—*Attaching Cords to Window Sashes*.—March 5, 1867.—The slotted bed plate is embedded in the edge of the sash. The knot of the sash cord is caught behind the catch plate, which is inserted behind the bed plate.

Claim.—The bed plate *a*, in combination with the catch plate *b*, for attaching the cord *d* to the sash A, arranged and operating as and for the purposes herein described.

62,702.—CHESTER W. SYKES, Suffield, Conn., assignor to JAMES MORSE, H. H. W. WRIGHT, ALBERT PICKERNELL, MARSHALL W. PARKER, RICHARD S. JENNESS, DANIEL DORR, JAMES A. KELLY, GEORGE OCHS, and CLARENCE L. WILKINS, South Boston, Mass., and ERASTUS WILKINS, Warner, N. H.—*Knife and Scissors combined.*—March 5, 1867.—A knife blade is attached to one blade of the scissors, and the edge of the former is covered with a hinged shield when not in use.

Claim.—The knife blade B, shield A, in combination with the scissors, when constructed and operating substantially as herein described.

62,703.—HENRY TODD, Bridgeport, Conn., assignor to THE BRIDGEPORT BRASS COMPANY.—*Machine for Polishing Sheet Metals.*—March 5, 1867.—The sheets of metal are passed through a trough, having pressure applied to corrugated scouring surfaces, between which the metal passes to a removable sleeve on a revolving shaft.

Claim.—The combination of the trough and presser B and C with the rotating shaft E, arranged to draw the sheet through the scouring surfaces of the trough and presser, substantially as specified.

Also, in combination with the same, the removable sleeve G and reversely-rotating shafts E and F, essentially as and for the purposes herein set forth.

62,704.—WILLIAM H. TOWERS, Boston, Mass.—*Kindling Fires.*—March 5, 1867.—A burner is attached to the side of a stove or grate connected with the gas pipes, so as to bring a jet of gas to play on the coals, or other fuel in the stove, to kindle it.

Claim.—The use of gas for kindling fires, substantially as herein set forth and described.

62,705.—JOS. F. TUDER, Philadelphia, Pa.—*Rest for Sharpening Saws.*—March 5, 1867.—The rest supports saws while they are sharpened, and the table is adjustable in any direction, and controlled by a projecting arm fitting in notches in a rack or plate, and secured in position by a set screw.

Claim.—First, combining the rest plate A with the standard B by means of the joint a at or near the plate, substantially as above described and for the purpose specified.

Second, the combination of the rack f on the standard B with the rest plate A, substantially as and for the purpose set forth.

62,706.—CHARLES USHER, Iowa Falls, Iowa.—*Manufacture of Iron and Steel.*—March 5, 1867.—Wrought iron or steel to be coated with malleable cast iron is placed between two shells of malleable iron, with intervening layers of borax. The sheets are then placed in a furnace heated to such a degree as to melt the malleable iron.

Claim.—The within-described process for plating iron and steel, substantially as herein described.

62,707.—MARY VAN VRANKEN, Washington, D. C.—*Attachment for Heating Kettles and Boilers by Gas.*—March 5, 1867.—The kettle stands on a perforated cone, which forms a cap over the burner, the apex of the cone extending within the bottom of the kettle.

Claim.—A perforated stand attached to the bottom of a kettle or boiler, and adapted to be used upon an ordinary gas burner, substantially as and for the purpose specified.

62,708.—C. F. WALKER, Benford's Store, Pa.—*Washing Machine.*—March 5, 1867.—The beaters are alternately vertically reciprocated by the lever. The standard on each dasher is the fulcrum while the other is being moved.

Claim.—The combination of the dashers B B, valves 6, lever C, weight D, and tub A, as and for the purposes specified.

62,709.—S. W. H. WARD, New York, N. Y.—*Envelope for Spittoons.*—March 5, 1867.—The spittoon is concealed in a box, whose hinged lid may form a footstool, &c. A hole in the bottom of the box assists in raising the spittoon for removal from the box.

Claim.—The spittoon envelope, with the perforation E in the bottom for the purpose of raising the

spittoon out of the cavity which contains it, when it is desired to remove it, substantially as set forth.

62,710.—GEORGE I. WASHBURN, Worcester, Mass.—*Steam Engine.*—March 5, 1867.—Explained by the claims and illustration.

Claim.—First, the arrangement of the cylinders A C with their double-acting pistons B D, and valve with three disks reciprocating in the chamber between the cylinders and controlling the ports, substantially as described.

Second, the steam valve, when arranged to be operated by pressure from below and an eccentric above, substantially as described.

62,711.—GEORGE I. WASHBURN, Worcester, Mass.—*Steam Engine.*—March 5, 1867.—The rods of the pistons of the respective cylinders are united to the cranks, which have a relative angle of 180° on the same shaft. Steam admitted above the smaller piston is used directly, and, the valve being raised, is cut off; and the annular space between the two disks forms a means of conveying the steam below the said piston, where it is equalized as to its effect on that piston, and above the larger piston, where it is utilized expansively.

Claim.—An arrangement of cylinders and steam ports, by which the steam, after being used on one piston, is permitted to flow to the other side of the same piston, and to the other cylinder, to be used expansively, substantially as described.

Also, the arrangement of the double-disk hollow valve H, operating substantially as described.

62,712.—GEORGE I. WASHBURN, Worcester, Mass.—*Steam Engine.*—March 5, 1867.—The cylinders may be parallel, in line, or otherwise. Live steam, after being used on the smaller pistons alternately, is used expansively upon alternate sides of the double-acting piston.

Claim.—The arrangement of the two cylinders with single-acting pistons, and the larger cylinder with a double-acting piston, upon whose sides the steam from the other cylinders is used expansively, substantially as described.

62,713.—GEORGE I. WASHBURN, Worcester, Mass.—*Steam Engine.*—March 5, 1867.—On each rod is a double-acting piston and a double disk valve, respectively working in steam and valve cylinders placed in line. Two such arrangements are placed parallel, and connect by ports, so that each valve governs the admission, &c., of steam to the steam cylinder alongside of it. A valve on the exhaust port prevents the reflux of steam into the cylinder after the exhaust has taken place.

Claim.—First, the arrangement upon one piston rod of the double-acting operating piston in its own cylinder, and a valve or valves attached to said piston rod and operating within a valve chamber in line with said cylinder, substantially as described.

Second, the combination with each other of two such arrangements as expressed in the above claim, the valves attached to a given piston rod in each case governing the induction and eduction ports of the opposite steam cylinder, in which reciprocates the other piston rod, substantially as described.

Third, a valve, operating in connection with an exhaust port or pipe, to permit the egress of steam and prevent reflux thereof, for the purpose described.

62,714.—GEORGE WAITE, New Orleans, La., administrator of the estate of JOHN WATTS, deceased.—*Filter.*—March 5, 1867.—The water in the annular outer chamber enters perforations at the upper portion of the filter, descends through the filtering material, and through the chamber below to the chamber above, whence it is discharged by a faucet.

Claim.—A water filter and cooler, having the chamber B, the cylinder H, perforated at a, filtering material C, cylinder H', perforated at a', chamber D, and clear-water chamber E, all arranged as herein set forth for the purpose specified.

62,715.—WENDELIN WEIS, St. Paul, Minn.—*Apparatus for Making Vinegar.*—March 5, 1867.—The wash passes from the top down through the whole series of troughs, and a current of air passes

in the opposite direction over the surface of the liquid.

Claim.—An apparatus for making vinegar, which consists of the boxes C C, troughs D D or blocks F or G, all made and operating substantially as and for the purpose herein shown and described.

62,716.—DAN. WELCH, Lowell, Mass., assignor to H. A. HILDRETH, Lowell, and W. J. JOHNSON, Newton, Mass.—*Plate Lifter.*—March 5, 1867.—The jaws consist of wire loops, which catch beneath the edge of the plate, the adjustability of one jaw allowing it to accommodate itself to varying sizes of plates.

Claim.—The combination of the fixed and swinging jaw B and C, arranged substantially as described and for the purpose fully set forth.

62,717.—JOHN S. WILLIAMS, Warsaw, Ohio.—*Ointment for Treating Diseases in Horses and other Animals.*—March 5, 1867.—For veterinary purposes. Composed of cantharides, pulv., 3 oz.; oil of spike, 2 oz.; tincture iodine, 3 oz.; gum camphor, 1 oz.; corrosive sublimate, 5 drachms; spirits of turpentine, 3 oz.; gum euphorbium, 3 oz.; fish or lard oil, 1 quart.

Claim.—The improved Spanish ointment, for treating the diseases of horses, prepared substantially as herein set forth and described.

62,718.—ELI YORK, Windsor, Ill.—*Portable Fence.*—March 5, 1867.—The posts are planted in the sills and braced by inclined struts, which are connected by cross-bars. The boards lie in the mortises of the posts, and have connecting slats at the overlap of adjacent panels.

Claim.—The combination of the post A, and sills B, braces C, planks D, connecting bars E, and cross-bars G, substantially as described for the purpose specified.

62,719.—JOSEPH ZAHM, Fredonia, N. Y.—*Shifting Rail for Carriage Seats.*—March 5, 1867.—The rear rail has a joint at its mid-length, each section being independently pivoted to a lever. When the latter is thrown down the sections are thrown in line, and the hooks on the rail are thrust into the retaining sockets on the seat.

Claim.—The joint and lever above described, and the use and application of the same, for the uses and purposes above described.

62,720.—JOHN HARTZELL ZINN, Idaville, Pa., assignor to himself and PETER D. JOHNS.—*Hinge.*—March 5, 1867.—The hinge may be used as a right or left. The leaves are counterparts. The portion of the leaf attached to the support is thicker than the remainder, and a shoulder is formed on each leaf at the point where they shut into each other. The central portion projects equally on each side.

Claim.—First, attaching the socket or knuckle c to the leaf centrally, so as to project equally on each side of the leaf at the point of attachment, substantially as herein shown and described.

Second, the leaves A and B, constructed with the parts a and b of different thickness, and arranged to shut together, as shown and described.

Third, a loose-joint butt hinge, constructed and arranged to operate as herein set forth.

62,721.—JOHN ZUNDORFF, New York, N. Y.—*Steam Valve.*—March 5, 1867.—The expansion ring on the piston throttle valve is packed against the walls of the cylindrical valve chamber. The valve is moved by a rack and segment pinion.

Claim.—The expansive movable ring b, with longitudinal slot n and ports m m', when constructed substantially as described and for the purposes set forth.

62,722.—JOHN ZUNDORFF, New York, N. Y.—*Safety Valve.*—March 5, 1867.—The pressure of the steam raises the valve against the force of the spring until openings in the tubular valve stem come opposite to the ports in the spherical enlargement of the escape pipe. If pressed above this point, the valve itself passes the ports and steam escapes freely.

Claim.—First, the spherical-formed pipe p, in combination with the ports G' G' G' G'' G''', when constructed and operated substantially as described.

Second, the combination of the valve E and ports G' G' G' G'' G''', for the purpose specified.

Third, the spring b, in combination with the piston d, shippers g and f, when operated as above described.

62,723.—R. D. CHATTERTON, Bath, England.—*Propeller.*—March 5, 1867.—The two water pipes traverse the vessel its whole length below the water line. The vertically moving diaphragms form stops in these pipes on each side of the pump, by which the water is actuated. Valves in one pair of the diaphragms allow the passage of water in one direction and those of the other in a contrary one. The valve rods are so coupled together that the descent of either pair raises the other.

Claim.—First, the arrangement of the valved diaphragms G G' in the tube A, constructed as described, and operated simultaneously by means of a connecting device of rack and wheel, or equivalent, for the purpose specified.

Second, the arrangement of the valves G G' H H', the racks and pinions, and the reversing apparatus I J K, or equivalent device, as set forth.

Third, the combination with the longitudinal tube A of the direct action engine and pump acting between valved diaphragms connected for simultaneous adjustment and reversal, substantially as described.

62,724.—ROBERT H. ALDRICH, Northampton, Mass.—*Dusting Brush.*—March 12, 1867.—The wires are planted in a circular series of holes in the stock and are furnished with strips of sheepskin with the wool on.

Claim.—The duster herein described, constructed of plumes formed by attaching strips of sheepskin to wires a, &c., which are fastened in the handle A B, in the manner set forth.

62,725.—THOMAS J. ARNOLD and BENJAMIN IRVING, New York, N. Y.—*Porcelain Gas Burner.*—March 12, 1867.—The porcelain burner is either perforated or slit. It is intended to avoid the difficulty in metal burners of gumming up from corrosion.

Claim.—The making of a glazed porcelain gas burner by perforating or slitting it after being glazed, for the purposes and in the manner substantially as hereinbefore set forth.

62,726.—WM. BAMFORD, Milwaukee, Wis.—*Heating Stove.*—March 12, 1867; antedated September 12, 1866.—The air chambers are suspended in the stove above the fire space.

Claim.—First, the air-heating chamber, composed of an upper and lower cylinder connected by one or more air flues, and located entirely above the fire box so as to bring all parts of the chamber and flues in contact with the heated products of combustion, substantially as set forth.

Second, the combination and arrangement of the upper cylinder C and lower cylinder B, connected by the flues c, and located above the fire box, with the pipe or flue F and the discharge pipe I or E and stove case A, substantially as specified.

62,727.—LEVI BISSELL, New York, N. Y.—*Car Truck.*—March 12, 1867.—The two-wheeled and four-wheeled frames are connected together by brace rods which cause the axles to assume a radial direction on a curve.

Claim.—A two-wheeled truck in combination with a truck of four or more wheels, both trucks moving on king bolts and connected together by jointed braces, substantially as set forth.

62,728.—JESSE BOOHER, Dayton, Ohio.—*Flower Pot and Tub.*—March 12, 1867.—Wooden vertical staves are confined in the grooves of the bottom and the annular head plate. These metallic plates are held together by bolts.

Claim.—The cast-iron plates A and B and their arrangement with reference to the staves e and rods ff, in the manner substantially as and for the purpose described.

62,729.—PURMORT BRADFORD, New Haven, Conn., assignor to SARGENT & COMPANY, same place.—*Lifting Handle.*—March 12, 1867.—Explained by the claim and illustration.

Claim.—The socket A formed with a vertical slot d, provided midway with a seat to receive the trun-

nion *a*, constructed and arranged to operate as herein described, as an article of manufacture.

62,730.—EUGENE BROWN and WM. POOL, Birmingham, Mich.—*Potato Scoop*.—March 12, 1867.—The iron rods or wires are placed at equal distances on an iron frame, which is attached to a wooden handle and acts as a screen in shoveling potatoes or other roots.

Claim.—As an article of manufacture, a potato shovel A A' B, constructed substantially as described.

62,731.—ENOCH CARLETON and ELI GOSS, Portland, Me.—*Artificial Leg*.—March 12, 1867.—The knee is stiffened when the weight is imposed upon the foot, and as the leg is flexed the detent catch of the knee articulation is withdrawn. A posterior spring rod remains in contact with a plate on the heel and is driven up as the leg is extended, and the heel rests on the ground.

Claim.—A knee joint made stiff when the weight is borne upon the leg by means of a movable rod or bolt attached to the leg, externally or internally bearing upon the heel and extending upward into a catch or slot upon the leg above the knee joint, which rod is worked by means of a spiral or other spring in such a manner that when the weight is removed from the leg the rod is forced downward by the spring out of the slot or catch, thus liberating the joint and leaving the lower leg free and swinging; and when the weight is placed upon the leg by bearing upon the heel, the rod is pushed upward into the slot or catch, and the knee joint thus held stiff while the weight is borne upon the leg.

Also, the rendering of the knee joint stiff or limber at pleasure by means of a spring rod and catch applied as above described.

62,732.—GEO. R. CLARK, Livonia, N. Y.—*Fence*.—March 12, 1867.—The notched rail ends of the adjacent panels overlap within the mortises of the post in which they are keyed. The fence is stayed laterally by A-shaped braces.

Claim.—The relative arrangement of the joint braces or jacks J and the sections or lengths B and A, when the parts are constructed and connected substantially in the manner and for the purposes herein set forth.

62,733.—ISAAC COOK, St. Louis, Mo., assignor to himself and M. RANDOLPH & Co., same place.—*Bran Duster*.—March 12, 1867.—The meal is fed into the machine at the bottom, separated from foreign substances, and then carried upward and in contact with the sieve by means of the devices cited in the claims.

Claim.—First, feeding the material through a pipe L and upon the receiving I head underneath the beaters, substantially as set forth.

Second, passing the material upwardly from the head I by an upward air draft drawn from the lower air feed K, substantially as set forth.

Third, the receiving head I, constructed and operating substantially as and for the purposes set forth.

Fourth, adjusting the beaters *n* to any desirable angle, by means substantially as described.

Fifth, the combination of the beaters *n* and the distributing head N, operating substantially as set forth.

Sixth, returning the bran from the receiving surface *f* through the feed pipe L, substantially as and for the purposes described.

Seventh, the combination of the feed pipe L, head I, distributing head N, and adjustable beaters M, substantially as and for the purposes described.

62,734.—HUGH H. CRAIGIE, New York, N. Y.—*Basin*.—March 12, 1867.—The interior conformation of the basin is preserved and a circle of holes near its upper margin leads into a circumferential chamber to whose walls the discharge pipe is connected.

Claim.—A stationary wash basin with a horizontal flattened water-way around the upper portion of said basin and outside of the general curvature of the interior of the basin, said water-way opening into the basin through the sides thereof so as to take away the surplus or overflow water from the basin, as specified.

Also, forming the descending horn or overflow pipe

upon the outside of said horizontal water-way and opening into the same, as specified.

62,735.—GEO. G. CURTIS, Rochester, N. Y.—*Gate*.—March 12, 1867.—Supporting rollers act on a slide bar upon the gate and another side bar projects from one side of the gate to raise and direct the same as it slides back. A flanged roller above has vertical play in a slotted plate and serves to hold the gate by a rail upon it.

Claim.—First, in combination with a sliding gate A, the employment of the double inclined rails B B', the one running the length of the gate and the other extending beyond and serving to hold the gate in place while at the same time it insures its self-action, the whole arranged and operating as and for the purposes herein set forth.

Second, the combination of the brace *d* with the extended inclined rail B' and gate A, as and for the purpose specified.

Third, the combination and arrangement of the clip or stirrup D holding the roller *a*, operating as herein set forth.

Fourth, the combination of the sliding guide *i* with gate A and inclines B B', as set forth.

Fifth, the double-acting latch C, employed in combination with the gate A, as specified.

62,736.—HORACE H. DAY, New York, N. Y.—*Canals and Navigation thereof*.—March 12, 1867.—It is intended to enable the removal of vessels from one water level to another without lowering the water on the higher levels under conditions of short supply of water. The vessel floating in a caisson is supported in a level position upon a wedge-shaped frame whose lower longitudinal bars run upon the rollers which have their bearings upon the inclined planes up which the vessel in the caisson is drawn by the cable.

Claim.—First, in the construction of canals the double inclined planes in combination with floating dry docks or movable camels, and their combination with canals for the raising and transportation of vessels from one water level to another, substantially as described.

Second, the ratchet shafts, or their equivalent, for holding or moving the wire or other cable, when used in combination with inclined planes and movable locks, substantially as described.

Third, the water tanks, caissons or locks, constructed with a wedge-shaped bottom, to hold water upon a level for passing ships up and down inclined planes, substantially as described.

Fourth, the water tanks, caissons or locks containing water for passing vessels up and down inclined planes, in combination with stationary rollers or wheels placed in and revolving upon the bed of the inclined plane, substantially as described.

Fifth, the wedge-shaped camels, or a detached segment or portion thereof, or both, upon inclined planes for passing the same from one angle or inclination to another, and the combination of the wedge-shaped camels with one or more inclined planes when used to transport vessels, substantially as described.

62,737.—A. J. DOOLITTLE, Hamden, Conn.—*Pruning Shears*.—March 12, 1867.—The spring operates to open the blades and the loop and hook to maintain the closed position when required.

Claim.—First, the arrangement of the double-leg coil spring in the manner described, in combination with the two handles B and D, substantially as and for the purpose specified.

Second, the combination of the loop I upon the one handle and the hook L upon the other, so as to operate substantially as set forth.

62,738.—EDWARD DUNSCOMB, Boston, Mass.—*Vacuum Pump*.—March 12, 1867; antedated February 28, 1867.—The vessel contains water and is fitted with a bell to which weighted cords are attached. A pipe is connected with the still, pan, retort or other object, passes up into the vessel and terminates above the surface of the water.

Claim.—The peculiar construction of the vacuum pump *j*, that is, as composed of the vessels *n* and *o* and pipes *h i k*, with their stop-cocks, as to operate both as a vacuum pump and vapor receiver and storeroom, substantially as and in manner described.

62,739.—EDWARD DUNSCOMB, Boston, Mass.—*Vacuum Pump, Pan, &c.*—March 12, 1867; antedated February 28, 1867.—The still has within it a steam heater and opens into a dome within a vessel which is filled with cold water. From the dome extend pipes connected with vacuum pumps, which consist of vessels containing water and fitted with inverted bells raised by weights. The vapors from the still are condensed upon the dome and caught by an annular trough, from whence they are conducted to the receiver.

Claim.—First, the air induction pipe *c'* with its stop-cock *d'* applied to the air-tight tank *g'* for the purpose described, substantially as set forth.

Second, the pipe *f* with the stop-cock *f'*, as applied to tank *g* and trough *e*, as before described.

Third, the employment of the generator *C* in combination with the condenser *D* and pipes *h* and *k* and vacuum pump *j*, substantially as set forth.

Fourth, in combination with the condensing apparatus before described, the air-tight tank *g*, in the manner and for the purpose set forth.

Fifth, the combination of the condensing dome *d* and trough *e* with pipes *h* *i* *k* and vacuum pumps *j*, *j'*, essentially as set forth and explained.

62,740.—JOHN E. FINLEY, Memphis, Tenn.—*Churn.*—March 12, 1867.—The blades of the respective dashers are so inclined as to cause them to revolve in opposite directions as the plunger is reciprocated.

Claim.—The combination of the propeller wheels *B* *C* with the air cells or indented arms *D* *D*, for the purpose herein set forth.

62,741.—L. H. GANO, Milwaukee, Wis.—*Bag Holder.*—March 12, 1867.—The arm and platform are respectively hinged to the standard and fold up for storage or transportation. The projecting arm holds the bag by means of a spring and is itself supported by a hinged brace which engages a notch in the standard.

Claim.—First, a platform *A*, upright standard *B*, and adjustable arm *C* in combination, to fold up, substantially as and for the purpose described.

Second, arm *C* with jaws *D*, metal jaws *E*, support *F*, and spring *G* in combination, substantially as and for the purpose described.

62,742.—AARON S. HADLEY, Boston, Mass.—*Dusting Brush.*—March 12, 1867.—A furniture duster whose flexible perforated arms are furnished with woolen yarn or other suitable substitute in the place of feathers.

Claim.—The combination as well as the arrangement of the spreader with the handle, the flexile arms and masses of fibrous material applied to and arranged with such arms or to them and the handle, substantially as specified.

Also, the combination of the finishing masses of fibrous material extending through the handle with the flexile arms, or the same and the spreader and the masses of yarns or fibrous material arranged within such arms, as explained.

62,743.—JOSIAH HARRISON, Frederick, Md.—*Truss.*—March 12, 1867.—Metallic slides enfold the flexible belt and afford points of attachment for the pads. The slides are secured by screwbolts passing through holes in the belt.

Claim.—The arrangement on the flexible belt *A* of the pad or pads *B*, adjusted by means of slides *D*, bolt *E*, and nut *E'*, substantially as described and represented.

62,744.—JOHN P. HART, Chicago, Ill.—*Car Truck.*—March 12, 1867.—Explained by the claim and illustration.

Claim.—The use of different sized car wheels of trucks upon the same axles, as and for the purpose set forth, to obviate the necessity of transferring passengers or freight on account of the difference in the gauges of railroads.

62,745.—JOHN P. HART, Chicago, Ill.—*Railway Frog.*—March 12, 1867.—The grooves in the frog below the flange track allow the larger wheels of trucks to pass through the frog.

Claim.—The grooves *G*, for allowing compound

wheels to pass through the frog, substantially as set forth.

62,746.—WILLIAM HAYES, Fall River, Mass.—*Preventing the Lapping of Belts on Shafting.*—March 12, 1867.—The loose sleeve placed round the shaft on which the belt is liable to be thrown will hold the belt without revolving, and prevent it becoming lapped and wound upon the shaft, which continues to revolve inside.

Claim.—The device herein described for preventing belts from lapping around shafts, constructed, applied, and operating as herein set forth.

62,747.—FRANCK HERRMANN, Newport, Ky.—*Spring Hinge.*—March 12, 1867.—An automatic hinge, that according to adjustment causes the door to either open or shut in reversal to the motion that has been given it by the person passing. When the door is oscillated on its hinges it presses upon one or the other check and winds the appropriate spring, which tends to restore it to its original position.

Claim.—First, the stationary pintle *D'*, having the notched collar *E*, and stop *J*, in combination with the helical springs *H* *H'*, cheeks *I* *I'*, and slotted eye *G*, constructed and arranged substantially as herein set forth.

Second, the square eye or socket *C*, in combination with the toe *d* on the pintle *D*, and collar *E* *e*, for the purpose herein set forth.

62,748.—A. K. and H. P. HOOD, Lowell, Mass.—*Bench Dog.*—March 12, 1867.—A spring beneath raises the bench hook, which is depressed or held in the required vertical adjustment by a cam spindle resting on the pressure block of the hook shaft.

Claim.—The cam spindle *c* and block *h*, when operating substantially as described and for the purpose fully set forth.

62,749.—MORGAN HUNGERFORD, San Francisco, Cal.—*Ore Concentrator.*—March 12, 1867.—The circular disk inclines downward toward its periphery, which has a grooved depression discharging through holes above its bottom into the trough surrounding the pan. The sulphurets being agitated with their accompanying sand, &c., in the revolving pan, are separated by their greater relative specific gravity, and collect in the outer trough, while the lighter matters are washed away.

Claim.—First, a pan cut in two and dropped about one inch, so that the lowest depression shall be two inches, more or less, below the ridge or angle of such concentrator, substantially as described and for the purpose set forth.

Second, the slots or outlets *F* *F*, above the line of the groove around the inner rim, as described.

Third, the outer rim *G*, with stops *H* *H*, also the discharge holes *J* *J*, under the pan, around the said outer rim, substantially as described and for the purpose set forth.

62,750.—JOHN HUNTINGTON, Cleveland, Ohio.—*Construction of Stills for Oil.*—March 12, 1867.—The reverting flues under the still may be made to communicate directly with the stack or with the annular flue which encircles the base of the still.

Claim.—The flues *E* *J* and damper *M*, or their equivalents, arranged in relation to an annular flue *K*, surrounding the base of the still, and operating conjointly in such a manner as to be combined with a single or double furnace, to diffuse a uniform heat without injury to the oil or burning of the still, and also to induce a current of cold air to reduce the heated oil and still, as specified.

62,751.—JOSHUA JENKINS, Salem, Ohio, assignor to himself and SAMUEL WILLIAMS, same place.—*Box for Transplanting Plants.*—March 12, 1867.—The boxes are for use in place of transplanting pots in a greenhouse; their movable sides permit the plants to be removed without injury to their roots. The boxes are arranged in a tray with movable front.

Claim.—A transplanting box, constructed and arranged substantially as and for the purpose specified.

62,752.—LEMUEL P. JENKS, Boston, Mass., assignor to EDWARD A. GALBRAITH, same place.—*Peat*

Machine.—March 12, 1867.—The rotating cylinder contains molds with movable bottoms; the molds are filled as they pass under the hoppers; are compressed by a plunger, and the cakes ejected by a radial projection of the bottom when the molds are in proper position.

Claim.—First, the combination of pockets or boxes, plungers and movable bottoms passing to the top of the pockets for the compression of peat and other substances, substantially as described.

Second, the arrangement of curved inclined planes, discharging shafts and ears, to bring the compressed cake of peat to the surface, substantially as described.

Third, the arrangement of wiping belts and mops pressing by the sides of and in combination with the perforated boxes, and the squeezing or drying rollers to dry the mops, substantially as described.

Fourth, the general combination and arrangement of the whole machine, constructed as and for the purpose substantially as described.

62,753.—DAVID C. JORDON, Sr., Brooklyn, N. Y.—*Door Lock.*—March 12, 1867.—The axial spindle in the key relieves the perforated disk of its catch pin, and the pin on the bit of the key engages the disk to rotate it and consequently to shoot the bolt.

Claim.—The combination of the bolts, revolving disk, and catch lever, substantially as described, operating as herein specified, for the purpose set forth.

62,754.—T. C. KEITH, Valley Falls, R. I., assignor to JOSEPH K. MALLERY, same place.—*Auger.*—March 12, 1867.—The clearing disk is applied to the shaft of the auger for the purpose of clearing the chips from the top of the stick which is being bored.

Claim.—The use, application, or employment of a clearing disk C, substantially as described, in combination with an auger or center bit, as described, for the purposes specified.

62,755.—B. J. KELLAM, Tremont, N. Y.—*Oar.*—March 12, 1867; antedated February 15, 1867.—The oar is loaded or banded between the row-lock and the handle.

Claim.—The construction of a balancing oar in the manner shown and described.

62,756.—A. D. KING, Granville Corners, Mass.—*Measuring Rod.*—March 12, 1867.—Quadrilateral ferules at the ends embrace the outer sections and the central slide piece. Clips on the sides of the outside sections form guides to the extension piece.

Claim.—An extension measuring rod, consisting of the frame formed of the parallel pieces A and C, connected substantially as shown, and the extension piece B, sliding in the same, the whole combined and arranged as herein set forth.

62,757.—GEORGE W. LAMPSON, Waterloo, N. Y.—*Cistern Filter.*—March 12, 1867.—The entering water is distributed by the cone, and then percolates through the various qualities of filtering material which are contained in the successive perforated pans arranged in vertical series in the case.

Claim.—The pans B, C, D and E and cone F, in combination with the vessel A, the whole constructed substantially as and for the purpose described.

62,758.—BERNARD LAUTH, Reading, Pa., assignor to himself and JAMES MCCARTY, same place.—*Manufacture of Bars or Rods of Iron or Steel.*—March 12, 1867; antedated September 2, 1866.—The rust is removed from the bar by acid, which is afterward neutralized with an alkali; the bar is covered with petroleum, with a small addition of wood ashes. The bars thus treated are then heated in a muffle furnace to a low red heat, after which they are removed and subjected to the action of finishing rolls.

Claim.—Bars of malleable iron or steel, treated substantially in the manner and for the purpose described.

62,759.—BENEDICT LEHMANN, Piqua, Ohio.—*Ointment for Curing Spavin, Splint, &c., in Horses.*—March 12, 1867.—Composed of deutoxide of mercury, 2 drachms; lard, 2 oz.; lamplblack, $\frac{1}{2}$ drachm.

Claim.—The combination of the above-named ingredients, so as to produce an ointment for the purpose of curing the blemishes above mentioned.

62,760.—GEORGE A. LEINAU, Philadelphia, Pa.—*Preparing Fertilizers.*—March 12, 1867.—Quicklime is spread upon and incorporated with grass or clover sod after it has been worked with a plow; the whole is then formed into banks and 134 per cent. of blood and the same of urine are then added, after which one per cent. of pigeon or horse dung is added. The mass is then covered with plaster and charcoal.

Claim.—The fertilizer made by the process set forth, in which vegetable matter is banked up with quicklime, and mixed with certain other named ingredients at proper intervals of time, in the manner substantially as described.

62,761.—ISAIAH LINCOLN and AARON PRATT, Cohasset, Mass.—*Animal Tether.*—March 12, 1867.—The tether is attached to a sleeve whose revolution prevents its becoming wound thereon. The trumpet form of the sleeve keeps the tether from working below it and becoming wound upon the stake.

Claim.—The device for tethering animals, substantially as described.

62,762.—SAMUEL MAINSTER and JOHN F. KIRKWOOD, Thistle, Md.—*Measure for Liquids.*—March 12, 1867.—The measuring vessel is mounted on a frame, which permits its vertical adjustment to reach the mouth of the faucet or gate in the barrel from which the liquid is drawn.

Claim.—First, the arrangement of the gates C D in relation to each other and to the measuring vessel A, all constructed substantially as and for the purposes specified.

Second, the arrangement and combination of the measuring vessel A, its supporting frame B, valves or gates C D L, and the standards N, substantially as and for the purpose set forth.

62,763.—JOHN MARTINO, Philadelphia, Pa.—*Dust Arrester for Stoves, Furnaces, &c.*—March 12, 1867.—A horizontal slot in the door beneath the level of the bottom of the grate, and equal to the width of the latter, for the insertion of the poker. Pendant valves close the opening but do not interfere with the passage of the poker, as they swing freely on their pivots.

Claim.—First, the combination of the horizontal slot *a* and door H, or its equivalent, with the fire door or other vertical plate of a stove, range, or heater, substantially in the manner described and for the purpose specified.

Second, the combination and arrangement of the pendant valves *b* and *b'* with the slot *a*, substantially upon the principle and in the manner above described and for the purpose set forth.

62,764.—PETER MARVIN, Warsaw, Ind.—*Brick Machine.*—March 12, 1867.—The rim containing the molds is revolved around the central vertical shaft, whose cams operate the followers to press and eject the brick. The mixers bring the clay into condition and the picker removes the stones.

Claim.—First, the combination of the mixers F, picker E, and molds *m*, substantially as set forth.

Second, the cams X Y Z &, in combination with dies *n*, molds *m*, guides P, and rim L, substantially as and for the purpose set forth and described.

62,765.—CHARLES G. MATCHETT, Greenville, Ohio.—*Window Blind.*—March 12, 1867.—The flexible blind is wound on a roller upon whose journals are wound the side tapes which are connected to the window frame above. One cord supports in its loop and adjusts the height of the lower roll of the blind; the other cord winds with the upper roll and adjusts its height by winding it or allowing it to unwind its contents.

Claim.—A flexible curtain B, provided with bands or cords E F I, arranged substantially as set forth, to admit of rolling the curtain from the upper or lower end at will.

62,766.—DON CARLOS MATTESON and TRUMAN P. WILLIAMSON, Stockton, Cal.—*Plow.*—March 12, 1867.—The mold board has two sharp edges, and by removing two retaining bolts either can be brought into working position, the diagonal corners each carrying a plow-point. The standard has a branching

attachment to the beam and a lug by which it is laterally braced.

Claim.—First, the curved standard A, with the lug B, and the offsets D and E, substantially as and for the purpose described.

Second, the curved mold board F, with its two complete edges H and H', attached to the standard as shown, and operated substantially as and for the purpose herein described.

62,767.—J. KENNEDY MAX, Springfield, Mass.—*Machine for Molding the Backs of Books.*—March 12, 1867.—The back of the book cover is rounded by being pressed between the heated cylinder of a given size and a corresponding groove in the bed plate beneath. The cylinder is depressed by a treadle and raised by springs.

Claim.—First, the adjustable cylinder D, constructed substantially as and for the purpose specified.

Second, the use of steam or the heated rods *x* for the purpose of heating the same, substantially as described.

Third, the adjustable bed E, operating substantially as described.

Fourth, the combination of the cylinder D, bed E, slides B B, and treadle I, having the rods F F and springs K K, with the table A, operating substantially as and for the purpose set forth.

62,768.—H. B. MILLER and M. P. WESTON, Grand Rapids, Mich.—*Broom Head.*—March 12, 1867.—The butts of the broom corn are pushed into the flaring mouth of the case and confined by the teeth of the side bars which project into the cavity, the bars being secured by screw bolts.

Claim.—The combination with the flaring case C of the bars D D with the teeth *d*, projecting through the sides of the case into the broom corn, and connected by set screws E E, substantially as described.

62,769.—D. C. MYERS, South Bend, Ind.—*Harrow.*—March 12, 1867.—The quadrilateral harrows may be so hinged at their angles as to be adjustable in width by means of their lateral diagonal brace, and the rear harrows are hinged to the one in advance and connected by a transverse coupling bar.

Claim.—The arrangement of the series of angular jointed harrows A B C with their respective braces and connections, when constructed and combined as and for the purpose set forth.

62,770.—JOHN NAGLE, Duncansville, Pa.—*Manufacture of Artificial Stone.*—March 12, 1867.—Composed of washed gravel, 1; sharp, washed sand, 1; hydraulic or Roman cement, 1 part.

Claim.—The composition of the ingredients when used in the quantities as herein described, and placed under water under a heavy pressure, for the purpose of producing a cheap and durable artificial stone.

62,771.—S. HENRY NOBLE, Chicago, Ill.—*Sleigh.*—March 12, 1867.—The knee has an internal support, whose feet rest upon the runner; its upper end has an elastic pad between it and the bench to diminish the jar upon the latter.

Claim.—First, the rubber spring I, or its equivalent, placed in the joint between the knee and the cross beam of a sleigh, substantially as and for the purpose set forth.

Second, the combination of the support H with the runner A, knee B, rubber I, and beam C, substantially as described.

62,772.—J. H. PARSONS, Quincy, Mich.—*Car Coupling.*—March 12, 1867; antedated March 1, 1867.—Improvement on his patent February 13, 1866. The entering link strikes the spring extension of the hook pin, and disengages the latter, which allows the frame of the coupling pin to drop, and the latter to engage the link.

Claim.—The use of a spiral spring *y* and the slide-hook pin S, or its equivalent, substantially as described.

62,773.—GEORGE B. PERKINS, Bridgeport, Conn.—*Ironing Machine.*—March 12, 1867.—The iron is heated by steam, revolved by a hand wheel and band, and caused to move to and fro, and to the right and

left, over the shirt bosom, which is stretched on the table below.

Claim.—First, the arrangement of the hollow revolving or rotating heated iron M, in relation to the mechanism described to permit the movement of the said iron over the surface to be ironed or polished, substantially as herein set forth.

Second, in combination with the foregoing the table B, constructed and arranged so as to draw the front smoothly thereon, substantially as herein described.

62,774.—THERON E. PLATT, New Haven, Conn.—*Book Holder.*—March 12, 1867.—The plate is attached to any object, the socket is adjustable to an angle thereon, the post in the socket and the rack on the head of the post.

Claim.—The combination of the rack J, the rod F, with their socket H, and with the socket B made adjustable upon a plate A, the whole constructed and arranged substantially as described.

62,775.—N. A. PLYMPTON, Northborough, Mass.—*Measuring the Strength of Watch Springs.*—March 12, 1867; antedated February 25, 1867.—The end of the spring is introduced into the chamber, and the body of the spring being bent over the pin, the end bears against the spring lever and vibrates it to a point, which is shown upon the index, and is the measure of its power.

Claim.—The index lever *b*, in combination with the chamber A, slot *a*, and pin *f*, constructed and operating substantially as and for the purpose described.

62,776.—J. H. RAE, Syracuse, N. Y.—*Collecting Gold and Silver from Washings, Sweepings, &c.*—March 12, 1867.—Explained by the claims.

Claim.—First, the within-described process of treating sweepings, filings, or washings containing gold or silver, by exposing the same to the combined action of a current of electricity and of suitable solvents or chemicals, substantially such as herein specified, or any others which will produce the same effect.

Second, separating gold and silver from washings, filings, or sweepings containing said metals, by the action or aid of electricity, substantially as described.

Third, using the bath A as an electrode and as an agitator, substantially as and for the purpose set forth.

62,777.—GUSTAVUS RICKER, Covington, Ky.—*Cotton Bale Tie.*—March 12, 1867.—One end of the hoop is looped over one bar of the link plate, and the other passed through the other opening and retained by the bite of the two angular edges.

Claim.—The plate with slot B having angular projections C, one above and the other below the plate on opposite sides of the same slot, substantially as represented and described.

62,778.—E. A. G. ROULSTONE, Roxbury, Mass.—*Traveling Bag.*—March 12, 1867.—The edge of the leather being clipped within the fold of a bent metallic strip is with the latter pushed within the rebent edge of the frame and the parallel plates secured by rivets. Instead of cutting a piece out of the corner to enable the bending of the frame into form, the rebent edge is turned down and lapped to form a reinforce for the rounded corner.

Claim.—Connecting the bag leather or body to the frame by first securing the edge of the flexible material in the fold of a strip *d* and then applying said strip to the frame between the groove *b* and plate *f*, uniting the whole together, substantially as set forth.

Also, reinforcing the corner of the frame by turning down the tail pieces *i* so as to form a backing for the plate *f* at the corner, substantially as described.

Also, forming the angle *k* rounding or concentric to the corner, when constructed and arranged as set forth.

62,779.—E. A. G. ROULSTONE, Roxbury, Mass.—*Traveling Bag.*—March 12, 1867.—The edge of the leather is nipped within the longitudinally double metallic strip, which is folded firmly upon it and then riveted to the turned-over edge of the frame. The bent-over side of the frame is folded and flattened down at the angle instead of being cut out.

Claim.—The attachment of the flexible body of a bag to the frame thereof by inserting the edge between

two lips *b d*, one or both of which are formed on a strip or plate *c*, riveted to the frame by rivets passing through the edge of the flexible body, the frame and the strip or plate substantially as set forth.

Also, by forming the corner *e* by producing folds *f* and flatly compressing the same, substantially as shown and described.

62,780.—S. C. RUNDLETT, Portland, Me., assignor to himself and JOSEPH GRANT, same place.—*Cattle Tie*.—March 12, 1867.—The rope is permanently attached to the rim surrounding the disks, which are fastened in the latter by a screw bolt. The prongs of the bow set within grooves in the periphery of the disk.

Claim.—First, the center screw *g* to unite the two disks when placed within the rim.

Second, in combination with the two disks *a* and *b*, when the disk *b* has the washer *c*, the shoulder *m* on the inside of the rim.

Third, attaching the rope at the rim, as set forth, in combination with the center screw *g*, shoulder *m*, and washer *c* on the disk *b*, for the purpose of allowing the two united disks to revolve within the rim.

62,781.—JAMES SANGSTER, Buffalo, N. Y.—*Brick Machine*.—March 12, 1867.—By the arrangement of the arms the objectionable employment of cams is obviated. The rollers are formed with concentric grooves for the more complete subdivision of the clay. The mold is constructed with an enlargement near the bottom for ventilation after the lower piston has descended. By a counterbalance the motion of the machinery is equalized.

Claim.—First, the combination and arrangement of the arms H I and J and the piston G, when constructed substantially as described.

Second, the grooved rollers, when used in combination with plain or straight rollers, as and for the purposes described.

Third, the construction of the lower part of the mold by means of which the piston K, as it descends, leaves the necessary ventilation as described.

Fourth, the segment T¹, when constructed substantially as and for the purposes described and set forth.

Fifth, the arms A A and crank wheels T and T¹, when used to give the reciprocating motions to the pressing piston of a brick machine, substantially as described.

62,782.—J. NOTTINGHAM SMITH, Jersey City, N. J.—*Brick Machine*.—March 12, 1867.—The annular revolving cam operates the plunger by its inclined upper edge, and the mold box by a cam groove in its face. These parts are raised up at proper intervals to the fixed presser head.

Claim.—The revolving annular wedge D, applied to a brick press, and constructed and operating substantially as and for the purpose herein specified.

Also, the mold carrier H, in combination with the annular wedge D, substantially as herein set forth.

Also, the plunger I, in combination with the annular wedge D, substantially as herein described.

Also, the combination and arrangement of the mold carrier H, plunger I, and annular wedge D, substantially as herein specified.

Also, the combination of the suspended bed C, in combination with the mold carrier H, plunger I, and annular wedge D, substantially as herein set forth.

Also, the mold, with chilled cast-iron plates *r r*, applied substantially as herein described.

62,783.—HEMAN S. SNOW, West Meriden, Conn.—*Boot Heel*.—March 12, 1867.—The movable heel is secured to a metallic plate attached to the sole by a central screw bearing on some elastic substance. The upper surface of the heel has notches into which fits a projection from the lower side of the metallic plate. When the heel is turned the elastic substance on which the screw bears yields sufficiently to allow turning from one notch to another.

Claim.—The combination of the heel C, with its notches *a*, more or less, and the heel plate B, with its projection *d*, when constructed and arranged so as to be adjustable to different points, and secured at such points by a spring, arranged substantially in the manner herein set forth.

62,784.—CLAS. F. SPENCER, Rochester, N. Y.—*Securing Buttons to Garments*.—March 12, 1867.—The button is retained in position by the head on the stem of the button, inside which is placed a disk which has four radial slits, which allow it to expand over the head when being placed in position, and then by contracting prevent its return.

Claim.—The disk *f*, constructed substantially as described, in combination with the stem or shank *c* of a button provided with a head *i*, arranged and operating substantially as and for the purpose set forth.

62,785.—W. H. TAMBLING, Mazo Manie, Wis.—*Churn*.—March 12, 1867.—The upper section through which the cream first passes has gauze-covered wings and a gauze-covered aperture in the bottom connecting with the lower section, in which paddles are attached to the ends of the arms at different inclinations to drive the cream in contrary directions. A band connects the two shafts.

Claim.—The arrangement of the boxes A and C, the one provided with the arms E E and paddles *a a*, and the other provided with gauze-wire wings and bottom, the two being constructed and used as and for the purpose specified.

62,786.—WM. B. TUCKER, Hillsborough, Ohio.—*Churn*.—March 12, 1867.—Angular three-sided dasher blades are secured in reversed positions upon alternate dasher arms. The angular edges of one set of blades strike into the cream and draw it toward the center of the churn; the succeeding set of blades present flat surfaces to the cream and force it outward.

Claim.—Combining the angular dasher blades, in alternating positions, upon the dasher arms of said churn, substantially in the manner and for the purpose herein set forth.

62,787.—D. UPFON, Rochester, N. Y., and C. H. NICHOLS, Buffalo, N. Y.—*Ash Pan and Fire Grate for Locomotives*.—March 12, 1867.—The grate surface is contracted by side and end plates in the same plane, and plates descending from the inner edges of the side plates to the bottom of each pit are inclined together at their front ends. The air passes under the side plates and around their rear ends to the space beneath the grate bars.

Claim.—First, the application of the draft or flue plates D, substantially in the manner and for the purposes herein shown and described.

Second, in combination with the said draft plates D the contracting plates P and grates B, substantially as and for the purposes set forth.

62,788.—SAMUEL VAN EMON, Cincinnati, Ohio.—*Hoisting Machine*.—March 12, 1867.—The upright guide timbers have anti-friction rollers, which engage a spiral flange upon the rotating drum beneath the platform. The upper floor of the platform rests on anti-friction rollers of a circular frame of the drum. The driving belt passes around two pulleys journaled in the platform, the upper one of which actuates the drum.

Claim.—First, an elevator platform, provided with a spiral drum or worm D, in combination with two or more vertical flights of rollers I, arranged and operated as set forth.

Second, the provision of the anti-friction roller frame E F G H, for the purpose specified.

Third, the gravitating pulley frame P and brake Q, operated in the manner and for the purpose specified.

62,789.—AARON VOTAW, New Garden, Ohio.—*Wagon Brake*.—March 12, 1867.—The cams on the ends of the brake bar behind the front wheels are brought against the wheels by the inclination forward on a down grade of the adjustable frame to which the thills are attached; the latter press back on levers which connect by links on a fulcrum with the bar to which the cams are affixed, and thus bring them against the wheels.

Claim.—First, the bar B, cam E, as arranged, in combination with the links F H I, levers G, and adjustable frame K, as and for the purpose set forth.

Second, the bar B, cam E, as arranged in relation to the wheels A, and operated by the frame K, levers G, and links F H and I, for the purpose and in the manner described.

62,790.—JOHN WATSON, Buffalo, N. Y.—*Brick Machine.*—March 12, 1867.—Perforations through the end of the piston allow the escape of clay from the middle of the brick during pressure, and render it more porous and less apt to crack. Pins attached to the inner ends of the guides clear the holes on the return of the pistons.

Claim.—The stationary pins F and G, or the equivalent thereof, when placed within the faces of the pressing pistons, and so arranged as to be dependent upon the motion of said pistons for their effect.

62,791.—JOHN R. WEBER, Bourbon, Ind.—*Loom.*—March 12, 1867.—A two-winged cam actuates the hooked arm to rotate another cam bar 90° at each movement, and this latter cam operates as a lever, to which the cord which raises the shuttle plate is connected. The object is to lift positively either shuttle into position to be driven by the picker. After elevation the plate descends by gravity.

Claim.—The combination of the lever 16, cams 17 and 18, with the hook 19, pinion 34, bar 24, spring 23, lever 26, cams 20 and 21, when constructed to operate the shuttle plate 37, substantially as set forth.

62,792.—WM. P. WENTWORTH, Detroit, Mich.—*Clamp for Clapboarding.*—March 12, 1867.—The device is clamped to the corner board or sash facing of the house, and the adjustable claw arm supports one end of the board.

Claim.—As a new article of manufacture, a clapboarding implement, arranged and operating as set forth.

62,793.—LORIN WETHERELL, Boston, Mass., assignor to himself and JOHN H. WELLS.—*Forging Hammers.*—March 12, 1867.—By a series of intaglio and cameo dies a hammer is forged exclusively by machinery, gradually assuming the required form by the action of the successive pairs of dies, which more and more nearly approximate to the required shape.

Claim.—First, the first pair of dies, represented in figures 1 and 2, constructed and operating as described.

Second, the fourth pair of dies, represented in figures 11, 12 and 13, constructed and operating as described.

Third, the fifth pair of dies, represented in figures 15 and 16, constructed and operating as described.

Fourth, the process of forging hammers by the use of a series of dies, constructed and operating substantially in the manner specified.

62,794.—OTIS C. WHITE, Hopkinton, Mass.—*Dentist's Chair.*—March 12, 1867.—The position of the head-rest is regulated by a swinging bail on the back of the chair. The vertical rod supporting the head-rest is clamped to the bail by a saddle and set screw.

Claim.—The combination as well as the arrangement of the bail D, the clamp C, and the pivoted rod B.

Also, the combination as well as the arrangement of the bail D, the clamp C, the slide rod E, and the pivoted rod B.

Also, the combination of the ball and socket clamp n, and the arm o, with either or both the rods B E, the clamp C, and the bail D, the whole being applied to the head-rest and back of a chair, or their equivalents, substantially in manner and so as to operate as hereinbefore set forth.

Also, the clamp C, constructed with the two openings f g, the rear saddle k, and the set screw h, arranged in it substantially as specified.

62,795.—JACOB G. WILLANS, Bayswater, England.—*Puddling Iron.*—March 12, 1867.—Granulated cast iron and oxide of iron are heated together until the iron is nearly decarbonized; the melted metal is run from the furnace upon a revolving disk, which is kept cool by jets of water. The metal thus granulated is mixed with the cinder and heated in a revolving furnace, through which an oxidizing flame is made to pass. In 30 minutes the metal is removed to the bed of an ordinary puddling furnace, kept at the highest possible heat by means of a reducing or decarbonizing flame, and is then balled, hammered and rolled in the ordinary manner. The revolving furnace is lined with blocks of fire-resisting minerals, cut out of the solid mineral in proper shape to fit securely in the furnace.

Claim.—The heating a mixture of cast iron and iron oxide, each being in a granulated or divided state at a heat below the fusing point of the cinder, and then removing the mixture into another furnace, (or it may be another part of the same furnace,) where it is subjected to a heat which melts the cinder and allows of the metal being collected together into puddle balls.

Also, the lining of that part of revolving or reciprocating puddling furnaces which is exposed to friction of the iron in the charge whilst working with blocks or forms cut or shaped from the minerals above described.

62,796.—JAMES F. WOOD, 2d, Cohocton, N. Y.—*Wagon Brake.*—March 12, 1867; antedated March 1, 1867.—Improvement on his patent May 10, 1864. The sliding tongue operates the brake by a bell crank, which has upon it a cam plate adjustable by a slot to regulate the position of the brake blocks. The motion is communicated through a link beneath the bolster, traversed by the king bolt.

Claim.—First, the adjustable cam E, on the lever D, the plate h on the brake lever, as and for the purposes herein described.

Second, the sliding plate B, hasp k, in combination with the sliding pole A, fork braces a a, and the brake blocks i i, substantially in the manner herein described and for the purposes set forth.

62,797.—WALTER WRIGHT, Danvers Center, Mass.—*Cut-off Valve Gear of Steam Engines.*—March 12, 1867.—A sliding plate on the valve has transverse slots coinciding with those of the valve, and trapezoidal stops upon it which come in contact with arms vibrated in a vertical plane by the governor. The inner inclined faces of these stops have rectangular indentations, which receive the impact of the arms and limit the movement of the plate to cut off the steam.

Claim.—The construction of each of the trapezoidal projections I I, with offsets or steps, as set forth, to operate in combination with the arms l m and the two shafts n o, arranged and connected in manner and to operate as described.

Also, the combination and arrangement of the shafts n o, the arms l m and r, when arranged in manner and to operate with the trapezoidal projections I I, fixed to the auxiliary valves G H, applied to the main slide valve F, as described.

62,798.—W. H. YOUNG, Athens, Ohio.—*Preparing Petroleum for Lubricating.*—March 12, 1867.—The oil is subjected to the action of hot water, which is contained in a tank and treated by a steam coil.

Claim.—The cleansing of oil by means of an underlying body of heated water, substantially as described.

62,799.—CHARLES J. ADDY, Roxbury, Mass.—*Tobacco Cutter.*—March 12, 1867.—The tobacco is forwarded by a draw pawl adjustably connected to the shaft of the cutter and acting through a ratchet wheel, spur wheel, and rack on the forwarder. The tobacco passes beneath an adjustable spring plate in the vicinity of the knife.

Claim.—The combination of the adjusting arms E E, and setting pin t, and holes s s, or the equivalent thereof, with the presser D, combined with a knife a and feeder C, arranged to operate substantially as specified.

Also, the above-described arrangement of the rack k, the pinion i, ratchet h, and draw pawl g, with the presser D, the feeder C, the knife a, or knife lever B and its shaft d.

Also, in combination with the knife lever B, shaft d, arm f, draw pawl g, ratchet h, the pinion i, rack k, and the feeder C, the mechanism for varying the feed, as described; such mechanism consisting of the bent prongs g g of the draw pawl, with the pin p, and the holes y y, arranged in the prongs, and the said arm f, as specified.

62,800.—CHARLOTTE W. ALLEN, Newport, Ky.—*Smoothing Iron Stand.*—March 12, 1867; antedated February 23, 1867. The stand has a rim round it to keep the iron from slipping off, and has a clamp and thumb screw for fastening it to the table.

Claim.—The smoothing iron stand, consisting of

the guard or rim A B and the screw clamps C D, combined and arranged substantially as and for the purpose specified.

62,801.—CLARK ALVORD, Westford, Wis.—*Handle for Brushes.*—March 12, 1867.—An elastic hand strap to the brush stock suits it to different sized hands.

Claim.—The application to and combination of an elastic strap with a brush, as above described and shown, and for the purpose above set forth.

62,802.—SOLOMON ANDREWS, Perth Amboy, N. J., assignor to EMMETT DINSMORE, Eric, Pa., and CHARLES E. PLUMB, New York, N. Y.—*Tobacco Pipe.*—March 12, 1867.—The stem is axial to the bowl and the mouth is on the side. This arrangement is to allow the escape of nicotine.

Claim.—The elongated pipe A, with its opening H at its upper side at the end B, when its stem is constructed and applied in the manner herein represented and described.

62,803.—RICHARD S. ARNALL, Wright City, Mo.—*Car Coupling.*—March 12, 1867.—The pin depends from a weighted lever worked by a treadle from the car top. A spring and catch on the treadle rod sustain the pin when uncoupled.

Claim.—The arrangement of the rod D, with its arm and pin C, and elongated box E, when used in combination with lever F, rod H, shoulder z, spring I, and box H, the several parts being constructed and used as and for the purpose specified.

62,804.—S. S. AYERS, Plainfield, N. J.—*Churn.*—March 12, 1867.—By a system of pulleys, cranks, &c., a vertical motion is given to the dashers, which are of a triangular form beneath and flat above, so as to drive down with ease but lift the cream in rising to aid the introduction of air. A fly wheel equalizes the difference in resistance between the upward and downward strokes.

Claim.—The combination and arrangement of the dasher O, churn lid or cover P, dasher handle L, guide rod K, pitman J, crank I, fly wheel H, pulleys and band E D F, or equivalent, and crank C, with each other, substantially as herein shown and described, and for the purpose set forth.

62,805.—SELDEN A. BAILEY, Woonsocket, R. I., assignor to BAILEY WASHING AND WRINGING MACHINE COMPANY, same place.—*Wringing Machine.*—March 12, 1867.—The upper and driven roller is made of smaller diameter than the driver to cause similar rotation, though checked by the clothes. The diameter of the driving wheel is greater than that of the pinion, but has an equal number of cogs. The pinions have outer flanges to impinge against the lower shaft when inclined and prevent too deep gearing of the cogs.

Claim.—First, the manner of assisting the increased rapidity of the driven roll D', and easing the movement of the machine, as set forth, by making the diameter of the driving pinion E greater than that of the driven pinion F, both pinions having the same number of teeth, substantially as described.

Second, the combination of the flanges a on the pinions E or F, or on both of them, with the shafts of the opposite rolls, as and for the purpose set forth.

Third, the combination, substantially as described, of the flanges a and hubs b with the pinions E and F, for the purpose set forth.

Fourth, the springs G G' and set screw d, or their equivalents, with the journal blocks H, operating substantially as set forth, in combination with the pinions E and F, arranged and operating substantially in the manner and for the purpose described.

62,806.—LORING J. BAKER, East Machias, Me.—*Climbing Stave.*—March 12, 1867; antedated March 1, 1867.—For climbing telegraph poles. The frame has upper and under cylinders studded with spikes. The upper cylinder is rotated by crank and gearing. A cam sustains the frame in position.

Claim.—The general construction and combination of the parts of a climbing machine, substantially as described and for the purpose set forth.

62,807.—A. BARDELL and S. SMITH, New York, N. Y.—*Coal Scuttle.*—March 12, 1867.—The peculiar conformation of the flanged sides of the bottom secures the point of contact from moisture, increases the strength where it is most required, and the rigidity of the bottom is increased by its arched and corrugated form.

Claim.—First, the combination of a body and base rim, with a bottom so constructed as to have a flange, which can be sprung into the recess formed upon the body, and thereby bring together three thicknesses of sheet metal, just above the bottom of the coal scuttle, substantially as and for the purpose herein described.

Second, a struck up and corrugated sheet-iron bottom B, in combination with the body and base rim, substantially as and for the purpose herein described.

62,808.—A. S. BARNWELL, Savannah, Ga.—*Cultivator.*—March 12, 1867.—A transverse bar is attached under the beam, extending on each side and carrying two adjustable standards and shares. A central standard and double share follow in the rear, working the balk between the furrows just made.

Claim.—The two adjustable shares G G, in combination with the fixed double share D, applied to the beam A, and arranged to operate in the manner substantially as and for the purpose set forth.

62,809.—SAMUEL R. BARTLETT, Detroit, Mich.—*Trap Door.*—March 12, 1867.—A swinging brace is hinged to the top or back of the door. A rod to the inner side of the brace has a heavy stop, which plays loosely through the door and forces the brace back to the right position for supporting the door when it is raised.

Claim.—The combination and arrangement of the arm C, the rod a, and the stop b, when attached to a trap door, substantially as herein shown and described.

62,810.—ALONZO T. BOON, Galesburg, Ill., assignor to himself and JOSEPH STAFFORD, same place.—*Composition for Roofing.*—March 12, 1867.—Composed of coal tar, 1 barrel; and from 2 to 6 gallons of molasses, with silicate of alumina, clay, ashes, or lime, in sufficient quantity to make it the consistency of plasterers' mortar. The molasses tends to give elasticity and prevents cracking.

Claim.—The composition for roofing, compounded from the ingredients specified, substantially as herein set forth.

62,811.—NICHOLAS H. BORGFELDT, New York, N. Y.—*Machines for Granulating Tobacco.*—March 12, 1867.—The circular, closed box contains a sieve revolving by a crank above the box lid. This sieve has triangular holes and has teeth projecting upward between pins on the lower side of the cross bar of the yielding head.

Claim.—First, an apparatus for granulating tobacco composed of a closed box A, movable toothed sieve D, and yielding head E, with projections d, constructed and operating substantially as and for the purpose described.

Second, the arrangement of a sieve D, with teeth b, constructed and operating substantially as and for the purpose set forth.

Third, making the sieve D, shaft C, and head E removable from the box A, as and for the purpose described.

62,812.—HARKNESS BOYD, New York, N. Y.—*Overflow Basin.*—March 12, 1867.—The overflow holes are near the bottom, but communicate with an upwardly bent pipe to allow the basin to hold water up to a given level.

Claim.—A stationary basin or vessel having an ordinary waste or discharge plug, in combination with an overflow pipe opening into said vessel near the bottom thereof and ascending as a siphon to the desired water level of such basin, as and for the purposes specified.

62,813.—IRA S. and CHARLES N. BROWN, Providence, R. I., assignors to themselves and J. MASON GROSS.—*Saw.*—March 12, 1867.—The curved form of the shanks tends to imbue them tighter in their sockets when meeting the resistance of the wood in saw-

ing; each tooth fastens the one next beneath it; the upper is secured by lock at top.

Claim.—The combination of the curved shank *b*, with projections *b'*, and means for locking or fastening the last tooth in the series, the whole operating together substantially in the manner and for the purpose above set forth.

62,814.—MELVIN C. CHAMBERLAIN, Plainview, Minn.—*Whiffletree.*—March 12, 1867.—The traces are cast off the pivoted bars on the whiffletree by throwing up the lever, and thereby unfastening the coupling connection of the two pivoted bars. By taking up a notch of the coupling the length of the traces is adjusted.

Claim.—The arrangement of the bars *C C* and *D* and *E*, constructed as described, and used in connection with the lever *F* and box *a*, substantially as and for the purpose herein specified.

62,815.—MOSES D. CHEEK, Clarendon, Ark.—*Baling Press.*—March 12, 1867.—The press is operated by screw power beneath the follower. The driving shaft has two bevel pinions, which may respectively be optionally engaged with a larger or a smaller wheel on the shaft which actuates the nut wheels on the screw shafts. By means of a lever and stirrup, a slow, effective motion and rapid return are thus obtained.

Claim.—The nut wheel *F*, constructed with the hub *G* and the bored recess *J*, substantially as and for the purpose set forth.

Also, the nut wheels *F*, pinion *L*, provided with the two bevel gears *M* and *N*, and dividing pinions *P* and *Q*, combined, arranged, and operated substantially as set forth.

Also, the lever *S* and stirrup *T*, in combination with the bevel gears *P* and *Q*, substantially as set forth.

62,816.—JOHN B. CHRISTOFFEL, New York, N. Y.—*Boiler-tube Cleaner.*—March 12, 1867.—The spiral blades are attached at one end to a stationary head, and at the other to a movable head, which is driven toward the former with a spring, so as to expand the spirals against the bore of the tube.

Claim.—First, an improved tube cleaner, formed by the combination of the series of spiral scrapers *C*, the stationary head *B*, and the movable head *D*, with each other and with the rod *A*, substantially as herein shown and described.

Second, the combination of one or more elastic or flexible scrapers *G* with the rod *A*, substantially as herein shown and described and for the purpose set forth.

Third, the combination of the coiled spring *E*, or equivalent, and adjusting nut *F*, with the rod *A* and movable head *D*, substantially as herein shown and described and for the purpose set forth.

62,817.—J. K. CLARK, Mount Pleasant, Iowa.—*Window-sash Lock.*—March 12, 1867.—The journals of the rollers are connected to the ends of toggle arms, and are guided in oblique slots in the plates on the sides of the sash. The extension of the toggle bends them against the window casing, and the contrary movement withdraws them and frees the sash.

Claim.—The connected levers *g g'*, in combination with the friction rollers *d d'*, moving on inclines *c c'* in the shell *A*, arranged and operating as and for the purposes herein described.

62,818.—ROBERT J. COLVIN, Lancaster, Pa.—*Combined Rake and Seeder.*—March 12, 1867.—The rake bar, seed roller, the hoppers, &c., each have their appropriate sockets when the apparatus is adjusted for the specific purpose of raking, seeding, or planting. The divided axle is extensible for width in raking, and a gear wheel on the axle is the means of driving the seed roller.

Claim.—First, the manner of attaching the rake piece *J* and corn-planter devices *P* and *Q* to the grain drill frame, as herein described.

Second, the adjustable bar *M*, to which the hoes are attached, with the shifting sections *Q*, by which means the machine, when used for planting corn or raking hay, is clear or free of all unnecessary machinery.

Third, the construction of the cylinder with its de-

vices *U V T*, so as to sow grain in different quantities, and plant one or more rows, as desired.

Fourth, the adjustable feed board or apron *H*, as combined with the hopper, by which the hopper *F* can be shifted without obstruction.

Fifth, the using of drag bars, in connection with their rear attachments *N N*, as cleaners for the rake.

Sixth, the construction of the shifting axles *X X*, with their devices *Y Z*, as arranged for the purpose of widening the drill frame *B* the proper width for the rake.

Seventh, the shifting rods *P P*, for the purpose of removing the extra drag bars that should be dispensed with when the machine is operating as a rake or corn planter.

Eighth, the combination of the grain drill, corn planter, and hay rake, so arranged as to be easily and quickly adjusted, as herein specified and for the purposes set forth.

62,819.—ANSON G. COOK, Burlington, Vt.—*Manufacture of Iron.*—March 12, 1867.—The iron case and its cover are lined with fire clay or brick. The top has perforations for the escape of gases, and the sides have recesses, which are filled with a composition of black oxide of manganese, coal tar, and clay. The vessel is then charged with charcoal; the iron, with 10 per cent. of hematite, is poured in, and, by the heat and decomposition, becomes carbonized and purified of extraneous matter.

Claim.—First, the rectifier or apparatus, consisting of a chamber or vessel lined with fire brick provided with recesses *a*, or their equivalents, substantially as described.

Second, the perforated cover *A'*, provided with the points or flanges for securing the lining of fire clay, substantially as described.

Third, the process, herein described, of treating fused metal in a closed vessel or chamber containing charcoal, or its equivalent, substantially as described.

Fourth, the employment or use of the compound of oxide of manganese and coal tar, for the purpose of refining iron, substantially as described.

62,820.—ALFRED A. CONSTANTINE, New Providence, N. J.—*Manufacture of Soap.*—March 12, 1867.—*A medicinal soap for cleansing and curative uses.*

Claim.—The use of pine tar in its combination with soap or soaps, and in the manufacture of soap or soaps, substantially as described.

Also, as a new article of manufacture, soap made with pine tar as one of its ingredients.

62,821.—JOHN GEORGE COOPER and EDWIN W. H. COOPER, Hartford, Conn.—*Caloric Regulator for Boiler Furnaces.*—March 12, 1867.—The metallic air chamber within the furnace communicates with a cylinder having an adjustable piston to limit the air space, and also with another cylinder whose piston rod has a rack, connected through segmental gears and a spring rack rod, to the damper within the door.

Claim.—First, the heater *B'*, working cylinder *G*, piston *H* and rod *I*, in combination with the sliding spring rod *P*, pusher rod *U*, and damper *V*, constructed and operating substantially as described, so that the position of the damper is regulated automatically by the expansion of the air or other elastic fluid in the heater.

Second, the regulating chamber *G'*, in combination with the heater *B'*, working cylinder *G*, spring rod *P*, and damper *V*, constructed and operating substantially as and for the purpose set forth.

Third, the arrangement of an adjustable piston *H'* in the regulating chamber *G'*, to operate in combination with the heater *B'* and cylinder *G*, substantially as and for the purpose described.

Fourth, the valves *E f* and trips *d e*, in combination with the chamber *G'*, cylinder *G*, and rod *P*, constructed and operating substantially as and for the purpose set forth.

Fifth, the spring catch *b* and recess *a* in the rod *P*, arranged to operate in connection with the rod *U* and latch *W*, substantially as and for the purpose described.

Sixth, the perforated plate *c'* and regulating slide *z*, in combination with each other and with the furnace door *A'* and rear shield *e'*, constructed and operating substantially as and for the purpose set forth.

Seventh, the sliding pin *l* and cam *l'*, in combination with the damper *V* and furnace door *A*², constructed and operating substantially as and for the purpose described.

Eighth, the chambers *b*² *d*¹ *f*² in the furnace door *A*², in combination with the damper *V*, slide *i*, shield *e*¹, and perforated plate *g*¹, constructed and operating substantially as and for the purpose set forth.

62,822.—H. R. CROWE, Carondelet, Mo.—*Field Roller*.—March 12, 1867.—The rear sections are hinged to a rod in the rear of the front roller frame, so as to enable them to conform to a rolling surface, or to plow lands. The seat is suspended by chains from flexible bars erected on the frame.

Claim.—First, hinging the frames *E* and *F* of the two end sections *A* and *B* to each other, substantially as herein shown and described, and for the purpose set forth.

Second, suspending the seat *K* by means of links *M*, or their equivalent, from the springs *L* attached to the frames *E* and *F* of the roller, substantially as herein shown and described.

62,823.—JAMES CRUTCHETT, Stroud, England.—*Manufacture of Gas*.—March 12, 1867.—Explained by the claims.

Claim.—First, the manufacture of gas, for lighting and heating purposes, from pulverized or fine coal, or other carbonaceous materials, injected into retorts or ovens in small quantities, either by separate successive injections or in small, continuous currents, as herein described.

Second, the injection into retorts or suitable ovens or chambers of pulverized, powdered, or small coal, saw dust, oils, or carbonaceous materials, by means of steam supplied to such retorts in separate charges or in continuous currents, as herein described.

Third, the injection of suitable carbonaceous materials, as aforesaid, for the manufacture of gas into retorts, ovens, or heated chambers, by separate successive injections or currents, by means of compressed atmospheric air, compressed gas, springs, or other mechanical means, as hereinbefore described, whether the interiors of such retorts be under a slight pressure or vacuum.

62,824.—JOHN CUNNINGHAM, Philadelphia, Pa.—*Curtain Fixture*.—March 12, 1867.—The slide to which the cord is attached has a rack, which is engaged by a worm wheel on a thumb-wheel shaft for its vertical adjustment.

Claim.—The slide *B*, fitted in a slot or opening *a* in the case, provided with a knob or pulley *C* at its outer side, and with a rack *c* at its inner side, into which a screw *C*^{*} on a rod *D* gears, said rod projecting through the end of the case, and having a thumb wheel *E* on its end at the exterior of the case, all arranged substantially as and for the purpose set forth.

62,825.—EDWARD P. CURTISS, Madison, Wis.—*Connecting Piston Rods for Steam and other Powers*.—March 12, 1867.—The connecting rod has parallelograms at a certain distance from the pin passing through it, and the piston rod has a slot at the outer end and a pin which traverses around the parallelograms, working upon its angular sides and forming a lever power to force the crank past the center.

Claim.—The parallelograms *A*, the flanges *L* *L* that support them, the pin *B* that works on the angular sides of the parallelograms *A*, the pin *E*, and slot *D* which moves the pin *B* to the opposite side of the piston rod *M*, which reverses the motion, and the slot *C*, which allows the piston rod *M* more stroke for the pin *B* to pass around the parallelograms *A*, coming in contact with their angular sides, forces the connecting rod past the centers, to work substantially as herein set forth.

62,826.—ALEXANDER T. DE PUY, New York, N. Y.—*Stereotype Plate Holder*.—March 12, 1867.—The frame is formed of separate pieces clamped in the chase, and has catch plates and screw-adjusted catches to clamp the plate.

Claim.—First, a block or holder for stereotype plates, constructed of sections, in the manner substantially as herein shown and described.

Second, the combination of independent or detached

clamps with a sectional stereotype plate holder, substantially as and for the purpose set forth.

62,827.—THOMAS DOLAN, Albany, N. Y.—*Bridge for Billiard Tables*.—March 12, 1867.—The bridge has concave anti-friction rollers to sustain the cue without checking its movement.

Claim.—A billiard table bridge having its resting or bearing surfaces for the cue formed of rollers, substantially as described, for the purpose specified.

62,828.—G. H. DONEY and MOSES CLAY, Lockport, Ill.—*Making Soap*.—March 12, 1867.—To 2 oz. lime, dissolved in boiling rain water, add aqua ammonia, 1 oz.; borax, 1 oz.; sal soda, $\frac{1}{2}$ lb.; forming the first compound. Mix rain water, $\frac{1}{2}$ gall.; hard soap, 1 bar; saltpeter, 1 oz.; borax, 1 oz.; rosin, $\frac{1}{2}$ lb.; alum, 2 oz.; sal soda, $\frac{1}{2}$ lb.; common salt, 2 oz.; alcohol, 1 oz.; after boiling for 10 minutes add $\frac{1}{2}$ pint of the first compound.

Claim.—The use of the ingredients specified in the particular proportions and manner set forth, to make soap.

62,829.—LUCIUS H. DWELLEY, Dorchester, Mass.—*Machine for Cutting the Rolls of Window Blinds*.—March 12, 1867.—The hopper is vibrated to deliver the rolls parallel to each other into the magazine, which delivers them to the indentations of rotating disks which carry them to the saws to be cut to length. The saws are adjustable on their shaft.

Claim.—The arrangement of the vibrating hopper *F*, which receives the sticks in mass, with magazine *G*, which arranges them in a single column, so that they may be delivered one at a time to a carrier or holder that conveys them to the tool or tools that are to afterward operate upon them, substantially as described.

Also, arranging within the magazine *G*, a guide *10*, at one of its ends only, which guide arranges the sticks in a line at that end of the magazine, and allows all the inequalities in their lengths to project at the opposite end, substantially as described.

Also, the spring *r*, with its roll *q*, in combination with its carrying disks *H* *I*, substantially as and for the purpose described.

Also, the crank *P*, with its eccentric *m*, in combination with a slotted arm *K*, and so arranged with a screw that, when turned in a direction to throw the worm wheel *L* into gear with the wheel *O*, it will clamp the arm *K* firmly in place, substantially as described.

Also, making the saw *E* adjustable on its arbor *D*, by means of the split collar or sleeve *R*, screw nut *v*, with its recess *14*, and recessed collars *t* *u*, substantially as set forth.

62,830.—O. F. FITCH, Morristown, Ind.—*Carding Engine*.—March 12, 1867.—The points which conduct electricity from the roping are above the same, and in vertical position to prevent the accumulation of waste upon them.

Claim.—First, the conductor, armed with slender pendant points presented to the roping in rear of the condensing rollers, as herein shown and described, as and for the purpose specified.

Second, the shaft *H*, uprights *I* *I*, and pendant points *a*, in combination with the condensing rollers *D* *D* *D*, spool *F*, and frame *A*, when constructed and arranged as herein set forth and for the purpose specified.

62,831.—DANIEL FITZGERALD, New York, N. Y., assignor to himself and R. ONDERDONK, same place.—*Portable House*.—March 12, 1867.—The grooved cap covers the apex of the house and has grooves to hold the ends of boards, which are sprung so as to form the arched roof and the sides of the house.

Claim.—The cap *F*, provided with grooves as represented, when used in combination with the boards *A* *A*, the upper ends of which are held by said cap, and which are bent to form the roof and sides of the house, said boards being prevented from warping, substantially as herein specified.

62,832.—MERWIN FOWLER, Wolcottville, Conn.—*Buckle*.—March 12, 1867.—Explained by the claim and illustration.

Claim.—A buckle formed of wire bow *a*, attaching

bow *b*, and clamping bow *c*, formed with eyes *e*, passing around the wire of the bow *a*, at the return bends *z*, as and for the purposes specified.

62,833.—**DAVID L. FURMER**, Rostraver, Pa.—*Machine for Washing Sand and other Materials.*—March 12, 1867.—A series of trays are arranged one above another, in an inclined position, in the frame. A shaft passing through the centers of the several trays carries stirrers to agitate the sand and water within the trays. Each stirrer moves the sand toward the highest part of the tray, where it is discharged into the tray beneath or the final outlet.

Claim.—The combination of the inclined trays *A* and stirrers *L*, constructed and acting conjointly, substantially as and for the purpose set forth.

Also, the combination of the inclined trays *A* and spouts *Y*, or their equivalents, to supply each tray separately with pure water, substantially as and for the purpose set forth.

Also, the trays *A*, when located one above another, and pierced centrally by the shaft *k* upon which the stirrers are located, so as to wash and re-wash the sand without rehandling the same and without occupying more space than the area of one tray requires, substantially as set forth and described.

Also, the agitating screw *S*, in combination with stirring mechanism of a sand washer, to comminute the sand and earthy matters before being submitted to the action of said stirring mechanism, substantially as set forth.

Also, the trays, stirring mechanism, water spouts, screen, driving gear, and framework, herein set forth and described, to form a machine for washing and cleansing sand of other earthy matters usually mixed with it.

62,834.—**CHARLES C. GARRETT**, Dayton, Ala.—*Corn and Cotton Seed Planter.*—March 12, 1867.—The cotton seed cylinder has vertical adjustment by a lever and set screw. The corn seed slide has movement from side-pins on the operating pinions of the cotton cylinder, which is journaled in an arm vibratable by a lever to throw it in or out of gear with its driver. The harrow is attached to draw springs.

Claim.—First, the stirrup lever *R*, connected to the cylinder *Q*, so that it can be raised and lowered, substantially and for the purposes herein described.

Second, the stirrup lever *R* and its connections with the seed cylinder *Q*, in combination with the lever *O*, for the purposes and substantially as described.

Third, the harrow *C* and its means of attachment to the springs *D* ² *D* ², in connection with the seed planter, when constructed in the manner and for the purposes and substantially as described.

62,835.—**LEWIS GIBBS**, Canton, Ohio, assignor to **BUCHER, GIBBS & COMPANY**, same place.—*Plow.*—March 12, 1867.—The casting attached to the rear end of the beam has a gain which receives the lip of a slotted casting attached to the handle, and a bolt of the former traverses the slot of the latter, by which lateral adjustment is admitted. The ground bar is detached from the share. The holding edges of the colter are beveled and the gain of its holder plate similarly formed, to admit of tightening the colter by screwing up the plate.

Claim.—Uniting the beam and handle of a plow by means of the castings *d f* and their lips *e g*, and a screw bolt *t*, substantially as described.

Also, the beveled edges of the socket *j* with the beveled edges of the colter *D*, and the screw bolts *k*, for the purpose of holding and tightening the colter, substantially as described.

Also, the bar *m*, made and united to and with the land side and share, substantially as and for the purpose described.

62,836.—**MARSHALL GILBERT**, New York, N. Y.—*Garbage Box.*—March 12, 1867.—The cask is let into the pavement and has an annular edge inside upon which is placed a grating that supports the garbage vessel, which is covered with a lid.

Claim.—The vessel *c*, formed with a ring or ledge *e*, in combination with the movable grating *f* and receptacle *g*, the whole constructed and applied in the manner specified to form a receptacle for ashes and other refuse matter.

62,837.—**JAMES E. GILLESPIE**, Boston, Mass.—*Low Water Detector.*—March 12, 1867.—A pipe from the boiler bottom and one from just below the water level are brought up above the boiler to form a coil and to communicate with a tank supported on said coil. When the fall of water level in the boiler exposes the end of the pipe to the steam, the latter fills the tank, which is raised by the coiled spring and operates a lever connected with the alarm whistle.

Claim.—First, the hollow springs *g f*, or their equivalents, in combination with the tank and boiler, as specified.

Second, the combination of the pipes and springs *g f* and tank *e* with the whistle of a boiler, whereby to raise an alarm in case of low water.

62,838.—**WILLIAM F. GOODWIN**, Washington, D. C.—*Harvester Rake.*—March 12, 1867.—The axle of the driving wheels has a lengthened key seat, in which the splinc key of a cog wheel has play, to bring a pinion gearing with the said wheel in connection with either one of a series of pinions of various diameters upon a shaft parallel with the axle. This shaft has a crank which traverses a yoke on a slide bar connected with a pivoted lever, which is connected to a series of levers so pivoted together to the frame and the rake as to give the latter the proper sweep over the platform. The series of wheels on the crank shaft furnish means for adjusting the movement of the rake. The rake passes beneath a jointed guide plate in its forward movement, and above it in its return, to raise it above the grain. The rake mechanism may be thrown in or out of gear by a lever.

Claim.—First, the gear wheels *A*, *A* ¹, *A* ², *A* ³, and *A* ⁴, shaft *B* ⁵, crank *B* ⁶, lever *L* and *L* ¹, and block *M*, arranged to operate in the manner and for the purpose substantially as described.

Second, the yoke *A* ⁷, and *A* ⁸, and vibrating arm *A* ⁹, arranged to operate in the manner and for the purpose substantially as described.

Third, the bars or levers *B*, *B* ¹, *B* ², *B* ³, and *B* ⁴, crank *B* ⁵, and post *B* ⁶, with the rake *B* ⁷, attached, arranged, and operating in the manner and for the purpose substantially as described.

Fourth, the switch *S* and tracks *T* and *T* ¹, arranged on the side of a circular platform, to operate in the manner and for the purpose substantially as described.

Fifth, the rake head *B* ⁷, hinged or jointed to the reciprocating and turning post *B* ⁹, arranged and operating substantially as and for the purpose described.

Sixth, the arrangement beneath the grain platform of the mechanism for communicating motion to a reciprocating, turning, and lifting rake, which operates from above upon the platform, substantially as described.

62,839.—**R. M. GREEN**, Baltimore, Md.—*Machine for Bending Cable Links.*—March 12, 1867.—One end of the link blank is clamped to the "former," and it is bent around the same by adjustable anti-friction rollers upon a swinging arm. The bent blank is thrown off the "former" by a treadle.

Claim.—First, the slotted lever *D*, provided with the wheels or pulleys *J J*, in combination with the "former" *C*, arranged as and for the purpose specified.

Second, the arrangement of the set screw *P*, with the "former" *C* and lever *D*, substantially in the manner and for the purpose herein specified.

62,840.—**C. S. S. GRIFFING**, Geneva, Ohio.—*Fence.*—March 12, 1867.—A series of compensating loops allow expansion or contraction of the wire without either loosening the attachment or injury to the fence, which is steadied laterally by tri-lateral braces at the junction of the panels.

Claim.—First, the frame *A*, provided with wires *C C* and compensating loop *K*, as constructed and arranged, in combination with the brace post *D*, for the purpose and in the manner as described.

Second, in combination with the above, the panel *A* ¹, constructed and arranged in the manner as described.

62,841.—**JOHN HAGUE**, Providence, R. I.—*Steam Trap.*—March 12, 1867.—The upper end of the tubular stem of the water valve forms the seat of the air valve. The water valve is opened by a float, which movement closes the air valve.

Claim.—The hollow valve stem C, constructed and arranged substantially as described, in combination with the air and water valves B and E, and operated substantially as herein set forth.

62,842.—JOEL HAINES, West Middleburg, Ohio.—*Dinner Bucket.*—March 12, 1867.—The permanent horizontal partition divides the bucket into two compartments. A door in the end opens into the lower division, in which sliding trays are supported on cleats.

Claim.—A victual and provision bucket, made with a double bottom or permanent horizontal partition to divide it into two apartments, one above the other, with a door in the side of the bucket opening into the lower division or apartment, substantially as described.

Also, the cleats in the lower apartment, in combination with the pans or trays.

62,843.—LEWIS HANNUM, Cortland, N. Y.—*Wringer for Clothes and Mops.*—March 12, 1867.—One roller rotates in fixed bearings in the frame; the other has its bearings in a sliding frame, and is brought up to the former by pressure upon the hand lever or treadle.

Claim.—First, the rolls B C and links D, arranged relatively to the arms E² on the shaft E, which latter is adapted for being partially rotated at will, all substantially in the manner and for the purpose herein set forth.

Second, in connection with the above, the hand lever E¹, foot lever G, and connection G¹, arranged substantially as and for the purpose herein specified.

Third, the board D¹, carried on the links D and arranged to serve relatively thereto and to the rolls B C, which are opened and closed thereby, substantially as and for the purpose herein specified.

62,844.—THOMAS HANVEY, Elma, N. Y.—*Machine for Making Cheese Boxes.*—March 12, 1867.—One end of the rim is clamped between the edge of the hinged segment and the contiguous part of the drum. The bottom is held by the pins projecting therefrom, and the box formed for nailing by a rotation of the same. The vibrating support arms of said segment are operated by a crank, which has a retaining spring catch.

Claim.—The hinged section D¹, constructed and operating in the manner and for the purpose substantially as set forth.

62,845.—L. O. HAYWORTH, New Cumberland, Ind.—*Grain Register.*—March 12, 1867; granted February 28, 1867.—The first wheel moves half a revolution, at an impulse derived from the motion of the carriage which holds the half-bushel measure. The succeeding wheels are connected to it, and are decimally arranged, to score units, tens, &c.

Claim.—The combination of the wheels B B B with ratchet center pieces of varying diameters and teeth, the wheel A², sliding frame I, swinging pawls J K, rod B², slotted arm L, and arms N O, operating with the grooved side bar S of the carriage P, substantially as described, for the purpose specified.

62,846.—EDMUND HERSEY, Hingham, Mass.—*Machine for Cutting Heads and Bottoms of Wooden Boxes.*—March 12, 1867.—Two gouge-shaped, circular reciprocating cutters complete the circular cut in the material placed upon the post beneath it.

Claim.—Having the edge of the cutter C formed of two gouge-shaped parts, substantially as and for the purpose shown and described.

62,847.—ARON HIGLEY, South Bend, Ind.—*Car Brake.*—March 12, 1867.—One ratchet on the windlass prevents the latter from turning if the train starts prematurely, which would tend to throw the retaining dog out of the other ratchet.

Claim.—The ratchets X and 2, in combination with windlass 7, substantially as and for the purpose set forth.

62,848.—LUCIAN HILL, North Brookfield, Mass., assignor to LAWSON M. HILL, same place.—*Corset Clasp.*—March 12, 1867.—The clasps are not attached to the stiffening ribs, but formed with sockets for the passage of the latter, so that all may be removed for washing.

Claim.—The detachable clasp for corsets herein described, consisting of the parts a a and spring b, constructed as set forth.

62,849.—T. HOFSTATTER, JR., New York, N. Y.—*Auger.*—March 12, 1867.—The clearing screw of the auger has an outer screw thread, which carries countersink dies, a holding collar, and a jam nut.

Claim.—The countersink b, washer c, and thumb screw d, when constructed and arranged upon the screw thread a of the auger A, and operating as herein set forth for the purpose specified.

62,850.—EDWIN HOYT and EDWARD P. WHITNEY, Stamford, Conn.—*Step Attachment for Berths.*—March 12, 1867.—The hanging arm on the side of the berth has a folding step at about midlength and a stop pin on the berth below.

Claim.—The device, herein described, of the arm B and folding step C, constructed substantially as herein specified, to serve as a resting place for the foot, for facilitating ascent to and descent from berths in steam and other vessels and railway vehicles.

62,851.—R. B. HUGUNY, Cleveland, Ohio.—*Wringing Machine.*—March 12, 1867.—A single gear is on the shaft of each of the rubber rollers, the lower one moving on the outer surface, and the upper one on the inner surface of the rim of the double-gear wheel, which is kept in adjustment with the cog wheel on the lower shaft by toggles. The bars are attached by bolts and springs, and adjusted by screw bolts passing through the stiffening bar.

Claim.—First, the arrangement and combination of the double-gear wheel A and single-gear wheels B, C, and D, and toggles E E, or their equivalents, as described, for the purposes specified.

Second, the arrangement and combination of the stiffening bar P, spring bars K and L, bolts M M, spring collars N N and adjusting screws O O, as described, for the purposes specified.

62,852.—JOHN S. JENNINGS, Medina, N. Y.—*Boiler Form.*—March 12, 1867.—The form is composed of two segmental blocks, with a rim and lips to keep the edge of the boiler in position. The blocks are connected by two dowels, and distended by a double-acting screw in the middle.

Claim.—The rim f and lips d, the double-acting screw b b', and the dowels a a, when combined with the two heads A A, the whole arranged and operating as herein set forth.

62,853.—OLIVER A. KELLEY, Slatersville, R. I., assignor to LAMB, COOK & Co.—*Governor.*—March 12, 1867.—The gate or valve is regulated by the action of two pivoted pawls and a ratchet gear. The pawls point in opposite directions and sweep over the circumference of the ratchet, one or the other engaging according as the speed exceeds or otherwise the medium rate desired, at which they sweep back and forth without engagement. The pawls are regulated by shoes, which are lifted by the rising or falling of the governor balls above or below a specified position.

Claim.—First, the weighted shoes F, in combination with the lever G, elbow shaft A, rod H and governor I, substantially as described, for the purpose specified.

Second, the cam groove D, in combination with the arm C, pawls b b', ratchet gear B, shoes F, lever G, rod H and governor I, constructed and operating substantially as and for the purpose described.

Third, the yielding or self-adjusting shoes F, in combination with the pawls b b', dovetail teeth a of the ratchet wheel B, lever G, rod H, and governor I, all constructed and operating substantially as and for the purpose set forth.

62,854.—GISON KEYES, Binghamton, N. Y., assignor to himself and F. Y. PAYNE, same place.—*Washing Machine.*—March 12, 1867.—The washboard covers the bottom of the suds box, and the canvas which lies upon it is secured by the sliding end pieces. The rubber is so presented as to bear angularly upon the corrugations of the board, and imitate the hand operation.

Claim.—The combination and construction of the suds box A with the lever E, notched handle of the

rubber B, and mode of securing the canvas apron by means of the slides C C, as described and for the purpose set forth.

62,855.—JOSHUA KIDD, London, England.—*Apparatus for Carburetting Gas and Air.*—March 12, 1867.—The gas-tight vessel contains a liquid hydrocarbon, and has a vertical aperture, which forms a chimney for the burner below, whereby the contents are heated. The cap over this aperture is adjusted vertically to increase or diminish the power of the liquid, which is heated principally from above. Oil is supplied to the reservoir by an intermittent fountain feeder.

Claim.—As new, for carburetting gas or air by heat at the burner for obtaining light, forming the apparatus with a heating aperture through its center, also with heat regulator D, together with the application of oil-supplying arrangement, substantially as described.

62,856.—JOSHUA KIDD, London, England.—*Apparatus for forming an Explosive Mixture of Air and Hydrocarbon Vapors for use in Motive Power Engines.*—March 12, 1867.—This is designed to make available light petroleum spirit, instead of gas, for working the Lenoir or other gas motor engine. The vaporizer has a chimney through its center, and a burner concentric within it. The feed is a distant intermittent fountain. Each stroke of the engine draws in air through the gauze mouth of the air inlet, and the air charged with vapor of hydrocarbon passes to the cylinder to be exploded in the ordinary manner.

Claim.—As new, for the purposes of this invention, the general arrangement of apparatus, substantially as described and set forth.

62,857.—MARTIN C. KILGORE, Washington, Iowa.—*Corn Sheller.*—March 12, 1867.—The face of the cylinder is slightly concave, and has T-headed spikes, which shell the corn pushed against the cylinder by the spring plate. Inclined bars lead the cobs to a side exit, and the shelled corn escapes at the bottom.

Claim.—A corn sheller having a box as described with plate *a*, springs *d*, *b*, *c*, and the device as described for the *gress* of cobs, all constructed, combined and arranged substantially as herein specified.

62,858.—H. J. KINTZ, Greece, N. Y.—*Potato Digger.*—March 12, 1867.—The pointed and elevated mold board passes centrally under the hills, divides them, and severs them from the vines. The tubers pass up and are acted upon by a double conical revolving sifter, which delivers them to the hinged conductor, which discharges them in a compact row at the rear.

Claim.—The construction, combination, and arrangement of the scraper A, consisting of the vertical side points *a a*, the central share *b*, extending backward and upward in a semicircular ridge, with its point projecting below the level of the side points, and the intervening shallow scoops with concave edges *c c*, and gradual upward inclination between the side and central points, operating substantially in the manner and for the purposes herein set forth.

Also, in combination with the scraper, constructed and arranged as above described, the double conical sifter E and its cogged driving wheel G, operating in the manner and for the purpose specified.

Also, the hinged adjustable and self-supporting conductor H, provided with the converging fingers *p*, and the concave *k*, when combined and arranged with the double conical sifter E, in the manner and for the purpose set forth.

Also, the special arrangement of the machine, consisting essentially of the scraper A, with draft arms D, the sifter E, with driving wheel G, the conductor H, and the vine clearers I, operating as herein described.

62,859.—RICHARD LAVERY, South Boston, Mass.—*Tool for Cutting off Boiler Tubes.*—March 12, 1867.—The eccentric cutter is pivoted in a cylindrical head, which fits the interior of the tube to be cut, and is revolved by a ratchet and handle. The cutter is turned on its own axis to project the edge of the tooth beyond the periphery of the head, or to withdraw it for insertion or removal from its place of working.

Claim.—First, the eccentric cutter B, in combina-

tion with the head A, constructed and operating substantially as and for the purpose described.

Second, the lip or nose *e* on the eccentric cutter, in combination with the shoulder *f* in the head A, substantially as and for the purpose set forth.

Third, the pin C, provided with a key *c*, in combination with the eccentric cutter B and head A, constructed and operating substantially as and for the purpose described.

Fourth, the ratchet handle D, in combination with cogs *g* in the head A, and with the eccentric cutter B, constructed and operating substantially as and for the purpose set forth.

62,860.—PETER LAWSON, Lowell, Mass.—*Apparatus for Refrigerating, Cooling, and Preserving.*—March 12, 1867.—The revolving shaft brings any portion of the tables over the opening of two chambers. A movable table in the upper compartment is operated by a rack and pinion for the purpose of introducing ice.

Claim.—First, an upright shaft with one or more tables or shelves, and suitable means to revolve the same, in combination with the interior of a refrigerator, provision safe, or preserving house or similar structure, substantially as herein set forth and described.

Second, one or more shelves M, rack *p*, pinion *q*, in combination with the body of a refrigerator or similar structure, substantially as herein described and set forth.

Third, the combination in a refrigerator or like structure of one or more revolving tables C, with one or more movable shelves M, substantially as herein set forth and described.

62,861.—FRANCOIS LECLERC, Watertown, N. Y., assignor to himself and J. S. LETRED, same place.—*Lantern.*—March 12, 1867.—Eyes upon the bail give points of attachment to the wire frame, and springs projecting inward from the lower ends of the frame-wires come beneath the flange of the lamp and support it in position.

Claim.—The combination of the bail F, with its eyes *f*, the wire G, and spring I arranged with the slotted chamber H, operating with the lamp A and its flange *a*, all constructed and arranged in the manner and for the purpose herein described.

62,862.—AUSTIN LEYDEN, Atlanta, Ga.—*Combination Padlock.*—March 12, 1867.—The lock is designed for through freight cars, the destination being indicated by an exposed letter, and it resists the attempt to open it by a way key.

Claim.—First, the disk bolt A, constructed substantially as described, with indicating letters upon one side, and the latch B attached to the other side, and operating substantially as herein shown and described.

Second, the catch C' C'' attached to the shell of the lock, substantially as described, in combination with the disk bolt A, for the purposes specified.

62,863.—ALBON MAN, Brooklyn, N. Y.—*Lock Seal.*—March 12, 1867.—The seal is printed on a slip of paper, with a marginal register, on which can be noted a memorandum of time and place.

Claim.—First, a seal for lock seals or other analogous purposes, where it is important to keep a record of the number and kind of seals used, and the times, places, and circumstances of the use thereof, by the preparation of the seal upon a slip of paper with a marginal register, on which all the said facts may be noted.

Second, constructing said seals variously, so as to operate as a check upon counterfeiting, and so that it cannot be known which design is used in any given case, except by the person using it and by the record.

Third, these variant designs combined in pass books on slips of paper, so as to allow a permutation of the designs for further security.

62,864.—THOMAS MARSH, Smithfield, R. I., assignor to himself, JOHN BALCHON and S. PERRY, same place.—*Beer Faucet.*—March 12, 1867.—A screw socket is fastened to the cask around the ordinary wooden plug, and a screw shaft is made the means of forcing in the said plug. A portion of the shaft is hollow, and has an ordinary spigot; when the screw

plug is forced in to a certain distance lateral openings are exposed, which admit liquid into its hollow interior, the discharge of which is regulated by the spigot as usual.

Claim.—First, the faucet, composed of two parts 1 and 2, the part 1 to be attached to the barrel at any time after the filling and before the tapping of the same, and to act in combination with the part 2 in forcing out the common wooden plug, the use of which is rendered inobjectionable by this invention, and which it is no part of my design to supersede.

Second, the combination of such faucet with a collar C affixed to the cask, such parts in combination constituting an apparatus for tapping a cask, substantially as described.

Third, combining with the apparatus described in the first clause a cutting bit F, substantially as described, for the purposes specified.

62,865.—FRANKLIN J. MAY, Morrisania, N. Y., assignor to himself and J. G. BARNUM, same place.—*Safety Key-holder for Door Locks.*—March 12, 1867.—The swinging plate being vibrated so as to bring the slot over the shank of the key, the pawl is brought to bear against a square on the shank to prevent its rotation by an outsider.

Claim.—The weighted pawl H, in combination with plate E, operating directly against the square shank of the key, substantially as herein represented and described.

62,866.—GEO. W. McCANN, Springfield, Ohio.—*Measuring Funnel.*—March 12, 1867.—The scale is marked on a bent strip which clips the side of the vessel. The stem of the valve is guided in a projecting bridge piece, and the measure stands upon a detachable base.

Claim.—First, the scale I, in combination with the cup A of a funnel, when said scale is constructed substantially as described, and retained in place by a spring pressure against the side of the cup.

Second, the guide bridge E, in combination with the valve C, stem D, and cup A of a funnel, when constructed so as to be readily removable, substantially as and for the purpose set forth.

Third, the removable base L, in combination with a cup and nozzle of a funnel measure, substantially as and for the purpose set forth.

Fourth, the nozzle J of a funnel, constructed with the wire k wound spirally round its outer surface, for the purpose of permitting the air to escape upward by the side of the nozzle, as set forth.

Fifth, the combined cup, funnel, and measure, constructed and arranged as set forth.

62,867.—DONALD L. McDONNELL, Detroit, Mich.—*Horseshoe.*—March 12, 1867.—The foot is protected from injurious concussion by the interposition of a vulcanite insole between the hoof and the iron shoe.

Claim.—The combination of the iron shoe, having a continuous groove in its upper surface, and spurs projecting upwardly therefrom, with the elastic shoe, having a continuous tongue fitting said groove, all constructed and arranged as described.

62,868.—C. F. MEGQUIER, Eureka, Ill.—*Cultivator.*—March 12, 1867.—The plows are raised vertically by levers which are actuated by hand or by treadles. The inside plows are moved laterally to conform to the sinosities of the rows by means of hand levers.

Claim.—The plow standards F F, pivoted at their upper ends in metal straps c, which encompass loosely the shaft G in the frame A, so that said standards and the plows H attached may be moved vertically and laterally in combination with the plow standards I I, pivoted to the outer sides of the frame A, the levers k k, to which the plow standards are connected, and the rods N attached to the plow standards, all being arranged to operate in the manner substantially as and for the purpose set forth.

62,869.—W. D. MILLER, Enon, Ohio.—*Automatic Wagon Brake.*—March 12, 1867.—As the team pulls back on the neck yoke and tongue the fore axle slides back, the king bolt traversing in the slotted bolster and coupling pole. The brake bar is connected to the fore axle, and by the motion of the latter the rubbers are brought into effective action on the wheels.

Claim.—First, the axle G and slotted bolster H, in

combination with the rollers J, substantially as and for the purpose set forth.

Second, the automatic brake A, operated by means of the connecting rod C and the axle G, in combination with the slotted bolster H, slotted perch I and bolt F, as and for the purpose set forth.

62,870.—JOHN MOODY, York, England.—*Floating Battery or Light-house.*—March 12, 1867.—The hull or base is of a star-like or radiating form viewed in plan or horizontal section, with a flat or slightly rounded bottom, and with its top preferably arched in all directions. The upper structure may be a light-house or plated battery.

Claim.—The construction of floating lights, beacons, floating batteries, and other vessels with radiating arms, as described, for the purpose of preserving their steadiness in a rough sea, as herein set forth.

62,871.—THOMAS B. MOORE, Bridesburg, Pa.—*Bed Bottom.*—March 12, 1867.—The springs are coiled upon spindles resting on the rails, and their upper ends are looped to bars beneath on the slats.

Claim.—First, an improved spring for bed bottoms, formed by combining the spring B, having a loop or hook b' formed upon its upper end, with the bars C and ears D, having notches formed in their rear sides, substantially as herein shown and described and for the purpose set forth.

Second, the combination of the loops or bridles F with the springs B, substantially as herein shown and described and for the purpose set forth.

62,872.—FRANK MORTON, Kingston, Mass.—*Strainer.*—March 12, 1867.—Two arms of the frame support the handles and two keep the bag distended while filling. The bag is then removed, enveloping contents, whose juice is expressed by torsion.

Claim.—The arrangement and combination of the handles C C' with the strainer cloth A, and the supporting frame B B' B''.

62,873.—ALFRED S. MUNGER, Chicopee Falls, Mass.—*Breech-loading Fire-arms.*—March 12, 1867.—The hammer constitutes the abutment to sustain the recoil, and the pivot of the detaining catch is relieved by the interposition of a rigid support between the back of the hammer and the stationary part of the frame.

Claim.—The lever catch G, formed with the foot g, which in the act of firing is interposed between the back of the hammer and the part c of the frame to relieve the pivot b of the pressure, and in the act of cocking is retracted to release the hammer, as and for the purposes described.

62,874.—JAMES H. MURHILL, Baltimore, Md.—*Valve Gear for Oscillating Engines.*—March 12, 1867.—Steam is admitted through one of the trunnions and exhausted through the other. The slide-valve rod has two studs embracing the eccentric arc which partakes of the side movement of the lever, which is oscillated from its upper end by the eccentric on the crank shaft. As the cylinder oscillates, the studs traverse the arc and move the valve rod longitudinally. Variation in the throw of the valve is effected by adjustment of the arc.

Claim.—The arrangement of the arc e, lever D, valve rod d, crank shaft F, and oscillating cylinder A, substantially as described and for the purposes set forth.

62,875.—GEORGE OGG, Lacon, Ill.—*Harrow.*—March 12, 1867.—The parts of the quadrilateral frame are pivoted together, and the implement is regulated as to the width of tilth by means of the diagonal draft chain.

Claim.—The manner of connecting the arms with each other by the bolts B and rings D, and the arrangement and combination of the chain E passing through the ring D, by which any width of harrow desired may be readily effected.

62,876.—ISAAC E. and JOHN A. OVERPECK, Overpeck's Station, Ohio.—*Cane Stripper.*—March 12, 1867.—The handle being grasped by the right hand, the stalk is grasped by the hook and cut by the knife, which is slipped by the sleeve; a downward motion

strips the blades and the stalk is cut off by an upward pull.

Claim.—First, the double-edged knife *e*, arranged and operating in combination with hook *a*, for cutting and stripping stalks, substantially as and for the purpose described.

Second, the handle *b d* and shield *A A'*, in combination with a hook and knife, arranged substantially as specified for the purpose set forth.

62,877.—ZIBA PARKHURST, Milford, Mass.—*Machine for Removing Burrs from Wool.*—March 12, 1867.—The wool fed in by the rollers is crowded by the induction plate between the teeth of the cylinder, and any fiber projecting beyond the teeth is acted on by the combs.

Claim.—The application of the induction plate *G*, or its equivalent, to, or its combination with, the burring machine, so as to operate with the main cylinder thereof, substantially as and for the purpose specified.

Also, the combination and arrangement of one or more combs with the burring machine, so as to operate with the main cylinder thereof, substantially as and for the purpose hereinbefore explained.

Also, the application of the induction plate and combs, or either of them, to the burr box, so as to be movable therewith, as described.

62,878.—GEORGE T. PARRY, Philadelphia, Pa.—*Preventing Incrustation of Steam Boilers.*—March 12, 1867.—The electricity, generated by a jet of steam impinging upon brush points, is carried to the boiler to detach the scale and prevent the incrustation of sediment.

Claim.—First, the mode, substantially as described, of removing the scale from, and preventing the incrustation of, boilers by means of electricity generated without the boiler by jets of steam impinging upon one or more points, or equivalent means, said electricity being conducted into the boiler by suitable means.

Second, the combination of the try-cock *B* and the insulated brush of points *H*, set in the bulb *G*, or its equivalent, when connected by a suitable conductor *K* with the shell of the boiler, and arranged to operate substantially in the manner and for the purpose set forth.

62,879.—ELIAS C. PATTERSON, Rochester, N. Y.—*Rein Holder for Carriages.*—March 12, 1867.—The jaws are attached to the dash-board and clasp the reins.

Claim.—The improved rein holder, constructed substantially as described.

62,880.—H. H. PEMBER, New York, N. Y.—*Fid.*—March 12, 1867.—The fid is made in several sections adapted to form cringles of various sizes.

Claim.—The fid, consisting of a series of transversely divided sections *B*, of conical form, resting on each other, fitted on the shaft *C*, and adapted to receive the thimble between the sections relative to size, substantially as represented and described.

62,881.—DANIEL PETERS and JOHN W. PAULY, Keokuk, Iowa.—*Plow.*—March 12, 1867; antedated March 4, 1867.—The wheel has adjustable journals in a holder attached to the mold board and relieves the sole of pressure upon the ground.

Claim.—The combination of the friction wheel *H* and adjustable supporting bar *G* with the mold board *E* of the plow, when said wheel and bar are constructed and arranged substantially as herein shown and described and for the purpose set forth.

62,882.—ALBERT C. PIERSON, Rahway, N. J.—*Calculating Machine.*—March 12, 1867.—The decagonal prisms have on each face two columns of figures and are rotatable on their journals. The figures are read in connection with a movable bar or slide, and its application cannot be briefly described.

Claim.—First, in calculating machines, presenting to the eye only the columns which are wanted to compute the units, tens, &c., substantially as herein specified, when the several columns for each of the nine digits, with the blank column for the cypher, are arranged to be presented simultaneously, so that they may be read off for units, tens, hundreds, &c., and added mentally, with the ease and rapidity of adjustment and of use herein set forth.

Second, the belt or sliding calendar-column *E*, when used in combination with columns of calculated interest, or equivalent calculated columns, the quantities in which vary according to the number of days, substantially as and for the purpose herein set forth.

Third, the combination of the bar *G*, having a parallel motion, with the several columns on the rollers *B C* and *c*, with or without the column *M* or other columns, substantially as and for the purpose specified.

Fourth, the slide *I* fitted on the bar *G* and adapted to operate in combination with calculated columns so as to expose different columns according as it is moved, and allow only one to be visible for the units, one for the tens, &c., at one time, substantially as and for the purpose herein specified.

62,883.—THOMAS PLACE, Alfred Centre, N. Y.—*Machine for Boring and Temoning.*—March 12, 1867.—Pressure on the treadle draws the spoke to the hollow auger whose stock is turned by hand till arrested by the stop. For boring feloes a detachable bed is fitted on the sliding carriage. A screw clamp in the bed holds the feloe, which is moved up to the auger turned by hand as in the former case and arrested by a gauge stop.

Claim.—The sliding carriage *D*, having adjustable rack *i*, adjustable stop *n*, and elbow lever *k*, and operated by the treadle *h*, and operating substantially as described for the purpose specified.

62,884.—EBENEZER S. PURDY, Croton, N. Y.—*Cider Mill.*—March 12, 1867.—The teeth of one cylinder run in the intervals between the teeth of the other cylinder, and one at a much more rapid rate than the other, so as to grate the fruit.

Claim.—The alternate arrangement of the teeth *a a'* on the cylinders *B B'*, the teeth of one cylinder passing closely between the teeth of the other cylinder, and adapted for grating the fruit instead of crushing it, the whole being constructed, arranged, and operated in the manner and for the purpose set forth.

62,885.—EMMETT QUINN, Washington, D. C.—*Steam Gauge.*—March 12, 1867.—Improvement on his patent March 13, 1866. The gauge performs the function of indicating the pressure in a steam generator irrespective of the changes of temperature. The compound siphons occupy small space and are removable after being charged for use without liability of derangement. The claims explain the devices.

Claim.—First, the tubes inserted in plates, as described, with the channels cut therein from one tube to another, and with the cap or outer plate covering the channels and ends of the tubes, as and for the purpose described.

Second, the packing and diaphragms between the plates, with the plungers for the purpose of cutting off communication between the tubes, as described.

Third, the means provided for adjusting the mercury in the final or index tube to the zero point on the scale, or for adjusting said zero point to the mercury, in the manner described.

Fourth, the construction of the index tube by a combination of a back piece containing a groove of a suitable caliber, with a glass face cemented to or clamped thereon, in the manner substantially as described.

Fifth, the construction of channels from tube to tube of a size sufficient for the necessary operation of the gauge, but too small to allow of a rapid movement of the fluids when pressure is suddenly applied.

62,886.—LEONIDAS M. REAMY, Kokomo, Ind.—*Corn Planter.*—March 12, 1867.—Two parallel shares raise a ridge which is split by the central share, in whose rear the seed is dropped and covered by the rake following. The seed cylinder is rotated by band connection to the wheel beneath the beam.

Claim.—First, in the described combination the two ridging shares *c c'*, followed by the seed-dropping drill *E*, substantially as and for the purpose set forth.

Second, a corn-planter, consisting of two shares *c c'* making a central ridge on which to plant, combined with the drill *E* and crescent-shaped rake *H*, the whole arranged and operating substantially as set forth.

Third, in this connection, the crescent-shaped grain coverer or rake *H*.

62,887.—SAMUEL RICHARDS, Philadelphia, Pa.—*Glass Furnace.*—March 12, 1867.—The doors are in line with the benches; the width of the "tone" or space between the benches is reduced, and the pots of tapering form extend over the "tone" and expose their side surfaces to the flame. At the bottom of each pot is a strainer and a tube reaching to the exterior of the furnace.

Claim.—First, the furnace, constructed with doors and of the width described, in combination with the tapering pots, the whole arranged and operating in the manner and for the purpose substantially as described.

Second, constructing refining pots with the projection *b*, with or without the strainer *c*, in the manner and for the purpose substantially as shown and described.

62,888.—JOSIAH S. RICKEL, Geneseo, Ill.—*Corn Planter.*—March 12, 1867.—A seed box is suspended from the beam of the single shovel plow and its discharge slide is operated by the handles as the plow moves across the check row.

Claim.—The seed slide *G*, placed within a chamber *c* in the tube *F*, having a hole *d* made through it and operated by the levers or hands *E E*, in combination with the fixed partition *H* provided with the elastic projection *i* and flap *I*, and the recess *e* with a glass *f* at its outer side, all arranged substantially as and for the purpose set forth.

62,889.—LOUIS S. ROBBINS, New York, N. Y.—*Construction of Dikes and Leves.*—March 12, 1867. The upright planks are driven in connection with guide clamps; have removable caps to keep them in line while being driven, and when built in a trench have longitudinal timbers at their feet within the embankment.

Claim.—First, the employment of a removable cap *D*, substantially as and for the purpose herein shown and described.

Second, the employment of a guiding clamp *E*, or its equivalent, in one or more parts, substantially as shown and described.

Third, the combination of one or more longitudinal timbers with the lower portions of the upright planks or timbers, substantially as and for the purpose herein shown and described.

62,890.—EDWARD A. L. ROBERTS, Titusville, Pa.—*Torpedo for Oil Wells.*—March 12, 1867.—Improvement on his patent, No. 59,936. A powder chamber is surrounded by nitro-glycerine and a quickmatch passes from the powder to the priming chamber, which communicates through a tube with the fulminate, which is exploded by a hammer.

Claim.—First, the combination of the quickmatch *F* with the priming chamber *H H*, for the purposes set forth.

Second, the torpedo with the priming chamber, in combination with the quickmatch, substantially as and for the purposes set forth.

62,891.—EZRA M. ROBARDS, Avoca, N. Y.—*Driving Well Tubes.*—March 12, 1867.—The plug of zinc or soft metal in the cap protects the screw threads which would be bruised by the contact of iron with iron in the process of driving.

Claim.—The metallic cap or cap *C*, provided with a block or plug of zinc *e*, or its equivalent, substantially in the manner and for the purpose as herein set forth.

62,892.—E. A. G. ROULSTONE, Roxbury, Mass.—*Traveling Bag.*—March 12, 1867.—The edge of the leather is laid in a groove of the frame and confined therein by a strip of metal and rivets which pass through each portion.

Claim.—The construction of the frame, with the groove or recess *e'* to receive the edge of the leather or cloth body *b*, and the confining strip *d*, all being formed, arranged, and connected together, substantially as set forth.

62,893.—JOSEPH RYAN, St. Louis, Mo.—*Fluid Ejector.*—March 12, 1867; antedated February 27, 1867.—A liquid packing around the joints prevents the leakage of air into the chamber and the consequent

vitiating of the partial vacuum caused by the condensation of steam. The water raised is discharged against pressure of the atmosphere by a body of air associated with the steam and expanded by receiving a part of the heat of the latter. While drawing from a single supply the discharge may be at several pipes.

Claim.—First, the method of economizing the heat produced by the condensation of steam in a siphon by application thereof to one or more air currents, then caused to act in combination with the steam current or currents upon the fluid to be raised, substantially as set forth.

Second, the arrangement of the tube *F²*, its feed of steam and stop-cock, or their equivalents, with the tube *f²*, its feed of air or throttle valve, or equivalents, in such a manner that the steam current shall impart to the air current velocity and heat, and bring said air current in acting contact with the water to be discharged, thus avoiding greater loss of power by condensation which would ensue if steam alone were used, substantially as set forth.

Third, the tube *F²*, arranged to utilize the expansion of steam by widening the inner diameter thereof, substantially as set forth.

Fourth, the globes or other increases of surfaces of the air feed tube *f²*, thus favoring an expansive action of air, substantially as set forth.

Fifth, the combination of the supply pipe *g¹*, the steam chamber *G*, stop-cock *g*, and feed pipes starting from *G*, for the purposes described.

Sixth, the arrangement and combination of the chambers *F*, the bulbs *E*, with the necks *A²* and the bulbs *C* and *D*, when used as set forth.

Seventh, the arrangement for packing the valve rods to effect the perfect exclusion of air from the vacuum, the same consisting of a stuffing box, arrangement *e¹* and *e²*, (Fig. 4.) and this surrounded by a liquid, usually water, as in *e²*, and this backed by a second stuffing-box, as in *e³* and *e⁴*, or any equivalent arrangement which uses a liquid to prevent the egress and ingress of air, in combination with some mechanical stuffing-box contrivance to prevent the leakage of the air-checking fluid.

Eighth, the combination of the male and female screw parts *c* and *c'* of the valve stem *c* with the pin *c''*, worm wheel *c³*, worm shaft *c⁴*, and hand wheel *c⁵*, as and for the purposes set forth.

Ninth, the joint of the pipe *D* with the root piece *D¹* by means of a flange *d¹* and lead cement, or equivalents, filling the space surrounding *d¹* of *D¹*, substantially as described.

Tenth, the valve ball *b²*, when arranged of an inner wooden kernel and coated with vulcanized rubber, or its equivalent, as set forth.

Eleventh, the combination of the bulb *B*, diaphragm plate *b¹*, and drop valve *b²*, as and for the purpose set forth.

62,894.—GEO. SAVAGE, JR., Bangor, Me.—*Planking Screw.*—March 12, 1867.—The fulcrum point of the lever is dogged to the rib, and while one end is propped against the rib the other has a clamping screw which brings in the plank to the shape of the frame. The lever slips in the clevis and the prop upon the rib to adjust the screw in the required position.

Claim.—First, the planking screw, consisting of lever *D* with the prop or fulcrum *E*, screw *F*, and dogs *d d*, attached to lever *D* by the clevis *G*, or its equivalent, all arranged to operate in manner substantially as described and shown.

Second, the rollers *a a* in fulcrum *E* in combination with sliding clevis *G*, whereby to allow the adjustment of screw *F*, substantially in manner as and for the purposes specified.

62,895.—DAVID SMITH, Hartfield, N. Y.—*Wash Board.*—March 12, 1867.—A pressure board is hinged to the upper side of the bottom of the washboard and is operated by a lever squeezing the clothes between it and the washboard. One or more hard rubbers are mounted at one end on rods attached to either side of the washboard.

Claim.—The combination of the hinged pressure board and lever *C e*, hand rubber or rubbers *f*, and rod or rods *g*, with the washboard *A*, arranged and operating substantially as and for the purposes described.

62,896.—JAMES SMITH and SAMUEL C. BROWN, Richmond, Ind.—*Stove Damper*.—March 12, 1867.—A section of pipe is extended into the stove and has a bell-shaped deflector adjustable vertically to act as a damper.

Claim.—First, a conical or bell-shaped damper, constructed and applied substantially in the manner set forth.

Second, the internal pipe A when provided with a damper and arranged substantially as described and for the purpose set forth.

62,897.—OLIVER SNOW, West Meriden, Conn., assignor to MERIDEN MANUFACTURING COMPANY, same place.—*Punching Machine*.—March 12, 1867.—The wrist of the driving shaft is eccentrically journaled in a revoluble box of the punch shaft. A flange on this box has circumferential projections that enter indentations of the punch shaft. To regulate the downward movement of the punch the box may be drawn forward to release the projections when it is turned partially around and returned to place.

Claim.—The combination of the wrist box D, adjustable center piece E, and endless screw I, operating substantially in the manner and for the purpose specified.

62,898.—ALEXANDER F. and THOS. M. STANSBURY, Lewistown, Ill.—*Cultivator*.—March 12, 1867.

—The power is applied to the rear of the cultivator by draft rods from the singletrees passing through closed staples which are pendant from a doubletree in the usual position to a doubletree in the rear, which is attached to the rectangular frame by two straps. The shovels are secured by bolts to iron bearers behind them.

Claim.—The slotted shoe or bearer F, the doubletrees K and G, the clevis bars H, draft rods I, and pendant staples J, all substantially as and for the uses and purposes hereinbefore set forth.

62,899.—C. B. STANTON, Scott, N. Y.—*Churn*.—March 12, 1867.—The central horizontal shaft and outer spiral frame revolving in contrary directions have radial projections which pass through the intervals between each other.

Claim.—The churn box A, with the eccentric frame *s s c e* and teeth *m*, the shaft W, with its arms *t t t*, operated by the wheels B *yx* and *d*, when constructed and used in the manner substantially as specified.

62,900.—WM. H. STARTZMAN, Big Lick, Va.—*Attaching Hoes to their Handles*.—March 12, 1867.—The handle is attached in the wedge-shaped eye of the hoe by a pole plate held by nuts and bolts.

Claim.—Attaching the handle C, having its lower end wedge-shaped, to the hoe A by means of the wedge-shaped eye B, tongued cap D, nut E, and bolts and nuts F and G, as herein shown and described.

62,901.—ABRAHAM STEERS, New York, N. Y., assignor to himself, HENRY L. ELDER, and S. H. KENNEDY, Philadelphia, Pa.—*Apparatus for Making Extracts*.—March 12, 1867.—The revolving brush cleans the steam coil. The floating rake breaks the scum on the surface of the liquid to allow the vapors to escape.

Claim.—First, the revolving brush F, in combination with the still A and coil C, constructed and operating substantially as and for the purpose described.

Second, the floating rake G, in combination with the still A, constructed and operating substantially as and for the purpose set forth.

62,902.—JAMES STEWART, Bangor, Me.—*Hawse Pipe Stopper*.—March 12, 1867.—Two pivoted plates inside the hawse hole have indentations to fit the chain cable, to prevent the passage of water through the hawse hole onto the deck.

Claim.—The plates *a a*, in combination with hawse pipe B, when arranged to operate in the manner substantially as described and shown.

62,903.—JAMES STEWART, Bangor, Me.—*Revolving Table*.—March 12, 1867.—The table and desk revolve independently. The former revolves round the pillar when the detent catch is released by pressure on the pedal. The desk turns on a pivot on the top of the pillar.

Claim.—The combination of table A, desk D, and arm k, in manner substantially as shown and specified.

62,904.—SVAN SWANSON, Swede Point, Iowa.—*Harrow*.—March 12, 1867.—The rollers have slightly curved teeth and their journals have their bearings at the lower edges of the frame. The latter is rounded at the forward ends of the side pieces, so that by turning it over it can be drawn like a sleigh, keeping the teeth from contact with the ground.

Claim.—The frame *a*, carrying the toothed rollers B B B, adapted to be reversed and drawn along the surface of the ground by the top side becoming the bottom, in the manner and for the purpose specified.

62,905.—HENRY SWARTHOUT, Altay, N. Y.—*Churn Power*.—March 12, 1867.—The driving wheel has rollers and an adjustable lever by which the position of the wheel is changed according to the direction and character of the power attached. A lever and weight binding on the upper roller balances the driving wheel.

Claim.—First, the arrangement of the roller E, lever F, and pivot box C, when applied and used as specified, and for the purpose of changing the inclination of the wheel H, as set forth.

Second, roller I, lever J, and weight K, when made and applied as and for the purpose herein specified.

62,906.—JOSEPH W. THORP, Sanbornton Bridge, N. H.—*Ironing Machine*.—March 12, 1867.—By a succession of levers and slides attached to a tailor's goose, sufficient pressure is obtained by action on the handle at the end of the front lever, which is so arranged that while at rest the goose is raised from the cloth.

Claim.—The compound levers *e h g*, provided with handle *d*, the end of the levers *e*, being pivoted to bar *c*, which is connected to swinging arm D by a swivel joint, and the end of levers *g g* being connected to the guides *a a*, which slide in sleeves *b b*, in combination with the iron E, the whole operating substantially as described and for the purpose specified.

62,907.—GEORGE W. TOLHURST, New York, N. Y.—*Boot and Shoe*.—March 12, 1867.—The counter, heel shank, and side strips are molded in one piece of malleable metal, and the counter and side strips are provided at their top edge with two serrated flanges, which, closing on the leather upper, make a watertight connection.

Claim.—The counter D, heel E, shank F, and slide-flanged strips G, made of one piece of metal, in the manner described, for the purpose specified.

62,908.—ALBERT W. UPTON, Lowell, Mass.—*Knob Latch for Doors*.—March 12, 1867.—The latch is withdrawn by the pressure of the horns of the tumbler against the inclines on the rear end of the latch bolt by an end motion of the tumbler spindle, or by the turning of the handle bringing the horns of the tumbler against a catch at the rear of said inclines. A spiral spring acting against the shoulder of the latch bolt throws it back to its former position.

Claim.—The combination of the inclines *a a* and the projections *c c* on the rear end of the latch bolt B, and the horns *e e* on the tumbler A, with the sliding arbor and knobs, the whole arranged to operate substantially as and for the purpose set forth.

62,909.—C. W. WAILEY, New Orleans, La.—*Life-preserving Raft*.—March 12, 1867.—The barrels are clamped in a frame which has gains to hold the chime.

Claim.—A life-preserving raft, embracing the combination of the bars A A A with the cross-pieces B B B, &c., (so grooved as to receive the chime of a barrel), and mortises *a a a*. The slats D D D, with pin holes and pins, the ropes *f f*, the bolts C C C C, with hand nuts *d d d d*, and the barrels E E E E, all arranged and constructed as specified, for the purpose hereinbefore set forth.

62,910.—W. S. WHEELER and S. E. BICKFORD, Franklin, N. H., assignors to S. E. BICKFORD and F. FLANDERS, same place.—*Miter Box*.—March 12, 1867.—The saw guides are pivoted to a frame so as to allow a vertical inclination, and this frame is so pivoted to the standard as to permit adjustment in a

horizontal plane. Scale disks and pointers indicate the inclination in each case.

Claim.—First, the guide frame E, so hung and pivoted to a standard A, that it can be swung around an axis vertical to the work, and also inclined to the said vertical axis, whereby the proper direction can be given to the saw to cut a miter or a bevel, or both simultaneously, substantially as set forth.

Second, providing the frame E with an index or indices for fixing or adjusting its position around its vertical axis or at the required inclination for a miter or a bevel, in combination with a suitable clamp or clamps, or equivalent mechanical device for locking it, when adjusted substantially as set forth.

62,911.—JOHN WILEY, 2d, South Reading, Mass.—*Car Starter and Brake.*—March 12, 1867.—Underneath the body of the car is a slide, the slotted end of which encloses a friction wheel fixed on the axle, the other end playing in a spiral spring. By a lever and cams operated by chains below, one or the other side of the slotted slide is pressed against the friction wheel, so that the momentum of the car may be accumulated in the spring, and expended to start the car when released.

Claim.—The slide E, provided with the oblong opening a and cylindrical projection b, working through the cross-bar c, spring F, wheel D, upon the axle C, treadle K, eccentrics I I, sliding bar H, chain e, and windlass G, when all are constructed and arranged to operate as herein set forth, for the purpose specified.

62,912.—JOHN H. WILLIAMS, Somerville, N. J.—*Car Brake.*—March 12, 1867.—The brakes are applied by a spring acting on a lever and connecting rods. The brakes are released by means of a hand wheel, shaft, ratchet wheel, and pawl similar to those usual for putting on the brakes. The pawl is withdrawn by drawing a cord in reach of the engineer.

Claim.—First, the drum I, lever K, spring T, chains H, J and N, when all are constructed and arranged as herein set forth, for the purpose specified. Second, the arrangement of the lever e, connecting chains or wires d, and horizontal swinging arm g, in combination with the pawl W, substantially as described, for the purpose specified.

Third, the foot lever y, connected with the brake chain, and arranged substantially as and for the purpose described.

62,913.—ORIN O. WITHERELL, Plaistow, N. H., assignor to himself and J. B. BRACKETT, Lewiston, Me.—*Pen Holder.*—March 12, 1867.—The ink retainer is made adjustable to prevent clogging, and is readily cleaned without removal from the holder.

Claim.—The application of the tongue or ink retainer to the pen and its carrier in manner so that the said retainer may be movable and adjustable with respect to the nib of the pen, as set forth.

Also, the construction of the pen carrier with the depression or notch a and the two terminal slots b b, arranged together and in it, and for the reception and holding of an ink retainer to operate with the pen, as specified.

62,914.—RICHARD WOODCOCK, Joliet, Ill.—*Tile and Pipe Machine.*—March 12, 1867.—The core is attached to a self-revolving core shaft in the hollow main shaft, by which the core is securely held in position. The receiver is a half cylinder of proportions corresponding to the size of the tile, and is also used to carry the tile and place it in position to dry.

Claim.—First, the self-revolving core shaft c in the hollow main shaft b.

Second, the receiver i, answering the double purpose of receiving the tile from the mill and handling the same while in a green state.

Third, a combination of the self-revolving core shaft c, the main shaft b, and the receiver i, when used and operating substantially as described.

62,915.—D. WRIGHT and W. A. KIRBY, Auburn, N. Y.—*Coal Scuttle.*—March 12, 1867.—The movable lip on the mouth of the scuttle is confined to its position by a pivot running in an elongated slot at its lower extremity and by a catch sliding into an open slot above. By pressing a spur, which is attached to the lower part of the lip, against the grate or furnace,

the lip may be raised till the catch leaves the upper slot and the lip falls and forms a chute for the coals.

Claim.—First, the use of a lip or flap as a part of the coal scuttle and in front thereof, so that the coal may be discharged through an aperture, the bottom of which shall be at a level sufficiently below that of the upper edge of the scuttle, substantially in the manner described.

Second, the manner of affixing the said lip to the scuttle, substantially as above described.

62,916.—JOHN ALLEN, New York, N. Y.—*Applying Medicines and Remedial Agents and Apparatus Therefor.*—March 12, 1867.—The air-tight box chamber has a hood to enclose the head of the patient and is connected with a boiler or retort heated by a lamp. The retort is filled with a solution of corrosive sublimate and iodide of potassium, the vapor of which passes into the chamber.

Claim.—First, the peculiar construction and arrangement of the apparatus for administering vapor baths, substantially as hereinbefore described and for the purposes set forth.

Second, the peculiar construction and arrangement of the bath armor No. 1, the frame, flexible, impervious casings and hood, and the armor No. 2, body and hood or head box, with glass front and thermometer, substantially as hereinbefore described, and for the purpose set forth.

Third, the flexible supply and escape pipes, combined and arranged with the apparatus, substantially as described and for the purposes mentioned.

Fourth, the gasoline stove, or other suitable device, the heat of which can be readily graduated, in combination with a boiler or retort for generating vapors for vapor baths, substantially as described.

Fifth, the combination and arrangement of the cup, with water in it, lamp and plate, constituting the sulphur vaporizing apparatus, substantially as described and for the purposes stated.

Sixth, the introduction into a boiler or retort of medicines which are soluble in water, or which may be vaporized by a moderate degree of heat, particularly the perchloride of mercury, (otherwise known as corrosive sublimate,) and iodide of potassium, together or separately, and their compounds or equivalents for converting them into vapor, substantially as hereinbefore described and for the purposes set forth.

62,917.—W. L. AINSWORTH and A. D. WRIGHT, Lowell, Mass.—*Stop Motion for Feeding Mechanism of Carding Engines.*—March 19, 1867.—When a sliver breaks it falls in its traverse to tilt as usual the trimmed lever, whose heavier end is then permitted to fall, bringing its opposite arm in position to be acted upon by a projection of the carriage, and to push the slide and disengage the shipping lever from its notch. The spring is then free to disengage the gears, and so stop the feed.

Claim.—The peculiar stop motion or mechanism for effecting the disengagement of the bevel gears s and x; and also the combination of such a stop motion, or its equivalent, and the laying and feeding mechanism, as described.

Also, the combination of the alarm apparatus, or its equivalent, with the stop motion and the laying and feeding mechanism, applied to or making a part of a carding engine, as described, the whole being substantially as and for operation in manner and for the object or purposes as hereinbefore explained.

62,918.—J. LAMBERT ASAY, Philadelphia, Pa.—*Staple for Artificial Teeth.*—March 19, 1867.—Staples of platinum have the ends embedded in the plastic teeth, which are then baked. The gum, prior to vulcanizing, is forced between the curves of the staples in the rear of the teeth.

Claim.—The use of staples a, with their bent portions projecting from the teeth, as a means of securing the latter to a vulcanizable gum attached to a metal plate, as and for the purpose herein set forth.

62,919.—D. ASHWORTH and R. B. EATON, Woburn, Mass.—*Concentrating Sulphuric Acid.*—March 19, 1867; antedated March 12, 1867.—The series of glass retorts situated over the furnace communicate directly with each other. The upper are connected with the pan from which the acid flows, and from

thence it finds its way successively into each one of the series.

Claim.—Condensing or rectifying oil of vitriol by passing the same through a series of glass retorts, in combination with a heating apparatus, substantially as described.

Second, the combination of a series of glass retorts G with the pan E and furnace A, substantially as and for the purpose specified.

62,920.—HENRY BAILEY, New York, N. Y.—*Steam Engine.*—March 19, 1867.—An extension of the cylinder, formed as required, encloses the connecting rod and crank.

Claim.—First, the combination, with the cylinder and its piston, of the steam or water-tight box or chambered cylinder head, pitman, and revolving crank, all arranged for operation within said head in open communication with the cylinder, substantially as specified.

Second, the chambered cylinder head H, constructed with its internal form corresponding to the course described by the pitman in its action, substantially as shown and described.

62,921.—S. R. and G. W. BALLARD, Coldwater, Mich.—*Carding Engine.*—March 19, 1867.—This machine cards rolls in continuous lengths for hand spinning. The tubes have removable tips, with varying bores to suit different sizes of yarn. The tubes are driven by a single belt, which passes alternately above and below them in the series.

Claim.—First, the rotating tubes *a a a*, having removable tips or points *h*, when the same are constructed and operated as described, for the purpose specified.

Second, we claim the arrangement of driving pulley *d*, single belt *E*, friction-roller belt tightener *r*, and a series of rotating tubes *a a a*, in combination with worm gear *s t*, heart cam *q*, finger *o*, lever and slide *L l*, for moving the guide frame *K*, as described, for the purposes specified.

62,922.—WILLIAM BAUSTIAN, Davenport, Iowa.—*Manufacture of Friction Matches.*—March 19, 1867; antedated March 11, 1867.—The matches are tipped with a composition of glue, 34 lbs., boiled in 4 quarts of water; to which are added, phosphorus, 24 lbs.; white zinc, 24 lbs.; Paris white, 24 lbs.; lampblack, 24 oz.; rosin, 4 lb., primarily dissolved in 1 quart of alcohol; and sulphur, 4 lb.

Claim.—The composition wherein the matches are dipped, as hereinbefore described.

62,923.—ALBERT B. BEAN, New Haven, Conn.—*Machine for Making Nuts.*—March 19, 1867.—One of the dies is upon a hinged support, so that it may be swung out of its working position to afford access to itself and the other dies.

Claim.—The crowner *T*, in combination with the punch *L* and die *A*, and hinged holder *U*, substantially as and for the purpose set forth.

62,924.—WILLIAM BIRCH, Cincinnati, Ohio, assignor to himself and THOMAS BIRCH.—*Steam-engine Slide Valve.*—March 19, 1867.—The sectional packing rings are so arranged that the joints of one are overlapped and closed by the other. An inwardly-opening valve in the balance plate, beneath the oil cup, admits oil and air on occasion of a partial vacuum in the steam chest. Steam is admitted beneath the packing rings to force them to their seat in the chest cap, and spiral springs are also placed beneath them.

Claim.—First, in the rectangular or square frame, the arrangement of the straight and angular packing strips, to be expanded by steam, in the manner described.

Second, the valve in the packing frame, to admit oil to the steam or valve chest, and also to admit air to prevent a vacuum in the cylinder and steam pipe.

62,925.—JOHN A. BLAKE, New Haven, Conn., assignor to BLAKE BROTHERS, same place.—*Ink-well Cover.*—March 19, 1867.—The pintle is formed on the cover, and a hooked shank is placed over the pintle to complete the hinge.

Claim.—The combination of the cover *C* and the shank *D*, when hinged together by a hook formed

upon the one and a corresponding bar on the other, substantially in the manner herein set forth.

62,926.—R. BOEKLEN, Brooklyn, N. Y.—*Explosive Torpedoes in Oil Wells.*—March 19, 1867.—Two insulated wires are carried into the torpedo, and their ends connected by a fine platinum wire, so that when the circuit is completed through the wires the heating of the platinum explodes the torpedo. Several torpedoes may be simultaneously discharged by a similar device to each, the whole having common wires of connection to the battery.

Claim.—The application of two or more torpedoes in an oil well, the same being connected together and exploded simultaneously by one continuous electric current, substantially as and for the purposes herein described.

62,927.—WILLIAM R. BRADFORD, Charlestown, Mass.—*Cover for Kilns of Sugar Refineries.*—March 19, 1867.—The fire brick or soapstone is held by a band of iron cast around it. The fire-resisting mineral is dovetailed into the metallic cover, which it preserves from the heat of the kiln.

Claim.—The construction or formation of a kiln cover by casting the metal upon a fire brick or bricks, or other similar material, and so as to secure the metal and brick together, substantially as set forth.

62,928.—JOHN E. BRASTOW and E. K. INGOLDSBY, Van Buren Centre, N. Y.—*Railroad Pick.*—March 19, 1867.—The strap is bent over the mortised end of the handle, and fastened to it by bolts. The pick is inserted through perforations in the strap corresponding to the mortise, and is secured by a wedge, the strap forming a head for the pick and a guard for the protection of the handle.

Claim.—Attaching the pick to its handle by forming a head of the strap *C*, constructed and applied substantially as and for the purposes herein set forth.

62,929.—S. J. BRIDGE and A. M. CRAIG, Portage City, Wis.—*Water Wheel.*—March 19, 1867.—The turbine wheel has a series of deflecting guides on its upper surface, spiral buckets on its periphery, and a central air chamber beneath.

Claim.—A water wheel, having spiral buckets *b* and the tangential guides *a*, combined and arranged substantially as shown and described.

62,930.—GEORGE M. BRIGGS, Boston, N. Y.—*Wool Press.*—March 19, 1867.—The table has folding leaves and a head, moved by a rope and crank, to compress the fleece into the box at one end. Six balls furnish twine to tie the fleece, and are placed in separate receptacles beneath the table.

Claim.—The separate twine receptacles *1 2 3 4 5 6* and corresponding grooves *a a a* and *b b b*, when combined and arranged with the stationary bed *A A*, fixed compressing box *D D*, and the follower *E*, substantially in the manner and for the purposes described.

62,931.—GEORGE BRILL, Philadelphia, Pa.—*Axle Box.*—March 19, 1867.—The sliding door is held by side grooves of the box, and has an edge groove to hold a packing strip. It is kept down by the collar of a screw which enters a groove of the box. The serow has a section cut away on one side, which, being turned to the groove, the slide may be withdrawn.

Claim.—First, the sliding door *F*, and pin *H* with its collar *h*, the whole being constructed and adapted to an axle box, substantially as and for the purpose herein set forth.

Second, the ribs *y y* and lip *z*, arranged on the box for the retention of the door, as set forth.

Third, the packing strip *G*, adapted to the door and box, as described, for the purpose specified.

62,932.—CHARLES R. BRYANT, Frankfurt, N. Y., assignor to CALVIN EATON, Webster, N. Y.—*Extension Ladder.*—March 19, 1867.—The extension rope revolves round a pulley, while the retractor connects directly with the windlass; this obviates the difficulty from contraction of the rope from moisture, the retractor being left sufficiently slack for any variation.

Claim.—In combination with the extension ladder *A* and *B*, the rope *D* and retracting rope *C*, arranged

and operating substantially in the manner shown and described and for the purposes set forth.

62,933.—JOSEPH H. BUCKLEY, New Haven, Conn.—*Hydrant*.—March 19, 1867.—The valve seat has a leather ring held by an annular nut. A waste pipe is stopped by an additional valve when the main valve is open, but allows the escape of water when it is closed.

Claim.—The combination of the valve C, having its seat formed and packed in the manner described, with the chamber B provided with waste passage or passages I, and with the cone *f* on the valve rod, when the said passage or passages I are united or arranged so as to form a central support for the valve rod, substantially as herein set forth.

62,934.—G. W. BUSS, Boston, Mass.—*Car Spring*.—March 19, 1867.—Improvement on his patent October 28, 1862. An open metallic box is attached to the under surface of the carriage, and has bearings in its side plates for a fulcrum pin, on which hangs a lever connected at its free end with the truck or journal boxes of the carriage. The lever presses on a spring enclosed in the box beneath the carriage.

Claim.—As a new article of manufacture a spring for railway and other carriages, made up of the following combined devices, namely: an open metal box, a lever hung upon a fulcrum in one end of the box, and having its free end projecting out from the opposite end of the box for connection with the truck, and a spring interposed between the lever and the roof of the box, the box serving as a bearing for the fulcrum pin, as a means of connection between and support of the spring and lever, and as a means of applying the spring, lever, and fulcrum to the body of the carriage, the whole being arranged to operate substantially as set forth.

62,935.—HARVEY L. BYRD, Baltimore, Md.—*Kindling Arrangement for Stoves*.—March 19, 1867.—The basket to contain kindlings is hinged beneath the grate, and when elevated in front is in a proper position for the ignition of the fire.

Claim.—A kindling basket beneath the stove grate or furnace grate, substantially as described.

62,936.—JOHN CA FLISCH, Union Mills, Pa.—*Composition for Roofing, Covering Wood, &c.*—March 19, 1867.—Raw coal tar is added to partially slacked lime, and incorporated by stirring. To this is added for roofing purposes sand or clay equal to half the bulk of the other materials. For painting purposes it is liquefied by the addition of varnish.

Claim.—First, the combination of lime with coal tar, in the manner substantially as and for the purpose herein shown.

Second, the composition of coal tar, sand, quicksand, or clay and lime, substantially as and for the purpose herein described.

62,937.—J. B. CAMPBELL, Cincinnati, Ohio.—*Apparatus for Regulating Draft in Steamboat and other Chimneys*.—March 19, 1867.—To the enlarged end of the horizontal smoke pipe are appended wings, which are actuated by side and stern winds, so as to keep a passage open.

Claim.—First, the enlarged end of the smoke pipe B, provided with the wings E E, and with the curbs D D, constructed and used in the manner above described.

Second, the wings E E, hinged and adapted to the purpose described.

62,938.—NATHAN S. CLEMENT, New Britain, Conn.—*Awl Handle*.—March 19, 1867.—The nut is larger at either end than in the middle, and has radiating projections, which fit recesses in the handle. It is of type metal, and cast in place around the screw stem.

Claim.—As a new article of manufacture the awl handle herein described, having a tapering head B, or a movable stem operated by a nut c, locked in the cover C, by being headed or enlarged to match the recesses provided in said cover, as herein set forth.

62,939.—JOHN H. COOPER, Philadelphia, Pa., assignor to E. J. SPANGLER, W. E. LOCKWOOD, and E. D. LOCKWOOD, same place.—*Envelope Machine*.—

March 19, 1867.—Improvement on the patent of S. E. Pettet, March 23, 1859. The paper is fed from the roll, passes between rollers, makes a loose, downward fold, then passes over rollers to the intermittent drawing rollers, where it is acted on by the knives of the cross-head, being automatically guided by lateral spring plates. The blade makes the curved cut, and the folding blade pushes the blank between the folding rolls, other knives making the incisions and removing the superfluous side pieces, succeeded by gumming and folding devices. The cutting and folding blades are arranged only a short distance apart from each other, and on the same cross-head, and perform their respective duties during one motion of the latter.

Claim.—First, knives attached to one cross-head or plate E, and so arranged as to cut or sever the strip of paper at several points simultaneously, substantially in the manner described, during one movement of the said cross-head.

Second, the combination of the said cross-head, its knives, the blade 3 and folding rollers T and T', so that the paper may be cut and folded during one movement of the cross-head.

Third, the stationary arm H, projecting through an opening in the cross-head E, and carrying rollers I, in combination with the rollers J.

Fourth, the combination of the intermittingly-revolving drawing rollers I and J, with the continuously-revolving feed rollers P and Q, the whole being arranged to act on the paper, as set forth.

Fifth, the system of rods $\alpha \alpha'$ and α'' , arranged for maintaining the paper in contact with the table, and imparting proper tension to the paper.

Sixth, the guiding plates *v* and *v'*, connected together by the system of levers herein described, or the equivalents to the same, and arranged for the proper guidance of the paper in a central course, substantially as described.

62,940.—EDMUND L. COUNTISS, Philadelphia, Pa.—*Car Brake Shoe*.—March 19, 1867.—The shoe holder has a central cavity and a catch on the upper side for the lugs of the shoe. The shoe has a square central stop and lugs on each end, and can be reversed when one end is worn.

Claim.—The combination of the shoe with the catches *c c* and the square-headed lug *d*, attached together with the receiver *b*, shaped as shown, with its slotted hole *l*, socket *g*, with its flanges and the double inclined groove, constructed and arranged in the manner described.

62,941.—C. O. CROSBY, New Haven, Conn., assignor to himself and H. KELLOGG, same place.—*Soldering Iron*.—March 19, 1867.—The body is made of cast iron, and has a dovetailed socket into which the shank of the copper is expanded by driving, so as to be retained therein; the point is afterward finished.

Claim.—The body A and point B, when constructed and united by the enlargement of the point within the body, substantially as herein described.

62,942.—FRANCIS CURTIS, Anburdale, Mass., assignor to himself and WILLIAM RUSSELL and SON, Lawrence, Mass.—*Screen Plate for Paper Machinery*.—March 19, 1867.—The material is lasting, forms no burr on the edges of the slots, and resists the action of chemicals.

Claim.—A screen plate for paper machinery, constructed of the material known as hard rubber.

62,943.—WILLIAM DERWENT, Jr., Rockford, Ill.—*Flour Bolt*.—March 19, 1867.—A short return conveyer is inserted between the main conveyer and the lower bolt reel for the purpose of rebolting so much of the meal as is conveyed.

Claim.—The short conveyer interposed between the upper and lower bolts, substantially as and for the purpose set forth.

62,944.—Canceled.

62,945.—PATRICK V. DUNN, Calamus, Wis.—*Holding Edged Tools on Grindstones*.—March 19, 1867.—An additional frame is erected upon the frame of the grindstone, and serves as a guide for clamps, which hold edge tools and scythes to be ground,

The tools are held to the stone by means of a lever and weight, which serve also as a regulator of the pressure to be applied to the tool upon the stone.

Claim.—First, the combination and arrangement of the frame C C C, the clamp D and the scythe device E, substantially as described, for the purposes specified.

Second, the combination of the weight I, lever J and wheel K, as described, for the purposes specified.

62,946.—ROBERT N. EAGLE, Washington, D. C.—*Hopple for Horses.*—March 19, 1867.—Improvement on his patent April 7, 1863. The bands are connected by flexible loops, which slip upon each other as the animal walks, and do not revolve the band upon the leg.

Claim.—A hopple, in which the leg bands are connected by loops, which slip upon each other or upon a device interposed between them or by a single loop connected more directly to another leg band, as in Figs. 5 and 6, substantially as described.

62,947.—CHARLES H. EDDY, Auburn, N. Y., assignor to himself and THEODORE J. DICKERSON, same place.—*Blind and Shutter Fastener.*—March 19, 1867.—The lever has hooks, and is pivoted to the sill so as to engage with corresponding notches on the blinds as they are closed.

Claim.—The shutter or blind fastening, composed of lever G, provided with hooks E F attached to the sill H, in combination with notches C D on the blind, to be operated substantially as and for the purpose set forth.

62,948.—JAMES E. EMERSON, Trenton, N. J.—*Saw-gumming Machine.*—March 19, 1867.—The machine is held in the hand of the operator, and has a revolving burr which cuts the saw plate to the desired shape and is guided by an adjustable handle.

Claim.—First, the thumb screws D D, arranged and operating as pivots, substantially as and for the purpose specified.

Second, the combination of the thumb screws D D and adjustable handle I, for exerting the pressure directly in line with the cutting part, substantially as described and represented.

62,949.—JAMES H. FARLEY, Lowell, Mass.—*Milk Can.*—March 19, 1867.—A metallic ring surrounds the bottom of the can and projects from its sides for the purpose of keeping the cans apart when placed in a car and make them more staunch by extending their base.

Claim.—The ring A, constructed as described, in combination with the bottom part of a milk can, substantially as described, and for the purpose herein set forth.

62,950.—JOSEPH FIRMINICH, Buffalo, N. Y.—*Apparatus for the Manufacture of Vinegar.*—March 19, 1867.—A vinegar mixture is formed of combined alcohol in the form of vapor with the wash or wort, which is slowly and continuously run through the apparatus described, where the combination takes place.

Claim.—The combination with the vessel C of the concave condensing surface N, perforated diaphragm i, and porous stratum j, with the pipe K, provided with perforated head l, constructed substantially in the manner and for the purpose set forth.

Also, in combination therewith, the tempering vessel E, constructed as described, with the pipe d and vapor generator A, arranged and operating substantially as described.

Also, the cooling vessel P, constructed as described, in combination with the water space H, arranged and operating as described.

62,951.—JOHN T. FOSTER, Jersey City, N. J.—*Peat Machine.*—March 19, 1867.—The hopper cylinder contains a series of revolving stirrers attached to a shaft which passes through a revolving plate moving in a direction opposite to that of the shaft. To the said plate are attached three slotted cylinders in the annular space between the stationary cylinder attached to the plate which supports the hopper. A stationary director is secured in the annular space between the outer slotted cylinders, directly opposite the molding tube. This director forces the peat

through the slots into the molding tube, and as the peat passes out it is cut into blocks by a reciprocating knife and deposited in a trough.

Claim.—First, the stirrer or agitator formed of vanes b b and d d, connected with a revolving shaft B, and of a convolute shape or character, inclining as they revolve to press the material downward, for operation in combination with a reversely-moving cylinder D, substantially as specified.

Second, the combination with a revolving stirrer or agitator of reversely-operating concentric cylinders, formed with oblique slots in or through their peripheries, for operation in connection with an intermediate stationary slotted cylinder, substantially as specified.

Third, the combination with the obliquely-slotted revolving outer cylinders F G and forming tube I, of the director J, substantially as shown and described.

Fourth, in combination with the forming tube I the yielding gauge L, operated by the material in its delivery, as described.

Fifth, the combination with the forming tube I and yielding gauge L of the knife M, moved forward to effect the cut by the action of the gauge through mechanism connecting it with the mill, substantially as herein set forth.

Sixth, the side guide K, in combination with the knife M and gauge L, for operation together, essentially as specified.

62,952.—JOHN T. FOSTER, Jersey City, N. J.—*Machine for Making Pastboard Boxes.*—March 19, 1867.—The reciprocating feeding bar takes a blank from the top of an automatically adjustable pile and forces it through a former, which creases, turns up the ends, and then laps them over above to form an open-ended box to hold a drawer for matches, troches, &c. The rectangular finish to the corners is given by grooved setting disks.

Claim.—First, the combination with the reciprocating feeding bar D of a former, so constructed as that, in the one motion of the bar, the blank is creased and bent over the same, and its one edge or end made to overlap the other, substantially as specified.

Second, the combination with the reciprocating feeding bar D and former, operating as described, of setting disks or wheels arranged to act on the bent edges of the box or case, as it is delivered from the former, essentially as herein set forth.

62,953.—JOHN HAFER, Bedford, Pa.—*Steam Generator.*—March 19, 1867.—In the interior flue of a vertical steam generator and over the furnace is a series of alternate cones and frustal flanges, with spaces between them, to compel the products of combustion to pass in a tortuous direction from the furnace to the smoke stack. Pipes pass through the walls of the generator for the introduction of air into the gases at different points of their progress through the flue.

Claim.—First, the combination of the cones and flanges with a steam boiler, arranged and operating substantially as and for the purpose set forth.

Second, the combination of the cones and flanges with a steam boiler, and with the tubes K, arranged and operating substantially in the manner and for the purpose set forth.

62,954.—E. HAMBURGER, Detroit, Mich.—*Caster for Furniture.*—March 19, 1867.—The zone of balls impinges upon the caster ball a little above its equator, and one at its north pole forms a rolling point of impact in that direction.

Claim.—The equatorial balls e, moving round the entire circumference of the grooved chamber d, in combination with the top ball f, operating relatively with the roller ball E, substantially as described, for the purpose specified.

62,955.—A. F. HAMMOND, Houston, Ohio.—*Garden Syringe.*—March 19, 1867.—The water is introduced while the nozzle is temporarily removed and is forcibly ejected by the pressure of the spring piston, which is actuated by a rack and the pinion on the hand-crank shaft.

Claim.—First, the arrangement of the cylinder e, spring piston d, operated by rack and pinion, substantially as described and represented.

Second, in combination with the subject-matter of

the first claim, the movable nozzle, operating as described.

62,956.—THOMAS HANVEY, Lancaster, N. Y.—*Preparing and Preserving Wood.*—March 19, 1867.—The wood is boiled in a solution of salt, saltpeter, or sulphate of copper; subsequently gas tar, petroleum, or other antiseptic substance is added, and the boiling continued until the wood is saturated therewith.

Claim.—The process of preparing wood for preservation, substantially as herein described.

62,957.—JACOB B. HOUGH, Lebanon, Ohio, assignor to himself and SAMUEL BRADEN, same place.—*Doubletree.*—March 19, 1867.—As one horse of the team advances his end of the doubletree, it rocks upon the stay block attached to the hounds of the tongue and becomes practically shortened relatively to the other end, by changing its point of draft upon the fulcrum block. The guides permit its motion in this direction, but sustain it in proper relation to the tongue.

Claim.—First, the combination of the doubletree D with the fulcrum block E and guides *a a*, constructed, arranged, and operating in the manner and for the purpose described.

Second, the stay block F, in combination with the compensating doubletree and its fulcrum block, arranged to operate conjointly with the guide rods *a a*, substantially as and for the purpose set forth.

62,958.—ROBERT L. HOWE, Westbrook, Me.—*Self-adjusting Guide Roll for Paper Mills.*—March 19, 1867.—The dry felt passes between wide rollers. When from any cause it tends to run to either side it becomes jammed slightly in the wedge-shaped space between the ends of the rollers, and thus pulls and swings the roller frame on its pivoted center, correcting its course and releasing itself from the bite of the rollers.

Claim.—The swinging base A set upon the stationary base B, as described, and having the two rollers *a b*, all constructed, arranged, and operating as set forth, and for the purposes specified.

62,959.—P. GENGEMBRE HUBERT, New York, N. Y.—*Carte de Visite Exhibitor.*—March 19, 1867.—The cards are slipped one over another and are viewed through a lens consecutively. Two cards are placed back to back between the elastic bands. The box is tilted, the lens withdrawn to focal distance, and the suspended reflector swings into position. The cards are brought forward consecutively by turning the wheel.

Claim.—First, the herein-described "revolvicon" in which cartes de visite are stored, as in figure 2, and in which they are exhibited, as in figure 1, by dropping in sight, one after the other, by their own gravitation force, arranged and operating as specified.

Second, the combination of the piece H, pins F, and wheel G, with the carte de visite J J', &c.

Third, the combination and arrangement of the leg R with the leg P' of the bottom B, to obtain the two positions of the instrument, as specified.

Fourth, the self-adjusting reflector E, arranged and operating as set forth.

62,960.—WILLIAM JANNEY, Martinsville, Ohio.—*Apparatus for Cooking and Preserving Fruit.*—March 19, 1867.—The fruit is prepared for canning in a fruit pan heated by a water bath or in a chest heated by a connecting pipe carrying steam from a boiler in the stove.

Claim.—First, the fruit pan D, in combination with vessel C, as above described and for the purpose set forth.

Second, the steam chest B, pipe F, and vessel C, in combination with fruit pan D, for the purposes above specified.

62,961.—JOHN H. KEYSER, New York, N. Y.—*Coal Burning Stove.*—March 19, 1867.—Explained by the claims and illustration.

Claim.—First, a stove which is composed of two apartments B E, one arranged below the other, with a removable open-grated fire pot F, which is provided with a grate G, said pot being suspended free from the sides of the lower cylinder B, and sustained by a cast-iron flanged ring C, which is secured permanently

to cylinder B, and which forms the base for and means of attachment of the cast-iron section D of the cylinder E, substantially as described.

Second, in combination with grates or open fire pot F, suspended within a cylinder B by means of a cap ring C, the grate G, when it is sustained independently of the fire pot, and by the cylinder B, substantially as described.

Third, the combination and relative arrangement of the air inlet passages *e*, with a suspended fire pot F, and with the two detachable cast-iron sections C D, substantially as described, and for the purpose of cooling and preventing said sections from warping.

Fourth, An open-grated fire pot F, which is suspended within the cylinder B, and combined with the removable sections D E, outlet *g*, descending flue *h*, and a damper *s*, the latter being located opposite the outlet *g*, substantially as described.

62,962.—JOHN H. KEYSER, New York, N. Y.—*Radiating Attachment for Hot-air Furnaces.*—March 19, 1867.—Explained by the claim and illustration.

Claim.—In the construction of radiators to be applied to hot-air furnaces, the arrangement of a central ascending flue *c*, passing through one or more radiating drums, and leading into the center of an upper drum, in combination with descending flues arranged around said flue *c*, and communicating with the lowermost drum and an exit pipe *g*, so that without the use of a damper the products of combustion rising from the fire chamber of the furnace shall be equally diffused throughout the said drums and pipes, substantially as described.

62,963.—W. M. KOPLIN, Newcastle, Pa.—*Machine for Making Carriage Bolts.*—March 19, 1867.—The machine cuts off a piece of the bar, grasps and points it, upsets it so as to form a square portion between the head and the thread, larger in diameter than the latter, and swages a raised head, completing the bolt blank, which is discharged by a hook.

Claim.—First, the combination, with the dies *a' b b'*, of the dies *c H*, operated as described, to form the square on the bolt.

Second, the die *c*, in combination with the swedge I on the lever F, operated as described.

62,964.—DAVID M. LAWRENCE, Washington, D. C.—*Metal Clasp for Barrel Hoops.*—March 19, 1867.—A substitute fastening for rivets. The ends of the hoop are looped inward over the bars and fitted into the bed between the shoulders before driving.

Claim.—The buckle or plate A, with its slotted or loop opening to receive the iron hoop, and with shoulders *c c*, at each end, together with the tongue or flange, substantially as set forth in the foregoing specification, and for the purposes therein indicated.

62,965.—EUGENE McDONNELL, Baltimore, Md.—*Cotton Press.*—March 19, 1867.—The power levers are pivoted to toggle arms which are hinged to the frame. They are operated by chains which pass around rollers at their lower ends and others in the frame. The follower is suspended by rods from the upper ends of the levers.

Claim.—A cotton-bale compressor provided with the following parts: fulcrum beams C C, power levers I I, toggle arms L L, lifting rods M M, rising follower E, adjustable upper bed G, and the whole driven by means of a pulley chain N and capstan P, or its equivalent, to which the power of horses may be applied, all arranged and operating substantially as and for the purpose herein specified.

Also, the combination of the fulcrum beams C C, arranged between the follower E and power levers I I, through means of the toggle arms L L and lifting arms M M, substantially as herein set forth.

Also, the adjustment of the bed G by means of the blocks or timbers H, and the means described, or the equivalent thereof, for raising and lowering the bed, substantially as described.

Also, the alternate arrangement or interweaving of the fulcrum beams C C and toggle arms L L, as specified.

62,966.—CHRISTOPHER MOEGLING, Milwaukee, Wis.—*Grinding Mill.*—March 19, 1867.—Wings are attached to the periphery of the running stone, and can be adjusted at different angles to regulate the

ventilation. A dust pipe carries off the heated air and has a receptacle for retaining the heavier particles.

Claim.—First, the adjustable wings E, in number more or less, when used upon the periphery of the rotating stone of a grain or flouring-mill for the purposes specified.

Second, the pipe g, the cover h, the elbow k, and the educting pipe I, when provided with the cap J, all combined and arranged substantially as set forth, and to operate in connection with the wings E, for the purposes specified.

62,967.—WALLACE T. MUNGER, Branford, Conn., assignor to THOMAS KENNEDY, same place.—*Attaching Door Knobs to their Shanks.*—March 19, 1867.—The filling material is inserted into a cylinder, and is forced into the handle by means of a plug and adjustable spindle, which are both worked by one handle.

Claim.—First, the combination of the cylinder A and plug C and tube I, constructed and arranged so as to receive and discharge the requisite quantity of filling substance, substantially as herein set forth.

Second, in combination with the above the adjusting spindle F, arranged to gauge the quantity of filling substance, substantially as herein set forth.

62,968.—WALLACE T. MUNGER, Branford, Conn., assignor to BRANFORD LOCK WORKS, same place.—*Adjustable Escutcheon for Night Latches.*—March 19, 1867.—The escutcheon has a cylindrical plate extending inward, which has a slot and a set screw, by which it is adjusted on the lock to accommodate it to the thickness of the door.

Claim.—The escutcheon E, in combination with a lock or latch when made adjustable thereon, substantially in the manner herein set forth.

62,969.—JOHN NESBITT, Northfield, Vt., assignor to himself and LEVI B. TYNG, Lowell, Mass.—*Steam Engine Slide Valve.*—March 19, 1867.—The packing segments of the outer side of the valve are forced against the shield plate by steam admitted beneath them. The steam is exhausted through the center of the valve.

Claim.—First, the arrangement of the valve d, with reference to the packing g g in its ends, substantially as herein described.

Second, the chamber ll over the valve d, constructed in the manner and for the purpose substantially as herein set forth.

Third, the combination and arrangement of the valve d, shield h, chamber ll, and exhaust port k, for the purpose substantially as described.

Fourth, the projections ff on the ends of the valve d, constructed in the manner and for the purpose substantially as herein described and set forth.

62,970.—J. H. PARKER, J. T. HALL, and ISAAC PIERCE, Trenton, N. Y.—*Horse Hay Fork.*—March 19, 1867.—The two independent spiral tines, having a right and a left-hand twist respectively, revolve in opposite directions in the cross-head, which is hoisted by the yoke attached thereto. A pawl engages ratchet wheels on the shanks of the tines to hold them in position while the load is being raised, and is withdrawn to free the tines and allow them to revolve and discharge their load.

Claim.—First, two spiral tines, one having a right-hand, the other a left-hand twist, and so arranged and held with relation to each other when in the hay that it will be bound and held from sliding and slipping off the tines until they are allowed to revolve at the will and pleasure of the operator.

Second, the combination and arrangement of the yoke B, cross-head A, tines C, ratchet wheels e, and pawl f, constructed, arranged, and operating in the manner herein described and for the purpose set forth.

62,971.—LEVI REPP, Tiffin, Ohio.—*Cultivator.*—March 19, 1867.—The three-beam cultivator is expandible laterally, the central portion having a hinged rear section with a shovel thereon. Pivoted clevises connect the points of the side beams to the central. The handle supports rise from the central beam.

Claim.—The construction of the central beam A of a three-beam cultivator with a jointed extension A', having a shovel applied to it, and also a spring g for

keeping it down and staying it laterally, substantially as described.

Second, pivoting the front ends of the three beams A B B to U-shaped clevis plates a a, substantially as described.

Third, the construction of the shovels m m, with narrow and wide wings, and so that they can be reversed at pleasure, substantially as described.

Fourth, in combination with the forward pivot connections of the three beams A B B the lateral extension braces C C, and still standards E, connected to beam A, in front of the joint e by a bolt e, substantially as described.

62,972.—G. B. RICH, Lafayette, Ind.—*Door for Grain Railroad Cars.*—March 19, 1867.—The shutter forms an inner door for the car, having end plates which expand by a toggle and fit closely to the jamb. It is suspended by rods from the ceiling, and is hooked up thereto when not in use.

Claim.—First, the application of the sliding joint plates p to the grain doors of railroad cars, substantially in the manner and for the purposes herein shown and described.

Second, connecting the said joint plates by means of the pivoted levers b and d, substantially as and for the purposes set forth.

Third, suspending the grain doors of railroad cars by jointed rods n, or chains, or any equivalent device, whereby they may be fastened up out of the way when not required for use.

62,973.—J. RICKARD and J. COOK, Philadelphia, Pa.—*Bed Bottom.*—March 19, 1867.—The slats rest on springs which are planted in strips whose dovetailed ends are secured in correspondingly shaped sockets on the bed rails.

Claim.—The strips b and b', having dovetailed ends adapted to dovetailed sockets d, in combination with the springs c c and slats h, substantially as described.

62,974.—BENJ. SHERWOOD and D. FITZGERALD, New York, N. Y.—*Safe.*—March 19, 1867; antedated March 12, 1867.—The interior book case may be drawn out horizontally upon the platform, in front of which is the writing desk. A burglar-proof spherical casket is arranged within the safe, and is closed by a chilled plug.

Claim.—First, the spherical fire and burglar proof casket, constructed substantially as specified.

Second, arranging the said casket within a safe or other receptacle, as set forth, which is otherwise filled by a bookcase or its equivalent, as described.

Third, constructing the safe with the opening of access on the side thereof, in combination with a bookcase inserted therein, and arranged so as to be readily withdrawn therefrom horizontally, all substantially as described.

Fourth, combining with the safe and the bookcase, as above, the platform F, or equivalent support for the bookcase when withdrawn from the safe as aforesaid.

62,975.—A. D. SMITH, Grafton, Ohio.—*Farm Gate.*—March 19, 1867.—The gate rests and moves on the top of the post, being sustained by boxing on the top rails.

Claim.—The gate A, constructed and described, in combination with the posts B C, the post B, being so arranged in relation to the gate that it forms the support fulcrum, and slide combined upon which the gate rests, slides, and turns when being opened and closed, as described.

62,976.—CHARLES SPRING, Dorchester, Mass., and ANDREW SPRING, Weston, Mass.—*Carriage for Children.*—March 19, 1867.—To allow the leading wheel to accommodate itself to a change in direction, it is connected to the frame by a vertical rotary axis in advance of the axis of the wheel, so as to compel the latter to swing in the rear of it when a deviating force is applied.

Claim.—In combination with the body, stationary axle, and two main wheels of a child's carriage, a leader wheel n, whose axis is supported in journals arranged out of line with the shaft i, substantially as shown and described.

Also, the means or mechanism for relative adjustment of the shaft i and axle m, and for changing the position of the axle, substantially as described.

Also, the arrangement of the pole so as to be capable of a vertical swinging movement, when this movement is fixed and determined, substantially as set forth.

Also, combining with the carriage body the crib box *o*, substantially as described.

62,977.—W. X. STEVENS, Worcester, Mass., assignor to J. M. and D. B. KING, Waterford, N. Y.—*Lathe for Chasing and Backing Down Taps.*—March 19, 1867.—The tool receives its "backing-down" motion through a guide bar, which also causes the tool during its feed to follow the taper or profile of the tap. The guide bar is supported on stems which rest on the lifters of a rocking shaft, actuated by a lever extending underneath the mandrel, and governed by a pattern cam, whose projections correspond in number to the depressions in the tap, as viewed in its transverse section, and known as "backing down," to give saliency to the thread by longitudinal depressions.

Claim.—First, operating the guide bar F, which regulates the taper of the tap so as to channel it longitudinally, by mechanism constructed substantially as described.

Second, the arrangement on the mandrel B of the pattern S, acting in combination with and indirectly through the lever G, rock shaft *f*, cams *e*, and guide bar F on the tool stock E for throwing back the tool, essentially as herein set forth.

Third, the combination of the pattern S on the mandrel, the lever G with its rock shaft and lifters, and the bar F, raised by the latter and acting on the lifting end of the tool stock, substantially as and for the purpose or purposes specified.

62,978.—ITHAMAR W. STUART, Jr., Charlottesville, Ind.—*Car Coupling.*—March 19, 1867.—The coupling link catches over the upwardly-projecting hook, which is grooved to admit a guard to prevent the link from accidental uncoupling. The guard is pivoted to an upright movable rod, which has also a projecting arm to lift the link out when necessary.

Claim.—First, the bumper head C, when formed with an upwardly-projecting part or hook grooved upon its inner side, substantially as herein shown and described and for the purpose set forth.

Second, the combination of the bar D, arms *d*¹ and *d*², balance guard E, chain G, and link F, with each other and with the bumper C, draft bar B, and end of the car A, substantially as herein shown and described and for the purposes set forth.

62,979.—A. F. SUMMERS and C. NYE, Peoria, Ill.—*Egg Detector.*—March 19, 1867.—The eggs are placed upright in the holes in the lid of the dark chamber, and viewed beneath through a peep hole, their quality being determined by their translucency as evinced by the transmission of light.

Claim.—The chamber A, provided with eye hole D, the adjustable screen B provided with receptacle for the eggs, reflector C, and ledge E, when all shall be constructed, combined, arranged, and operated as and for the purpose set forth and described.

62,980.—EPHRAIM THOMAS, Middleboro, Mass.—*Horseshoe-nail Machine.*—March 19, 1867.—The bed knife has a depression upon one side to correspond with the previously-rolled plate, which has a ridge upon one edge, to form the heads of the nails. The two cutting dies are arranged in such a position as to cut off the end obliquely, to give a sharp point to the nails.

Claim.—The bed knife, as made with the channel *s*, for receiving and guiding the head projection of the nail plate during its entrance into the machine.

Also, the combination of the point shear O and its fellow shear N with the dies for separating the blank from the nail plate and heading it, as described.

62,981.—THOMAS TRACY, New Britain, Conn.—*Butt Machine.*—March 19, 1867.—The mechanism relates to that part of a butt machine which performs the work of holding, distributing, and driving the wire into the joints of butts. The devices being adapted to prevent it or the driver from kinking.

Claim.—The spring button *f* and tongued bar *c*, or their equivalents, in combination with suitable mechanism for operating said bar, substantially in the manner and for the purpose as described.

62,982.—SAMUEL B. TUCKER, St. Louis, Mo.—*Instrument for Supporting Fractures.*—March 19, 1867.—This support is composed of steel plates, which are relatively adjustable by slots and set screws, and straps whose tension is regulated by buckles. The specific application to varying circumstances cannot be briefly described.

Claim.—The invention of the plates E E and the springs F F F F and G G, making, when put together, the instrument for the support of fractures of the scapula, clavicles, and vertebrae of the cervix and spine.

62,983.—THOMAS VARNEY, San Francisco, Cal.—*Machine for Concentrating Ores.*—March 19, 1867.—The pulp is passed from the hopper to the pan, which is horizontally oscillated by a cam and recoil spring. By the inclination of the disk forming the floor of the pan, the motion, and the flow of the water, the lighter and heavier particles are assembled on the respective sides of the radial strips which divide the disk into sectional compartments. The trough beyond the periphery of the disk is divided in line with the said strips, and has openings on each side of said divisions, which conduct the respective qualities, thus sorted by their relative gravities, by separate channels to their distinct receptacles, the lighter being discharged centrally to the waste pipe, and the heavier particles of one being collected in a circular series of boxes placed one below each discharge.

Claim.—First, the use of the disk A, divided into compartments.

Second, the trough B, all constructed in the manner and for the purposes set forth.

62,984.—W. Y. WARNER, Wilmington, Del.—*Car Coupling.*—March 19, 1867.—The pin has two shoulders, which limit its sliding motions in the bar, which rocks as the pin is pushed by the entering link, and swings back into coupling position. To avoid coupling, the end of the pin is supported on a shelf in the draw head.

Claim.—First, the pin D, arranged to operate within the opening *c* and recess *a* of the block A, and to slide in a cross bar F, which can turn in projections on the said block, all substantially as set forth, for the purpose specified.

Second, the shoulder *m*, arranged as a support for the pin D, substantially as specified.

62,985.—THOMAS WELCH, Churchville, N. Y.—*Harvester Cutter Bar.*—March 19, 1867.—A skeleton head is attached to the cutter bar, and contains the boxes of the pitman journal, which are adjusted and held by means of a set screw and jamb nuts.

Claim.—First, the skeleton or shell head H, constructed as described, in combination with the knife bar of harvesters, substantially as and for the purposes set forth.

Second, the arrangement of the skeleton or shell head H with the boxes B and B', pitman P, and set screw *s*, substantially as and for the purposes set forth.

62,986.—HENRY F. WILSON, Fort Wayne, Ind., assignor to W. G. WILSON, Cleveland, Ohio.—*Sewing Machine.*—March 19, 1867; antedated March 12, 1867.—To avoid the moving of the cloth at improper times by the feeding needle, it plays through a sleeve pivoted to an adjustable vibrating lever operated by a cam. The long throw of the needle allows it to cast its loop over the point of a vertical shuttle without interfering with the length of the stitch.

Claim.—First, a needle bar, receiving an independent vibration from a crank, in combination with an oscillating lever and with a vibrating needle-bar holder, in such a manner as to produce a compensating vibration, substantially as described.

Second, the set screw J, in combination with the eccentric E' and oscillating lever H, for the purpose of affecting the length of the stitch by regulating the throw of the needle to the left, said lever being jointed to the vibrating fulcrum of the needle bar, as described.

Third, the stationary shuttle, constructed and supported substantially as described, in combination with the needle bar and oscillating bar, for the purpose described and set forth.

62,987.—JOHN BROWN ALDEN, Worcester, Mass., assignor to himself and EDWIN C. CLEVELAND, same

place.—*Brush*.—March 19, 1867.—The brush can be reversed when the further end is worn out, by removing the screw from that end and turning the handle on the central pivot.

Claim.—The arrangement and combination of the parts of the brush marked A, B, and C, whereby the parts A B may be reversed or turned end for end, substantially as described, for the purposes herein set forth.

62,988.—DAVID ALTER, Freeport, Pa., assignor to CHARLES W. BODEY, same place.—*Distillation of Bromine and Iodine*.—March 19, 1867.—The close stone still is traversed by an open-ended lead flue. The funnel traversing the top has exit below the surface of the bitters, with which the still is nearly filled, and is used for the introduction of the acid and manganese. Heat is applied through the flue. The bromic vapors escape through an upper pipe bent down through a water tank, and discharge into a receiver containing water. Another pipe is connected to this pipe within the tank, which discharges into a receiver containing an alkaline solution to take up the superfluous vapors.

Claim.—The use of an alkali to absorb the fumes of bromine and hydrobromic acid while in process of distillation, substantially as herein shown and described.

62,989.—JAMES O. ALTICK, Dayton, Ohio, assignor to himself and GEORGE W. HOLGEN, same place.—*Grape and other Arbors*.—March 19, 1867.—The cast elbow has end sockets to receive the vertical and horizontal pieces by which the slats are supported.

Claim.—The metallic casting A, constructed substantially as described, and used for the purposes herein set forth.

62,990.—SHERMAN E. ANTHONY, Stillwater, N. Y.—*Shingle Machine*.—March 19, 1867.—The separate block carriages have friction rollers, which are held in continuous grooves around the inside of the frame, and the blocks are in turn brought to the action of the saw. As the blocks come over the tilting plate the dogs are retracted, and they are allowed to settle upon the same, when the dogs are again driven forward into the block.

Claim.—First, the disconnected bolt carriages B with projections *e*, operating with the toothed wheels *d*, substantially as described, for the purpose specified.

Second, the operating of the sliding dogs through the medium of the T-headed screws H, flanged spring plate G, pin *k*, arm *f*, and lip *g*, substantially as described, for the purpose specified.

Third, the fixed or stationary dogs L, in connection with the sliding bars M and the plates N on the framing, having beveled or diagonal ends, substantially as shown and described.

Fourth, the fixed plate *i*, in combination with the slotted dogs F, substantially as and for the purpose specified.

62,991.—GRINMON AUSTIN, Denmark, N. Y.—*Cheese Vat*.—March 19, 1867.—The water wheel is turned by the waste water from the vat and connects by a series of cranks and rods with the oscillating bar; the latter is attached by rods to the rakes of the vat and keeps them in regular motion.

Claim.—The within-described device for cooling milk, so constructed that the water which passes around the milk receiver to cool the same will act upon a wheel, or equivalent device, operating the parts, which causes continuous agitation to the milk, substantially as specified.

62,992.—ANSON A. AVERY, Cardiff, N. Y.—*Churn Dasher*.—March 19, 1867.—The dasher has a series of fluted and slotted ears which convey the air down into the cream, with which it becomes intermingled as in an atmospheric churn.

Claim.—The slotted and fluted fingers *a* and *e e*, in combination with the cross-head B and the cross-beams D D, arranged and operating substantially as herein described.

62,993.—ANDREW BARCLAY, Kilmarnock, Scotland.—*Injector for Steam Generators*.—March 19, 1867.—The nozzle separating the steam and water has an annular chamber containing non-conductive matter.

Another similar nozzle is placed outside and concentric to the first, increasing the number of annular vents for steam and water. Access is afforded to all parts.

Claim.—First, the combination with the steam and water nozzles of an injector of a fixed casing, containing any non-conducting substance interposed between the said nozzles, as herein shown and specified.

Second, the arrangement of an adjustable air-tight packing between the steam and water inlets, as hereinbefore described.

Third, the arrangement and construction of apparatus for injecting or ejecting fluids and liquids, in which a double set of nozzles is employed in combination with an injecting or water nozzle so as to form annular jets of steam and water, as hereinbefore described.

Fourth, the arrangement and construction of apparatus for injecting or ejecting fluids of different temperatures, whether in immediate contact or not with the steam nozzle, as hereinbefore described.

Fifth, the combination of the exterior main portions of the instrument with the pillars or studs, or equivalent devices, for connecting the same under the arrangement herein specified, so that the stuffing boxes, joints, and packing are rendered accessible and capable of being readily adjusted, as set forth.

Sixth, the application of a set of variable nozzles and throats to apparatus of the kind hereinbefore described, in the manner specified.

62,994.—HENRY C. BASCOM, La Crosse, Wis.—*Gun Worm*.—March 19, 1867.—When the nut is held and the ramrod rotated the thread in the nut advances or retracts the screw, according to the direction of said rotation.

Claim.—The gun wormer, consisting of the thimble C, worm screw *m*, and revolving nut *b*, arranged in such manner that the said screw shall be extended or retracted, substantially as described.

62,995.—O. A. BASSETT and ERASMUS SMITH, Norwich, N. Y.—*Saw Mill*.—March 19, 1867.—The feed motion is communicated from a friction disk on the saw shaft, and its speed is regulated by sliding its friction pinions nearer to or farther from its axis. The "feed" motion is reversed by a lever which changes the connection in the series of friction pulleys.

Claim.—First, the combination of the friction wheels C E F and wheels G I, or equivalent, and the friction wheels K S with each other and with the saw shaft B and feed shaft R, substantially as herein shown and described and for the purpose set forth.

Second, the combination of the toothed sliding bar V, gear wheels W Y and shaft X with each other and with the friction carriage D, substantially as herein shown and described and for the purpose set forth.

62,996.—HIRAM BEADLE, Washington, D. C.—*Automatic Boiler Feeder*.—March 19, 1867.—The water supply chamber is connected by its lower and upper ends to the water and steam spaces respectively of the generator. The fall of water level, and consequently of the float, opens communication between the water tank and supply chamber and closes the communication between the latter and the generator, and the raising of the float has a contrary effect.

Claim.—First, the arrangement of the pipe B, condenser D, valves C, pipes I and N, with reference to the chamber A and float E, substantially as herein set forth.

Second, the combination of the supply pipe B, valve C, and chamber A, with the float E, rod F, and valves K and K', substantially as and for the purpose set forth.

Third, the combination of the rod F, yoke G, rods I, and valves K and K', substantially as and for the purpose set forth.

62,997.—H. C. BECKER, New York, N. Y.—*Starch Sirup*.—March 19, 1867.—Ground corn and starch boiled in water are treated with sulphuric acid after cooling; the free acid is neutralized by chalk. It is then treated by a centrifugal machine. The mass is then mingled with a solution of gum arabic and forced through a fine sieve, then heated by steam, filtered through charcoal and boiled down.

Claim.—A composition which is made of the in-

gredients and substantially in the manner herein set forth and described.

62,998.—HENRY BEHN, New York, N. Y.—*Burglar Alarm.*—March 19, 1867.—The knob of the lock connects with a pendulum, which is released from its horizontal position when the handle is moved, and as it vibrates strikes the alarm bell.

Claim.—First, the arms *G* and *G'*, rods *J J'*, and lever *C*, operating the bell hammer through a lug, adjusted, combined, and arranged substantially as specified.

Second, the arrangement of the pendulum *H* in combination with the stop lever *N*, operated by a projection *w* fast to the lever *C*, in the manner and for the purpose as set forth.

62,999.—WALTER BENNETT, Hunt's Hollow, N. Y.—*Shuttle Carrier for Sewing Machines.*—March 19, 1867.—The wear of the slide against the under side of the table is compensated for by tightening the screws, which thus compress the springs and bring the bearing surface of the shuttle carriage closer to the table.

Claim.—The guide rod *C*, applied to the bed or cloth plate *A* by means of the screws *D D* and springs *e c*, or their equivalents, substantially as and for the purpose specified.

Also, constructing the shuttle carrier *B* with a part or portion *b*, to serve as a bearing surface against the cloth plate *A* when used in combination with the adjustable guide rod *C*, arranged and applied substantially as set forth.

63,000.—HERMANN BERG, Springfield, Mass.—*Rocking Chair.*—March 19, 1867.—The side pieces are connected by removable rods at the top under the seat and back of the rockers. Stops with springs attached prevent the chair rocking over.

Claim.—First, constructing the side frames of a rocking chair of elastic strips *b b' c c'*, substantially as and for the purpose set forth.

Second, the combination of removable cross-bars *a a'* with the elastic side pieces *B C* of a rocking chair, substantially as and for the purpose described.

Third, the flexible back *E*, in combination with the seat *D*, top cross-bar *a'*, and side pieces *B C*, constructed and operating substantially as and for the purpose set forth.

Fourth, the yielding stops *e*, in combination with the runners of a rocking chair, constructed and operating substantially as and for the purpose described.

63,001.—LYMAN BICKFORD, Macedon, N. Y.—*Grain Drill.*—March 19, 1867.—By the construction of the grain wheel foreign substances, such as sticks or straws, are expelled, and by the arrangement of two runs of different sizes upon opposite sides of the wheels the machine is suited for large or small grain.

Claim.—First, the construction of the distributing wheel whereby it is adapted to the discharge or delivery of grain upon its opposite vertical sides or faces, for the purpose specified.

Second, the distributing wheel, provided with the enlarged hub or center and with curved or angular sides or faces, substantially as described.

Third, the starting ribs, formed upon the curved or angular sides or faces of the vertical distributing wheel, substantially as and for the purpose described.

Fourth, the casings upon the opposite sides of and in combination with a double distributing wheel adapted to the delivery of grain upon its opposite vertical sides, substantially as described.

Fifth, providing the lugs or ears, through which the casings of the distributing wheel are fastened to each other, with the interlocking faces, substantially as described.

Sixth, the casings of the distributing wheel, provided with the external flanges and with the side delivery or discharge opening, substantially as described.

Seventh, the employment of the casings, provided with the external flanges and side delivery openings, in combination with the vertical starting ribs or teeth on the side of the distributing wheel, substantially as described.

Eighth, the employment of a slide in combination with the double distributing wheel for closing the seed run upon one side or face thereof, and simulta-

neously opening that upon the opposite side or face, substantially as described.

Ninth, the adjustable block, or its equivalent, at the end of the grain box in combination with the slide, substantially as and for the purpose described.

63,002.—CHAS. F. BLAKSLEE, Brooklyn, N. Y.—*Carpet Bag.*—March 19, 1867.—The frame of the bag has perforations for the passage of the twine by which the cloth or leather is sewn to the frame. Sunken channels between the holes guard the sewing twine from wear.

Claim.—A traveling-bag frame, provided with sunken perforations *a* having a connecting channel *e*, for the purpose described as herein specified.

63,003.—ASA BLOOD, Sr., Janesville, Wis.—*Washing Machine.*—March 19, 1867.—The levers beneath the suds boxes are moved by handles and impart a vibratory motion to the presses through the medium of connecting rods and arms.

Claim.—The pendent or swinging presses *C C*, placed in suds boxes *A A*, which are connected together substantially as shown, and operated through the medium of the arms *h*, rods *j*, and lever frames *D D'*, one or both, substantially as shown and described.

Also, the connecting of the two suds boxes *A A* in such a manner as to allow a space *B* between them for the rods *j* to work in, substantially as set forth.

Also, the combination of the hinges *m*, handles *F*, uprights *E*, and lever frames *D D'*, as and for the purposes specified.

Also, the combination of the two suds boxes *A A*, lever frames *D D'*, presses *C C*, rods *j*, arms *h*, and springs *G*, with the lids or covers *b*, fluted or otherwise, and all arranged to operate in the manner substantially as and for the purpose set forth.

63,004.—ALONZO T. BOON, Galesburg, Ill.—*Gas Heater and Petroleum Stove.*—March 19, 1867; antedated March 1, 1867.—The petroleum passes through a bundle of fine wire previous to its exit from the pipe. The flame is deflected by a plate which protects the feed pipe. The ogee-formed cylinder is enclosed in a cylindrical case with air openings near the bottom.

Claim.—First, the bundle of short fine wire *F*, in combination with the horizontal tube *C*, substantially in the manner and for the purpose as herein set forth.

Second, the solid heater *E*, as constructed and provided with a cone *g*, in combination with the horizontal tube *C*, substantially in the manner and for the purpose as herein set forth.

Third, the ogee cylinder *B*, in combination with the funnel-shaped bottom *a* of the stove, substantially in the manner and for the purpose as herein set forth.

63,005.—JAMES BOWERS, New York, N. Y.—*Corset Fastening.*—March 19, 1867.—The hook plates are hinged to one side, and engage eyelets in the other.

Claim.—A fastening for stays or corsets, composed of eyelets *C* inserted in one of the parts *A*, just behind its hem *b* and plates *d*, formed or provided with hooks *e*, and attached by loops *e* to the front edge of the other part *A*, substantially as herein shown and described.

63,006.—JOHN C. BRIGGS, Ansonia, Conn.—*Reed Musical Instrument.*—March 19, 1867.—A sound chamber is formed below the wind chest, the top of said chamber being a flexible diaphragm, which is also the bottom of the wind chest. The flexible diaphragm communicates the vibration of the air caused by the motion of the reeds to the sound chamber below.

Claim.—The separation of the wind chest of a melodeon by a flexible diaphragm *D*, substantially as described and for the purpose specified.

63,007.—RANSOM BROWN, West Edmeston, N. Y.—*Water Elevator.*—March 19, 1867.—The bucket is raised by the windlass till it engages a hook attached to the discharge spout, is tilted and emptied into the spout. A valve in the bottom of the bucket admits the water. A brake is attached to the frame to govern the descent of the bucket.

Claim.—The arrangement of the windlass *B*, stop

c, pivoted to the bar *d*, bucket *C*, with its valve and curved hook *a*, all constructed and operating as set forth.

63,008.—T. I. BURHYTE, Fond du Lac, Wis.—*Gate*.—March 19, 1867.—The gate is counterbalanced, and is opened by turning it upside down, it being thereby raised sufficiently high to allow persons and teams to pass under it. The vertical rod has a handle, is pivoted to the gate, and connected by wires with a spring catch fitting in a recess of the bar and shutting into a recess on the face of the post.

Claim.—First, a gate constructed with the high posts *B*, provided with the counterbalancing weights, said gate being pivoted to turn in a vertical plane, substantially as described.

Second, the spring catches *f*, connected to the vertical rod *b*, and arranged to operate in connection with the gate, as set forth.

63,009.—GEORGE BURKET and SAM'L M. GASKILL, Bluffton, Ohio.—*Head Block for Saw-mills*.—March 19, 1867.—The log is shifted laterally to the saw by a rack and pawls; the rack being actuated by inclined blocks, clamped to the gauge bar, which act on anti-friction rollers to reciprocate the rack. The distance of the anti-friction rollers, and consequent thickness of the lumber, is determined by a screw. The longitudinal movement of the carriage is reversed by adjustable stops, which actuate the shifter of a straight and crossed belt to bring either of them upon the fast pulley.

Claim.—The bar *G*, provided with the adjustable beveled plates *H H'*, secured by clamps *I I'*, substantially as shown, and connected or arranged with the rack *F*, and also provided with the pendent bars *J J'*, the above parts being used in connection with the stop *K* for operating the rack *F*, substantially as described.

63,010.—WILLIAM BURNS, Chicago, Ill.—*Lantern*.—March 19, 1867.—The various parts of the lamp, as stated, are connected together by screws spun upon annular plates, one of which is permanently attached to the lower end of the chimney.

Claim.—First, the construction and arrangement of a lantern having its cap, globe, and oil cup separately connected and detachable by screws, so that no part of the weight of the lantern is supported by the screws of the globe, substantially as shown and specified.

Second, attaching and supporting the globe of a lantern at the base by means of the screw band *d*, permanently attached to the bottom of the globe, substantially as specified.

Third, the upper rod of a guard detachable from the dome, when made of a spun screw band, substantially as and for the purposes specified.

63,011.—MANLOVE BUTLER, Vernon, Ind.—*Horse Hay Rake*.—March 19, 1867.—Two hooks are attached to a single lever for regulating the rake. The lever swings on a pivot, and will pack beside the head of the rake for transportation or storage.

Claim.—First, the piece *A*, when constructed with the hooks *f f* and bar *g*, and attached to the lever *c*, and arranged to operate in combination therewith, substantially in the manner and for the purpose set forth.

Second, the hinge attachment *d*, which permits the lever to be laid alongside of the head of the rake, all arranged and operating as set forth and described.

63,012.—ALLEN CALKINS and WILLIAM TOWER, Almont, Mich.—*Machine for Forming Eave Troughs*.—March 19, 1867.—Bars are hinged to each other and to the frame, and are adapted for bending over the metallic strips to receive the strengthening wire. By other devices the trough is formed in shape by dies of peculiar conformation, and sliding blocks operated by rope and windlass.

Claim.—First, the combination of the bars *B* and *C* with each other, and with the frame *A* of the machine, substantially as described and for the purpose set forth.

Second, the combination of the bars *D E F* with each other, and with the frame *A* of the machine, substantially as described and for the purpose set forth.

Third, the combination of the die *G*, sliding block *H*, nippers *I*, rope *J*, shaft *L*, gear wheels *M N*, and crank *O* with each other, and with the frame *A* of the machine, substantially as described and for the purpose set forth.

Fourth, the combination of the die *P*, guide *T*, bar *U*, nippers *I*, rope *J*, shaft *L*, gear wheels *M N*, and crank *O* with each other, and with the frame *A* of machine, substantially as described and for the purpose set forth.

63,013.—DAVID CAMMERER, Cincinnati, Ohio.—*Beer Cooler*.—March 19, 1867.—The wort from the boiler issues in a series of jets on each side of the rib above the upper tube and flows in two streams, enveloping the respective sides of the vertical series of tubes, which are cooled by an interior refrigerant. The cooled wort is received in the fermenting tun.

Claim.—The arrangement of the tubos *A B C D*, &c., decreasing in size from the bottom upward, the separate troughs *N N'*, and projecting flange *g*, substantially as and for the purposes set forth.

63,014.—LUTHER W. CAMPBELL, Aurora, Ill.—*Steam Generator*.—March 19, 1867.—Within a strong metallic shell or generator, which is exposed to the direct action of the heat in the furnace, is a receiving chamber, within which the incoming water is converted into common or saturated steam, which then escapes into the outer apartment, where it is reheated and converted into superheated steam.

Claim.—First, the receiver for water or other liquid, constructed and arranged, operating inside of a superheating steam generator, which is exposed directly to the fire, substantially as and for the purpose explained.

Second, a receiver *E*, constructed so as to form two or more parts, combining an inner lining and an outer jacket, the lining having no top and the outer jacket no bottom, with a space between them of suitable capacity to form a steam passage, substantially as described.

Third, the combination of the receiver *E*, the cone or cap *F*, and the feed water pipe *E*, with a superheater, substantially as described.

Fourth, the receiver *E*, with the blow-off pipe *G*, in combination with the superheater *D*, substantially as described.

Fifth, the receiver *E*, in combination with the cup *E'* and the blow-off pipe *I*, substantially as described.

Sixth, in combination with the superheating steam generator, constructed to operate substantially as described, the feed-water regulator, operating substantially as explained.

63,015.—WILLIAM CARLTON, Dunkirk, N. Y.—*Head Block for Saw-mills*.—March 19, 1867.—By turning the shaft the screw is rotated by means of the bevel gears, and the longitudinal motion of the rack and knee sets the log to the saw.

Claim.—The gear which operates the knee of a head block, consisting of the bevel wheels *D E*, worm *F*, rack *L*, sleeve *B*, and lever *G*, arranged and operating substantially as described, for the purpose specified.

63,016.—HENRY W. CASWELL, Yarmouth, Me.—*Post Auger*.—March 19, 1867.—The air tube parallel with the shaft admits the passage of air in withdrawing the loaded auger.

Claim.—Combining with a post auger an air tube, substantially as and for the purposes specified.

63,017.—N. L. CHAMBERLAIN, West Roxbury, Mass.—*Hand Stamp*.—March 19, 1867.—The ribbon is doubled at the end, thrust through the split shaft, and a retaining pin passed through the loop.

Claim.—The manner herein shown and described of attaching the ink ribbon to its shafts.

63,018.—JAMES CHAMBERS, Greensburg, Ind.—*Seed Drill*.—March 19, 1867.—The seed drill has a forward wheel connecting by a crank and rod with the rod shaft, which communicates by rods with the seed slides of the separate hoppers, which discharge into the seed tubes of the shares. The side bars are pivoted to the main frame, and are adjustable laterally by rack bars and a central pinion.

Claim.—First, the arms E E, made in the form described, and connected to the frame A, in the manner and for the purposes herein specified.

Second, the arrangement of the frame A, with the driving wheel C, hoppers D D and D', arms E E, pipes h h and seed pipes k k, substantially in the manner and for the purposes herein set forth.

Third, the adjustable journal boxes a a, when used as and for the purposes specified.

Fourth, the rock shaft d, provided with the uprights e f e, and operating in three perforated wheels s, by means of their rods g g g, in the manner and for the purposes set forth.

Fifth, the arrangement of the rack bars H H, with the cog-wheel w and cog-shaft w', metallic band F, handle G, with spring n for expanding or contracting the arms E E, with their attachments, in the manner as and for the purposes specified.

Sixth, the hoppers D D, when used with their open tubes h h and seed pipes K K, substantially as set forth.

63,019.—ISAAC H. CHAPPELL, Lawrence, Kan.—*Combined Planter and Cultivator.*—March 19, 1867.—The machine is constructed for optional use as a cultivator or a planter by the attachment of the appropriate devices. The plow standards are pivoted to the frame and raised by hand levers and chains. The seeder is mounted on a sled trailed in the rear and actuated by a lever.

Claim.—First, so arranging the crank lever M that when the plows are raised they will be thrown apart, so that, in turning, the plows will not break down the corn.

Second, the standards e, in combination with the bars F F, for the purpose of elevating and lowering the plows without changing their angle.

Third, attaching the bars F F to the standards e e, for the purpose of elevating or lowering the ends of the bars F F, so as to change the line of draft above or below the center of the axle, substantially as shown and described.

63,020.—R. O. CODDING and G. W. PRINGLE, Coldingville, Ohio.—*Wagon Brake.*—March 19, 1867.—The rubbers are placed on rods, which are pivoted to the hounds or brake bar and are thrown in contact with the wheels by pulling back on the neck yoke, which is attached to a bar pivoted on the end of the tongue. The set of the shoe on its shaft is determined by the ratchet, and a spring on the tongue withdraws the brake when the team ceases to hold back.

Claim.—First, the pivoted lever H and rod or bar M, operating the brake bar or shaft I and ratchet wheels n n, substantially as herein shown and described, and for the purposes set forth.

Second, the ratchet wheels n n, operating substantially as shown and described, in combination with the brake bar or shaft I, as and for the purposes set forth.

Third, the spring L and neck yoke G, in combination with pole or tongue E, substantially as shown and described.

63,021.—JOSEPH G. COLLINS, Boston, Mass.—*Washer for Socket Bolts in Steam Boilers.*—March 19, 1867.—The face of the washer toward the plate is made concave so as to hold a quantity of cement to make a water-tight packing around the opening through which the socket bolt passes.

Claim.—A washer, constructed or formed substantially as herein shown and described, for the purpose set forth.

63,022.—WILLISTON CONNER, Rensselaerville, N. Y.—*Back Sight for Fire Arms.*—March 19, 1867.—A graduated spring piece slips within a vertical slot in the small of the stock and is adjusted as required. Its spring retains it in place, or it may be clamped by a set screw or lowered below the line of the hind sight.

Claim.—A spring sight A A', guided in a metal plate B, and constructed and operating substantially as and for the purpose herein shown and described.

63,023.—JAMES J. DAVELIN, Philadelphia, Pa.—*Churn.*—March 19, 1867; antedated March 5, 1867.—The two concentric dashers are arranged axially in the cask churn and are separately revolved by power

applied to their cranks, which are at the respective ends of the churn.

Claim.—The combination of dasher N M and P O, constructed and held together by fastenings A W C and D, with churn B, the whole combined and acting in the manner and for the purpose above described and shown.

63,024.—CHARLES DISSTON, Philadelphia, Pa.—*Saw.*—March 19, 1867.—The tooth has a tapering arm, which is first inserted laterally and then pushed outward in the plane of the saw so as to occupy its socket; a washer is then placed in the opening in the saw plate, its projecting flanges entering at the enlargements of the latter; the washer is then rotated 90° in its own plane, its projections looking against the plate on one side and the tooth on the other.

Claim.—The securing of detachable teeth in saw plates by means of the tapering arm b' of a saw tooth, and the ring or washer D, when both are constructed and adapted to openings in a saw blade, substantially in the manner and for the purpose described.

63,025.—HENRY DISSTON, Philadelphia, Pa.—*Buck-saw Frame.*—March 19, 1867.—The rack and catch used for straining the saw are covered with a guard or shield.

Claim.—The guard F, inclosing a portion of the rack e, and connected to the bar D of the saw frame, all substantially as described, for the purpose specified.

63,026.—WILLIAM ELMER, New York, N. Y.—*Separating Metals.*—March 19, 1867.—The ore in a pulverized condition is placed in a furnace, the hearth being first covered about six inches with quicklime. The gases for the treatment are stored in gas-holders and introduced by tuyeres.

Claim.—The process of treating metallic ores, or other materials containing metals, by the following three operations performed successively upon them, viz: 1st, the oxidation of the oxidizable substances by treating the material while hot with a gaseous substance that supplies oxygen to them. 2d, the reduction of the oxides by treating the oxidized ores while hot with a gaseous substance that has a higher affinity for oxygen than the metals whose oxides are to be reduced. 3d, the fusion of the metals by treating the reduced ores while hot with a gaseous substance that is incapable of oxidizing them. These three operations being performed in the order and substantially as hereinbefore set forth.

Also, the process of treating metallic ores, or other materials containing metals, by the following two operations performed successively upon them, viz: 1st, the reduction of the metallic oxides by treating the material while hot with a gaseous substance that has a higher affinity for oxygen than the metals to be reduced have. 2d, the fusion of the metals by treating the reduced ores while hot with a gaseous substance that is incapable of oxidizing them, these two operations being performed in order and substantially as hereinbefore set forth.

Also, the process of separating the metals from each other by treating their mixtures at progressively increased temperatures with a gaseous substance that has a higher affinity for oxygen than the metals have, so that the metals are fused in a non-oxidizing atmosphere in the order of their fusing temperatures, the process being conducted substantially as hereinbefore set forth.

63,027.—H. H. ETTER, Washington, D. C.—*Burning Fluid.*—March 19, 1867.—To 40 galls. naphtha is added, oil of vitriol, 2 quarts; linsed oil, 1½ pints; ground white oak bark, 2 lbs.; ground hemlock bark, ½ lb.; slippery elm bark, 1½ lb.; sassafras bark, 1 lb.

Claim.—The ingredients, when mixed in the proportions as herein specified, for the purpose of producing a safe and brilliant light.

63,028.—DAVID EVANS, Studley, England.—*Needle Wrapper.*—March 19, 1867.—The needles are stuck in the paper by impaling a strip or by an enclosing band, and their heads and points are covered by flaps made out of the same piece of paper which constitutes the wrapper.

Claim.—Fastening and folding up of the needles in wrappers or papers that have flaps and folds, as herein shown, so that the needles are easy of access from the

outside, without liability to drop or fall from the wrapper or to corrosion from contact with the fingers, as herein described and represented.

63,029.—JOHN L. FINCH, Warwick, N. Y.—*Milk Can.*—March 19, 1867.—The can sets within a sheet-iron pail, whose removable inner bottom section sustains the can.

Claim.—First, the combination of the sheet-iron outer case B with the body of the milk can, substantially as herein shown and described and for the purpose set forth.

Second, the combination of the removable hoop C with the projecting lower end of the sheet-iron outer case B, substantially as herein shown and described and for the purpose set forth.

63,030.—HENRY S. FORNEY, Baltimore, Md.—*Washing Machine.*—March 19, 1867.—The shaft of the vertical dasher is supported by resting on a collar in the lid of the suds box, and is rotated by bevel gearing and a hand crank.

Claim.—In combination with a flanged metallic collar *f* in the lid *E*, the bevel pinion or gear *I*, made, arranged, and operating therewith and with the drive gear and the agitator or stirrer, substantially in the manner and for the purpose described.

63,031.—ANDRÉ FOUBERT, New York, N. Y.—*Apparatus for the Manufacture of Vinegar.*—March 19, 1867.—Steam is admitted to the vessel of wine and the vapors are carried by a pipe to the upper part of the vessels, into which percolate jets of vinegar and water from the vessels above. After passing through the charge of shavings, &c., the liquor is received in vessels below.

Claim.—The manufacture of vinegar from the vapors of wine, condensed and acidified in substantially the manner specified.

63,032.—HERMAN FRITZ, Cleveland, Ohio.—*Galvanic Battery for Remedial Uses.*—March 19, 1867.—The air and water-tight case is charged with a hot acid solution whose chemical action on the zinc maintains the temperature in the chamber. The patient placing his feet upon the foot plates receives the electric current thereat; the application to other parts of the body is by conducting wires, the feet resting upon a non-conductor over the heated case in place of the foot plates.

Claim.—First, the air and water-tight case A, connecting bridge G, rods R, in combination with zincs E and covers B, as arranged and for the purpose set forth.

Second, the insulating washer I, connecting screw F and M, and insulating washer K, as arranged in combination with the arm L and foot plates N, and insulator N', for the purpose and in the manner specified.

Third, the screw M, insulating washer I, as arranged in combination with the screw F, zinc E, and bridge G, for the purpose and in the manner described.

63,033.—H. W. FULLER.—New York, N. Y.—*Sewing Machine Attachment for Marking Tuks.*—March 19, 1867.—The marking nippers and their supporting arm are lifted by the screw on the needle bar acting upon the auxiliary arm. They are forced downward, to pinch and mark, by springs. The screw of the supplementary spring serves to graduate the pressure of the springs. The nippers open slightly when lifted.

Claim.—First, the employment of the nipping fingers, to form ridges or creases in fabrics for the purposes specified, when arranged with respect to and operating upon the fabric, in substantially the manner described.

Second, the combination, with the marking device described, of the plate F, for the purpose specified.

Third, the use of the screw 4, or its equivalent, to adjust the fingers to the fabric, as specified, and to determine the amount to be seized.

Fourth, in combination with the marking device possessing the functions and mode of operation described, the spring B, arm C, and auxiliary arm D, or its equivalent, as specified.

Fifth, in combination, the said marking device, the bed plate E, or equivalent, and a feeding device, for the purposes specified.

Sixth, in combination, the marking device, bed plate, feeding device, and a stitch-forming mechanism, substantially as and for the purpose specified.

Seventh, so constructing and combining the arm C and spring B as to be adjustable for various widths of tuks or plaits, in combination with the marking device.

Eighth, the supplemental spring B' and its screw B', or their equivalent, for the purpose specified.

Ninth, in combination with the aforesaid marking device, a suitable gauge F.

63,034.—E. D. and W. K. GIRD, Cedar Lake, N. Y.—*Bending Machine.*—March 19, 1867.—The disk is fastened to a movable cross-head bar working between two uprights. Two semicircular jaws moving on pivots bend the metal or wood about the disk as it descends. The belt shifter works into two slots on a fly wheel, so as to cause one semi-revolution to open the jaws and another to close them.

Claim.—The disk C and the jaws *a*, in combination with the cross-head bar *b*, substantially as described.

Also, the belt shifter *n*, in combination with the slots *c* in the fly wheel, and the disk C, substantially as and for the purpose herein set forth.

63,035.—H. A. GRAEF, Brooklyn, N. Y.—*Portable Tree Box.*—March 19, 1867.—The tree box is formed of slats conformed to hoops, and secured to the tree by india-rubber bands. The hoops are held together by buttons, and so arranged that an additional section of slats can be added, as required by the tree to accommodate its growth.

Claim.—First, a portable tree box, formed of slats or strips *a* fastened to bands or hoops *b b*, and secured to the tree by lashings *d d*, constructed and arranged substantially as and for the purposes herein described.

Second, the hooks or bands *b b*, fastened by buttons or slats, or their equivalents, in combination with sectional hoops or bands *b' b'* for enlarging the size of the box, substantially as herein set forth.

63,036.—THOMAS GRAY, Union Road, England.—*Manufacture of Bleaching Powder.*—March 19, 1867.—The free acid in ordinary bleaching powder is neutralized by alkali, which may be added before or during the process of manufacture.

Claim.—The application, as before stated, for the purposes of bleaching fabrics or fibers, or other materials, without destroying or injuring them, substantially as described.

63,037.—E. C. GREEN, Plainfield, Ind.—*Hay Elevator.*—March 19, 1867.—The frame on the running gears of the wagon has a hollow central post and an extension shaft carrying the cross-arm, over which passes the rope which leads from the draft animal to the horse hay fork. The shaft is capable of horizontal rotation, and the rope runs over a pulley on a horizontal slide roller, to give it direction when driving a bunch of hay toward the wagon.

Claim.—First, the hoisting apparatus herein described, in combination with the wagon bed A, arranged and operating substantially as and for the purposes herein specified.

Second, the hollow center post B, inclosing the hollow center standard D with its cross-arm E and pulleys *d d*, in combination with the slide roller F with its pulley *s* and spring *l*, connected with the horse rake G, and operated by the rope *e*, constructed, arranged, and operating together substantially as and for the purposes herein described.

Third, the crank *n*, in combination with the slide roller F and the spring *p*, constructed and arranged substantially as and for the purposes set forth.

63,038.—J. DELOS GREEN.—Antrim, Ohio.—*Seed Planter.*—March 19, 1867.—The carriage runs upon spoked wheels without rims, and seeders are attached to each spoke, so as to plant at their points of contact with the ground, the seed being dropped by the hinged spring plate attached to the end of the spoke. The seed slides are worked by cams attached to the frame.

Claim.—First, providing the spokes H H with adjustable supplementary spokes or bars F, which carry

seed boxes and slides, as and for the purpose herein set forth.

Second, the arrangement of the overlapping and adjustable bars C C' with the cams G G' and seed slides e, substantially as and for the purpose specified.

Third, the automatic covers K upon the ends of the supplementary spokes F, for the purpose of discharging the grain, substantially as specified.

63,039.—THOMAS HALL, Bergen, N. J.—*Connecting Rod for Machinery.*—March 19, 1867.—The object is a ready means of adjustment after the bearings have worn loose. The rod is passed through a hole in the hook-shaped plate, and the parts are clamped together by a set screw.

Claim.—The combination of the rod A, the sliding piece B with wedge-shaped bearing, and screw C, when the same are arranged and operate substantially as described.

63,040.—E. HAMBURGER, Detroit, Mich.—*Buckle.*—March 19, 1867.—Explained by the claim and illustration.

Claim.—A buckle constructed of a single piece of wire, the ends of which constitute the tongues, being coiled upon each other in the rear, and bowed thence toward their points, substantially as described.

63,041.—WILLIAM J. HARE, New York, N. Y.—*Trunk Lock.*—March 19, 1867.—The jaws catch into a neck on the stud secured to the door, and are forced apart by the action of a key on the wedges, which enter between the jaws and divide them to release the stud.

Claim.—The spring jaws C, in combination with a stud D, one or more wedges E, and a key K, constructed and operating substantially as and for the purpose described.

63,042.—O. J. HARDGROVE, Canton, Ohio.—*Horse Hay Fork.*—March 19, 1867; antedated March 10, 1867.—The case in which the plunger works has a thimble at its lower end, to which are pivoted four tines. The lower end of the plunger is enlarged, and when forced downward drives the prongs outward. A spring upon the case enters notches in the plunger to hold it in any desired position.

Claim.—The case A, shaft B, thimble d with prongs a, a', and a'', and spring b, when constructed, arranged, and operating in the manner as and for the purposes specified.

63,043.—JAMES R. HASKELL, New York, N. Y.—*Reducing Vegetable Fibrous Substances.*—March 19, 1867.—Vegetable fibrous substances, as cane, corn-stalks, and similar jointed structures, are reduced to fiber by cutting, rolling to break the gummy particles, boiling to soften and open the pores, treating with alkali and rolling to remove mucilage and expose the fibers to receive a caustic alkaline solution, which is removed by pressure.

Claim.—The combined process of treating vegetable fibrous substances consecutively, and by relation of each process to the preceding and following process, in the form and manner and for the purposes substantially as hereinbefore described.

63,044.—JAMES R. HASKELL, New York, N. Y.—*Treating and Separating Vegetable Fibers.*—March 19, 1867.—The boiler has a manhole for filling, a pipe with a stop-cock leading to the boiler, and a pipe to draw the air off. The contents of the boiler are discharged through a valve.

Claim.—First, the mode of producing a vacuum or partial vacuum by first steaming the vegetable fibrous material under pressure and expelling the air, and then condensing the steam with a shower of cold lye, which causes a rapid absorption of the lye in every part of the plant, in the manner and for the purposes substantially as hereinbefore described.

Second, the mode of treating vegetable fibrous substances, in the form and manner and for the purposes substantially as hereinbefore described.

63,045.—MOSES HAWKINS, Birmingham, Conn.—*Steam Engine Oil Cup.*—March 19, 1867.—Steam is admitted through the stand pipe and condenses in the chamber, displacing an equivalent amount of oil,

which overflows into the stand pipe. This is repeated as often as required and the oil lasts, when the cup is removed, the water withdrawn, and the chamber discharged.

Claim.—An oil cup A, provided with a stand pipe D, extending up to near the cap E, and a water cock f, the whole constructed and operating as described.

63,046.—E. M. HENDRICKSON, Brooklyn, N. Y.—*Construction of Safes.*—March 19, 1867.—Coils of wire are placed in the mold and the iron cast around them with a chill. The object is to destroy the homogeneity of the iron and to check and break a drill which is brought to operate upon it.

Claim.—Using for such purpose and in the manner described, wires or rods, bent or coiled spirally, as herein shown and described.

63,047.—CURRAN W. HENKLE, Washington C. H., Ohio.—*Corn Planter.*—March 19, 1867.—The motion of the trigger on the plow handle actuates the valve in the hollow share to drop the corn and at the same time return the cup to the seed hopper. The counterbalance weight then lifts the cup and throws the seed into the tube ready for a repetition of the operation.

Claim.—First, the curved arm J, operated through the medium of the loaded arm L and lever F, in combination with the hopper H, provided with the tube h, and the spout I, all arranged to operate in the manner substantially as and for the purpose set forth.

Second, the valve D in the opening a in the plow C, when arranged to operate in connection with the curved arm J, substantially in the manner as and for the purpose specified.

63,048.—EDWARD HISERODT, Washington, Ill.—*Railroad Crossing.*—March 19, 1867.—A cast-iron chair is used at each angle; the base rests on the timbers and supports the rail, a lip on the chair sustaining the outside of the rail. No lip is on the inside, but free course is afforded for the flanges of the wheels. Horizontal bolts secure the rails to the outer lip.

Claim.—The peculiar form and arrangement of the crossing chair, with the lip outside of the rail holding it to its position, with the omission of the lip on the inner side of the rail and the application of the cleats h, as and for the purpose described.

63,049.—HUMPHREY HOLDEN, Hartford, Conn., assignor to himself and A. S. BARBER, same place.—*Car Coupling.*—March 19, 1867.—The bumper has springs on the four sides of its horizontal opening sustaining a block, which is pressed forward by a spring and has in its forward end an opening to receive the link; the slide acts as a support for the pin and releases it upon the entrance of the link.

Claim.—The combination of the draw head A with the block E, springs G and F, and the link B and pin C, said parts being arranged for use substantially as set forth.

63,050.—HENRY HOWE, Oneonta, N. Y., assignor to himself and E. R. FORD, same place.—*Cultivator.*—March 19, 1867.—The cultivators are separately suspended from the elevated frame of the carriage by rods and chains. The plows are elevated by chains and pivoted levers, which maintain their position by vibrating the centers of suspension past the centers of oscillation. A horse is hitched to each plow.

Claim.—First, the pendants D and the manner of securing them to the plow beams and frames, substantially as and for the purpose shown and described.

Second, the bars E, in combination with the plow beams E and pendants D, substantially as and for the purpose herein shown and described.

Third, the combination with the tongue F and driver's seat G of the plow beams E, swivel braces e, and doubletree H, substantially as and for the purpose herein shown and described.

Fourth, the slotted tongue F, made substantially as and for the purpose herein shown and described.

Fifth, the levers I and chains h, for the purpose of raising the plows out of the ground and retaining them in that position, substantially as herein shown and described.

Sixth, the upright side frames B, as arranged and connected with the horizontal cross-bars C and C',

substantially as and for the purpose herein shown and described.

63,051.—FLEURY HUOT, Perth Amboy, N. J., assignor to himself and JOHN ROGERS, New York, N. Y.—*Refining Petroleum, &c.*—March 19, 1867; antedated September 19, 1866.—The centrifugal filtering apparatus has two thicknesses of woollen material with sheets of filtering paper between them, attached to the wire gauze sides of the apparatus. The oil is mixed with bone black and fed into the apparatus in the ordinary manner.

Claim.—First, separating the bone black and impurities from the oil, by filtering the same through a centrifugal filter, as specified.

Second, the centrifugal filter, formed of two thicknesses of cloth with sheets of filtering paper between them, as and for the purposes set forth.

63,052.—C. B. HUTCHINSON, Auburn, N. Y.—*Machine for Setting Staves in Barrels.*—March 19, 1867.—The chine hoop is suspended by clamps over a concave table which holds the head in position to receive the staves which form the barrel. When the hoop is driven on to hold the staves in place on the head, the clamp is withdrawn and the barrel removed from the table.

Claim.—First, the setting up of barrels, casks, &c., by suspending the chine hoop by means of a clamp, or its equivalent, in such relation with the head, which is placed on a suitable frame or support, that the ends of the staves may be inserted between the head and chine hoop, substantially as shown and described.

Second, the adjustable table D, constructed with a concave upper surface, and of a diameter smaller than that of the barrel, for the purpose described, substantially as specified.

Third, the combination of the clamp frame or support and gauge, when arranged substantially as and for the purpose set forth.

63,053.—SAMUEL JACKSON, Newark, N. J.—*Compensating Brace for the Springs of Vehicles.*—March 19, 1867.—The compensating stay is attached at the foot of the spring by a joint and connects by a pivot to the bar above, bracing the spring from a forward lurch of the vehicle. The bar slides in a guide at its foot.

Claim.—The application to the springs of wheel vehicles of a stay or brace, arranged as shown and described, or in an equivalent way, to compensate for the yielding movement of the spring.

63,054.—W. W. JACOBS, Hagerstown, Md.—*Burning Fluid.*—March 19, 1867.—Composed of gasoline, 40 galls.; pine gum, 1 lb.; ground bark of sasafrafs root, $\frac{1}{2}$ lb.; gamboge, $\frac{1}{2}$ lb.; and galbanum, $\frac{1}{2}$ lb.

Claim.—A fluid composed of the ingredients hereinabove named, mixed together in and about the proportions described, and for the purpose specified.

63,055.—BARTON H. JENKS, Bridesburgh, Pa.—*Treadle cam for Looms.*—March 19, 1867.—Improvement on the patent of Richard Garsed, dated July 20, 1846, and extended July 18, 1860. The diagonal portion of the cam grooves which give sliding movement to the treadle cams are in a removable segment, so as to admit of changing the automatic devices to work more or less treadles.

Claim.—Constructing the grooved hub of a treadle cam C of two parts, substantially in the manner and for the purpose described.

63,056.—SAMUEL KEELER, Lancaster, Pa.—*Seed Drill Teeth.*—March 19, 1867.—The teeth are connected by curved arms to spiral springs which are attached to the drag bars. The recoil of the spring enables them to resume their positions after passing obstructions.

Claim.—The arrangement and combination of the curved arm J with the spiral spring M, operating as herein described and for the purposes set forth.

63,057.—PHILIP H. KELLS, Adrian, Mich.—*Brick Machine.*—March 19, 1867.—The pressure of the two pug mills upon the opposite sides of the mold disk makes a counterbalance. The clay passes beneath inclined throat pieces which pack it into molds and remove the superfluity.

Claim.—First, the combination of the annular mold bed B and the central support C, substantially as described and represented.

Second, the arrangement of the throat piece *d* above the molds, operating to pack in the clay and remove the superfluity, substantially as described.

Third, the arrangement upon the mold wheel of the two pug mills on opposite portions, substantially as described.

63,058.—T. J. KINDLEBERGER, Eaton, Ohio.—*Water Wheel.*—March 19, 1867.—Improvement on his patent July 11, 1865. By the intervention of a spiral spring in the rod which attaches the gate to the annular plate, any particular gate which is obstructed may remain open without preventing the closing of the other gates.

Claim.—First, the wheel, having its plates and their buckets, constructed and arranged as herein described.

Second, the combination and arrangement of the plate C, arm D, worm wheel E, and bevel gear with the hand wheel F, for operating the gates as set forth.

Third, the combination of the rod *a*, box *b*, and spiral spring *m*, with the set screw *o*, arranged to operate as and for the purpose set forth.

Fourth, constructing the crown plate B with the recesses or notches in its periphery, as shown and described, the outer points of said plate being arranged to protrude even with the periphery of the annular rim A, as and for the purpose herein set forth.

Fifth, constructing the gate H with the outwardly projecting arm *r*, for the purpose of attaching the spring box *b* thereto, as shown and described.

63,059.—CHARLES KINKEL, New York, N. Y., assignor to ALEXANDER WEHLE, same place.—*Plow.*—March 19, 1867.—The nose of the beam is adjustable on the wheel frame vertically and longitudinally by devices mentioned in the claims.

Claim.—First, the general construction of the plow, consisting of the plow frame C in connection with the axle D, the plow beam B, screw tree F, and shaft H, substantially as described.

Second, the plow frame C, in combination with the screw tree F and universal joint G, substantially as set forth.

Third, the universal joint G applied to the plow beam B and screw tree F, substantially as described.

Fourth, the movable axle D in combination with the plow frame C, substantially as described.

Fifth, the application of the improvement to plows of the usual construction, by means of the cast-iron shoe R, substantially as described.

63,060.—A. O. LATHAM, Wheeling, W. Va.—*Bookkeepers' Ruler.*—March 19, 1867.—The main ruler has an extended lip on one side to prevent the contact of ink with the paper, and is longitudinally slotted to receive the ruler bar.

Claim.—The combination of the secondary ruler B with the main ruler A, the former swiveling upon a pin at or near the cutter of the latter, substantially as and for the purpose specified.

63,061.—W. H. LAUBACH, Philadelphia, Pa., assignor to himself and W. S. COOPER, same place.—*Low Water Indicator.*—March 19, 1867.—The falling off of the float releases the pawl which supports the weighted lever; this descending, opens the valve and admits steam to the whistle.

Claim.—First, the weighted lever E, controlled by a float or weight *g*, and having a projection adapted to a catch or hook on the end of the lever D, in combination with the pawl *k*, arms *e*, weighted arm *c'*, and whistle H, the whole being arranged and operating substantially as and for the purpose herein set forth.

Second, the weight or float *g* and its projections *y*, arranged to operate in the interior of the glass tube B, as and for the purpose herein described.

63,062.—PETER LAWYER, Richmondville, N. Y.—*Carpenters' Gauge.*—March 19, 1867.—The friction plate is held down by a spring depressed by the cam.

Claim.—The combination of the cam lever E, lever spring D, plate C, flanged and slotted metallic eye B, substantially as described, for the purpose specified.

63,063.—Cancelled.

63,064.—JACOB B. LINDEMAN, Manor Twp., Pa.—*Harness.*—March 19, 1867.—The breeching and its stay strap are attached immediately to the shafts instead of being attached to the other portions of the harness.

Claim.—The combination and application of the breeching A and stay strap B, when affixed to the shafts of a vehicle, in the manner and for the purpose specified.

63,065.—S. C. MAINE, Boston, Mass.—*Wardrobe Bedstead.*—March 19, 1867.—The case containing the bed is attached to a rotary shaft whose spring acts as a counterpoise to the weight of the bed. The upper portions of the molding in front of the case drop by their own weight into position and form legs for the bedstead.

Claim.—The balance spring a, or its equivalent, attached to shaft b by chains, or their equivalent, in combination with frames or cases, as shown in Figs. 1 and 2, and operated substantially as set forth.

63,066.—DAVID MANUEL, Boston, Mass., assignor to himself and WILLARD MANUEL, same place.—*Bed Bottom.*—March 19, 1867.—The springs have a coil at each end and are connected by hooks to the slats; the curved sides first receive the pressure and yield before affecting the coils which are affixed to the rails.

Claim.—The arrangement of the compound wire springs, having spiral ends a a, attached to the frame of the bedstead A and held by the cords b b, and having also long curved sides c c, connected with the slats B by the hooks d, formed, combined, and operating substantially as and for the purposes herein described.

63,067.—JOHN W. MARTIN, Washington, D. C.—*Gate.*—March 19, 1867.—The lower edge of the tubular post resting on a spirally-inclined surface, the gate revolves thereon and shuts by gravity.

Claim.—First, the combination of the tubular portion E with a step F and pintle J, said parts E and F being constructed with spirally-inclined abutting surfaces and applied to a gate post, substantially in the manner and for the purposes described.

Second, in combination with the spirally-inclined tubular portion E and the step F formed of cast or hardened metal, the wrought-metal pin J, substantially as and for the purposes described.

63,068.—H. B. MASSER, Snubury, Pa.—*Ice Cream Freezer.*—March 19, 1867.—The can and the beater may be revolved either together or separately. The perpendicular arms of the beater have rubber strips, which, conforming to the irregularities of the metal can, remove the film which settles thereon.

Claim.—First, the device of a catch k, or its equivalent, for locking and unlocking the beater shaft h in combination with the gear wheel b, by means of which separate or alternate motions may be given to the beater and the freezing can A, or both together, arranged and operating substantially as and for the purposes herein described.

Second, the india-rubber packing m m, fitted on the edge of the beater wing g, arranged and operating substantially as and for the purpose specified.

63,069.—A. S. McCURE, Duncannon, Pa.—*Railway Joint.*—March 19, 1867.—The fish-rail overlaps the joint of the main rails and the outer flange of each is cut off for a short distance and supplied by a projecting flange of the fish-rail. The latter is bolted through longitudinal slots in the main rails to the fish-plates on the opposite side.

Claim.—The construction of the ward rail B, when fitted into the flanges of the main rails A and fastened and supported by the guard plate C, as herein described and for the purposes set forth.

63,070.—BICHARD McDOWELL, Lambertville, N. J.—*Car Axle Box Cover.*—March 19, 1867.—Flanges in counterpart recesses on the opposite parts allow the cover to slip on. A partial rotation interlocks the flanges and the cover is held in position by a weighted handle.

Claim.—First, an axle box having a projecting ring in front, provided with tapering flanges b receiving the cap B, with corresponding flanges c having an

operating weighted handle d, in the manner described, for the purpose specified.

Second, the weighted handle d arranged on the cover B, for the purpose of holding the same in position, substantially as herein shown and described.

63,071.—JAMES P. McLEAN, Brooklyn, N. Y.—*Piston Packing.*—March 19, 1867.—The cork and india-rubber are combined so that the former is brought in contact with the bearing surface and the rubber is used as a follower to expand as the cork is worn away. Radial plates of soft metal separate the packing into sections. For rod packing it may be bound with a ribbon of soft metal.

Claim.—Combining the cork C, rubber R, with or without the mineral coating, and securing the same by means of metallic strips, all substantially as described and for the purpose set forth and shown in the drawing.

63,072.—JAMES P. McLEAN, Brooklyn, N. Y.—*Piston Rod Packing.*—March 19, 1867.—The lower annular plate has an inner inclined surface, and its base is exposed to a pressure of steam from perforations in the cylinder head. The upper annular plate has an outer inclined surface, and an upper plane surface to receive the impact of the follower. Between the inclined surfaces is interposed a sheet of fibrous material.

Claim.—Packing the piston rod or shafting R of a steam engine with the steam by means of the sectional rings N N', pad C C, and steam ports U U, constructed and operated substantially as described and shown in the accompanying drawings.

63,073.—JAMES P. McLEAN, Brooklyn, N. Y.—*Packing for Manholes of Steam Generators.*—March 19, 1867.—The packing consists of layers of cork and rubber coated with asbestos or other incombustible material.

Claim.—The cork diaphragm (or rings) or sections thereof, coated with a non-combustible substance, for the purpose substantially as described and shown in the accompanying drawings.

63,074.—JOHN MEGOWN, New London, Mo.—*Churn.*—March 19, 1867.—Motion is communicated from the belt on the pulley of the hand-crank shaft to a pulley on the dasher-crank shaft, which is adjustable in a slot of the standard, and has two cranks projecting in opposite directions to actuate the two dashers. The frame is attached to the hinged lid, and may be raised and thrown back with it.

Claim.—First, the combination and arrangement of the pulleys F G and band L, or their equivalent, shafts H J, cranks I K, standard E, and hinged lid D, with each other and with the dasher handles P, churn B, and frame C, substantially as described and for the purpose set forth.

Second, the combination of the box or cap M, bolt N, and nut O, with the shaft J and standard E, substantially as described and for the purpose set forth.

63,075.—J. B. J. MIGNON and S. H. ROUART, Paris, France.—*Apparatus for Compressing Air.*—March 19, 1867.—The two receivers for the exhaust or compression of air are mutually connected, and also communicate by pipes with an upper and lower water vessel. The action is by gravity, the column of water above one vessel acting to compress the air, and the pipe leading from the lower one to attenuate the air therein by the weight of its vertical column. Stop-cocks govern the ducts.

Claim.—First, the herein-described apparatus for obtaining the compression or exhaustion of air, the same consisting of one or more reservoirs into and from which the compressing and exhausting agent is conducted, so as to compress or exhaust the air within the same by means of supply and exhaust pipes and regulating valves, arranged and operating substantially as shown and set forth.

Second, the combination with two or more reservoirs, arranged as described, of the air and water supply and exhaust pipes and their operating valves, connected with the said reservoirs, in such manner as to effect the continuous compression or exhaustion of air, substantially as specified.

Third, the combination with one or more air-compressing reservoirs, as described, of a hollow pillar or other tubular receptacle for the despatches, or other

objects to be transmitted through the tubing, under the arrangement and for operation as herein set forth.

63,076.—JOHN MILLER, Buffalo, N. Y.—*Bung for Casks, Barrels, &c.*—March 19, 1867.—The bushing is screwed in the bung hole, and is enlarged at its inner end. A plug surrounded by packing is inserted, and the latter is condensed against the wall of the bush as the plug is partially withdrawn. A socket in the upper end of the plug has an elongated opening and a cavity within. The handle has a T-head which enters the plug, and being turned 90° catches the shoulder and enables the plug to be drawn into the bushing.

Claim.—First, the metallic box A, expanding inwardly to receive the plug B, when employed as a lining for bung holes, and constructed substantially as described.

Second, the plug B, when provided with the head *h* and enlarged end *g*, and combined with the packing ring F and box A, substantially as set forth.

Third, the handle and driver K, constructed and operating with the other parts, as described.

63,077.—RICHARD MONTGOMERY, New York, N. Y.—*Curved Corrugated Steel Plate.*—March 19, 1867.—Explained by the claim.

Claim.—As an article of manufacture curved corrugated steel for the construction of steam chimneys, furnace and flues for steam boilers, and for other purposes, substantially as described.

63,078.—JOHN MORTON, Winchester, Ind.—*Rail-road Track Lifter.*—March 19, 1867.—The frame has wheels for removal on the track. The claws take under the rails, and are raised by the compound levers.

Claim.—First, a combination of levers E and G, fulcrum D¹ and D², and hooks F, constructed and arranged to operate substantially in the manner and for the purpose set forth.

Second, the combination of the crossed levers E and slotted adjustable hooks F, substantially in the manner and for the purpose set forth.

63,079.—JOHN I. MUNROE, Burlington, Mass.—*Hay Rake.*—March 19, 1867.—The divider clears a space in front of the teeth onto which they descend after discharging the hay, preventing the dragging of scattered hay behind the rake.

Claim.—The combination of the divider J K L M N, chain R, or equivalent lever P, teeth E, and frame of the rake with each other, substantially as herein shown and described and for the purpose set forth.

63,080.—ISAAC H. NEWTON, Oakfield, Mich.—*Saw Mill.*—March 19, 1867.—A pendent toggle lever has a timber hook to take under the log and turn it. The tilting blocks act as abutment slides to the log in turning, and are raised by cams on a rocker shaft, which is put in motion by a clutch. A pulley on this shaft has a cord which operates the toggle lever. The claw of a slide bar engages the lower side of the log, and acts simultaneously with the other devices.

Claim.—First, the hook M, suspended from the bent or loaded lever L, in combination with the operating mechanism for turning the log upon the carriage, substantially as herein set forth.

Second, the tilting blocks D, furnished with inclined or cam-shaped ends *d*, and combined in relation with the sliding blocks E and frame J, substantially as herein set forth for the purpose specified.

Third, the rock shaft H and cams G, in combination with the sliding blocks E and tilting blocks D, and frame J, substantially as herein set forth for the purpose specified.

Fourth, the arrangement of the bent lever L, hook M, and cord N, with reference to each other and with the wheel P, and rock-shaft H, substantially as herein set forth for the purpose specified.

63,081.—MILTON V. NOBLES, Elmira, N. Y.—*Boat Detaching Tackle.*—March 19, 1867.—The triangular jointed frame by which the boat is steadily supported is hinged to fall on the deck when out of use.

Claim.—First, in combination with a boat-detaching apparatus, a bail, bar or brace connected to the sides of the boat, so as to prevent the boat from tipping when unevenly loaded, substantially as described.

Second, hinging the bails by which the boat is steadied, at the sides, so that when let go or disconnected they will drop and lie upon the decks, and thus not incommode or endanger the passengers or crew, as described.

63,082.—MILTON V. NOBLES, Elmira, N. Y.—*Boat Detaching Tackle.*—March 19, 1867.—The boat is suspended on jointed rods that extend a distance above the level of the gunwale, and have lateral brace rods to insure steadiness. The ends of the boat are simultaneously detached from the davits by withdraw ing sister bolts attached to a common rock-shaft amid ships.

Claim.—The combination of the detaching apparatus with the brace, and with the central suspension of the boat, as and for the purpose herein described and represented.

63,083.—BENEDICT OTT, La Crosse, Wis.—*Clothes Tongs.*—March 19, 1867.—The tongs are used for handling clothes in lifting from the wash boiler or rinsing. The spring tends to open them, and the jaws are closed by the grasp upon the divided handle.

Claim.—The legs A and handle B, with blades formed at right angles to them, pivoted together at *a*, and provided with the spring *b*, which holds the legs A open, constructed and arranged as herein set forth.

63,084.—ALFRED PARAF, Mulhouse, France.—*Dyeing and Printing Textile Fabrics, and Com-pounds therefor.*—March 19, 1867.—A compound is formed by dissolving arsenious acid in glycerine, and is used in connection with acetate of alumina, &c., in fixing the aniline colors in dyeing.

Claim.—First, as a new article of manufacture, the arsenite of glycerine, hereinabove described.

Second, the combination, in the operation of dyeing or printing on textile fabrics or yarns, of the arsenite of glycerine, coal-tar color, and acetate of alumina, magnesia, or other metallic oxide, substantially as and for the purpose hereinabove set forth.

63,085.—FRANCIS R. PEARSON, Germantown, Pa.—*Spinning Jack.*—March 19, 1867.—The friction motion is made subsidiary in assisting the operator in working the jack by allowing the said motion to operate without moving the twist gearing. The shifter bar is not positively connected to the levers which actuate it, but the usual slot in the bar is dispensed with and a spring forces the bar in one direction, a pin thereon being thus caused to actuate the lever connecting with the twist gearing.

Claim.—First, actuating the belt-shifter bar *f* in one direction by means of the twist gearing, and in the other direction by the spiral spring, the whole combined and arranged substantially as described and for the purpose set forth.

Second, the combination and arrangement of the catch *e*, loop *p*, and faller *n*, constructed as described and operated from the front of the carriage, substantially as described and for the purpose set forth.

Third, the combination of the rod *r*, lug *o*, catch *e*, stand *h*, and nut *t*, when constructed as described for the purpose set forth.

63,086.—CARY PEEBLES, Santa Clara, Cal.—*A d-justable Handle for Fruit Boxes.*—March 19, 1867.—The adjustable handle of wire, has prongs and points turned inward to fit the box, which is held by the elastic clasp of the same. It is intended for holding boxes while being filled with berries as they are picked, and then detached; the boxes being shipped.

Claim.—A handle A, constructed with the arms *b b*, and the prongs *c c*, similar to that herein described, substantially as and for the purpose set forth.

63,087.—ANTONIO PELLETIER, Parkersburg, W. Va.—*Composition for Coating Wood, Cloth, Metals, and for Forming Various Articles.*—March 19, 1867.—A fire and water-proof coating for application to wood and other perishable articles.

Claim.—First, the compound, consisting of vegetable fiber, soapstone, silicate of soda, or its equivalent, red lead and litharge, substantially as described and for the purposes set forth.

Second, the compound, consisting of vegetable fiber, soapstone, silicate of soda, or its equivalent, red lead

and litharge, when coated on wood, cloth, leather, brick, stone, iron or other fibrous, porous, or solid substances, and treated with a solution of muriatic acid consisting of one part of the acid to three parts of water, substantially as described and for the purposes set forth.

Third, as a new article of manufacture, the composition substantially as herein described and for the uses and purposes set forth.

63,088.—DAN. PERRY and EDWIN PERRY, Pawtucket, R. I., assignors to ORRIN F. PERRY, North Providence, R. I.—*Hooping Casks.*—March 19, 1867.—The iron band is bent so as to expose both sharpened edges to the parallel circumferential kerfs in the cask, into which it is driven and fastened at the lap.

Claim.—The concave hoop B, fitted permanently in channels or grooves on the outer face of the barrel, tub, pail, or other article made of wood and hooped, substantially as described for the purpose specified.

63,089.—JOHN PHILLIPS, Jr., Chicago, Ill.—*Wood Turning Lathe.*—March 19, 1867.—The hollow fixed mandrel contains a cutting tool which turns the stuff as it is passed through the mandrel. A tool attached to a sliding frame finishes and gives shape to the article turned.

Claim.—First, the cylindrical bearing or holder B, or its equivalent, in combination with the cutters E, arranged and operating substantially as specified.

Second, the arrangement of the cutter G with the cylindrical bearing B, or its equivalent, operating as and for the purposes set forth.

63,090.—JOHN E. PHILLIPS, Philadelphia, Pa.—*Press Strainer.*—March 19, 1867.—The base plate is fastened to a bench, the lower portion of the cylinder is perforated and has a movable cylindrical shield. Strainers of a fineness appropriate to the use are placed within, and the charge is forced through by a hand or screw plunger.

Claim.—The perforated cylinder *d* and band cover *e*, in combination with the disk strainers and a screw plunger and base plate *a*, operated substantially as described for the purposes specified.

63,091.—WILLIAM POMEROY, New York, N. Y.—*Truss.*—March 19, 1867.—From its spring attachment to the main spring of the truss the pad derives an independent upward and inward pressure, which is adjustable in degree and direction.

Claim.—The construction, combination and arrangement of the pad spring F with the pad E and main spring B of the truss, substantially as herein described and for the purpose set forth.

63,092.—THOMAS POWELL, Milroy, Ind.—*Sleeve Supporter.*—March 19, 1867.—Explained by the claim and illustration.

Claim.—The elastic band B, provided at one end with the ring C, through which it passes after encircling the arm above the elbow and having at its lower end the hook D, adapted to catch it in the slit of sleeve as herein described and represented.

63,093.—SEYMOUR RAYMOND, Middletown Pa., assignor to himself and J. CAMPBELL, same place.—*Stove Cover for Cooking Stoves.*—March 19, 1867.—The plates are reversible, so as to expose the sides to the fire alternately, to equalize the warping action of heat thereupon.

Claim.—The reversible pot-hole division plates in the upper plate of a cook stove, constructed and operating substantially as and for the purpose herein described.

63,094.—JOHN T. REESE, Baltimore, Md.—*Stall for Roasting Ores Containing Sulphur, &c.*—March 19, 1867.—The fumes of sulphur, arsenic, &c., from the ores in the furnace are conducted to sinuous and interrupted passages, whose obstructions precipitate the metallic vapor for subsequent uses.

Claim.—An ore stall, with a roof *a* by arch or otherwise; a closed front by doors *b b*; the arrangement of draft ports *d d*, the arrangement of fume ports *e e* and *f f*; the connection of stack *s*, and culvert *h*, with culvert *i*, and main culvert and stack; this process of confined roasting; a long and crooked main culvert;

and the process of securing sediment by the bends, the rough walls or the obstructions in the culverts.

63,095.—ADAM H. RENNIE, Binghamton, N. Y.—*Bedstead Fastening.*—March 19, 1867.—The ends of the rails have pins projecting obliquely downward, which engage counterpart holes in the face of the post. An eccentric pivoted to the latter binds on a pin in the rails, and forms a latch to hold the parts together.

Claim.—The mode of constructing, arranging, and combining oblique dowelled pin joints with the eccentric clasp D, substantially in the manner herein described and represented.

63,096.—ASA R. REYNOLDS, Auburn, N. Y.—*Tempering Steel after being Welded to Iron for Cutting Tools.*—March 19, 1867.—Explained by the claim.

Claim.—Tempering steel that is welded on iron, such as shear blades, plane irons, chisels, axes, or hatchets, and other cutting tools, by means of a reactionary blow, produced by a drop die or hammer, substantially as herein described and represented.

63,097.—ASA R. REYNOLDS, Auburn, N. Y.—*Welding Steel to Malleable Iron and Tempering the Steel by one Operation.*—March 19, 1867.—Explained by the claim.

Claim.—Welding steel to malleable or wrought iron, and tempering the steel by one and the same process or operation, viz: by submitting the two metals in a properly heated condition to the action of a drop die, and the reaction thereof, with the under or anvil die, and the metal held between them, substantially as described.

63,098.—ISRAEL I. RICHARDSON, Delaware, Ohio.—*Fireplace.*—March 19, 1867.—The calorific current passes through lateral reverting flues in chambers formed by recesses in the jambs, whose fronts have perforated doors nearly flush with the other finish of the front of the grate.

Claim.—The arrangement of the open grate A, chambers E recessed in the jamb, and with perforated front doors and reverberating flues D D, as described and represented.

63,099.—JOHN ROSS, Greenville, Mich.—*Fountain.*—March 19, 1867.—The pressure of the descending column of water causes the jet, and the water is raised again to repeat the duty by means of the pump attached.

Claim.—The combination and arrangement of the receiver D, chambers A and B, jet pipe *b*, pipe *c*, air pipe *d*, pipe *e*, pump E, pipe *f*, stop cocks *g h* and *i*, substantially as described for the purpose specified.

63,100.—JOHN H. ROWLEY, Fabius, N. Y.—*Fence.*—March 19, 1867.—The panels are connected in line by a sliding bar, and are laterally braced by a hinged bar, which is set on either side of the fence, as required, and at any inclination.

Claim.—The arrangement of the panels A A with the braces E E, adjustably hinged to the said panels and the sliding bar D, the several parts being constructed and used substantially in the manner and for the purpose herein specified.

63,101.—C. W. ROYSE, Peterborough, N. H.—*Towel Rack.*—March 19, 1867.—The rectangular rack is hung in legs projecting from a plate fastened to the side of a room. The arm and set screw hold it in position.

Claim.—The frame C, hung in projecting pieces E of a block or plate F, in combination with the arm G, having set or thumb screw H, substantially as and for the purpose described.

63,102.—JOHN A. RUSS, Springfield, Mass.—*Pocket Implement.*—March 19, 1867.—The checks form a rasp and tweezers, and pivoted between them are pieces which form a knife blade, screwdriver, rule, ear spoon, calipers, crochet hook, and dividers.

Claim.—As a new article of manufacture, the instrument herein described, consisting of the various tools mentioned, combined and arranged substantially as herein set forth.

63,103.—M. L. SALYARDS, Troy Grove, Ill.—*Fence Gate.*—March 19, 1867.—The gate is double, the parts are opened or closed simultaneously by pulling on the cords on either side of the gate.

Claim.—First, the peculiar arrangement of the ropes D D, in combination with the gates B B, substantially as and for the purpose described in the foregoing specification.

Second, the peculiar arrangement of the ropes H H and I I, in combination with the gates B B, substantially as and for the purpose described.

Third, the posts G G and weights M M M M, in combination with the gates B B, substantially as and for the purpose described.

Fourth, the rollers C C C C, in combination with the gates B B, substantially as and for the purpose described in the foregoing specification.

63,104.—LOUIS SCHOERKEN, Köln, Prussia.—*Match Box.*—March 19, 1867.—The drawer slides out of its open-ended case, and strains the cord which opens the lid of the drawer as soon as the latter has been sufficiently retracted. It is shut again by contact with the case as the drawer is returned.

Claim.—Connecting the hinged part D of the cover C of an inner sliding box with the back a of an outer case by means of an elastic band or strap, substantially as and for the purposes described.

63,105.—DANIEL M. SECHLER, Cincinnati, Ohio.—*Cotton Bale Tie.*—March 19, 1867.—One end of the hoop is looped around one side of the buckle, and the other end around one side of the guard of the smaller quadrilateral piece; the latter is then passed through the wider gap in the buckle, and being slipped underneath is retained by the latter.

Claim.—The arrangement of the buckle A, constructed with notched slot 4 5, and the loop B, adapted and proportioned to engage with the buckle, substantially as described and represented.

Also, the loop B for attachment to one end of the hoop, and adapted to lock within a buckle or equivalent device on the other end of the hoop.

63,106.—GEORGE SELSOR, Philadelphia, Pa.—*Nail Hammer.*—March 19, 1867.—Between the "pein" and the claws is a recess, in which a nail may be held to start it in the lumber; the other parts are effective for their specific duties.

Claim.—First, the combination, substantially as described, of the claws c, with the "pein" of a hammer, for the purpose specified.

Second, the groove x in the "pein" beneath the claws, for the purpose described.

63,107.—IRA W. SHALER, Brooklyn, N. Y.—*Clothes Sprinkler.*—March 19, 1867.—One side of the chamber has a relatively large hole for admitting water, and the other has smaller holes, which emit it in fine jets.

Claim.—As a new article of manufacture the dampener described, when constructed substantially as set forth.

63,108.—P. SHAW and E. S. DAWSON, Syracuse, N. Y.—*Pad Plate for Harness.*—March 19, 1867.—The screw shank of the check-rein hook and the terrets pass through the steel cover and the strengthening plate, which are riveted together, and furnished with perforations for attachment to the leather accessories.

Claim.—As an article of manufacture the pad plate herein described, the same consisting of the struck-up plate of steel A, strengthening plate of malleable iron B, combined and provided with the loop G, substantially as and for the purpose specified.

63,109.—JULIUS SHELTON, New York, N. Y., assignor to himself and W. C. GRISWOLD, same place.—*Hat Blocking Machine.*—March 19, 1867.—Improvement on the patent of Joseph De Lamar, in respect of making the parts of the machine adjustable to the size and depth of the hat under treatment; in the apparatus for opening, closing, and giving the proper pressure to the clamps which perform the stretching of the brim. The hat body is placed on the machine; the ring is raised which closes the clamps; the ring which determines the size of the hat

is brought down upon the hat body; the clamps are raised, flattening out the brim; and lastly, the crown is stretched.

Claim.—First, the bars f, provided with notches g', for the purpose of adjusting said bars to all depths of hats, substantially as described.

Second, the slides l, provided at one end with pins g, which act as the fulcra of bars f, and having their inner ends so arranged with the cone n as to be adjustable, substantially as described.

Third, the ring k, provided with a surrounding elastic cushion to adapt it to the two functions of breaking the band and giving the pressure to the clamps, substantially as described.

Fourth, the ring p, disconnected from but arranged to operate the clamps i, substantially as and for the purpose specified.

63,110.—AMOS SHEPARD, Plantsville, Conn.—*Stove Cover Lifter.*—March 19, 1867.—The lifter has a skeleton socket to receive the end of the wooden handle, which is secured by a screw.

Claim.—First, a cast metal stove-cover lifter with the perforated hollow and notched socket or ferrule, substantially as described.

Second, casting the herein-described perforated hollow socket or ferrule in the manner and by means substantially as described, for the reception of wood handles.

63,111.—JAMES SHOBE, Principio, Md.—*Corn Harvester.*—March 19, 1867.—The machine is designed to be drawn by one horse and to cut two rows at a time, delivering them in vertical gavels upon a platform, from which they are liberated by the driver. The corn is guided to the rotary cutters, conveyed back in a vertical position between parallel, toothed endless bands, the butts sliding in troughs, and is lodged against the arms, which revolve 90° to release the gavel when sufficient has accumulated.

Claim.—The combination of the revolving cutters I I, receiving guides f h, gathering belts m g, standards k b, and cross-arm K K, for holding the gavels, the forked hook catch M, and foot lever R, for liberating, as herein specified.

63,112.—ISAAC B. SIDDLER, Caswell Co. N. C.—*Corn Sheller.*—March 19, 1867.—The ear of corn is held in the hand and brought in contact with the studs on the plate with a longitudinal and rotary movement.

Claim.—The improved corn sheller herein described, composed of the plate A, with teeth b, or their equivalent, the whole arranged to operate substantially as described.

Also, the tooth plate A, in combination with the blocks M N, and base B, or their equivalents.

63,113.—J. D. SMITH, Naugatuck, Conn.—*Window Fastening.*—March 19, 1867.—The metallic thimbles have exterior screw-threads by which they are set in the edges of the sash stile. They form bearings for the spiral spring and sockets for the spring bolt which engages the stop in the window jamb.

Claim.—The combination of the slide bolt C, with the thimbles D D', provided with screw-threads on their exterior surfaces, substantially as and for the purpose herein set forth.

63,114.—JOSEPHINE STEWART, Owosso, Mich., administratrix of the estate of R. L. Stewart, dec'd.—*Saw Mill.*—March 19, 1867.—Improvement on the patent of R. L. Stewart, February 9, 1864. An arm is pivoted to a horizontally working lever which is attached to the top end and center of the pitman so that the saw in its upward reciprocation will be forced back from the timber and avoid friction, being drawn forward to the timber in its effective stroke.

Claim.—The pitman F, pivoted at its center to the pivoted arms G, at its outer end, to the arm d, and at its inner end to the pitman D, constructed and operating substantially as described, for the purpose specified.

63,115.—A. H. TAIT and JOSEPH W. AVIS, New York, N. Y.—*Apparatus for Distilling Petroleum.*—March 19, 1867.—The still is divided by partitions, pierced by communicating openings guarded by gates. The first and last compartments of the still are immediately connected by a pipe which serves to equalize

the gravity of their contents when required. The intercommunicating apertures are below for liquid and above for vapor; the latter passes to condensers and the heavy residuum of the former to coking retorts.

Claim.—First, the arrangement of partitions *a*, in the still *A*, said partitions being provided with apertures *c* at or near their bottoms, and with apertures *d* at or near their tops, substantially as and for the purpose described.

Second, placing the apertures *c* at or near the bottoms of the partitions *a*, in a zigzag position, substantially as and for the purpose set forth.

Third, the arrangement of valves *e e'*, in the top parts of the partitions *a*, substantially as and for the purpose described.

Fourth, the arrangement of two or more condensers *C C'*, in combination with the compartments *b b' b'' b'''*, of the still *A*, and with valves *e e'*, regulating the communication between said compartments, substantially as and for the purpose set forth.

Fifth, the equalizing pipe *n*, in combination with the compartments *b b'*, of the still *A*, substantially as and for the purpose described.

Sixth, the gates *i i'*, in combination with the compartments *b b' b''*, of the still *A*, substantially as and for the purpose set forth.

Seventh, the combination of coking or tar retorts *E E'*, with a still *A*, divided into a number of compartments *b b' b'' b'''*, substantially as and for the purpose described.

63,116.—A. H. TAIT and JOSEPH W. AVIS, New York, N. Y.—*Process and Apparatus for the Fermentation of Saccharine Liquids.*—March 19, 1867.—The hot mash is forced into a tun by a pump. A current of cold air is forced through a refrigerator and into the mash by an air pump. When the mash has been cooled the air is exhausted from the tun and the mash is allowed to ferment. A current of steam is let into the tun to distil off the low wines.

Claim.—First, effecting the fermentation of saccharine solutions or liquids in vacuo.

Second, the arrangement of the force pump or fan blower, in combination with a suitable refrigerator and with the fermenting tun for the purpose of cooling the wort, as set forth.

Third, the arrangement of a steam pipe, in combination with the tun *A*, refrigerator or condenser *C*, and receiver *D*, substantially as and for the purposes described.

63,117.—JOSEPH THOMAS, New York, N. Y.—*Braiding Attachment for Sewing Machines.*—March 19, 1867.—The plate through which the braid is passed is attached to the top surface of the table and directly under the needle. The frame lies loosely on the table and may be turned in all directions for stitching the braid to the cloth as the pattern may demand; the cloth is stretched upon rollers.

Claim.—First, the arrangement of the plate *m*, forming part of the braiding plate *A*, and capable of opening and shutting to facilitate the passing in of the braid, and provided with a groove *s*, on its underside to guide the braid, the whole being constructed in the manner and for the purpose set forth.

Second, the arrangement and use of the frame *D*, with rollers *B* and *B'*, or their equivalent, at the ends, and the manner of stretching the material upon the same, for the purpose substantially as described and set forth.

63,118.—H. TYLER, Gaines, N. Y.—*Pump Valve.*—March 19, 1867.—The valve stem is guided by a cross-rod and bridge piece, through both of which it passes. The valve has a certain liberty of play on the rod which allows it to adjust itself to its seat.

Claim.—The valve *N*, attached to the end of the sliding rod *L*, by means of the nut *d*, so as to permit the said valve to play on the rod as herein described, piece *M*, and guides *b b'*, when all are constructed and arranged as herein set forth.

63,119.—JACOB B. VAN DERWERKER, Cobleskill, N. Y.—*Hop Frame.*—March 19, 1867.—To the posts are pivoted arms which are inclined against the neighboring post to conduct the bines thereto.

Claim.—A hop frame, composed of the vertical stakes or poles *A*, and inclined bars *B*, the latter

being connected to the former and arranged relatively therewith, substantially as shown and described.

63,120.—RICHARD VOSE, New York, N. Y.—*Window Sash Supporter.*—March 19, 1867.—The sash stop engages a rack in the jamb and is withdrawn either by a pin projecting through a slot in the face of the sash, or by the turning of the thumbscrew, to which it is connected by rod and crank.

Claim.—A thumb piece and crank united to form one piece, when supported by a simple divided plate *C* upon a window sash and combined with a spring catch upon the edge or side of said sash by means of a connecting cord or wire, all substantially in the manner and for the purpose herein set forth.

Also, the combination of a pin *r* with a spring catch *e*, as herein described, when said pin is made to project in or through a slot cut in the sash, all substantially as and for the purpose herein set forth.

63,121.—JAMES WALKER, Cincinnati, Ohio.—*Boot Jack.*—March 19, 1867.—The jaws slide inward when force is applied and bite the boot.

Claim.—A self-adjusting boot jack composed of the two jaws *D D'*, with the curvilinear slots *E E'*, sliding between two plates *A* and *B*, so as to be closed by the action of withdrawing the foot from the boot, substantially as set forth.

63,122.—THEODORE WALLIS, A. B. MATTOON, and CHAUNCEY E. TUTLER, Auburn, N. Y.—*Attaching Thills to Wagons.*—March 19, 1867.—The thill iron slips into its socket, entering downward and forward, and the slide block which prevents its retraction is fastened by a screw-bolt.

Claim.—The shackle *A*, when provided with a receptacle as described, in combination with slide *C*, as constructed, and both being employed in the manner and for the purpose set forth.

63,123.—AARON WARR, Lockport, N. Y.—*Instrument for Drawing Ellipses.*—March 19, 1867.—The pair of dividers has an adjustable bifurcated brace to steady one foot, while on the other foot is a jointed pen or pencil carrier whose sleeve slips upon the leg as the pencil revolves around the leg and traces the line of the ellipse, the foot setting in the intersection of the transverse and conjugate diameters.

Claim.—The combination with a pair of dividers of the pen and pencil carrier *f*, jointed to a sleeve *e*, or equivalent, which enables the device to slide up and down and turn upon the inclined bar or leg *B* of the dividers, arranged and operating substantially as set forth.

Also, in combination therewith, the double brace *C*, consisting of the legs *h h'*, collar *z*, and set screw *n*, substantially as and for the purpose specified.

63,124.—C. WATERMAN, New York, N. Y.—*Burglar Alarm.*—March 19, 1867.—The trigger is pivoted to an arm on the door and on the opening of the latter is disengaged from the hammer, which makes an alarm by rapid strokes upon the bell. The trigger falls, so that in closing the door again it does not arrest the alarm.

Claim.—First, the rod *G*, connected by a pivot or any suitable joint, to the arm *F*, on the door *A*, and arranged in relation with the hammer rod *B* of an ordinary bell alarm, to operate in the manner substantially as and for the purpose set forth.

Second, the hook or fastening *C*, in combination with the hammer rod *B*, and the other rod *G*, substantially as and for the purpose specified.

63,125.—DAVID N. WILLIAMS, Chicago, Ill.—*Apparatus for Drawing Iron from the Fire.*—March 19, 1867.—The windlass has a pulley and transversely-movable support secured in the floor. Its object is to operate tongs to draw heated iron from the furnace.

Claim.—The sliding drum *G* in combination with the traveler *C*, chain *E*, and tongs *F*, all arranged to operate substantially in the manner as and for the purpose set forth.

63,126.—JOHN WILCOX, Thompsonville, Conn.—*Valve.*—March 19, 1867.—The seat is a section of a tube and has exterior grooves for attachment of the

elastic tube of an inflatable life-preserver. One of the threads in the double-threaded upper portion is cut away and a stop piece on the valve stem works therein and is arrested to prevent its being drawn entirely out.

Claim.—A valve, constructed, arranged, and operating substantially as herein shown and described.

Also, the stop arrangement *a b*, substantially as herein set forth, in combination with a screw valve.

63,127.—JOHN WILCOX, Thompsonville, Conn.—*Faucet.*—March 19, 1867.—The down-turned flange around the stem packs against a ring around the thimble in the partition, and the rim of the thimble packs against a ring in a recess of the stem, so as to make a double joint at this part. The upper and lower edges of the shell pack against rings in the cap and socket respectively.

Claim.—The faucet, consisting of the shell *A*, stem *C*, socket *D*, thimble *a*, valve joint *B*, and packing recesses *p*, constructed as herein set forth, for the purpose specified.

63,128.—JOHN B. WILSON, New York, N. Y.—*Veneer Cutter.*—March 19, 1867.—The veneers are cut from straight-grained wood with a knife having a corrugated cutting face, so that the veneer will show a difference of shade when pressed flat.

Claim.—Cutting a crimped or corrugated veneer, substantially as described, for the purpose set forth.

63,129.—PARKER WINEMAN, Chicago, Ill.—*Steam Engine Slide Valve.*—March 19, 1867.—A cup on the back of the valve has a ring which is thrust by a spring against the roof of the chest. A peripheral groove in the ring has a packing which is expanded by steam against the inner wall of the cup.

Claim.—First, the application of a laterally-expandible packing to a ring which is applied within a cup *B* upon the back of a slide valve, said ring being held against the valve chest back by the pressure of a spring alone, while the packing is expanded by the pressure of steam, substantially as described.

Second, the detachable ring *a*, grooved on its circumference and fitted with expansible packing, in combination with the cup *B*, for the purpose of packing a slide valve, substantially as herein set forth.

Third, the combination of the flanged ring *a* and its spring *b*, with the expansible packing and its spring *h*, applied within a cup *B*, and operating substantially as described.

63,130.—HENRY R. FOOTE, Oil City, Pa., assignor to himself, STILLMAN B. ALLEN, and J. H. WINSOR.—*Vapor Generator and Burner for Heating Purposes.*—March 19, 1867.—Improvement on his patent September 18, 1866. A hydro-carbon is supplied from a tank to the retort, which is also supplied with air by means of a force pump and with the gaseous results of steam decomposed by heated iron filings. The combined results are supplied to burners for use in steam generators.

Claim.—First, a retort or vessel *a*.
Second, a tank or means of supporting the retort, with the hydro-carbon oil or liquid.

Third, an apparatus for decomposing steam and introducing its gaseous constituents into the retort.

Fourth, an air pump, or means of forcing air into the retort.

Fifth, means of discharging from the retort and burning the mixture of air, hydro-carbon vapor, and the gaseous constituents resulting from the decomposition of steam, as set forth.

Also, the combination of such combination, and the reservoir *b*, applied thereto and for use substantially as described.

Also, the employment of the vapors of a light and volatile hydro-carbon, as set forth, with the heavier oil, the air and gaseous constituents of steam introduced into the retort, substantially as described, such light and volatile hydro-carbon being placed in the air reservoir *b*, so as to be vaporized therein by the air forced into and through it, or by any other proper means, the vapors of such hydro-carbon being carried by the air from the reservoir into the retort.

Also, the admixture of gas of a hydro-carbon fluid, air, and the gaseous constituents of steam, and their combustion by the means, in the manner, and for the purposes set forth.

Also, the deflector or radiator *g*, constructed as described, and arranged in relation to pipes *f* and elbow *f'*, as and for the purposes set forth.

Also, the combination of the heating coil of pipes *p'*, or its equivalent, with the tank *c*, the retort *a*, a steam-decomposing apparatus, and an air-forcing apparatus, the whole being to operate substantially as set forth.

Also, the arrangement of the oil tank *c*, surrounded with the water jacket *t*, with the retort *a*, a steam-decomposing apparatus, and an air-forcing apparatus, substantially as specified.

Also, the combination of the drain pipe *k* with the retort *a*, the tank *c*, a steam-decomposing apparatus, and an air-forcing apparatus, when combined for use as specified.

63,131.—SAMUEL W. ADAMS, Providence, R. I., assignor to AMERICAN EYELET COMPANY, same place.—*Machine for Making Eyelets.*—March 26, 1867; antedated March 12, 1867.—Improvement on the patent of Jesse F. Richards, October 4, 1864. The strip of metal from which the eyelets are formed is carried on two reels and intermittently fed to the compound punches between them. The "former" die is traversed by a clearing punch to drive out any eyelet accidentally remaining therein. A finger is swung around to discharge the eyelet from the punch on its backward movement. When using a strip of metal wide enough for more than one course of blanks, the perforated portion is trimmed from the side by a cutter during the passage of said strip.

Claim.—First, the improved mode of constructing and operating the compound male cutter 3, former 2, and punch 1, as described, for the purpose specified.

Second, a pair of reels *C*, for holding and delivering, and for taking up the metal strip, in combination with the eyelet-forming instruments, for forming eyelets therefrom, substantially as described.

Third, a pair of sliding clamping jaws, constructed and operating as described, in combination with suitable instruments for forming eyelets from a metal strip, as described, for the purpose specified.

Fourth, in combination with the eyelet-forming instruments, constructed substantially as described, a clipping or trimming mechanism for trimming off the perforated portion of the stock as it passes through the machine, substantially as described.

Fifth, the clearing punch *V*, in combination with the compound female cutter and forming die, substantially as described, for the purpose specified.

Sixth, the clearer *t*, substantially as described, for the purpose specified.

63,132.—FRANK ARMSTRONG, Waterbury, Conn.—*Sewing Machine.*—March 26, 1867.—For attachment to the Wheeler and Wilson machines to render them capable of making the Grover and Baker stitch. The under spool support is beneath the table. The down-curved edge of the cloth plate is not cut away for the looper; the looper curving upward close to the under side of the cloth plate. By the use of this attachment without the bobbin thread a double-thread loop stitch is made, and the bobbin thread may be used in addition to make a three-thread stitch.

Claim.—First, constructing the plate *A* of the attachment with the slot or aperture *B*, whereby the said attachment can be readily adjusted and secured upon the machine and removed therefrom, substantially in the manner set forth.

Second, the combination and arrangement of the under spool support with the said attachment, so that when secured upon a Wheeler and Wilson sewing machine the under thread spool *Y* will be entirely under the front edge of the cloth plate of the machine, substantially as and for the purpose set forth.

Third, the employment, in combination with the slotted plate *A*, of the adjustable slotted plates *E*, substantially in the manner and for the purposes described.

Fourth, the employment of the guide *C'*, in combination with the under thread carrier, tension device, and spool, to allow the latter to be arranged under the cloth plate *d*, and in the position relatively to said thread carrier and tension device, all substantially in the manner and for the purpose herein set forth.

63,133.—GEORGE B. ATWOOD, Philadelphia, Pa., assignor to ALFRED A. OAT, same place.—*Permuta-*

tion Lock.—March 26, 1867.—An improvement on the patent of Alfred A. Oat, July 31, 1866, (No. 56,790.) The bolts are connected by pivoted bars to a central disk upon a shaft which has a diametric slot at its outer end to receive the end rib of a key by which it is rotated to retract the bolts. This disk has concavities at its periphery to receive the edges of four disks, which have each a concavity to allow the rotation of the former disk when they are in the proper position therefor. Each one of this series of four disks is adjustable on a shaft which has an index disk at the outer side of the door, and an adjustable cam by which the bolts that lock the keyhole plug are withdrawn. The bolts are connected to the central disk and are simultaneously retracted by its rotation.

Claim.—First, making the plug B cylindrical and with an annular groove b^2 therein, substantially as and for the purposes described.

Second, the employment of the recessed central disk H for controlling the bolts G, the said disk being constructed and arranged to operate substantially as described.

Third, the employment of the surrounding recessed disks D for the purpose of locking the central disk H, the said surrounding disks D being constructed and operated substantially as described.

Fourth, moving the slides A by means of the respective cams C, substantially in the manner described.

Fifth, operating the inclosed or invisible disks D and cams C by means of the exposed or visible indicating disks E, or their equivalents, substantially in the manner described.

Sixth, the employment of the combination consisting of the recessed disk H, with the four recessed disks D, whereby they reciprocate with each other, in the manner and for the purposes described.

63,134.—WILLIAM J. M. BATCHELDER, Dayton, Ohio.—*Shovel-plow Guard*.—March 26, 1867.—The guard is attached to the post of the shovel plow for raising the lower leaves of tobacco out of the way of the shovel.

Claim.—The shovel-plow guard E, when constructed substantially as herein described and for the purpose specified.

63,135.—JAMES M. BEEBE, Casadaga, N. Y.—*Bee Feeder*.—March 26, 1867.—The feeder is above the hive, and communicates therewith to be warmed thereby. It has two separate compartments with receptacles for water, saccharine solution, and rye flour. A glass pane gives light, and a gate confines the bees when the trays are moved.

Claim.—First, the construction of a bee feeder, with an apartment for sugar liquid and an apartment for water, provided with racks or floats E, and an apartment for flour or other food, with a central passage way C and door H, all combined substantially as described.

Second, a bee feeder, having a central passage way C for the entrance of the bees, slide door H, and glass cover B, for the purpose substantially as described.

63,136.—JOHN B. BRACKETT and WYMAN DEARBORN, Boston, Mass.—*Cotton Gin*.—March 26, 1867.—The cotton passes between the two bars of the clearer and is carried between the pressure plate and the endless belt. The seeds are doffed off by the clearer, which is reciprocated by the oscillation of the pivoted levers from which it depends. The boxes of the lower roller have downward extensions traversed by a rod which extends outside them to engage an adjustable lever at each end, for the purpose of adjusting the tightness of the belt.

Claim.—First, the rolls C C', constructed as described, as arranged with the belt D, in combination with the sliding bearing J and levers j with their variable fulera, substantially as and for the purpose described.

Second, the rolls C C', constructed as described, in combination with the convex pressure bar E and endless belt D, arranged and operating as and for the purpose described.

Third, the arrangement of pressure roll, in combination with belt D, when arranged as described, in connection with rollers C C', and pressure bar E, as and for the purpose described.

Fourth, the arrangement of slotted levers G in combination with clearer F and crank shaft H, and fur-

ther combination of said clearer, levers and crank shaft with rods m, as and for the purpose described.

63,137.—W. BUCHANAN, New York, N. Y., and J. M. TOUCEY, Poughkeepsie, N. Y.—*Steam Generator*.—March 26, 1867.—The fire box is divided into two sections by an inclined water partition, with an aperture through it for the passage of the caloric current. This aperture is surrounded on its upper side by concentric circular pipes with inwardly projecting nozzles to inject air and steam into the gases passing through the opening. The lower section of the box with the lower plate of the partition may be removed without interference with other parts.

Claim.—First, the divided fire box B C, when constructed and arranged substantially as and for the purposes herein set forth.

Second, the arrangement of the fire box by which we are enabled to readily disconnect, remove, and replace the lower portion, as herein set forth and described.

Third, the hollow ring H and its connections, protected from the direct radiant heat of the fire and adapted to throw fresh air and steam into the gases rising through the hole D, or its equivalent, substantially in the manner and for the purpose herein set forth.

Fourth, the steam blow pipe M, with its nozzles m, connection N, arranged as represented relatively to the air pipe H and nozzles h, substantially as and for the purpose herein specified.

63,138.—EDGAR T. CHAPMAN, Middlebury, Ohio.—*Manufacture of Stone Ware*.—March 26, 1867.—The crocks have curved sides, deep cylindrical rims, and nest compactly.

Claim.—A crock constructed as hereinbefore described, being a new article of manufacture.

63,139.—FAYETTE CLARK, Marcellus, N. Y.—*Grain Shovel Handle*.—March 26, 1867.—The swinging handles are attached in positions to bring the weight of grain evenly on both hands to facilitate the shoveling of the same.

Claim.—The principle of putting the labor of handling grain equally upon both hands, it being in shape like the accompanying drawing or any other shape substantially the same, and which will produce the same effect, namely, the placing of the weight of grain equally on both hands.

63,140.—ROBERT COOK, Franklin, Ohio.—*Fender for Corns Plows*.—March 26, 1867.—The fender which keeps clods from the corn is connected to the beam through two serrated disks, which are operated on by a spring attached to the beam.

Claim.—First, the yielding and adjustable fender D, attached to a plow beam by mechanism, substantially as and for the purpose specified.

Second, the construction of the disks C and C' for holding the fender D, operating substantially as and for the purpose described.

Third, the combination of the fender D, disks C and C', with the beam plate A and spring B, arranged substantially as and for the purpose described.

63,141.—J. M. COOMBS, Boston, Mass.—*Combined Name Plate and Letter Slide*.—March 26, 1867.—The name plate is pivoted to flanges on the face of the letter slide, securing it from draft and wet when closed; it is fastened by a spring latch.

Claim.—The combined arrangement, as and for the purposes set forth, of a name plate pivoted to a flange which has a metallic chute fixed thereunto, by which the flange and plate are held to the surface with which the back of said flange is in contact.

Also, constructing the metallic chute in two pieces, each with an exterior flange, and uniting and holding them in their place by means of the spring latch f.

63,142.—CHARLES CROW, Onarga, Ill.—*Scaffold*.—March 26, 1867.—The standards in which the supporting racks slide and the racks themselves are jointed so that the tops of the standards and the bottoms of the racks may be folded to permit the low descent of the platform. The racks are engaged by cog wheels actuated by winches and retained by ratchet wheels and pawls.

Claim.—First, the combination of the jointed rack

H, jointed standards F, and bars *v*, when constructed to operate the platforms L, substantially as set forth.

Second, the combination of the sliding bars T U V, platforms L, and frames A B, substantially as set forth.

63,143.—J. M. DEEN, W. B. BOLDING, and H. PERRY, Dayton, Iowa, assignors to themselves and E. G. WHEATSTONE.—*Hand Power Loom.*—March 26, 1867.—The harness, shuttles and cloth beam are automatically actuated by the movement of the cloth beam. The claim enumerates the devices which are employed for operating the treadles and for driving the picker staffs.

Claim.—First, operating the treadles H H by means of the levers F and G, jointed connecting rod E, the feed hand *b*, and ratchet *c*, with the wipers *d*, arranged and combined with the batten B, in the manner and for the purposes set forth.

Second, the levers L, feed hand *i*, shaft M, and arms N, in combination with the tumblers K, picker staffs I I, and batten B, substantially as and for the purpose set forth.

63,144.—THOMAS B. DE FOREST, Birmingham, Conn.—*Hoop for Skirts.*—March 26, 1867.—Elastic metallic warps are introduced in the manufacture to give additional stability and pliability to the hoop.

Claim.—Hoops for skirts, formed by the introduction of elastic metallic warps in the fabrication of the hoop, substantially as described, as a new article of manufacture.

63,145.—THOMAS B. DE FOREST, Birmingham, Conn.—*Hoop Skirt.*—March 26, 1867.—The lateral movement of the tape on the hoop is avoided by the indentation or enlargement of the hoop at or near the ends of the pocket.

Claim.—Securing the hoop and tape by one or more indentations or enlargements of the hoops, substantially as herein set forth.

63,146.—PETER DEGIVE, New York, N. Y.—*Apparatus for Hatching Eggs.*—March 26, 1867.—A thermostatic rod in the incubator by its contraction or expansion actuates a train of wheels, which govern the damper in the passage, admitting the heat. The object is uniformity of temperature in the incubator.

Claim.—The screw C and rod D, or its equivalent, in combination with the train of gears E, the door or damper G and hatching box K, substantially as and for the purposes described and set forth.

63,147.—JAMES EDGE, Acquackanonk, N. J.—*Seed Planter.*—March 26, 1867.—The seeder is hinged to a barrow, whose wheel actuates the operative mechanism. The seeds are supplied periodically by a revolving perforated disk, which takes the seed from the throat of the hopper. The disk and throat are changeable to vary capacity and rapidity of sowing for different seeds.

Claim.—First, the movable throat *s* at the base of the seed hopper, in combination with the seed-measuring disk *o* (made changeable) and with the seed tube *d*, as and for the purposes specified.

Second, the frame *k*, hinged to a frame *a* and detachable, as shown, in combination with the hopper *v*, wheels *l* and *c*, miter wheels *m* and *n*, and seed-measuring disk *o*, as and for the purposes set forth.

63,148.—PHILIP ELY, New York, N. Y., assignor to J. M. KEEP & Co., same place.—*Steam Motor for Toys.*—March 26, 1867.—A steam engine on the principle of Hero's aeolipile, and revolving with its boiler on a central vertical pivot, is connected by a band with the shaft, on whose platform the toys are displayed.

Claim.—The revolving boiler C, provided at the center of its concave bottom with a conical projection *b*, which is fitted on the rod B, forming the bearing for the boiler, and having at its upper end the arms D, and adapted to bear the strap or band F, by which motion is communicated to the toy E, as and for the purpose described.

63,149.—GEORGE A. FAIRFIELD, Hartford, Conn.—*Feeding Mechanism for Sewing Machines.*—March 26, 1867.—The arrangement is for giving a four-motion feed, and regulating the length of the stitch.

Claim.—The combination of the eccentric H, operating upon a regulating lever K, rocking shaft L, cam M, and feed bar N, or their equivalents, to produce a four-motion feed, substantially as described.

Also, cam M, having an eccentric surface whereby the feed bar is raised and dropped, and hooks or stops for producing horizontal motion in the feed bar.

63,150.—MOSES P. FARNHAM, Janesville, Wis., assignor to himself and DANIEL P. FARNHAM.—*Grate for Stoves.*—March 26, 1867.—The movable fire box is suspended in the fire chamber of the stove, entering at the boiler hole, and its flange resting on the stove top. Its tilting gate is vertically adjustable to change the capacity and to vary the height of the fire.

Claim.—First, the supplemental fire box A, for stoves and furnaces, having a movable bottom or grate D that may be placed on different bearings B, substantially as and for the purposes described.

Second, the general arrangement of a supplemental stove fire-box with grate D, bearings B, flue G, fire grate E, when the whole are constructed and arranged substantially as and for the purposes described.

63,151.—JOSEPH FOWLER, Hartland, Wis.—*Plow.*—March 26, 1867.—A wedge driven beneath a cross pin of the standard above the beam varies the angle formed by the two, and regulates the depth of furrow. A screw bolt passing horizontally through the standard and beam adjusts the end of the latter to and from the land, and regulates the width of furrow slice.

Claim.—First, adjusting the draft vertically by the wedge *n*, beneath the cross pin or T-front end of the plow standard, in combination with the wedge *l* to clamp the standard in the beam, as set forth.

Second, the screw bolt *i*, or its equivalent, fitted as specified, in combination with the standard *e*, introduced in a mortise of the beams, so as to adjust the draft horizontally, as set forth.

63,152.—ANDREW FULLER and FRANCIS J. BRAY, Buffalo, N. Y.—*Pump.*—March 26, 1867.—The rim of the sucker is attached to the pump shaft by elastic strips, which by their elongation allow the sucker to come in contact more effectively with the pump barrel.

Claim.—The elastic strips C B and D, in combination with the staff A and sucker H, substantially as described.

63,153.—GEORGE L. GERARD, New Haven, Conn.—*Bed Bottom.*—March 26, 1867.—The U-shaped spring is rooted to the rail by a clamp bolt, and the slot rests on its free end.

Claim.—The combination of the clamp bolt D with the slotted spring A and the bar C, constructed so as to operate in the manner described.

63,154.—BENJAMIN F. GLADDING, Providence, R. I.—*Rake.*—March 26, 1867; antedated March 10, 1867.—The rake head is formed of two separate pieces of iron, with the teeth riveted through it and through the forked shank.

Claim.—First, constructing the rake head double or of two pieces of metal secured together, substantially in the manner described, for the purpose specified.

Second, the combination of a rake head, constructed as described, and a forked shank, the two parts being united, substantially as described.

63,155.—JOSEPH A. HARRIS, Philadelphia, Pa.—*Apparatus for Regulating the Exhauster in Gas Works.*—March 26, 1867.—For regulating the speed of the exhausting engine. An excessive draft raises the water in the annular space, and depresses it in the central space, whose float is thereby dropped, the motion being communicated to the throttle valve to decrease the speed of the engine. If the exhaust is interrupted the gas will flow through the hand pipe, which has a gravitating valve in its enlarged portion.

Claim.—First, the within-described regulator, consisting of a vessel inclosing two chambers partly filled with water communicating with each other, and one chamber communicating with the main pipes, through which gas is exhausted from the retorts, while the other chamber has a float connected to the throttle valve of the steam engine, which drives the

fan or other exhausting device, all substantially as set forth.

Second, the branch pipe J, its enlargement X and valve I, arranged in respect to the exhausting main and discharging pipe, substantially as described for the purpose specified.

63,156.—WILLIAM B. HAYDEN, Columbus, Ohio.—*Bridle Bit.*—March 26, 1867.—The rein rings, cheek pieces and jointed bars are made in separate parts, and are connected by passing the cheek pieces through eyes, which are formed on the mouth pieces and rings, and securing the whole together by bands or collars applied to the cheek pieces.

Claim.—First, a bridle or harness bit, which has its rein rings attached to the mouth piece by passing the cheek pieces through solid eyes formed on said parts, substantially as described.

Second, a bit, which is composed of separately formed parts A B C and d, put together substantially as described.

63,157.—GUSTAVE FRANZ HEDRICH, Buffalo, N. Y.—*Sash Fastener.*—March 26, 1867.—A pin projected through the lower sash is made to prevent the motion of either. It is attached to a plate pivoted to the face of the sash, on which it may be rotated to allow the withdrawal of the pin, except when it is locked by a slide bolt.

Claim.—The improved fastener, consisting of the combination of the sliding knob H, or its equivalent, pivoted lever C, provided with the bolt g and spring e, arranged and operating substantially as set forth.

63,158.—EDWIN HOLMES, New York, N. Y.—*Electric Circuit Breaking Clock.*—March 26, 1867.—The purpose is to effect the breaking of an electro-magnetic circuit at a definite time, and to keep it broken for a determinate time thereafter, if desired, or close and keep it closed. An alarm may be thereby given, indicating a duty to be performed, unless the alarm be anticipated by the previous performance of the duty.

Claim.—The combination as well as the arrangement of the circuit breaker B, its adjuster C, and the spring D, with a clock or time-piece A, and an electric or electro-magnetic circuit, the whole being substantially as and for the purpose hereinbefore specified.

63,159.—JOHN HOLT, Lowell, Mass.—*Making Dies for Figures in Press-dyed Fabrics.*—March 26, 1867.—The mold for casting the dies for producing the figures in press-dyed fabrics is formed by inclosing in frames a skeleton core, containing in a series of grooves the figures to be printed. The metal to form the dies is cast in this frame.

Claim.—The method, substantially as herein described, of making the impression dies which produce the figures in press-dyed fabrics.

63,160.—BENNET HOTCHKISS and S. C. GOODSELL, New Haven, Conn.—*Ore Crusher.*—March 26, 1867.—The hammer shaft is connected by two straps to the respective cranks, which are set at 180° to each other on the same shaft. One slacks as the other pulls, and conversely, so that between them the hammer receives a positive vertical reciprocation. Quartz is fed to the mortar through a tube, and the descending hammer so nearly fits the mortar as to expel the powdered quartz. The treadle works a brake to modify the speed of the pulley.

Claim.—First, the shaft F, with double cranks I I, straps L and L', hammer C, box O, when constructed and arranged to operate together, substantially as described.

Second, the tubes S and T, when constructed as described and used in connection with the box O, for the purposes substantially as specified.

Third, controlling the force and rapidity of the blows of the hammer by means of the treadle m, cord h, spring e, pulley f, and plate d, when operating as and for the purposes set forth.

63,161.—B. B. HOTCHKISS, New York, N. Y.—*Railway Track.*—March 26, 1867.—Cellular sections contain blocks and have marginal seats for the rails, which are laid therein.

Claim.—The construction and arrangement of a

street railway track in sections, consisting of the cast-iron cellular base plates, in which are inserted blocks of wood fitting therein, with the rails arranged upon the outer sides of said track, and held in position as herein described, the whole being so constructed and arranged as herein set forth.

63,162.—B. B. HOTCHKISS, New York, N. Y.—*Pavement.*—March 26, 1867.—Each cell has its block, which is packed therein by ramming rubble in the intervals; a lower layer of sawdust keeps the rubble from working under the block.

Claim.—First, fitting wood blocks in cast-iron cells or cavities by employing blocks of less size than the cells, and driving a packing H into the spaces between the blocks and the sides of the cell, substantially as and for the purpose herein specified.

Second, in connection with the above, the stopping material G, introduced in the bases of the cells opposite the bottoms of the blocks, and adapted to prevent the working of any of the packing under the wood, substantially as herein specified.

63,163.—GEORGE L. JOHNSON, Fairfield, N. Y.—*Extension Ladder.*—March 26, 1867; antedated March 15, 1867.—The upper section of an extended ladder is supported by a hook pivoted thereto and catching upon the rounds of the lower sections. A slide on the hook holds it in position. A guard on the slide prevents the hook clasping a ring as the ladder is being extended.

Claim.—The combination with the hook A, of the slide B and socket C, all constructed, arranged and operating in the manner and for the purpose specified.

63,164.—GEORGE A. KEENE, Boston, Mass., assignor to himself and JOSEPH E. MANNING, same place.—*Neck Tie.*—March 26, 1867.—The elastic loop for fastening on the neck tie is secured to a bar of the staple, by which the parts are elinched together.

Claim.—Fastening wing piece, knob band and tie strip together, and attaching the elastic ring by means of the clinch bar, as shown, illustrated and described.

63,165.—S. G. LADD and G. W. CROWN, Lowell, Mass.—*Machine for Grinding Cards.*—March 26, 1867.—The grinding cylinder is fastened on two hubs or sleeved upon shafts rotating at different velocities. One of the hubs has longitudinal motion on its shaft, and communicates rotary motion to the cylinder. The other hub has a pin traversing a cam groove on its shaft, and gives the longitudinal reciprocating movement as it slips on its shaft.

Claim.—The two central shafts A and C, revolving at different velocities, causing the grinding cylinder to revolve by means of the hub d, and to reciprocate longitudinally by means of the hub k, groove g, pin h, slot f, and pin e, in the manner and for the purpose substantially as described.

63,166.—OSBORNE MACDANIEL, New York, N. Y.—*Wire Bale Tie.*—March 26, 1867.—The ends of the hoop are bent around the respective pieces of the fastening, which are hooked together.

Claim.—The construction of a wire bale tie fastened with hooks and eyes, substantially as herein described.

63,167.—R. McMURRAY, Washington, D. C.—*Trunk.*—March 26, 1867.—The stay is coiled around the boxing of a spiral spring as the lid is shut, keeping it from being caught under the lid when closing.

Claim.—The stay A, in combination with a coiling device B, substantially as and for the purposes set forth.

Also, constructing and applying a trunk-stay so that one end shall be drawn into the trunk frame, substantially as and for the purposes set forth.

63,168.—Canceled.

63,169.—PURCHASE MILES, New York, N. Y.—*Curtain Fixture.*—March 26, 1867; antedated March 15, 1867.—The knotted cord passes through the enlarged end of the staple, but is held in position when slipped between parallel slides.

Claim.—The cord holder g, in combination with a cord for curtain fixtures, upon which cords are knots or projections, substantially as and for the purposes specified.

63,170.—CHARLES F. MYER, Troy, N. Y.—*Ash Sifter*.—March 26, 1867.—While the revolving drum is sifting ashes a reversible guide plate delivers into the ash box. By shifting the plate and opening a trap in the drum, the coals are conveyed to another box.

Claim.—First, in combination with a revolving drum sifter D and right and left inclined fixed guide plates H and H¹, the reversing or shifting guide plate E, constructed and arranged substantially as described, and operating in manner and for the purpose as set forth.

Second, in combination with a drum sifter D, right and left fixed guide plates H and H¹, and a shifting guide plate E, the employment of two ash pans or boxes G and G¹, arranged in manner and for the purpose as described.

Third, in combination with a revolving drum sifter D, right and left fixed inclined guide plates H and H¹, and two ash pans or boxes G and G¹, arranged as shown, placing the journals of the shifting guide plate E eccentrically, to operate in manner and for the purpose as herein shown.

63,171.—E. Q. NORTON, Bangor, Me., assignor to himself and ALPHEUS PATTEN, same place.—*Knife and Watch Key Combined*.—March 26, 1867; antedated March 13, 1867.—A watch key is substituted in place of one of the blades.

Claim.—As a new article of manufacture, the aggregation of the pen knife blade and watch key in one handle, as set forth.

63,172.—EDWARD C. H. NYE, Ascushnet, Mass.—*Cross Bow*.—March 26, 1867.—The magazine is moved forward by the bent lever engaging the notch of the cord slot with the cord. The backward movement of the lever draws back the magazine, leaves an arrow in the groove, and retracts ready for discharge by the tripper.

Claim.—The combination of the cross bow, the arrow magazine, and a mechanism for setting and discharging the cord of the spring of the bow, the whole being substantially as hereinbefore described.

63,173.—STARR POLLEY, Brooklyn, N. Y., assignor to AMBROSE HILL, same place.—*Rounding Jack for Trimming Brims of Hats*.—March 26, 1867.—The described devices refer to means for adjustment of the cutter as to the breadth of the brim and the depth of cut. A guard prevents the mutilation of the brim-supporting board.

Claim.—First, the cutter *b*, the head *b*¹, adjusting screw C, removable bearings M, and confining means D, combined and arranged for joint operation on the sliding block B of the brim-cutting instrument, substantially in the manner and for the purpose herein set forth.

Second, the radial adjusting screw G, arranged to operate relatively to the sliding block B and adjustable cutter *b*, in the brim-cutting instrument, substantially in the manner and for the purpose herein set forth.

Third, the shield E, arranged in combination with the brim cutter, and adapted to serve relatively to the adjustable cutter *b*, substantially in the manner and for the purpose herein set forth.

63,174.—E. F. PRENTISS, Philadelphia, Pa., and C. C. PARSONS, Boston, Mass.—*Treating Indian Corn*.—March 26, 1867; antedated March 15, 1867.—The grain is crushed between rollers and placed in the tank above the usual proportion of malt which lies on the perforated false bottom. Water at 165° Fah. is forced upward through it till the grain is saturated; the wash is strained off and successive saturations at higher temperatures are obtained and the saccharine solutions removed, the water increasing in temperature to 195° at the end of the operation. The wort is fermented for distillation. The residual grain may be dried and used for feeding cattle.

Claim.—The process of treating Indian corn in the manner and for the purposes as described.

63,175.—E. F. PRENTISS, Philadelphia, Pa., and C. C. PARSONS, Boston, Mass.—*Preparation from Indian Corn*.—March 26, 1867; antedated March 15, 1867.—The residuum of the process described in the foregoing is dried and used as food for cattle.

Claim.—The preparation from Indian corn, made substantially in the manner described.

63,176.—KOSCIUSKO PUCKETT, Parish of Morehouse, La.—*Cotton Chopper*.—March 26, 1867.—The chopping hoes are revolved in a transverse plane by a bevel wheel on their shaft, which engages a gear on one of the ground wheels.

Claim.—The combination of the driving wheel A, the balance wheel G, pinion B, shaft C, and hoe D, with the frame E and its appurtenances when their several parts are arranged and constructed as described for the purpose set forth.

63,177.—GEORGE W. RAY, Springfield, Mass.—*Machine for Embossing Articles of Wearing Apparel*.—March 26, 1867.—The rolls have their bearings in adjustable sliding boxes, the upper roll being covered with the fabric whose reticulated pattern is to be impressed on the paper; a metallic plate is covered with fabric which produces its negative on passing between the rollers.

Claim.—First, the roll *c*, covered or partially covered with a woven fabric in combination with the roll *d*, substantially as described and for the purpose set forth.

Second, the plate *p*, in combination with the roll *c* and roll *d*, one or more of these parts being covered, all substantially as described and for the purpose set forth.

63,178.—E. A. G. ROULSTONE, Roxbury, Mass.—*Carpet Bag*.—March 26, 1867.—The turned down side is cut at the corners, the ends lapped and riveted; a hollow bead at the angle of the frame gives rigidity thereto. The material is secured by a U-shaped piece which overlaps the edge of the turned down side and is riveted thereto.

Claim.—In combination with the corners *d*, made by lapping the metal, the bead *c*, extending around these corners and along the angle of the frame, substantially as set forth.

Also, the manner of applying the flexible bag forming material to the frame, by means of the metal strip *g*, folded over the folded edge of the cloth or leather, and the edge of the frame, and secured to the frame by rivets or other fastening devices, substantially as set forth.

63,179.—E. A. G. ROULSTONE, Roxbury, Mass.—*Carpet Bag*.—March 26, 1867.—The edge of the material, in connection with a strip, is placed in a returned groove of one side of the angular frame, and then riveted to the flat portion thereof. Instead of cutting out the corner it is turned under to form a reinforce.

Claim.—The manner of connecting the flexible bag material to the frame by means of the strip *d* and the frame groove *b*, the strip and cloth or leather being first united and then connected to the frame, as herein set forth and described.

Also, the reinforcement of the corner by leaving the goring piece *g* in the frame, and turning it down against and so as to form part of the wall piece *f*, as herein set forth and described.

63,180.—SAMUEL C. RUNDLETT, Portland, Me.—*Sifter for Sand, &c.*—March 26, 1867.—The crank shaft connects with the suspended sifter by a rod, crank, and arm, and projects it laterally against the side of the frame.

Claim.—The sieve *j*, when suspended by the four chains *i*, and so operated by the means hereinbefore described as to swing from side to side and at each motion to strike the inner side of the frame A, as and for the purposes specified.

63,181.—SAMUEL C. RUNDLETT and R. DODGE, Portland, Me., assignors to themselves and JOHN L. MESERVE, same place.—*Scrubbing Brush*.—March 26, 1867.—The handle is attached to the brush with a socket joint and is vertically adjustable. The head of the brush is surrounded by a band of rubber or other soft material to prevent injury to the foot boards.

Claim.—A scrubbing brush having the arrangement of the jointed handle *c* and rubber band *f*, as and for the purposes set forth.

63,182.—SILAS C. SCHOFIELD, Chicago, Ill.—*Shaft Coupling*.—March 26, 1867.—At the end of each rod is a head with outwardly-displayed gudgeons, which catch within chambers on the inside of the ring into which they are laterally introduced.

Claim.—First, providing the coupling forks or heads B with gudgeons, or their equivalents D, substantially as and for the purposes specified.

Second, constructing the ring A with two chambers *a*, provided with lateral opening *b*, substantially in the manner and for the purposes set forth and shown.

Third, the combination of the forks or heads B, provided with the gudgeons D, or their equivalents, with the chambered ring A, arranged and operating substantially as specified and for the purposes described.

63,183.—SIMEON SHERMAN, Weston, Mo.—*Hemp Brake*.—March 26, 1867.—The hemp is passed between braking rollers and thence is carried forward by and between endless slatted carriers, where it is broken by the action of oscillating beaters above and below, whose teeth strike it in concert between the bars of the carriers.

Claim.—The endless chains provided with bars or slats, and operating in connection with the reciprocating rotary beaters, substantially as described.

Also, the arrangement of the beaters whereby the upward blow of the lower set of knives and the downward blow of the upper set are made to conjoin their actions upon the interlying hemp, substantially as described.

Also, the combination with an endless carrier and reciprocating rotary breaker of a preliminary series of toothed rollers.

63,184.—GREENLEAF STACKPOLE, New York, N. Y., assignor to himself, NATHANIEL T. SPEAR, Jersey City, N. J., and CYRUS and DARIUS COBB, Boston, Mass.—*Propelling Canal Boats*.—March 26, 1867; antedated March 13, 1867.—A continuous rail is supported by posts upon the bank, and its upper and lower surfaces are traversed by wheels upon an arm extending from the boat, the wheel being rotated by a motor on board.

Claim.—The wheels *g i* and clamp *k l*, in combination with the radius arm *b*, horizontal driving shaft *a*, boat A, and rail *h*, constructed and operating substantially as and for the purpose described.

63,185.—THEODORE THURBER, Auburn, N. Y.—*Piston Packing*.—March 26, 1867.—The recessed ring contains the sectional packing ring and double-seated valve for admitting steam therein to expand the packing rings. A quantity of steam is admitted to the piston when it is first introduced into the cylinder and is there shut off. The pressure within the piston being below that within the cylinder the too tight packing of the piston is prevented.

Claim.—First, the construction of the internal ring plate A with ring caps B fitted, leaving a steam chamber or recess *a* between them and the metal ring packing C, so that it can be put in its place without opening or expanding, substantially as described.

Second, the valves *e e*, as constructed in combination with the ring plate A and cap B, operating from both sides or faces of the piston, they being supported by the spring *d*, so that steam, gas or water forced into the chamber *a* is not exhausted or liberated at each stroke, the internal force being retained, thereby producing the result substantially as herein specified.

Third, the combination of the skeleton frame and plate E, flange plate A, ring cap B, face plate F, metal packing ring C, valves *e e*, and spiral spring *d*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

63,186.—WILLIAM M. TOBEY, New London, Conn.—*Ironing Machine*.—March 26, 1867.—The bosom is laid on the platform, the polisher having a quick reciprocating motion given to it; by pressing the treadle the platform is raised till the bosom is brought in contact with the polisher. By lateral adjustments, in connection with manipulation, the bosom is moved under the polisher.

Claim.—The shirt bosom ironing-machine made substantially as, and to operate as described, viz: of

the chambered polisher, (to be heated as described,) the mechanism to operate or move such polisher, the platform for supporting the work, the mechanism for moving such platform laterally and vertically, in manner as specified, the whole being applied to a frame, and so as to operate substantially as hereinbefore explained.

63,187.—L. W. TURNER, Yalesville, Conn., assignor to himself and G. S. WILCOX, same place.—*Weather Strip*.—March 26, 1867.—The strip is jointed to conform to the worn condition of a threshold, and has a strip of rubber projecting below it. It is depressed by a lever whose end engages the jamb, and is raised by a spiral spring.

Claim.—The combination of the lever D with two sections A B, spring E, when the two sections are arranged so as to be operated simultaneously, substantially in the manner described.

63,188.—CALVIN G. UDELL, Chicago, Ill.—*Extension Ladder*.—March 26, 1867.—A band near the top of the lower section clamps the ladders at their upper junction; a pivoted catch at the lower junction slides over the projecting rings while extending, and catches to the one next beneath, when reversed.

Claim.—First, in combination with a section or sections of an extension ladder, the pivoted catches D, arranged and operating substantially as and for the purposes specified.

Second, the combination of the sections A B, the catches D, and bar C, arranged and operating substantially as described.

63,189.—JOSEPH D. WEST, New York, N. Y.—*Sand Trap for Water Pipes*.—March 26, 1867.—The diaphragm of wire gauze is placed between a hollow disk above and an annular receiver underneath. The latter has a central induction pipe with a covered valve at top, to obstruct the flow of water which discharges laterally into said receiver; the debris is detained by the diaphragm and settles in the receiver.

Claim.—The gauze or perforated diaphragm check A, or its equivalent, receiver C, hollow disk B, or its equivalent, and induction pipe D, whether provided with a valve cover or not, when all combined and arranged together so as to operate substantially in the manner and for the purpose described.

63,190.—LEVI H. WEST, Cambridge, Mass.—*Car Truck and Spring*.—March 26, 1867.—The wheel box is suspended from the platform and has side brackets supporting the shorter ends of levers having fulcrums beneath the platform sills and a bolt passing through their longer ends bearing on the upper sides of the said sills. Springs are placed beneath all the bearings of the levers.

Claim.—The combination as well as the arrangement of the additional levers D' D'', their springs F' F'', and supporting rods e' e'', with the platform A, the wheel boxes *a a* and the levers D' D'', rods c' c', and springs F' F'.

Also, the combination as well as the arrangement of the springs *f e* F' and the suspension rod *c'* with the lever D', the wheel box *a*, and the platform A.

Also, the combination as well as the arrangement of the hanger *l* and the staple *h* with the platform A, the wheel box *a*, and the supporting levers D' or D' D'', applied to such box and platform.

Also, the combination as well as the arrangement of the springs *i* with the hanger *l*, the box *a*, the platform A, and the supporting levers applied to such platform and the wheel box or boxes, the whole being substantially as hereinbefore specified.

63,191.—T. F. WESTON, Salem, Mass.—*Machine for Shaving Hides*.—March 26, 1867.—A circular tool is attached to a shaft to which a reciprocating motion is given by means of a wheel. A rotary motion is imparted to the tool by means of a band. The hide is secured to an inclined bed plate.

Claim.—The use of the cutting, shaving, or scraping tool having such motions imparted to it by any suitable arrangement of mechanical devices as to produce a drawing cut upon the surface of the leather, as hereinbefore set forth and for the purpose specified.

63,192.—WILLIAM N. WHITELEY, Jr., Springfield, Ohio.—*Harvester*.—March 26, 1867.—The reciprocating

ing sweep rake is lifted from the platform on its return movement by a latch which is attached to a guide bar. The latter is supported by a frame mounted on the inner shoe, one foot standing in front of the finger bar and the other at the rear; the platform not being connected to the guide frame. The pitman that drives the rake is connected to and meshes with a driving pinion on the main pinion shaft, bringing the center of the crank up to the level of the rake guide and equalizing the movements. The sector standard guides and supports the free end of the sector plate, on which the main wheel is mounted and is supported at its upper end by a curved brace that also forms an attachment for the reel post.

Claim.—First, the rake guide rail N' and arch S' when attached to the main frame by a bolt in front of the cutting apparatus and another bolt behind the said cutting apparatus, and without any connection with the platform, substantially as described and shown.

Second, in combination with the internal gear wheel J and its driving pinion M, the pitman K, and rake Q', substantially as and for the purpose set forth.

Third, the combination and arrangement of the sector plate C, curved standard D, and standard E, substantially as described.

63,193.—B. B. WILCOX, New Haven, Conn.—*Fruit Jar*.—March 26, 1867.—The yoke connects the lugs of a divided ring beneath the shoulder and swings over the cover to clamp it upon the packing beneath.

Claim.—The yoke D and divided ring C in combination with a jar A and cover B, when constructed and arranged so as to operate substantially in the manner herein set forth.

63,194.—GILMAN K. WINCHESTER, Providence, R. I.—*Take-up for Brading Machines*.—March 26, 1867.—The object of the adjustment described is to regulate the rate of feed.

Claim.—An adjustable feed or take-up stand so constructed as to be readily moved forward and backward to allow a larger or smaller worm wheel to be placed upon the feed-roll shaft to connect with the worm upon the worm shaft, substantially as and for the purpose set forth.

63,195.—JOHN ALTHOUSE, East Coacalico Township, Pa.—*Compound for the Cure of Glanders, &c., in Horses*.—March 26, 1867.—For the treatment of glanders and farcy. Composed of convolvulus panduratus or wild potato and wild carrot roots, both dried and pulverized and mixed with black pepper in equal quantities.

Claim.—The composition of my powder for the cure of glanders and farcy in horses, when combined and administered substantially in the manner specified.

63,196.—T. K. ANDERSON, Hornellsville, N. Y.—*Stove Pipe Damper*.—March 26, 1867.—The elliptical damper is pivoted a little above its center and is counterbalanced by a hanging arm; the increased draft from a hot fire partially closing the damper damps the fire. To one end of the pivoted rod is attached a short tube in which works an adjustable weighted lever by which the damper can be regulated to the right angle.

Claim.—The pivoted damper B, stop D, tube E, and weighted lever F, or its equivalent, combined to operate together and arranged with the stove pipe A, substantially as described for the purpose specified.

63,197.—EMERY ANDREWS and WM. TUCKER, Fiskdale, Mass.—*Manufacture of Matches*.—March 26, 1867.—By leaving the matches in notched cards or sheets until dipped the necessity of placing them in racks is avoided. The sheets are then separated into matches by a series of knives which enter the notches.

Claim.—Notching and dipping the cards preparatory to the cutting the matches therefrom, substantially as and for the purpose specified.

63,198.—JOHN B. ATWATER, Chicago, Ill.—*Combined Steam and Air Engine*.—March 26, 1867.—Air is forced into the flaring end of a pipe which communicates with the desiccating chamber in the upper portion of the generator, into which chamber steam is admitted through another pipe. The combined fluids

are superheated preparatory to use in the cylinder of the engine.

Claim.—First, a desiccating or superheating chamber E, which is combined with a steam boiler and adapted for receiving and desiccating steam mixed with air, substantially as described.

Second, the combustion chamber D when arranged in a steam boiler and supplied with air, substantially as shown, so as to effect the combustion of the gases after they have escaped from the fire box or chamber, substantially as described.

Third, the air injector operating upon the principle specified in combination with a desiccating chamber E, substantially as described and for the purposes explained.

Fourth, the arrangement of the steam generators C C' with steam communication B leading into generator C above the water level therein with respect to the desiccator E, substantially as and for the purpose described.

Fifth, the desiccator E constructed as described, arranged within the circle of tubes for the purpose set forth.

Sixth, the valve L on the end of pipe Z in combination with apparatus constructed and operating substantially as described.

Seventh, the combination of air chamber G and cock P with an apparatus constructed and operating substantially as described.

63,199.—CALEB BATES, Kingston, Mass.—*Rotary Harrow*.—March 26, 1867.—The harrows are made to rotate by hinged blades which are suspended from the arms and present themselves at one side in opposition to the line of draft.

Claim.—The combination and arrangement of the arms b, axis d, perforated rear bars e, curved bar E, and swinging blades F, constructed and operating substantially as described for the purpose specified.

63,200.—JOSEPH H. BLACK, East Windsor, N. J., assignor to WM. GILBERT.—*Tree Digger*.—March 26, 1867.—The blade that connects the beams of the plow has a suitable angle and depth for cutting the vertical and lateral roots of the trees and is sharpened in front with two plow points at its lower corners. The beams pass on either side of the row of trees simultaneously.

Claim.—The employment of the plate C constructed substantially as represented and used in combination with the beams A A, as and for the purpose set forth.

63,201.—JOHN BLACKIE, New York, N. Y.—*Electro-Magnetic Apparatus for Registering Votes*.—March 26, 1867.—The balls are deposited in tubes, from which they are ejected by the completion of the circuit when the key is actuated by the voter. A yea and a nay key for each voter operate the corresponding balls, and the latter collect in a graduated and numbered tube which shows the total at a glance.

Claim.—First, the combination of a series of hollow magnets for ejecting the balls, as described, with the receiving troughs e and tubes B, arranged to operate substantially as shown and described.

Second, in combination with the tubes B open at their lower ends, the drawer D provided with the stop n, when arranged to operate as herein described.

63,202.—STEPHEN BOURNE, Headstone Drive, Harrow, England.—*Vent Peg and Valve for Beer Casks*.—March 26, 1867.—The vent pegs are made of rubber and have perforations or slits which are closed in their normal position and are opened by extension as the air presses into the casks of ale, &c., to which they are applied.

Claim.—A valve made of india-rubber or other elastic or suitable material, whether in the form of a disk cone cylinder or any other proper shape, when said valve is provided with one or more perforations, slits, or other openings, in such a manner that by the distension of the valve its perforations will be opened, but closed by its elasticity, substantially as and for the purposes described.

63,203.—N. P. BOWLER, Cleveland, Ohio, assignor to himself, THOMAS MAHER, WM. BOWLER, and J. W. LUNT, same place.—*Railroad Frog*.—March 26, 1867.—The frog is made of hard cast iron and the chill has a longitudinally concave face to insure straightness in the face of rails when cooled.

Claim.—Making railroad frogs by the method and in the manner substantially as specified.

63,204.—EDWARD W. BRETTELL, Newark, N. J.—*Door Lock.*—March 26, 1867.—The tumblers have vertical adjustment by a key plate pushed beneath them and have side slots, which, when they are properly adjusted, receive the dog of the lever and allow its oscillations to shoot the bolt.

Claim.—First, the encasing of a series of self-acting vertical-sliding tumblers with their operating dog within an independent detachable case, substantially as herein shown and described.

Second, the dog *d* attached to the lever *B* so as to act independently of both the bolt and the lock case, substantially as herein shown and described.

63,205.—CHARLES BROMBACHER, New York, N. Y.—*Shears for Brushes.*—March 26, 1867.—The wedge-shaped throat holds the bristles as the blade clamps and divides them.

Claim.—The triangular opening in the bed shear *a* in combination with the swinging blade or shear *b* hinged directly to the shear *a* and acting as a clamp and cutter, as specified.

63,206.—DAVID BROOKS, Philadelphia, Pa.—*Insulator for Telegraph Wires.*—March 26, 1867.—The wire holder is inserted in an insulating plug confined in a case. If an excessive charge of electricity be thrown on the wire, it will pass to an adjacent conductor without rupturing the insulators.

Claim.—The metal casing *A*, insulating block *B* and stem *C*, arranged and constructed as described, when the same are combined with arms or holders *b b*, so arranged that the distance between the holders and the case is less than that between the stem and case.

63,207.—JAMES H. BROWN, Berea, Ohio.—*Rest for Grinding Tools.*—March 26, 1867.—The central bar has a point at the lower end for securing it to the floor; two swinging arms jointed to the cross-bar and moving on the segment guide are adjusted to the tool to be ground.

Claim.—The stem *A*, adjustable sides *D*, pivoted to the arms *C*, in combination with the arm *B*, hooks *G* and staple *b*, provided with screws, as and for the purpose set forth.

63,208.—JABEZ BURNS, New York, N. Y.—*Powder Mixer.*—March 26, 1867.—The spiral flanges running in opposite directions are attached to the movable head, and act as counter buffs for mixing granulated substances.

Claim.—The spiral flanges *f f*, running in opposite directions, in combination with the movable head *c*, drum *A* and standards *B*, with band and friction rollers, constructed and operating substantially as and for the purpose set forth.

63,209.—DANIEL CARPENTER, Peekskill, N. Y.—*Air Pump.*—March 26, 1867.—The lower valve is raised by a positive motion, communicated from the lever, which operates the piston, and held elevated till nearly the end of the down stroke; it is then released, and the air passes out through the upper valve, and the water above it during the up stroke. A strong air-tight box is connected with the lower chamber of the air pump.

Claim.—First, the mechanism herein shown and described of operating the valve *E*, automatically by the same power which operates the piston, so that the valve is opened and closed, and the piston raised and lowered, substantially in the manner herein set forth.

Second, the piston *F* and valve *E*, when so constructed that the piston fits perfectly over the valve, so that all the air is completely forced out of the cylinder *A* at each stroke of the piston through the valves *c c*, substantially as herein shown and described.

Third, the perforated piston *F*, in combination with the ring *d* and conical plugs *c c*, all made and operating substantially as herein shown and described.

Fourth, the arrangement in the chamber *B*, below the valve *E* of the valve operating parts, substantially as and for the purposes herein shown and described.

Fifth, the box *G*, when constructed as herein shown and described, and when provided with braces *H I* and *K*, all made as set forth, in combination with the pipe *f* and air pump *A B*, the latter being made and operating substantially as herein shown and described.

63,210.—C. L. CARTER, Union, Ind.—*Washing Machine.*—March 26, 1867.—The perforated box is placed in a tube, and the washing takes place therein. A lever is pivoted to a clamp on the side of the tube, and the clothes are attached thereto by a strap, being alternately raised from the water to drain and compressed between the follower and bottom boards as the lever descends.

Claim.—The arrangement of the perforated box *C* and compressor *D K* and the strap *G*, constructed and operating in the manner and for the purpose herein specified.

63,211.—ORLANDO L. CASTLE, Upper Alton, Ill.—*Broom Head.*—March 26, 1867.—The forked spring enters the corners of the oblate flattened sheath, and passing through it and through a trapezoidal wedge, is secured with nuts. The wedge is armed with teeth to secure the butts of the straw within the sheath.

Claim.—First, the use and employment of a spring *B* for the purpose, and operating substantially after the manner herein set forth.

Second, a combination of the spring *B*, the wedge *C*, and the nuts *n n* with the sheath *A*, arranged and operating substantially as herein described and for the purpose herein set forth.

63,212.—JOHN H. CHAPMAN, Utica, N. Y.—*Elevating Hay Forks.*—March 26, 1867.—The draft rope is run round a pulley on top of a post in front of the barn, and from that descending to a ground pulley, ascends to the pulley from which the hay is suspended. A casting-off plate on the first-mentioned pulley detaches the rope, and the hay then descends by its own gravity.

Claim.—First, in a hay fork elevating apparatus or the like, the post *A*, in combination with the draft rope *G* and ground pulley *H*.

Second, the pulley *E*, and the casting-off plate *F*, constructed and operating in combination substantially as described.

63,213.—JAMES CHASE, Rochester, N. Y.—*Wood-turning Lathe.*—March 26, 1867.—The stuff after subtraction to the roughing and plain work tools is shaped by the pattern head, whose rest has a longitudinal sliding motion, while the head has an equal rotation to leave its counterpart pattern on the stuff. It is intended for turning bead-work, or molding of given form upon the wood, the pattern being repeated at each revolution.

Claim.—First, the employment of a pattern knife or cutter in wood-turning lathes, rotating upon an axis, arranged at right angles or nearly so to that of the stick or timber which is being turned, and so geared to the frame of the lathe as to leave its pattern upon the stick, substantially in the manner and for the purposes set forth.

Second, the employment of the pivoted box *M*, which constitutes the axial bearing for the knife journal or shaft *N*, when the parts are arranged and operate substantially in the manner and for the purposes herein shown and described.

63,214.—S. L. CHASE, New York, N. Y.—*Door Lock.*—March 26, 1867.—The rotating disk has a lug upon its periphery, by which the bolt is thrown. The lock plate has a vertical series of spring pins, which engage holes in the disk, and prevent its rotation, and these pins are driven back the requisite distance to free the disk for said rotation, by pins which rest upon the ends of the former, and project from the outer side of the disk to be pressed in by the key. The disk has a circular plate, which prevents access to the bolt. The tumblers are raised by the key.

Claim.—First, the circular ward *e* on the disk *b*, substantially as and for the purpose described.

Second, the bridge *h* in the circular ward, substantially as and for the purpose set forth.

Third, the partition *i* in the circular ward, as and for the purpose described.

Fourth, the nose *f* on the disk *b*, in combination with the key, the pins *c*, stops *d*, tumblers *B*, and

with the bolt, all constructed and operating substantially as and for the purpose set forth.

63,215.—WILLIAM H. CLARKE, St. Anthony's Falls, Minn.—*Apparatus for Carburetted Air, &c.*—March 26, 1867.—The concentric cylinders are united at the bottom, forming an annular water vessel into which the bell dips. The blast pipe passes through the diaphragms, which are arranged in vertical series in the cylinder, forming compartments which communicate with each other by pipes.

Claim.—First, the arrangement of the plates I I in the cylinder B, and providing the same with air pipes *b b*, supply pipes M M, discharge pipes L L, and gas transmitting pipes J J, substantially as and for the purpose specified.

Second, the combination of the cylinders A and B, float C, bellows T, and tank O, provided with lime and cotton, as and for the purpose specified.

Third, the arrangement of the pipe H with the pipe P, for supplying heat to the machine from its own gas, substantially as specified.

63,216.—JOSEPH C. CLYMER, Galion, Ohio.—*Churn.*—March 26, 1867.—The lever connects by a vibrating link with the dasher shaft, which passes through a stuffing box in the lid. The cream deflected by the dasher against the channel in the cover is precipitated again on the dasher.

Claim.—In a churn the cover F and its channel *c*, arranged and operating as described and set forth, in combination with the stuffing box G, key H, stirrups I, and adjustable lever E, substantially as and for the purpose set forth.

Also, the channel *c* in a churn cover, arranged and operating as and for the purpose described.

63,217.—J. W. COCHRAN, New York, N. Y.—*Breech-loading Fire-arm.*—March 26, 1867.—These devices are applicable in the conversion of muzzle loaders. The movable breech is jointed to the brace piece, and is opened by lifting the rear end of the latter, and sliding them backward. The movement of the breech operates the shell extractor. The rubber packing prevents the escape of gases on discharge, and the jarring of the parts in manipulation. The cartridge is exploded by a pin acted on by the hammer through the intermediate rod.

Claim.—First, the sliding breech piece A and swinging brace B, jointed together at *a*, and arranged for operation substantially as shown and described.

Second, the arrangement of the elastic packing D, with or in the movable breech at its forward end, operating not only to hold said breech when closed and make tight its joint in front, but serving without restraining the self-adjustment of the breech piece to prevent concussion of the latter against the gun chamber on closing the breech, essentially as specified.

Third, the cartridge shell extractor E, constructed with its rear end inclined or beveled on its upper and lower sides, as at *i h*, operating in connection with the inclined recess *j* in the rear end of the receiver *c*, substantially as and for the purpose set forth.

Fourth, the sliding rod H, with its forward lip *n* and rear projection or head *k*, hung and arranged for operation, in combination with the brace B, hammer G, and detonating pin I, substantially as specified.

63,218.—GILBERT M. COLE, Folsom City, Cal.—*Operating Railroad Switches.*—March 26, 1867.—The levers are placed so that a wheel flange of the locomotive on either of the tracks will depress the switch lever, and set the switch to connect that track with the single track toward which they converge.

Claim.—First, the mechanism herein described for rendering a railroad switch absolutely self-adjusting as the train approaches it on either branch of the double track, in combination with the mechanism herein described, by which the engineer can render the switch self-adjusting as the train approaches in opposite direction.

Second, the levers *b b'*, the pinion *a**, the sector *d*, shaft *c* and crank *c'*, in combination with the levers *a'*, pinion *a*, sector *d'*, and the loose wheel *b** on the shaft of the locomotive truck, all constructed, arranged, and operating substantially as described.

63,219.—A. M. CORBIT, Bethlehem, Iowa.—*Corn Planter.*—March 26, 1867.—An oscillating motion is

given by levers to the slides in the seed boxes, regulating the passage of the seed and preventing clogging. It is adjustable to wide or close planting, as desired.

Claim.—First, the combination of the plate K, with the plate L and set screw M, for the purpose of regulating the amount of seed through the holes *c c*, all made and operating substantially as herein shown and described.

Second, the cross bars D T and G, which are so made and provided with holes that the scrapers E, plates K, and seed boxes R, may be moved more or less apart, so as to permit the planting of the corn in rows of suitable distances from each other, substantially as herein shown and described.

63,220.—EDWARD T. COVELL, Brooklyn, N. Y.—*Machine for Soldering Metal Cans.*—March 26, 1867.—The bottom of the vessel to be soldered is placed on its protecting depressible pan, and with it immersed in the solder in the pan below sufficiently to cover its lower joint.

Claim.—The improved soldering apparatus, consisting of a supporting plate B, combined with a suitable soldering pan A, constructed and arranged substantially in the manner and for the purpose herein set forth.

63,221.—FRANCIS W. CROSBY, N. Y.—*Amalgamator.*—March 26, 1867; antedated March 19, 1867.—The bulbous vessel contains a lead bath and is supported in the furnace. The tubular conductor has a disk on its lower end against which rotates a grinding plate attached to the vertical axial shaft. The ore passes down the tube, is associated with lead which flows through openings in the side of the ladle, and the combined mineral and metal are triturated together between the grinding surfaces, the precious metals becoming amalgamated with the lead while the refuse mineral rises to the top and is skimmed off.

Claim.—Grinding or triturating pulverized ores when submerged in a bath of quicksilver or molten lead, substantially in the manner and for the purpose herein set forth.

Also, the combination of one or more grinding plates or surfaces with the bottom of an ore-supplying chamber and an enclosing bath of quicksilver or molten lead, substantially in the manner and for the purpose herein specified.

Also, the combination of a hollow column or pillar O, with the bottom of an amalgamating vessel B, and an enclosing furnace H, substantially in the manner and for the purpose herein set forth.

63,222.—A. M. CULVER, Bedford, Ohio.—*Combined Sheep Holder and Wool Tyer.*—March 26, 1867.—Adjustable shackle heads are attached to pivoted bars which hold them in position, the movable head being adjusted to the length of the sheep, and the shackles turning as required. A lever and strap, in connection with the folding table, after the fleece has been folded, packs it ready for tying.

Claim.—First, the sides of the table C L, as arranged in combination with the strap K' and lever S, for the purpose and in the manner described.

Second, the arrangement of the sides C L and strap K, in combination with the table C', shackle J, bar H, and lever I, as and for the purpose herein set forth.

63,223.—JOHN CURTIS, Cincinnati, Ohio.—*Carriage.*—March 26, 1867.—The spring bars are bent around and their ends form the sills, dispensing with body loops. The perches are connected together in a curve in front to form part of the fifth wheel. The lower metallic bar of the fifth wheel has a strap beneath it attached to the upper portion and has a set screw by which wear may be compensated for. A pad of leather or rubber is placed between this bar and the screw follower.

Claim.—First, the bent strip B C D E of elastic timber forming the sills of the body proper and to take the place of the spring bar and body loops, as and for the purpose set forth.

Second, the bent and rebated strip of timber L L N N', discharging the functions of the double perch and of the upper member of the fifth wheel as set forth.

Third, the arrangement of strap P, screw Q, and gland R, to enable the members of a fifth wheel to be set up as they were, in the manner explained.

Fourth, in the described combination with the elements of claim third, the pad or cushion S, for the purpose stated.

63,224.—JOHN CUSTER, Corsica, Ohio.—*Roller for Pulverizing Soil and Clods.*—March 26, 1867.—Improvement on his patent, June 26, 1866. The equidistant, annular, metallic cutters have projections from their inner surface which prevent rotation on the rollers. A corrugated metal plate attached to the back bar of the frame cleans the cutters as they revolve.

Claim.—First, the continuous single ring cutters *s s*, secured by projections *a a*, in grooves *e e*, upon the periphery of the rollers *D D*, arranged as and for the purposes herein described.

Second, the cleaners or scrapers formed of a corrugated metal plate secured to the cross bar *F*, with the corrugations or volutes *c c*, placed between the cutters *s s*, in the manner and for the purpose herein described.

63,225.—J. DAVIS and S. W. FOSTER, Lowell, Mass.—*Spinning Bobbin.*—March 26, 1867.—A slit is sawn in the slightly enlarged lower end of the quill, which is thrust into the taper hole, through the head, pressing the slit together, and making a tight fit.

Claim.—Removing a portion of the lower end of the quill and slitting the end as shown at *g*, thereby forming the annular space *c*, and the parts *d d*, which act against the surface of the spindle, all substantially as and for the purpose set forth.

63,226.—R. W. DAVIS and D. DAVIS, Long Island City, N. Y.—*Steam Generator.*—March 26, 1867.—Explained by the claims and illustration.

Claim.—First, the arrangement, over the body of the boiler and within the smoke box, of a series or circle of superheating spheres *G*, connected and applied to circulate or pass the steam received from the boiler successively through them, substantially as specified.

Second, the combination with a steam drying chamber or dome *E* of a series or circle of superheating spheres *G*, both arranged within the smoke box of a vertical boiler for operation in connection with each other and with a steam generating space or chamber below, essentially as described.

Third, the combination with the smoke box and body of the boiler of an inner and outer series of smoke tubes and combustion or heating chambers, the inner series having their draft contracted relatively to the outer series, essentially as and for the purpose or purposes herein set forth.

Fourth, the combination of the superheating spheres *G*, arranged as described, smoke box *D*, and outer row or series of smoke tubes *C*, arranged relatively to the spheres, substantially as specified.

63,227.—HENRY O. DEMAREST, New York, N. Y.—*Automatic Boiler Feeder.*—March 26, 1867.—The two water cylinders have a steam-tight connection between their faces and the end plates, through which their connecting pipes pass to the supply tank and the boiler. Either cylinder when in the upper position communicates with the supply tank, and becoming filled, its weight depresses it until it is thrown in communication with the boiler, and the other cylinder with the water tank. An injector is placed in the supply pipe. A steam pipe whose mouth is at the required water level supplies steam to the cylinders, to take the place of water and enable their discharge, which only takes place when the water is below the proper level.

Claim.—The oscillating chambers *C C'*, with apertures *c c'*, in combination with the seats *B B'*, apertures *d d'*, pipes *e g*, and injector *h j k*, all constructed and operating substantially as and for the purpose described.

63,228.—ROBERT DEVEREAUX, Buffalo, N. Y.—*Hammer.*—March 26, 1867.—The metallic strap forms a dovetail in the eye of the hammer and extends along each side of the handle, to which it is riveted.

Claim.—Attaching a hammer or analogous tool to its handle by means of the plate *A*, when said plate is constructed and applied to the handle as described, in combination with the recess *d'*, in the eye of the hammer to receive the plate, substantially as set forth.

63,229.—HENRY C. DEWITT, St. Louis, Mo.—*Burning Oil.*—March 26, 1867.—Composed of gasoline, 40 galls.; powdered alum, 4 lbs.; cut potatoes, 2 qts.; pure carbon oil, 2 galls.; alcohol, 1 qt.; gum camphor, 2 oz.; oil of sassafras, 8 oz.; acetate of potash, 1 lb.; and sal soda, 2 lbs.

Claim.—First, the mixture formed from and by the action of the ingredients *A B C F H* and *I*, substantially as set forth and described.

Second, the mixture formed from and by the action of the ingredients *A B C D E F G H* and *I*, substantially as set forth.

63,230.—WALTER DICKSON, Albany, N. Y.—*Lock.*—March 26, 1867.—The spindle is tubular, and contains at midlength a tumbler which has a side groove permitting the traverse of the stump when in one position, but acting as a tumbler to stop the stump when turned 90° from said position. This tumbler is acted upon by a key having a spiral shank, which, traversing a similar passage in a cylindrical block, rotates freely in the spindle. The handles have a central longitudinal hole to admit the key.

Claim.—First, the arrangement of the tumbler *H*, to operate within the hollow spindle *E*, substantially as herein specified.

Second, the combination of the tumbler *H* within the hollow spindle, and the key inserted into the end of the said spindle and penetrating into the end of the said tumbler, substantially as herein specified.

Third, the stump *G*, arranged in connection with the bolt *C*, and in relation with the hollow spindle and the tumbler *H*, within the spindle, substantially as herein described.

Fourth, the application to a lock of a key having its body formed of a true spiral twist like that of a screw auger, with a matrix corresponding thereto formed within a movable block or blocks, the key passing through said matrix to act upon the follower in the manner and for the purpose specified.

63,231.—WILLIAM M. DOTY, New York, N. Y.—*Clothes Pin.*—March 26, 1867.—The bent wire has a coil spring and is crooked at the points at which it encloses the line. The legs are restrained from opening too far by a cross attachment.

Claim.—The wire clothes pin *A*, having the arm *b*, doubled and secured thereto as at *b'*, forming a loop, the arm *a* passing through said loop and resting upon cross piece *b'*, whereby any lateral movement is prevented, as herein set forth.

63,232.—J. E. EMERSON, Trenton, N. J.—*Saw.*—March 26, 1867.—The teeth are set within their sockets in saw plates and there held by springs.

Claim.—First, the springs as shown at *B* or *E*, either as a part of the saw plate itself, or made separate and firmly attached and fastened to the saw plate or cutter disk, when used for holding the teeth or cutters as herein described.

Second, the combination of the saw plate and the springs as shown at *B* or *E*, when made separate from said plate with the tooth *C*, when fitted and arranged substantially as described and for the purposes set forth.

63,233.—AUGUST FELLHEIMER, New York, N. Y.—*Hoop Skirt.*—March 26, 1867.—Improvement on the Bardwell patent, May 22, 1866. A loop is formed at each end of the hoop which is bent over and secured to the main portion by a clasp.

Claim.—The looped ends to the hoops of the skirt, of that class hereinabove referred to and substantially as and for the purpose specified.

63,234.—LOUIS FELLHEIMER, New York, N. Y.—*Hoop Skirt.*—March 26, 1867.—The hoops at the lower front portion of the skirt are dispensed with, so as to avoid the entanglement of the feet. A gathering in the waistband regulates its size. The skirt is projected to the rear by an inner band attached to its sides and passing behind the person.

Claim.—The skirt with the lower hoops passing entirely around the skirt and the upper ones secured to the stay *a'*, and provided with the gathering *b'* attached to the waistband, and having at its rear the trailing device, *c'*, consisting of the bands *C*, strings *d*, and band *d'*, when all parts are combined and arranged in the manner herein represented and described.

63,235.—ELI FLANEGIN and A. B. SMITH, Pittsburg, Pa.—*Pump.*—March 26, 1867.—To regulate the action of the pump to varying depths of water a float in the well is made to move a sliding weight on the rocking lever, to which the pump rod is attached, so that a uniform counterpoise is maintained.

Claim.—The floating weight P, counter weight Q, pinion pulley N, rack bar M, and balance weight L, arranged and operating together, substantially as and for the purpose herein specified.

63,236.—ALBERT M. FORCE, Norwich, Conn., assignor to himself and A. H. VAUGHN, same place.—*Meat Slicer.*—March 26, 1867.—The blade is set in the holder like a plane bit in its stock, and is adjustable toward and from the lip which forms the throat, to vary the thickness of the slice.

Claim.—First, the outwardly-flaring bar F, secured to the holder A, operating in combination with the adjustable slotted knife E, substantially as and for the purpose specified.

Second, the slicer, the parts of which consist of the handle B, holder A, outwardly-flaring bar F, slotted knife E, set screw b, set screws F, substantially as described.

63,237.—JOB FROGGETT, Youngstown, Ohio.—*Hot Blast Apparatus for Furnaces.*—March 26, 1867.—The heating cylinders are placed transversely across the furnace. The communicating pipes of the consecutive air chambers are on the outside.

Claim.—A hot blast arrangement whereby the air is heated by passing through cylinders which are connected together on the outside of the heating chamber, substantially as herein shown and described.

63,238.—MERRITT GALLEY, Marion, N. Y.—*Everer for Whiffletrees, &c.*—March 26, 1867.—The links to which the respective horses are attached are pivoted to the central block, which has a capacity for horizontal oscillation on the wagon hammer. If one horse pull ahead of the other he shortens the leverage of his connection and gives the other the advantage.

Claim.—The body of the everer A, with stops E E', the projecting levers C C', and pivoted bars B B' B', combined and constructed as herein set forth, and for the purposes mentioned.

63,239.—J. B. GERMAN, Walnut Hills, Ohio.—*Car Coupling.*—March 26, 1867.—The hook bar has projections on each side, which come in contact with the saws of the draw head when a car is displaced and pry the hook away from the coupling pins.

Claim.—First, the self-releasing car coupling, composed of the draw head A, reversely-hooked bar B, formed with shoulders c c', the spring D, and coupling pin E, combined and adapted to operate in the manner set forth.

Second, the combination of the lever F, hooked bar B, spring D, and coupling pin E, constructed and arranged to operate substantially as set forth.

Third, the connecting bar B, having reversely-directed hooks b b' and shoulders c c', and capable of instant release when in direct line by withdrawal of the coupling pin E, or by advance of the lever F, or when out of direct line by the automatic action of the parts in the manner set forth.

63,240.—JACOB GREEN, Norristown, Pa.—*Melting and Smelting Furnace.*—March 26, 1867.—Blasts of steam and air maintain a pressure inside of the furnace, and a blast in the latter directs the calorific current on to the hearth. The final reduction takes place on the reverberatory hearth and the metal is collected in the basin.

Claim.—First, subjecting ores to the action of the products of combustion in a furnace where the gases are confined under pressure, substantially as and for the purpose described.

Second, the combination with a smelting furnace of pipes, through which currents of steam and air can be introduced among the products of combustion previous to the latter being brought into contact with the ore, for the purpose specified.

Third, a blast pipe, so arranged in respect to the hearth and the fireplace of a smelting furnace as to direct the products of combustion in a blast on to the hearth, for the purpose set forth.

Fourth, a chamber or chambers H, through which

the ore is admitted to the furnace, when the said chambers are arranged in respect to the bed and to the fireplace, substantially as specified.

Fifth, the fireplace D, bed F, stack G, inclined passage H, with its openings C c, and reservoir E, all constructed and arranged substantially as and for the purpose set forth.

Sixth, the combination of the two fireplaces D D', stacks G G', passages H H', beds F F', and the basin E, the whole being constructed and arranged substantially as specified.

63,241.—JACOB GREEN, Norristown, Pa.—*Glass Furnace.*—March 26, 1867.—A pressure is maintained within the furnace. Blasts of air and steam are admitted below the grate, and air through side openings into the furnace; these direct the calorific current around the pots and then over them to the exit openings.

Claim.—First, subjecting the materials of which glass is to be formed to the action of the products of combustion under air pressure by blasts within a furnace, as set forth.

Second, the combination of a glass furnace with pipes so arranged that blasts of air and steam can be introduced among the products of combustion before the latter are brought into contact with the contents of the pots or crucibles, for the purpose specified.

Third, the combination with a glass furnace of a blast pipe and openings so arranged as to direct the products of combustion around the pots, substantially as set forth.

Fourth, the within-described furnace consisting of the walls A A' B B', with their openings, the top C, "siege" a, and fireplace E, the whole being constructed and arranged as described.

63,242.—CHARLES GSCHWIND and CHARLES REICHAUDT, Union Hill, N. J.—*Lock for Trunks, &c.*—March 26, 1867.—The key is first inserted with the spindle reversed, in which position alone can the bit reach the dog to free the bolt; being then withdrawn, it is inserted in the usual manner and actuates the bolt as usual.

Claim.—First, the application to a lock of the dog D, and its combination with the notched spring-catch B and bolt C, substantially as herein shown and described.

Second, a lock which is so constructed that it can only be opened by reversing the position of the key in the key-hole, substantially as and for the purpose herein shown and described.

63,243.—N. B. HADLEY, Providence, R. I., assignor to the INTERNATIONAL SCREW COMPANY.—*Machinery for Nicking Screws.*—March 26, 1867.—The two parts of the mandrel meet within the hub of the driving wheel, where a clutch connection is maintained by a spiral spring. A rod passes axially through one of the parts of the mandrel and bears against the spring to unclutch the parts of the mandrel. The rod is operated by levers which are actuated by cams on the driving shaft of the machine.

Claim.—Uniting the spindle D with its driving power by means of the movable latch connection e, or its equivalent, arranged and operating substantially as described, for the purposes specified.

63,244.—GEORGE W. HEATH, Burlington, Pa.—*Horse Hay Fork.*—March 26, 1867.—The flukes are so pivoted to the bars as to be projected when the two movable bars are thrust downward, and retracted by their upward motion so as to be in suitable condition for entering the hay as a harpoon. The motions are obtained by a trigger worked by ropes.

Claim.—In combination with the bars A D and G the curved handle E and points or flukes C and F, when the same shall be constructed and operated substantially as shown.

63,245.—WILLIAM HELFFRICHT, Philadelphia, Pa.—*Passenger Register.*—March 26, 1867.—Improvement on his patent, January 8, 1867. A paper strip, printed for tickets, is wound upon the pulley and the end pressed through the slot of the plate, and thence between the feed rollers to the slit in the front of the case. The pins maintain the paper as well as the two portions of the case in the proper lateral position.

Claim.—First, the plates h and h', arranged within

the case in respect to the rollers C and C' and slit *y* in front of the case, substantially as described.

Second, the combination of the roller C with the spring b, for the purpose described.

Third, the plate E, with its transverse slot *f*, arranged within the case in respect to the rollers C and C', as set forth, for the purpose specified.

Fourth, the steadying and guiding pins *i* *i*, secured to one portion of the case and adapted to holes in the other portion, as and for the purpose herein set forth.

63,246.—RICHARD B. HENDERSON, Warren Co., N. C.—*Cotton Cultivator*.—March 26, 1867.—The machine travels on two wheels between the rows and has an oscillating hoe on each side, which are actuated by bevel gearing and rod connections to a crank revolving on a shaft arranged longitudinally of the machine. The action is to chop gaps in the rows and leave the plants in hills. The machine is adjustable in width and has a cultivator in the rear.

Claim.—First, the frame A, running on wheels B, and operating in combination with the hoes, substantially as and for the purposes set forth.

Second, the crank G, in combination with the handles M and hoes N and O, substantially as and for the purposes set forth.

Third, the hoe N, when constructed and operating substantially as and for the purposes set forth.

Fourth, the hoe O, when constructed and operating substantially as and for the purposes set forth.

Fifth, the hoe P, when constructed and operating substantially as and for the purposes set forth.

Sixth, the extension frame H, when constructed and operating substantially as and for the purposes set forth.

Seventh, the cultivator Q, in combination with the machine herein set forth.

63,247.—W. H. H. HEYDRICK, Chestnut Hill, Pa.—*Steam Gang Plow*.—March 26, 1867.—The plows are dropped consecutively to their duty so as to enter the ground on a given line at right angles to the course of the machine, and are withdrawn from the ground in a similar manner; the ends of the land are thus left square. Each plow is connected by a chain to a pivoted lever, which is dropped or raised seriatim with its fellows, the actuating agents in each case being shafts with spiral sets of cams.

Claim.—First, the shaft *k*, rotated by the clutch connection or by hand, as desired, and operating by means of a spiral series of cams, to elevate the plow consecutively from the ground, substantially as described.

Second, the shaft *o*, rotated by the clutch connection or by hand, as desired, and operating by a spiral series of cams, to trip the dogs, or their equivalents, consecutively to lower the plows to the ground, substantially as described.

Third, the combination with the cam shafts *k* *o* of the levers *g* and spring dogs *t*, operating substantially as described.

Fourth, the director wheel *b'*, shaft *a'*, and bar *z*, constructed and operating substantially as described.

Fifth, the bar *e'*, supporting the cord pulleys and adjustable by devices, substantially as described.

63,248.—EDWARD HICKS, North Hempstead, N. Y.—*Elevator*.—March 26, 1867.—The movable car has apparatus to raise and support the load and travels on ways to different parts of the building. It is so arranged that the lifting device operates till a certain height is attained, and then the power is directed to the transportation of the car and its suspended load.

Claim.—First, the application and use of the movable side plates *h* *i*, arranged and operating substantially as and for the purposes set forth.

Second, supporting one truck of the car, so that it can rise and fall in respect to the car, substantially as and for the purposes set forth.

Third, the arrangement of the cross-bar *k*, or its equivalent, for supporting the end of the car, substantially as and for the purposes set forth.

Fourth, the combination and arrangement of the pulley *f* and block *g*, or their equivalent, for elevating the bearing wheels *b* *b* and releasing the car, operating substantially as set forth.

Fifth, the combination and arrangement of the block *g*, spool *d*, and supporting brace *l*, or their

equivalents, for holding and releasing the fork and load, and operating substantially as set forth.

63,249.—DAUPHIN S. HINES, Brooklyn, N. Y., assignor to JOHN J. CROOKE, New York, N. Y.—*Manufacture of Lead Foil Coated with Tin*.—March 26, 1867.—Explained by the claim.

Claim.—The process, substantially as described, for making foil of lead coated with tin on both sides by inserting a plug of lead within a pipe made of tin, and then rolling the compound ingot thus formed, as set forth.

63,250.—PETER HOFFMAN, Jersey City, N. J.—*Tool for Cutting off Boiler Tubes*.—March 26, 1867.—The cutter bar is inserted in the tube, the wedge occupying the slotted end; the points are driven outward as the wedge is driven.

Claim.—A tool for cutting boiler tubes which is composed of a split or sectional bar A, provided at one end with a boss *a* and at the opposite end with teeth *c*, to operate in combination with a wedge B, substantially as and for the purpose set forth.

63,251.—GEORGE L. and WILLIAM M. HOWLAND, Topsham, Me.—*Hoisting Apparatus*.—March 26, 1867.—Improvement on the patent of G. L. Howland, September 18, 1866. A third pawl can be thrown in when required by which the notched bar may be raised two teeth at a time. The lower pawls are flexibly connected by links to render their motion more free.

Claim.—First, the pawls G and I, arms *g'* and *i'*, and links *i* and J, in combination with the spring lever H, bars A and B, and lever D, all made and operating substantially as herein shown and described.

Second, the pawl *m*, in combination with the pawls G and I and with the bar B, substantially as and for the purpose herein shown and described.

Third, the pin *l* and pawl *m*, in combination with the band *n*, arm *g*, and spring *p*, all made and operating substantially as set forth.

63,252.—ELIAS HONIE, Montezuma, N. Y.—*Carriage Clip*.—March 26, 1867.—The ears of the axle clip are bent over the pins of the block, which is then ready to receive the square socket in the thill iron; a nut on the threaded upper end of the block maintains the connection.

Claim.—First, the joint, when formed by bending the two external joint pieces C C onto the solid stand D, as above set forth.

Second, in combination with the above, the thill iron A, when used as and for the purpose above described.

63,253.—GEORGE W. HUBBELL, Birmingham, Conn., assignor to himself, W. E. HOUSTON, and J. R. LATTIN, same place.—*Skirt Wire*.—March 26, 1867.—A fabricated edge is formed upon the wire by the mode of interweaving the braiding material to whose projecting portion the tapes are stitched.

Claim.—A cord or edge formed upon the wire from the same material with which the wire is covered, substantially as herein set forth.

63,254.—WILLIAM H. HURLBUT, Elgin, Ill.—*Converting Motion*.—March 26, 1867.—The edge of the double spiral flanged cam is engaged by pins projecting from the cross-head slide, and by the reciprocating motion of the latter is caused to revolve continuously.

Claim.—The spiral flanged cam B, having its ends constructed as described, in combination with the cross-head A and pins *a* *a* of a steam engine, or with an equivalent part of any other motor, and with the shaft C, the whole being constructed, arranged, and operated substantially in the manner and for the purpose set forth.

63,255.—JOHN ALLCOCK JONES, Middlesboro' on Tees, England.—*Non-conducting Composition for Covering Boilers, &c.*—March 26, 1867.—Composed of peat or silt alone, or the following: peat or silt, 100 lbs.; Roman or Portland cement, 20 lbs.; oxide of iron, 15 lbs.; lime, 10 lbs.; sand, 10 lbs.; cow hair, 4 lbs.; gypsum, 2 lbs.; and mineral oil, 4 lbs.

Claim.—First, the application and use, for the purpose of impeding the passage of heat or caloric, of peat, turf, bog, silt, or other similar accumulations

of vegetable, or partly vegetable and partly earthy matter, either alone or in combination with other ingredients, substantially as hereinbefore described.

Second, the molding of the said material or composition into cakes and bricks, and the subsequent application of the same, in that form, for the purpose specified.

63,256.—GERHARD KAMPS, Pittsburg, Pa.—*Manufacture of Vinegar.*—March 26, 1867.—The distillate of the fermented vegetable matter passes from the still to a perforated wooden box supported within the generator, which has sufficient water in it to cover the end of the pipe. Blocks of wood soaked in vinegar surround the box. A hydrometer floats in a tube on the side of the generator for testing the specific gravity of the vinegar.

Claim.—The mode of manufacturing vinegar from any vegetable substance containing saccharine or farinaceous qualities.

63,257.—HEINRICH KESSLER, Caub City, Duchy of Nassau.—*Steam Engine Lubricator.*—March 26, 1867.—The oil is conducted from the annular reservoir by a wick of fibrous material into the tubular valve stem. This stem has radial holes at its lower end for the discharge of oil, and wire gauze to arrest impurities. Between the upper and lower valves is a spiral spring. When the engine is running the valves are closed by steam and spring pressure; when stopped, the upper valve is closed by the spring, and when running without steam, both valves are sucked open and the oil flows.

Claim.—The combination and arrangement of the tube C, vessel A, network in the tube C, valves D and E, and the spring G, substantially in the manner and upon the principle as herein set forth.

63,258.—DAVID KING, Aberdeen, Ohio.—*Press.*—March 26, 1867.—The nut of the screw shaft is made in two sections, which being opened by a lever, the shaft can be raised at increased speed by a rack and pinion.

Claim.—First, the rack O, gear wheels J and K, in combination with the screw shaft I and sash G, substantially as shown and described and for the purposes set forth.

Second, the nut P, made in sections, as herein shown and described, in combination with the shaft I, sash G, and posts A and B, substantially as and for the purposes herein set forth.

63,259.—ROBERT T. KNIGHT, Philadelphia, Pa.—*Apparatus for Drying Straw Boards, Sheets of Paper, &c.*—March 26, 1867.—The throat of the oblong chamber has a series of deflecting partitions to cause equal distribution of air from the fan. The sheets of paper are hung upon the upper series of removable slats and pass between the slats of the lower series, whose sides are cut away at intervals to allow passage of air.

Claim.—First, a chamber communicating with a fan or other blowing or exhausting apparatus, and having any desired number of bars D D', or their equivalents, for the reception of detachable slats F, or their equivalents.

Second, the construction and arrangement, substantially as described, of the lower slats G, for the purpose specified.

63,260.—H. P. KYNETT, Lisbon, Iowa.—*Gang Plow.*—March 26, 1867.—Two adjustable plows are on each side of the cultivator which straddles one row of corn. The plow beams are adjusted by clevises and pendants to raise or lower the plows. The pendants are also adjustable laterally and secured by bolts in slots.

Claim.—The combination of the slotted cross piece E, side pieces S, bolts f, pendants e, adjustable clevises d, and beams F, substantially as described, for the purpose specified.

63,261.—JOHN L. LADIAUX, Newark, N. J., assignor to himself, C. COURTOIS, P. W. VAIL, and WILLIAM C. GRISWOLD, Newark, N. J., and N. B. DAY and JULIUS SHELTON, New York, N. Y.—*Machine for Pouncing Hats.*—March 26, 1867.—Improvement in the patents of E. Nougaret, February 20, 1866, and September 18, 1866. The two heads have

oscillatory movement by radial arms, and the shafts of the hat block and pouncing block have longitudinal movement by levers at their rear ends. The shafts have rotary motion by pulleys between their journal bearings. A longitudinal key enters a groove in the pouncing block to clamp the edges of the sand paper used therein.

Claim.—First, the combination of the levers e e', respectively, with the shafts E E', spiral springs g g, block G, or roller H, substantially as and for the purposes herein shown and described.

Second, the combination of the disks C or C' and handle I or I' with the pin i and flange b or b' on the posts B or B', all made and operating substantially as herein shown and described.

Third, the combination of the metal pouncing roller H with the wedge l, ring n, and shaft E', arranged to operate substantially as and for the purposes herein shown and described.

63,262.—EBENEZER G. LAMSON, Shelburne Falls, Mass.—*Drill Spring for Quarrying Stone, &c.*—March 26, 1867.—The drill rod is adjustably secured in a head which occupies a position at midlength of the metallic strap which forms the bow of the spring.

Claim.—First, in combination with stone drilling or quarrying machines, a metal bow spring and metal strap or cord for carrying and sustaining a drill, substantially as described.

Second, constructing the metal strap or cord of the spring to a central, divided, and adjustable head, substantially as and for the purpose described.

Third, the combination of the spring, strap, drill stock, and drill, substantially as and for the purpose described.

63,263.—CHARLES LANG, New York, N. Y.—*Machine for Embossing and Perforating Paper, &c.*—March 26, 1867.—The paper passes between cameo and intaglio dies, by which it is embossed or perforated; a third roller is used for a cutter, and the last one is a wheel brush for removing stray fragments from the embossing roller above it.

Claim.—The new mode of manufacturing embossed and perforated goods out of paper linen, cotton-lined paper, paper mixed with cotton threads or linen threads, cotton cloth, linen cloth, or similar material, by means of the machine, substantially as described; the principal parts of which said machine consist of three rollers, two of which contain the design, depressed and raised, and the third acting, by its pressure, as perforator, between which said rollers a strip of paper or other material is passed, and is embossed, perforated, and cut during its passage, substantially for the purpose set forth.

63,264.—HENRY S. LANSDALE, New York, N. Y.—*Water Ejector.*—March 26, 1867.—Two or more water inlets discharge into a chamber, and a central jet of steam unites them. In the steam induction pipe is a valve opening upward, which is kept closed by the steam pressure, and is opened when relieved by a spring to allow collected water to escape.

Claim.—First, the arrangement of the two or more water inlet pipes or nozzles m m, in relation with the nozzle s of the jet pipe and liquid-receiving chamber, substantially as and for the purpose specified.

Second, the combination with a steam siphon or ejector of an escape valve p, applied to the jet pipe G for operation, substantially in the manner and for the purpose specified.

63,265.—B. B. LEHMAN, Lebanon, Pa.—*Machine for Making Paper Alumettes.*—March 26, 1867.—One edge of the sheet of paper is placed beneath the feeding slide, which is then pushed forward. The strip is formed by the rotary cutter and relieved by the upward incline of the guide. The paper passes between the folding rollers, and the slide is thrown back by a spring.

Claim.—First, the circular saw or cutter B, having knife-edged teeth, operating substantially as and for the purpose herein described.

Second, in combination with the above, the carrier F, substantially as and for the purpose herein specified.

Third, the creasing or pressing rollers, operating substantially as and for the purpose herein set forth.

Fourth, the folder D, in combination with the creasing and pressing rollers, substantially as and for the purpose herein set forth.

Fifth, the inclined plane H, operating substantially as and for the purpose herein specified.

63,266.—MOSES LEWIS and SAMUEL MILLER, Greenville, Conn.—*Pulleys for Belting.*—March 26, 1867.—The pulleys of shafts that are at right angles to each other are tapered to suit the twisted belt.

Claim.—The tapering or conical pulleys B E, over which the twisted belt F circulates, arranged on shafts A D at right angles to each other, for the purpose described, in the manner specified.

63,267.—NATHANIEL and FRIEND LEWIS, Adams, N. Y.—*Cheese Box.*—March 26, 1867.—The sides of the box are cut serrated at the bottom edge, and the angular pieces are bent over inward and secured between two disks to form the box bottom, which has an enveloping hoop.

Claim.—As a new article of manufacture, a cheese box constructed of paper provided with a removable head B', and a head B permanently secured to the lugs C, which are made in one piece with the side of the box, and secured between disks D, substantially as described.

63,268.—JOHANN A. LIBERTZ, Hamburg, Germany.—*Boat Detaching Tackle.*—March 26, 1867.—The metallic base plate is bolted to one of the thwarts, and has two lugs whose pivoted arms press upon the davit fall ropes. The arms are clamped upon the ropes by a screw-bolt, and simultaneously released by a backward rotation.

Claim.—The vertical shaft H, provided with the nut J, lever I, and the slide K, having lateral arms d, in combination with the arms G G, pivoted in the ears or lugs F F on the plate E, all arranged to operate in the manner substantially as and for the purposes set forth.

63,269.—JOHN S. LIGHTNER, Westford, Wis.—*Liniment.*—March 26, 1867.—Composed of vinegar, 1 qt.; spirits of turpentine, $\frac{1}{2}$ pt.; sugar of lead, $\frac{2}{3}$ oz.; salt, 1 oz.; white of 3 eggs, and 1 oz. sulphuric acid.

Claim.—The liniment compounded as above set forth and described.

63,270.—JOHN LOCKWOOD, Wilton, Conn., assignor to himself and EDWIN GILBERT, Redding, Conn.—*Wire Pointing Machine.*—March 26, 1867.—The end of the wire is inserted in the socket of the revolving cutter head, and is pointed by the obliquely set serrated cutter.

Claim.—The improved wire-pointing machine herein described, consisting of the frame-shaft pulley, cutter head, and cutter, all constructed, arranged, and operating substantially as described.

63,271.—C. E. LOMBARD, Springfield, Mass., assignor to himself, A. O. SINCLAIR and C. C. MERRITT, same place.—*Key.*—March 26, 1867.—Grooves in the handle clasp the shaft of the key, which is turned on the pivot at their junction to reverse it in the handle, bringing it into convenient form for the pocket.

Claim.—As a new article of manufacture, a key formed of two parts A and B, constructed and arranged so that the handle B shall close over the opening in the shaft A, substantially as set forth.

63,272.—DAVID LYMAN, Middlefield, Conn.—*Clothes Wringer.*—March 26, 1867.—The movable roll shaft is accommodated by an adjustable clutch connection, preventing wear from change of position in the upper roll. The frame is grooved to accommodate the varying position of the upper roll.

Claim.—First, in clothes wringers the within-described construction and arrangement of the grooves M N, and intermediate piece E X Y, combined and arranged relatively to the shafts B A and D, so as to communicate the motion and withstand the wear, substantially in the manner and for the purpose herein set forth.

Second, the piece C C', constructed and arranged as represented, to hold both the shafts A and B, so as to transmit the motion as represented, and to maintain the shafts at a uniform distance apart, however much the other parts may move relatively thereto,

substantially in the manner and for the purpose herein specified.

63,273.—DAVID LYMAN, Middlefield, Conn.—*Clothes Wringer.*—March 26, 1867.—The jaws which give motion bearing to the rollers are hinged together at their rear ends, and pressed together in front by the wooden spring bars. The rear clamp is adjustably pivoted and of bell-crank form, one arm engaging the tub and the other traversed by the clamping thumb-screw. Each roller has two end cranks set at a right angle to each other. Pins sliding freely in a horizontal slot of the frame form pivots to rods connecting them to the cranks of the rollers to insure an equal rotation. The jaws have links connecting them to a cross-bar on a central shaft, which oscillates freely with the movement of the jaws on their pivot, and insures their equal distance from the said shaft.

Claim.—First, in combination with the shafts c d, crank e' d', and connecting rod G G', a swiveling guide H, operated so as to retain the central position, during the greater or less divergence of the shafts, substantially as and for the purpose herein set forth.

Second, in a clothes wringer having diverging jaws, a spring operating on both pairs of jaws, and acting as both spring and brace therefor, substantially as herein set forth.

Third, in a clothes-wringing machine, substantially as herein described, the gripping arm L and spring K, operating substantially as herein set forth.

63,274.—JOHN A. MACKINNON, Reading, Pa.—*Table-leaf Support.*—March 26, 1867.—The brace is hinged to the leaf and fits into a slot in the leg. The lower end of the brace is attached to a spiral spring, which keeps it from falling when out of the slot.

Claim.—The straight levers A, hinged at one end and notched at the other, when constructed, combined, arranged, and operated by the lever catch G, spiral spring H and button K, as herein described and for the purposes set forth.

63,275.—ELI J. MANVILLE, Waterbury, Conn., assignor to TURNER, SEYMOUR & JUDDS, Wolcottville, Conn.—*Metal Case for Spring Bolts.*—March 26, 1867.—The blank is placed between the mandrel and the lower die, and bent in a U-form by a side pressure of the die. It is then made cylindrical by descent of the upper die. The inner and outer flanges on the opposite ends are formed by the simultaneously operating end dies, and the mandrel retracted within its sleeve to free the case.

Claim.—The combination of the mandrel a, and dies b c d and e, to which movements are communicated in substantially the manner specified for bending up a sheet-metal case with flanges at its ends, as set forth.

63,276.—SETH MARCH, Norfolk, Va.—*Plow.*—March 26, 1867.—The mold board is cast separately from the standard and the heel from the landside, and being attached by bolts can be replaced separately. The weeder is bolted to a bar attached to the frame.

Claim.—The frame, the mold board, the heel D, and the weeder, substantially as described.

63,277.—ARTHUR McCARTER, Lancaster, Pa.—*Car Coupling.*—March 26, 1867.—The pin swings on a transverse bolt which slides vertically in the slotted standards, whose recesses hold the pin in an elevated position when required. The drawhead has a sliding spring block to hold the link in a horizontal position for coupling.

Claim.—The combination and arrangement of the slotted casing A with its vertical standards B B', cross-arm d of pin C, when operating in a vertical slot D with a terminal recess D', together with a stationary or yielding stand post F with its link notch g, all arranged and operating in the manner and for the purpose specified.

Also, the cross-arm d on the pin C in combination with the upright standards B B' when slotted in the manner and for the purpose shown.

Also, the yielding stand post F with its link slot in combination with the coiled spring H, constructed and operating in the manner shown, for the purpose described.

Also, the prolongation or jaws E' of the flared mouth E, in combination with the open case A, when

constructed in the manner and for the purpose shown and set forth.

63,278.—JOHN A. McCLAIN, Philadelphia, Pa.—*Swing*.—March 26, 1867.—The movable footboard is connected by a rope with a vibrating frame and actuates springs which oscillate the swing.

Claim.—First, the vibrating frame P O O P and springs S' S', whether metallic or otherwise, when constructed and combined in the manner and for the purpose above described and set forth.

Second, the combination of the upright A A and vibrating frame P O O P, rope and foot board R and F, springs S' S', and suspenders and seat S F and S, the whole combined and constructed for the purpose and in the manner aforesaid described and set forth.

63,279.—HENRY MELLISH, Walpole, N. H., assignor to DAVID LYMAN, WASHINGTON WHITNEY, and GILMAN WAITE.—*Machine for Making Fruit Baskets*.—March 26, 1867.—The shavings are cut in continuous strips of helical form out of the solid wood and the guide traversing a central bore. The coil is afterward cut in the plane of the axis of the log, each piece forming a basket.

Claim.—First, the cutter H, constructed substantially in the manner and for purpose above specified.

Second, the hollow cylinder C, in combination with the main cutter H, arranged to operate substantially in the manner and for the purpose above set forth.

Third, the head cutter I, when in combination with the main cutter H, substantially in the manner and for the purpose above described.

Fourth, revolving a log against a cutter or cutters arranged to move gradually in a direction parallel to its axis for the purpose of cutting a helical coil suitable to be divided into pieces that, when sprung from their helical form to a circular one and properly fastened, they will constitute fruit baskets, pots, or bowls with the bottoms on, substantially in the manner as above described.

63,280.—HENRY MELLISH, Walpole, N. H., assignor to DAVID LYMAN, WASHINGTON WHITNEY, and GILMAN WAITE.—*Machine for Cutting the Bottom of Fruit Baskets*.—March 26, 1867.—The face of the stuff is circularly grooved out by the cutter head. The inner cutter has an inner lip and is moved toward the center at the proper time to under-cut the groove for the reception of the ends of the shavings which form the sides. After grooving, the disks are removed from the timber by a circular saw.

Claim.—First, the grooving cutter C², so mounted on the quadrant or plate C on the head B, that it may be moved inward thereon and produce an undercut groove adapted to receive and hold the properly formed material driven therein, substantially in the manner and for the purpose herein set forth.

Second, the rod E, in combination with the hollow arbor A and the surface D, adapted to operate the plate C with its cutters C¹ C², and move it inward when required, substantially in the manner and for the purpose herein set forth.

63,281.—J. VAUGHAN MERRICK, Philadelphia, Pa.—*Steam Engine*.—March 26, 1867.—The cylinder is annular and has two piston rods which connect to a cross-head plate slotted to permit the movement of the connecting rod which passes through it. Rods pass up from this plate to an upper cross-head whose slides are within the annular cylinder. The connecting rod passes from this cross-head to the wrist pin of the crank.

Claim.—First, the combination of the annular cylinder A, its piston E, two or more piston rods *n n*, plate or cross-head *k*, rods *n n*, cross-head G, connecting rod I, and crank *h*, the whole being arranged and operating substantially as and for the purpose herein set forth.

Second, the combination of the above with rods *m' m'*, for the purpose specified.

63,282.—DANIEL C. MERRILL, South Paris, Mo.—*Churn*.—March 26, 1867.—The air pump discharges air through the bottom of the churn. The dasher has a vertical reciprocation by the pin on its adjustable arm which enters a socket on the balance wheel; a slight oscillation is imparted by this connection.

Claim.—First, making the horizontal arm *d'* of the standard D adjustable so that it may be extended or contracted, substantially as herein shown and described and for the purpose set forth.

Second, the combination of an adjustable slide or socket J, with the balance wheel G for the reception of the end of the arm K, adjustably attached to the dasher handle E, substantially as herein shown and described and for the purpose set forth.

Third, combining an air pump M with the churn A in such a way that the discharging pipe *m'* of said pump may enter the churn through the middle part of its bottom, substantially as herein shown and described.

63,283.—HARMAN MILLER, Hoboken, N. J.—*Paint Can*.—March 26, 1867.—A thread is spun upon the upper edge of the can and the screw flange of the cover inserted therein.

Claim.—A wooden cover B, which is screwed to the paint can A for the purpose of easily opening and reclosing the same, substantially as herein shown and described.

63,284.—JOSEPH A. MILLER, New York, N. Y.—*Street Crossing and Sewer Inlet*.—March 26, 1867.—The perforated crossing plates cover a drain inclined to the center of the street where they discharge vertically into a trap basin and overflow into the sewer.

Claim.—First, the arrangement of a trough the bottom of which slopes down from its ends toward the middle, in combination with a street crossing made of perforated plates of metal or other suitable material, and with a pipe extending from the lowest part of the trough down into the sewer, substantially as and for the purpose described.

Second, the sewer inlets *b* and aprons *c* at the ends of the trough B in combination with pipe C, extending from the lowest portion of the trough down in the sewer D, substantially as and for the purpose set forth.

Third, the application of the stench trap E in combination with the pipe C, sewer D, trough B, and crossing A, all constructed and operating substantially as and for the purpose described.

63,285.—WILLIAM H. MILLER, Philadelphia, Pa.—*Packing for Piston Rods*.—March 26, 1867.—A filling of fibrous or other material is covered with yarn saturated with powdered steatite and wound around the filling.

Claim.—A new manufacture consisting of packing composed of a filling of fibrous or other materials covered with cotton, woolen, or other yarn, saturated with powdered soapstone, or other equivalent material, and wound around the filling, substantially as shown and described.

63,286.—LUKE S. MILLS, Brooklyn, N. Y.—*Portable Boiler for Pitch, &c.*—March 26, 1867.—The pitch chamber has an arched exterior with a flat top and a semicylindrical plate separates it from the fire space beneath. Between the wall and the outer jacket is a layer of non-conducting material.

Claim.—First, a portable boiler formed with an arched fire chamber and an exterior shell contracted toward the top as and for the purposes specified.

Second, a portable boiler formed with sides to set down upon the earth or pavement, an arched fire chamber provided with doors at the ends, a smoke pipe or flue passing off from the top of the fire chamber through the boiler, and a movable cover to give access to the contents of the boiler, substantially as set forth.

Third, in combination with a portable boiler formed as aforesaid, the jacket of felt and cover *l*, as set forth.

63,287.—GEORGE R. MOORE, Lyons, Iowa.—*Heating Stove*.—March 26, 1867.—The stove top is partially insulated to enable the use upon it of ornamental designs in Japan varnish, &c. A hot-air chamber before the fire space has an inclined rear plate which supports the coal when the ashes are shaken out. A horizontal diaphragm above the fire chamber has a central aperture covered by a damper. A space above the air chamber has a door for the introduction of kindling and dampers covering communications to the fire space and upper smoke chamber.

Claim.—First, the insulation of the tops of heating stoves, substantially in the manner and for the purposes set forth.

Second, the chamber in the front part of the stove between the door E and upper part of plate H, when constructed and arranged as and for the purposes set forth.

Third, the flue from the fire chamber through the front upper chamber to chamber in top of the stove with the controlling dampers, arranged substantially as and for the purpose set forth.

63,288.—D. S. NEAL, Lynn, Mass., assignor to himself and J. B. BLOOD, same place.—*Farm Gate.*—March 26, 1867.—Each gate has a transverse pivot at the heel and a segmental slide bar concentric therewith which occupies the groove of a roller on the post. The gate is opened by swinging upward and backward on the pivot.

Claim.—A rectangular gate, the bars of which are relatively fixed, hung, and operated, as described, by supporting it upon a pin *c* and guiding it in its vertical swinging movements by means of the vertical slot in the upright, substantially as set forth.

63,289.—D. P. NICKERSON, Cleveland, Ohio.—*Ships' Davit and Winch.*—March 26, 1867.—The davit bars are extended by a pinion upon the winch shaft. This pinion turns freely upon the shaft except when clutched thereto for the projection of the davit, and when free its pulley may be used to hoist the boat.

Claim.—The adjustable sliding davit A, pinion C, as arranged in combination with the adjustable shaft D, clutch E, and winch H, for the purpose and in the manner substantially as set forth.

63,290.—A. W. OLDS, Green Oak, Mich.—*Field Fence.*—March 26, 1867.—The upright stakes are placed a little wider apart at the top, thus allowing the rail the opportunity of wedging downward. The stakes are bound together at top with a tie. Bracing stakes slanting below one rail and above another, near the top of the fence are fastened below to a foot frame or the ground.

Claim.—The posts or stakes A A, base B, in combination with the braces C C and tie E, when arranged in relation to each other and the rails D, as and for the purpose set forth.

63,291.—SIMON B. PARKER, New York, N. Y.—*Safety Attachment for Pocket Books.*—March 26, 1867.—A spiral spring enclosed in a case attached to the pocket book projects a needle or pointed rod through the pocket, and is secured by a catch on the book. It is used as security from pickpockets.

Claim.—A safety attachment for pocket books, composed of a sliding needle C, arranged and applied substantially in the manner as herein shown and described.

63,292.—WALTER S. PEPPER, Carlisle, Pa.—*Boot Jack.*—March 26, 1867.—A sloping heel piece is hinged on to a foot piece below, on which it can be folded back when out of use; and adjustable toe catch is kept in position by a spiral attached to a movable block, which is kept in place by two metal strips.

Claim.—A boot jack with the two parts hinged together at F, and the part B B, provided with a movable toe piece D, acted on by any suitable spring, substantially as specified within.

63,293.—ABRAHAM G. POLHAMEUS, Nyack, N. Y.—*Water-tight Iron Tank for the Protection of the Timbers of Steamboats.*—March 26, 1867.—Laterally extended close tanks are interposed between the heated surface of the furnaces and boilers and the wood work of the vessel. Water circulates in the tanks.

Claim.—The construction of the water-tight iron tanks, in which are maintained a constant change and circulation of water as the foundation of boilers and furnaces on steamboats to protect them against fire, substantially as herein described.

63,294.—E. N. PORTER, Morrisville, Vt.—*Mop Squeezer.*—March 26, 1867.—The slotted jaws of the squeezer are attached to a movable platform, and op-

erated by a treadle. The platform is set on casters, so as to be readily moved.

Claim.—The jaws D, lever H and treadle J, arranged and operated as herein described, in combination with the movable platform B, for the purpose set forth.

63,295.—E. P. PORTER and G. W. HALLET, Waterford, N. Y.—*Door Lock.*—March 26, 1867.—The spring catches are withdrawn singly by the key, and their spring pins retain them in that position; the bolt may then be shot.

Claim.—First, the spring catches H, whether more or less in number, in combination with the bolt B, when arranged together, substantially as and for the purpose described.

Second, the catch X, in combination with the bolt B, substantially as and for the purpose specified.

63,296.—AARON W. PRATT, Pultneyville, N. Y.—*Fence.*—March 26, 1867.—A wooden frame for a panel is filled with pales, which are held in position by wires made fast to the posts, and alternating on either side of the pales.

Claim.—The sill E, the posts A, the cap D, the pales *b* and the wire strands *c*, the whole arranged, constructed, and operating substantially as herein described.

63,297.—JOSHUA C. PRICE, New Philadelphia, Ohio.—*Bridle Bit.*—March 26, 1867.—The headstall and reins are attached to the opposite ends of movable and sliding levers, which run through the eyes of the bit; these as they are drawn through by the reins, increase the leverage on the jaw of the horse.

Claim.—The movable or sliding levers or sides B B, when applied substantially as and for the purpose set forth and described.

63,298.—DANIEL R. PRINDLE, East Bethany, N. Y.—*Composition for Destroying Insects.*—March 26, 1867.—Petroleum and coal tar are mixed to the consistency of paint, and used on a swab to destroy caterpillars and their nests.

Claim.—The composition of coal tar and petroleum, in the manner and for the purpose herein specified.

63,299.—DANIEL R. PRINDLE, East Bethany, N. Y.—*Hydraulic Paint.*—March 26, 1867.—Pulverized hydraulic lime is mixed with scalding "skim" milk to the consistency of paint. It is intended for coating brick work.

Claim.—A paint composed of pulverized hydraulic lime and skim milk, either with or without the addition of chrome yellow or other pigment, as herein specified.

Also, in combination with the above, the use of linseed flour, as set forth.

63,300.—DANIEL R. PRINDLE, East Bethany, N. Y.—*Preserving Wood and Timber.*—March 26, 1867.

—The timber is immersed in hot coal tar, and afterward coated with the residuum of the same, put on hot, and sand dusted upon it.

Claim.—The application of coal tar, common tar, or equivalent substance, or the ingredient thereof, to wood and timber successively, substantially as specified, as a new process of preserving the same.

63,301.—P. O'THAYNE, New York, N. Y.—*Ironing Machine.*—March 26, 1867.—The rotating iron is heated by a gas burner, and the calorific current passed off through the hollow shaft. The boxes of this journal are supported on spiral springs, and are depressed by a divaricated lever, operated by a treadle. The segmental plate to receive the linen has clamps for the attachment of the ironing sheet or article to be ironed, and may be oscillated by a hand crank.

Claim.—First, the construction and arrangement upon the frame A of the cylindrical revolving smoothing iron D, hollow shaft B, having its bearings in the yielding boxes *a*, which are provided with the standards *c*, adjustable rest *e*, forked lever E, rod *d* and treadle F, substantially as herein shown and described.

Second, the segmental platform G upon the end of the shaft H, provided with the clamps *g g*, flatboard

G', having the toothed rack I, pinion J, mounted upon the shaft i, when all are constructed and arranged upon the frame A, as and for the purpose specified.

63,302.—HENRY RECHER, Liberty, Ohio.—*Water Gate.*—March 26, 1867.—The pivoted gate is connected by levers to the float, so as to vary the sectional area of opening according to the height of water in the dam, and thus keep an equal flow upon the wheel.

Claim.—The arrangement and combination of the centrally-hinged gate F, with the connecting rod E, lever C and float B, all constructed and operated substantially as described.

63,303.—THOMAS RESTELL, London, England, assignor to CHARLES POMEROY BUTTON, New York, N. Y.—*Breech-loading Fire-arm.*—March 26, 1867; antedated March 13, 1867.—This breech-loading needle gun is convertible to use as a cane. The vent of the barrel has a nipple bored to receive the movable supporter, which is detached, and carried separately, when the weapon is used as a walking cane. The aperture is opened or closed by a sleeve, to which the needle guide is attached. The cylindrical hammer moves in a guide block, and is actuated by a spring lever and a trigger.

Claim.—The reciprocating hammer H, with its curved-inclined plane S and spring lever G, in combination with the sleeve C and tube E for operating the needle d, substantially as described for the purpose specified.

63,304.—AUGUST J. T. REUTER, Boston, Mass.—*Lemon Squeezer.*—March 26, 1867; antedated March 18, 1867.—The grooved ovoid knob on the end of the handle fits the inside of a half lemon or orange to extract the juice therefrom by pressure.

Claim.—A grooved bulb or knob, constructed substantially as above set forth, for the purposes herein specified.

63,305.—JOHN R. RICHARDS, Mount Joy, Pa., assignor to himself and A. L. MENNEZ, same place.—*Safe Lock.*—March 26, 1867.—The two sand boxes have adjustable communication to regulate the amount of sand transferred from the upper sand box to the lower in a given time. The gravitation of the lower box frees the operating shaft, by whose rotation the screw bolts are withdrawn.

Claim.—First, the twin sand boxes A A', or their equivalent gravitating force and regulating key H for timing the period that shall intervene before the bolt D and bolts W can be operated, so as to unlock the door by withdrawing or unscrewing them by simply turning the knob F, substantially in the manner and for the purpose specified.

Second, the socket, screw bolts W D, operated substantially in the manner and for the purpose specified.

63,306.—ORVILLE M. RIDGWAY, La Porte, Ind.—*Sash Fastener.*—March 26, 1867.—The sash has on one edge a friction block of rubber, and on the other a metallic spring ear bears against the casing.

Claim.—The combination of the metallic spring C, rubber block D, when constructed and arranged upon each of the sashes B, as herein set forth, for the purpose specified.

63,307.—A. W. ROBERTS, Hartford, Conn., assignor to P. JEWELL & SONS, same place.—*Leather Scouring Machine.*—March 26, 1867.—The leather is stretched upon the table, which is capable of a partial rotary and also a transverse motion in a horizontal plane beneath the reciprocating tools, which are adjustable as to angle and pressure.

Claim.—First, the rotating plate T, sliding plate T', guide way T'', or their equivalents, in combination with the table S', to produce a transverse movement of the table with the guide ways B'', substantially as described.

Second, in combination with the above the table S, to produce a universal horizontal movement of said table, substantially as described.

Third, the employment of an oscillating, adjustable tool holder with the arms H', for altering the angle of the tool, substantially as described.

Fourth, the altering of the angle of the tool, with or

without the use of the tool arms H', by means of the adjustable shaft H, or its equivalent, substantially as described.

Fifth, the employment of the springs K, secured to the arms H', and bearing upon the tool holders I, extending in an opposite direction from that to which the springs are secured, for the purpose of imparting pressure from one to the other, substantially as shown and described.

Sixth, the alternate action of the springs K, imparted from one to the other by raising either one of the arms from the table, substantially as described.

Seventh, the arms G G, in combination with the arms F F', arm E, rock shafts F F', and their connections, for lifting the tools from the table, substantially as shown and described.

Eighth, arranging the arms H', upon an independent shaft H, to more perfectly utilize their action.

Ninth, arranging the shaft H, in adjustable or sliding boxes H', whereby it can be elevated or depressed by screws c c, or their equivalents, for the purpose as shown and described.

Tenth, the employment of slide dogs P'', or their equivalents, for holding up the tools from the work while the tool stock C is in motion.

Eleventh, the employment of the screw e'', with the arm L, or their equivalents, for increasing the tension of the spring K, substantially as described.

63,308.—WILLIAM RUNTE, New York, N. Y.—*Tool Handle.*—March 26, 1867.—The supplemental ferrule connected to the other by a screw contains a central wooden plug to receive the tang of the awl.

Claim.—The combination of the plug D, and the adjustable ferrule or tube E, with the tool handle, substantially as and for the purpose herein shown and described.

63,309.—BENJAMIN RYDER, JR., South Orlingfoh, Me.—*Wagon.*—March 26, 1867.—The middle sliding bar of the reach is connected by the king-bolt to the forward axle and by a chain which passes around a pully on the bolster to the box frame at its midlength. By withdrawing the forward pin which holds the box in usual position the chain draws the box back till it is about evenly balanced on the hind axle convenient for dumping.

Claim.—The frame G, which supports the reach and allows the wheels to be extended forward, substantially as described.

Also, the rollers C D, and the chain h, arranged and operating substantially as shown and described, for the purposes specified in combination with the wagon body.

63,310.—LOUIS SAARBACH, Philadelphia, Pa.—*Tobacco Pipe.*—March 26, 1867.—The cup in continuation of the stem collects the saliva and prevents its passage to the bowl; the smoke passes through an orifice in the side of the cup.

Claim.—The tube c, in combination with the cup D, for the purpose described.

63,311.—RUFUS S. SANBORN, Ripon, Wis.—*Fire-proof Safe.*—March 26, 1867.—Improvement on his patent, July 17, 1866; reissued November 6, 1866. The water is introduced by pipes so as to half fill the vessels which are inserted in the walls of the safe, the tube passing to the center of the chamber. Steam generated by exterior heat is carried off by valves.

Claim.—First, introducing water vessels provided with steam valves into a fire-proof safe of any ordinary construction, said vessels being of such size and conformation as to adapt them to the form and dimensions of the safe in which they are placed.

Second, providing each of such water vessels with a tube t, reaching from any portion of the edge or perimeter to or toward the mathematical center of the vessel, as and for the purpose specified.

63,312.—B. B. SCOTFIELD, Woodhull, Ill.—*Wagon Brake.*—March 26, 1867.—As the brake bar is revolved by the lever its projecting curved shoe is brought into contact with the wheel.

Claim.—An improved brake formed by the combination of the revolving cylinder A, curved shoes C, and lever D, with each other, substantially as herein shown and described and for the purpose set forth.

63,313.—H. G. SEEKINS, Elyria, Ohio, assignor to himself, LEONARD B. GRIFFING, and ORANGE S. FRYAR, same place.—*Bed Bottom Spring.*—March 26, 1867.—The bar has longitudinal slots and the slats are separated by fulcrum blocks. The elasticity is distributed throughout its length instead of being concentrated in its middle.

Claim.—A compound bed spring consisting of the middle leaves A A', the upper leaves B B', and lower leaves C C', the several springs being supported by the fulcrum blocks d d', constructed and arranged as and for the purpose specified.

63,314.—DANIEL SHATTUCK, Buffalo, N. Y.—*Soap Compound for Cleaning Wool, &c.*—March 26, 1867.—Tallow, 150 lbs.; olive or cottonseed oil, 50 lbs.; flaxseed oil, 10 lbs., is saponified with lye; 15 lbs. of rye flour is saturated with water and mixed with boiling water, 15 galls. and lye of 5° strength, 5 galls.; mix with the former saponified mass and add lye of from 15° to 25°, then add spermaceti 2½ lbs.; isinglass, ¼ lb.; borax, 1 lb.

Claim.—A soap formed by the combination of the ingredients above described, substantially in the manner and proportions specified.

63,315.—C. W. SHERWOOD, Chicago, Ill.—*Folding Seat.*—March 26, 1867.—Improvement on his patent, November 6, 1866. To avoid noise in changing position of the folding seat, a piece of rubber introduced in the joint is compressed between the nave and the axle.

Claim.—The rubber spring e, or its equivalent, and the lug d, in combination with the axle C' and nave B', all constructed substantially as and for the purposes specified.

63,316.—J. A. SINCLAIR, Woodsfield, Ohio, assignor to himself, J. T. JUDKINS and W. HOLISTER, same place.—*Flour Sifter.*—March 26, 1867.—Flour from the hopper passes to the cylinder, through the meshes of which it is forced by the rotary spiral brushes. Refuse is discharged by a spout and the operative mechanism is arranged in a drawer which is removable.

Claim.—First, the combination of the two cylinders H and I, having lines of brushes M winding spirally around them in opposite directions, with sliding drawer E, substantially as herein shown and described for the purpose set forth.

Second, the drawer E, consisting of two hinged parts, e¹ and e², with opening on its upper side, registering with the discharge orifice of the hopper, having at its bottom the semi-cylindrical sieve G, swept by the spiral brushes M, and a passage at its rear opening into spout N, and constructed and operating substantially as described for the purpose specified.

Third, the combination of the sliding drawer E, with the box A, hopper B, and spout N, substantially as herein shown and described.

63,317.—THOMAS J. SLOAN, New York, N. Y., assignor to EZRA GILDERSLEEVE, same place.—*Window Blind Fastening.*—March 26, 1867.—A shaft passes through the window frame and is attached to a beveled cog wheel which engages an arm on the hinge of the blind, which is rotated thereby.

Claim.—The hinge having bevel cogs in combination with the shaft extending to the inside of the window provided with a bevel cog wheel, and the hinge shank constituting the hinge journal on which the blind turns, and the box in which the shaft turns, substantially as and for the purpose described.

Also, the combination of the hinge with its beveled cogs, the shaft with its beveled cog wheel, the spring spur on the knob and the plate or its equivalent, with the recess to receive the spur to lock the blind when either shut or open, substantially as described.

Also, the beveled recesses in the face of the locking plate, or the equivalent thereof, for holding the blind or shutter at any angle desired, in combination with the spring spur; the shaft and hinge connected by bevel gears, substantially as described.

63,318.—ALBERT C. SMITH, Fort Madison, Iowa.—*Self-Acting Gate.*—March 26, 1867.—The hub of a vehicle striking against a block pivoted on a short post elevates a latch bar and slides the gate endways.

The rollers of the gate traverse on rods, and it is closed by the hub of the vehicle striking the counter-part lever on the other side of the gate.

Claim.—The combination and arrangement of the gate A, lever E, and rods b d, and operated by the lever H H', with their cords r s, rod g, and pulleys, in the manner substantially as described, and for the purposes set forth.

63,319.—J. Y. SMITH, Pittsburg, Pa.—*Drilling Apparatus.*—March 26, 1867.—The rope is undulated between the parallel series of sheaves, those on one side being adjustable. The sheaves are moved by gears and worm wheels and pay out the rope at a given rate.

Claim.—First, automatically feeding a drill by means of the sheaves a and b, having motion imparted to them, substantially as described.

Second, the adjustable sheaves a, in combination with the non-adjustable sheaves b, when arranged to operate as set forth, for the purpose of holding the rope R, and feeding it out as described.

Third, the combination of the shaft E, provided with the wheel m, and worm wheels H, with wheels D, attached to the journals of sheaves a, all mounted in the rotating frame A, and arranged to be operated as set forth.

Fourth, the use of the within-described apparatus for feeding drills whether the same be rotated by the twist imparted to the rope, or by means of the ratchet I, substantially as described.

63,320.—D. H. SOUTHWORTH, New York, N. Y.—*Rice Hulling Machine.*—March 26, 1867.—The cone has projecting pins and adjustable elastic scourers upon its surface and revolves within the case of coniform shape.

Claim.—The conical drum D, provided with a series of teeth or pins g, and elastic plates and rubbers F F', on its periphery, arranged and operating essentially as specified.

63,321.—CHARLES F. SPENCER, Rochester, N. Y., assignor to himself and CHARLES W. BARKER.—*Lantern.*—March 26, 1867.—Explained by the claims and illustration.

Claim.—First, resting the globe C, with the top E, attached thereto, loosely in the open-topped guards B, so as to be raised and dropped at pleasure, as herein set forth.

Second, constructing the lantern with closed base and open-topped guards, for the insertion of both the lamp and globe through the top, as herein specified.

Third, the enlarged wheel c, so situated and arranged as to reach above the top of the base to be easily operated by the finger, as herein set forth.

63,322.—SAMUEL S. SPURGIN, Jacksonville, Ill.—*Riding Saddle.*—March 26, 1867.—The seat is strained between the pommel and cantle, and has an additional support by transverse, arched springs whose ends rest upon the side plates.

Claim.—The arrangement in the saddle of the springs G G, supported on the side plates and the elastic straining piece H, fastened to the springs and to the pommel and cantle respectively, substantially as described.

63,323.—JOHN STADERMANN and HENRY SAUERBIER, New York, N. Y.—*Breast Protector.*—March 26, 1867.—The protuberant breast pads are in frames, hinged on the median vertical line, and give an agreeable rotundity to the dress.

Claim.—The two wire-gauge or wire-cloth parts A A, swaged each with a protuberance a, and in such a form as to admit of being inserted in or attached to the garment, substantially as and for the purpose set forth.

Also, the connecting of said parts together by hooks and eyes, slides, elastic or other fastening, which will admit of said parts being connected and disconnected with facility, and still keep the parts in proper position, substantially as described.

63,324.—C. W. STAFFORD, Saybrook, Conn.—*Pavement.*—March 26, 1867.—The cells of the iron sections have wooden blocks and the adjacent sections are locked together by clamps and keys.

Claim.—Connecting and securing the sections of

the pavement together by means of the staples or clamps *a*, over pins or keys *b*, passing through horizontal slots in the vertical flanges, substantially as herein shown and described.

63,325.—HENRY STANLEY, St. Johnsbury, Vt.—*Reservoir for Cooling Grain and Flour.*—March 26, 1867.—Explained by the claim and illustration.

Claim.—A reservoir for cooling grain or flour when constructed by placing the posts thereof in zig-zag position, and surrounding them with wire-gauze or other porous material, thus forming air recesses *a* upon the outside of the body of the grain or flour, increasing the surface of the grain exposed to the air, substantially as described and for the purpose specified.

63,326.—JOHN S. STEPHENSON, Cleveland, Ohio.—*Apparatus for Carburetted Gas and Air.*—March 26, 1867.—The agitator wheel and fan are rotated by a spring and train of gearing; the fluid passes up siphon tubes from whose open ends it is blown in spray by jets of air.

Claim.—The combination of the tubes *H* and *T* with the agitating wheel *A*, and fan wheel *N*, and funnel pipe *F*, constructed as described, and arranged to operate in the manner set forth.

63,327.—DAVID STODER, Dayton, Ohio.—*Drying House and Oven.*—March 26, 1867.—Air passes through the flat convolute pipe in the furnace and thence is conducted to the chamber above, where the fruit is exposed on shelves.

Claim.—First, the metallic oven *A*, when the lower part is constructed with double walls, and the upper part is lined with wood in the manner substantially as described, and for the purposes specified.

Second, the air chamber *O*, when arranged with reference to the furnace *F*, and oven *A*, in the manner substantially as described, and for the purpose specified.

63,328.—C. C. STREMMER, Austin, Texas.—*Vitrography.*—March 26, 1867.—A warm solution of glue is applied to a surface of ground glass; this in drying contracts and brings away particles of glass, giving a frosted appearance thereto.

Claim.—The mode of ornamenting glass as herein described, by the application of glue or similar adhesive and contracting matter, and in this manner produce models for casting all and every kind of ornamental glass and glass ware.

63,329.—W. H. STROUP, Pittsburg, Pa.—*Runner for Chairs.*—March 26, 1867.—The upper edges of the runners have sockets to receive the feet of chair legs to adapt them for use on the ice.

Claim.—First, an improved runner, having adjustable fastenings attached to its upper edge, substantially as herein shown and described, and for the purpose set forth.

Second, making one of the fastenings adjustable longitudinally, substantially as herein shown and described, and for the purpose set forth.

63,330.—JAMES B. STUART, Banker Hill, Ill.—*Spring for Vehicles.*—March 26, 1867.—The lower leaves are rooted to the middle of the spring bar and the ends connect with those of the shorter sections which are connected to the ends of the said bar.

Claim.—The constructing of a side spring for wheel vehicles of three parts, *D D C*, connected together and applied to a spring bar *A*, substantially in the manner as shown and described.

Also, the securing or holding of the leaves of the parts *D D C* in contact, by means of clips or collars *c c'*, substantially as set forth.

63,331.—ABRAM S. SWARTZ, Buffalo, N. Y., assignor to himself and W. A. CASE, same place.—*Apparatus for Preparing Mash for Brewers and Distillers.*—March 26, 1867.—The vertical shaft of the rake is hollow, as are also the arms; through perforations in the latter a current of air and steam is poured for the purpose of boiling the wort, and subsequently a refrigerated stream of air for the purpose of cooling it. A stationary perforated pipe in the vat may be the medium of conveying the currents aforesaid.

Claim.—First, the combination of the air pump

H and conducting pipe *F* with the hollow shaft *C* and perforated rake head *E*, for the purposes and substantially as described.

Second, the combination of the receiver *G* and and cooler *M* with the conducting pipe *F*, hollow shaft *C*, perforated rake head *E*, and air pump *H*, for the purposes and substantially as set forth.

Third, in an apparatus for preparing mash for brewing, the combination and arrangement of the receiver *G*, steam pipe *O*, and steam and air pipe *N*, for the purposes and substantially as described.

Fourth, the shifting frame *V*, in combination with the clutches *T* and *U* and bevel wheels *R* and *S*, for the purpose and substantially as described.

63,332.—ELI SWEET, Whitney's Point, N. Y.—*Hay Loader.*—March 26, 1867.—A crane and single pulley rope are used in connection with a pitchfork, sliding tongue, and brake on the fore wheels in such manner that by the sliding of the tongue when it is tripped, the horses hoist the fork with the hay. The sheave around which the rope passes is attached to the sliding tongue and moves with it.

Claim.—The arrangement of the sheave in the sliding tongue, and moving therewith, the rope passing over said sheave, and connected at its respective ends to the fork and to the brake bar on the tongue hounds.

63,333.—PORTER L. SWORD, Adrian, Mich.—*Brick Machine.*—March 26, 1867.—Improvement on the patent of Sword and Tiffany, June 14, 1864. The clay is fed from the pug mill and passes under the adjustable inclined plate into the molds of the horizontally-rotating mold wheel. Near the end of the press plate is an adjustable knife whose edgeremoves the superfluous clay, and its elongated surface smooths the face of the brick. The wheels which support the bed and also those which work the followers are vertically adjustable. A collar fastened by a nut to the central shaft supports the inner ends of the axles of the wheels.

Claim.—First, the adjustable knife, when constructed with a cutting edge set opposite to and so near the press plate *H'* that there is merely room for the shaving of clay to rise between them, and having a cutting edge and elongated horizontal blade adjustably attached at both ends to and below the bed plate *H*, and resting upon the revolving mold wheel *S*, so as to perform the double function of cutting off the superfluous clay and smoothing the upper surface of the brick, substantially as described.

Second, so suspending the rods *O*, sustaining the wheels *N* and *L*, that they may be independently adjusted at both ends, substantially as and for the purpose set forth.

Third, the combination of a bed plate *H* and stationary shaft *U* with the rods *M* and *O*, wheels *N* and *L*, collar *Q*, bolts *Q'*, mold wheel *S*, substantially as and for the purpose set forth.

Fourth, the arrangement in a brick machine of a stationary shaft *U*, mold wheel *S*, revolving around the same and having gearing upon its periphery, and the driving spur pinion *R*, substantially as set forth.

63,334.—ISAAC P. TICE, New York, N. Y.—*Spirit Meter and Separator.*—March 26, 1867.—The upturned discharge pipe from the worm contains a hydrometer and is covered by a transparent cap to expose it to view. An upper branch of this pipe discharges air or vapor into the chamber containing the hydrometer. An excess of vapor turns a ratchet wheel which acts on a pivoted bar to give an alarm. The spirit runs alternately into one of the two compartments of the meter, which is pivoted on a balance bar so that the filling of a compartment depresses that end of the bar and shuts a valve in the supply chamber. This descent of the meter frees it to oscillate sufficiently to discharge its contents and present the other compartment for filling. This discharge from the meter allows its ascent and that of the valve of the supply opening. The number of oscillations of the meter is registered by an index. The meter automatically operates the four way cocks to direct a small quantity of spirit to the test cocks at each movement. The tilting trough operated by a lever determines to which cocks the spirit flows. The double set of cocks is furnished so as to permit the examination of the spirit by two inspectors. These test cocks

are under lock. The operating devices, except the hydrometer, are inclosed in double walls to preserve the spirit from chilling.

Claim.—First, the receiver B, provided with a lock- α or sealed transparent cap or cover C, when used in connection with a branch pipe H, communicating with the receiver, the worm A, and air discharge openings, substantially as and for the purpose set forth.

Second, a tilting or partially rotating meter R, arranged with or applied to a scale frame Q, to operate substantially in the manner as and for the purpose specified.

Third, a valve M, connected with and operated by the scale frame Q, when used in connection with the meter R, and arranged to work conjointly therewith, substantially as shown and described.

Fourth, the pin n on upright a^* , in combination with the notches $m\ m'$ in the circular end of the meter K, for the purpose of holding the meter in position while being filled, as set forth.

Fifth, the pin k on upright a^* , in combination with the pins $l\ l'$ on the end of the meter, to serve as steps to determine the quarter revolution of the meter, as set forth.

Sixth, the many-chambered or four-way cock W, arranged in connection with sample chambers $g\ g\ g'\ g'$, and operated from the meter, or other movable part of the device, for the purpose specified.

Seventh, the weight or counterpoise j , applied to the meter R, in combination with the scale frame Q, as shown and described.

Eighth, the adjustable spouts U B*, connected by a bar E', or its equivalent, so as to be operated simultaneously, as shown and described.

Ninth, discharging the air from a still into a receiver having a sinuous passage, substantially as shown in cover K, for the egress and ingress of air, as set forth.

Tenth, a locked or sealed cock D', when used in combination with a meter R, for the purpose specified.

Eleventh, the combination of the pipe or end A of the worm with the receiver B and pipe H, substantially as described.

Twelfth, the wiper or plunger E within the transparent cap cover or cylinder C, arranged substantially as and for the purpose specified.

Thirteenth, the alarm composed of the wheel I and the spring or click J, or their equivalents, when arranged so as to be operated by the air or gaseous vapor or contents of the still, substantially as shown and described.

Fourteenth, a case C*, constructed with double walls, or in any other manner, when said case is used with or incloses a meter, for the purpose of preventing the freezing of the contents of the same, as set forth.

Fifteenth, a meter, in combination with a sealed transparent receiver, substantially as and for the purpose specified.

Sixteenth, the combination of a meter, transparent receiver, and a locked or sealed cock, for the purpose specified.

Seventeenth, the adjustable spout U, in combination with the cock W, substantially as and for the purpose set forth.

63,335.—ISAAC P. TICE, New York, N. Y.—*Spirit Meter and Separator.*—March 26, 1867.—The meter has a box divided by a diagonal partition. As either side is filled the box tilts and brings the other side under the stream of spirit. The filling of a division raises a float within it and closes a valve to stop the flow of spirits into said meter. The separator is so arranged that the proof is registered, and whenever the strength falls to low wines a lever operated by the hydrometer moves a funnel so as to shift it to the other side of the V-shaped partition to separate the low wine for re-distillation.

Claim.—First, a revolving or tilting meter, hung or suspended on journals or pivots i , and divided into two compartments $m\ m'$ by a diagonal partition or diaphragm n , with discharge openings o , all arranged substantially as herein shown and described.

Second, the floats N, placed within the compartments $m\ m'$ of the meter, and arranged to operate a valve O, to regulate the supply or flow of whisky to the meter, substantially as set forth.

Third, the placing of the journals or pivots i of the meter within oblong boxes k , having springs l at their ends, substantially as and for the purpose specified.

Fourth, separating the high from the low grade whisky or spirits by means of a hydrometer, arranged with suitable mechanism in such a manner that the turning or tilting of the meter or other motor will transmit power through the intervention of a wheel stud or other device carried by the hydrometer to suitable mechanism, which will effect a diversion of the flow or discharge of the whisky or spirits into different receivers, according to its grade or strength.

Fifth, the employment or use of indicators or clock movements, in connection with the separating mechanism, substantially as and for the purpose specified.

Sixth, the hand G, of paper or other material, in connection with a hydrometer, and separating mechanism, substantially as and for the purpose set forth.

Seventh, in spirit meters, charging the paper which receives the record with preservative composition, substantially as described.

63,336.—ISAAC P. TICE, New York, N. Y.—*Meter Attachment for Stills.*—March 26, 1867.—Two or more meters are attached to a still, one to register the amount of distillate and the other the amount returned to the still for re-distillation. The difference shows the amount subject to tax.

Claim.—The combination of a plurality of meters with a still, to operate in the manner substantially as and for the purpose herein set forth.

63,337.—JAMES TILLINGHAST, Buffalo, N. Y.—*Railway Switch.*—March 26, 1867.—The movable rails are connected in pairs, and the points of the middle ones are expanded by spring bars to make the main track continuous unless otherwise determined by the switch lever. The middle switch rails which belong to the main track are capable of separate adjustment and the switch is set to the right or left turn-out, by the vibration of the switch lever in one direction or the other from the vertical.

Claim.—A triple switch for railroads, composed of the rails D D' E E', connected respectively by the cross bars b with the cross bar G, applied to the rails D D', through the medium of the oblong slots $d\ d$ and pivots a^* , and connected to the lever bar H by the spring I and the bars $c\ e$, connected by the spring F, and attached to the switch rails D D', all arranged to operate substantially in the manner as set forth.

63,338.—WASHINGTON TINGLEY, New York, N. Y.—*Drill for Wells.*—March 26, 1867.—The tubular tool has a diametric division which forms a cutting edge, whose ends are turned and follow the circumference so as to act upon the sides of the bore in concert with the curved edges at the throats of the channels which lead into the central channel.

Claim.—In combination, the Z-shaped cutting surface, composed of the parts $n\ ll$, and the curved reaming cutters m , whose edges on alternate sides are made oblique, so as to effect a drawing cut on the sides of the bore, substantially as shown.

63,339.—SAMUEL P. TOWNSEND, New Providence, N. J.—*Manufacture of Railroad Ties, Bridges, Buildings, Wharves, Fences, and other Articles of Galvanized Iron.*—March 26, 1867.—The sheet-iron forms, suitable to the use intended, are corrugated when necessary for strength, galvanized to preserve them from rust, and are then filled with earth, sand, or other unyielding material.

Claim.—First, a new article of manufacture for railroad ties, sills, foundations, structures in water, fences and buildings, fortifications, steps for stoops, piazzas, galvanizing sheathing for bottoms of vessels, ships, steamers, boats, &c., and the like, made of the materials and in the manner herein described, or any other substantially the same, and also for the galvanizing and preservation of railroad car wheels, axles, and machinery.

Second, the preservation of iron from oxydation or corrosion by galvanizing it, as above described, when used for the purposes herein mentioned.

63,340.—JAMES TRACY, Brewer's Village, Me.—*Saw Mill.*—March 26, 1867.—The chain of the timber-raising fork is connected to a series of cog wheels thrown into operation by friction wheels which are brought into contact by a treadle lever. A spring raises the lever and breaks the connection on the removal of the foot.

Claim.—Applying the spring *k'* to bent lever *K*, for the purpose of throwing the friction pulleys out of contact, substantially as described.

63,341.—JUSTUS A. TRAUT, New Britain, Conn., assignor to himself and JEREMY W. BLISS, Hartford, Conn.—*Endless Belt for Polishing.*—March 26, 1867.—The endless belt of fabric is coated with rubber, and emery is attached to its outer surface by some glutinous substance.

Claim.—As a new improved article of manufacture, an endless fabric rubber polishing belt, substantially as described.

63,342.—THOMAS J. WELLS, St. Anthony, Minn.—*Peat Machine.*—March 26, 1867.—Two concave grinding plates are mounted on revolving shafts which are rotated at different velocities. The peat from a hopper passes upon the casing between the grinding plates, and is forced into a reciprocating mold, which is brought alternately over the passage and a receptacle for the molded blocks of peat.

Claim.—The conical grinding plates *F F'*, rotating at different speeds, and inclosed within a case *G*, provided with a discharge spout *H*, substantially as and for the purpose set forth.

Also, the reciprocating mold box *I*, provided with the molds *b b* and the plungers *J J*, operated substantially as shown, in combination with the rotating conical grinding plates *F F'*, enclosed within the case *G*, provided with the spout *H*, all arranged substantially as and for the purpose set forth.

63,343.—AMOS WESTCOTT, Syracuse, N. Y.—*Fan Wheel Blower.*—March 26, 1867; antedated March 15, 1867.—The blower is rotated by a winch and a train of multiplying friction wheels. The air has ingress near the center and exit on the other side near the periphery.

Claim.—A fan wheel blower, propelled by friction wheels, as shown and enclosed within the parts *A J B*, constructed and made adjustable substantially in the manner described.

63,344.—JAMES M. WHITING, Providence, R. I.—*Device for Holding Horses.*—March 26, 1867.—The check connects with a windlass in front of the axle, which engages with the wheel when thrown into gear by the lever in front of the dashboard.

Claim.—First, combining with the wheel of a carriage a hitching apparatus, arranged in such manner that the winding up or shortening of the reins or other checking device shall take place only during the forward movement of the wheel, the said apparatus being disconnected from the driving gear during the backward movement of the carriage, substantially as shown and set forth.

Second, the combination with the windlass provided with a ratchet wheel, as described, of a driving pinion loosely mounted upon said shaft, and carrying a pawl engaging with the said ratchet wheel under such an arrangement that the said shaft shall be disconnected from the driving gear during the backward movement of the carriage, as set forth.

63,345.—A. F. WICKE and O. EVANS, Alliance, Ohio.—*Horse Hay Fork.*—March 26, 1867.—The prong is pivoted to a shank, and is brought in line therewith or projected laterally by connection to a lever above, which is pivoted to the said shank at a point above.

Claim.—The rod *A*, foot *B*, connecting rod *C*, and lever *D*, provided with the shoulder *C'*, when these several parts are constructed and operated as and for the purpose set forth.

63,346.—J. E. WIGGINS and DANIEL G. CROSBY, Stoneham, Mass.—*Heel Shaving Guard.*—March 26, 1867.—The guard has a ball and socket joint attachment to the pin, allowing a certain freedom of motion to the latter while the guard maintains its proper relation to the heel.

Claim.—First, the combination and arrangement of the guard *A* and pin *B*, when the two are constructed substantially in the manner described.

Second, the device of the ball and the socket joint when combined with the guard and center of a heel-trimming machine.

63,347.—JAMES W. WILKIE, Auburn, N. Y.—*Axletree.*—March 26, 1867.—The axle has no collar at the inner connection of the arm, the outer end of which has two shoulders, against one of which the box works, the other being a stop for the nut to avoid friction against the box.

Claim.—First, constructing the axle without a collar, and providing it on the under side of the arm with an oil chamber, as and for the purpose set forth. Second, the combination of the axle and box, when both are constructed as and for the purpose described.

63,348.—JAMES W. WILKIE, Auburn, N. Y.—*Axletree.*—March 26, 1867.—A collar is fastened on the spindle; a divided nut screws into the box and revolves therewith around the spindle, being prevented by the collar from slipping off.

Claim.—First, the employment of a divided nut, as and for the purpose set forth.

Second, the employment of a divided nut in combination with the arm of the axle as constructed, as and for the purpose described.

Third, the box as constructed in combination with a divided nut, substantially as set forth.

63,349.—GEORGE WILLARD, New York, N. Y.—*Steam Plow.*—March 26, 1867.—The spades and harrow teeth following are fixed to longitudinal bars whose ends have a revolving motion in a vertical plane by crank shafts actuated by chains, and chain gear wheels connected with the axle. The series of spade bars are supported on a vertically adjustable frame, and descend in consecutive order. Colters precede the spades.

Claim.—First, in combination in a steam or other plow, as described, of the bars which carry the spades and other mechanism for breaking the ground, with the crank shaft for operating the same, under the arrangement herein specified, so that the said bars, while alternately and successively moved toward and away from the earth, shall at all times maintain their parallelism with the surface passed over by the machine.

Second, the combination in the movable and adjustable plow frame of the colters, with the vibrating spades and harrow teeth, under the arrangement and for operation as set forth.

Third, the combination with the stationary plow frame, of the movable frame and the cams, and their operative mechanism for adjusting the same frame to different elevations above the ground, the whole being arranged and operating as herein shown and specified.

Fourth, the herein described mechanism for adjusting the movable plow frame, the same consisting of a series of cams arranged and connected with the stationary and movable frame on each side of the plow as described, and operated by means of a shaft mounted in the stationary frame and provided with a ratchet and pawl so that the movable frame may be elevated and lowered, or held at any desired distance from the ground, substantially as shown and set forth.

Fifth, the method of and means herein described for directing the movements of a steam plow or other like machine—that is to say, mounting the wheels of said machine upon their axles or shafts in such manner that each wheel and its respective axle may revolve together or independently of each other, substantially as and for the purposes set forth.

63,350.—C. S. WILLIAMSON, Covert, N. Y.—*Securing Cutters to Sickle Bars.*—March 26, 1867.—The cutter has a tapering tang with dovetailed edges fitted into a recess of the cutter bar, and held in place by a screw.

Claim.—The cutter *B*, having shoulders *e*, resting against the sickle bar *A*, with tapering shank *c* fitting in groove *a* of the sickle bar, forming a dovetail joint, in the manner described, and for the purpose specified.

63,351.—JAMES A. WOODBURY, Boston, Mass.—*Valve for Steam Engines.*—March 26, 1867.—The induction valves have a series of steam passages arranged with reference to the openings in the walled ports. These valves are operated separately from the exhaust valves, and may be regulated by the governor to cut off at any part of the stroke.

Claim.—The valve constructed as described, and arranged with reference to the openings in the walled

ports upon which it works, substantially as described, which arrangement enables me to regulate the movement of the induction valves, so as to cut off the steam at any desired part of the stroke of the piston, without reference to the exhaust valves.

63,352.—JAMES A. WOODBURY, Boston, Mass.—*Valve for Steam Engines.*—March 26, 1867.—The independent sections of the valve may be moved in unison by means of a yoke, which is attached to each and yet allowed to expand separately so as to accommodate themselves to the valve seats.

Claim.—The combination of two or more valves, with intermediate walls, when constructed and operating substantially as and for the purpose set forth.

63,353.—CASPER ZWICKI, Chicago, Ill., assignor to JAMES J. WALWORTH and GUSTAVUS E. BUSCHICK.—*Loom.*—March 26, 1867.—Springs and links prevent jar of the lathe when the loom is run at high speed. Other springs stop the shuttle and prevent recoil, and keep it in proper position to receive the blows of the picker. A block in a cam is susceptible of adjustment radially to regulate the length of stroke of the picker staves.

Claim.—Combining with the shuttle race, and with the cranks and connecting rods which actuate it, the links D', when upheld by spring braces capable of vertical adjustment, and which, acting by their elasticity, ease the movements of the shuttle race, substantially as described.

Also, in combination with the shuttle race, the springs H, at either end, arranged over the top of the shuttle path, and provided with means for vertical adjustment, substantially as described.

Also, in combination with the picker staff of a loom, the cam N, when provided with the adjustable piece c, substantially as described.

63,354.—HAWLEY ADAMS, Stamford, Conn., assignor to himself, W. H. COBANKS, and H. THEALL, New York N. Y.—*Grate for Furnaces.*—April 2, 1867.—The bars of the grate are obliquely arranged viewed in the plan, instead of being parallel with the sides of the grate.

Claim.—A grate for furnaces having bars B extending diagonally across the grate-frame in an unbroken line, in the manner herein set forth.

63,355.—Z. G. ALLEN and G. W. MARSHALL, Buffalo, N. Y.—*Smut Machine.*—April 2, 1867; antedated March 18, 1867.—The grain is admitted above the upper concave and thence passes to the lower one which is of greater diameter, being subjected during its passage to the action of spiral beaters and the adjustable, obliquely corrugated peripheral plates of the case. The draft is upward, being effected by spiral wings and a fan above.

Claim.—First, the combination of the upper and lower concaves H K, the former of lesser diameter, with the beaters D D, or their equivalent, when arranged and operating in the manner specified.

Second, the adjustable beater slats D D, in combination with the concave formed of the obliquely corrugated iron plates or sections I I and J J, substantially as described.

Third, in combination with the fan E and beater shaft B, the spiral wings c c, operating substantially for the purposes described.

63,356.—JOHN N. ARVIN, Valparaiso, Ind.—*Wrench and Tongs.*—April 2, 1867.—The shank of one jaw passes transversely through the shank of the other jaw, being actuated by a lever pivoted to a lug on the last mentioned shank.

Claim.—The arrangement and combination of the levers A B, straps C, spring D, jaws O P, and shank m, when constructed substantially as and for the purpose specified.

63,357.—B. F. BAKER, Milton, N. Y.—*Horse Yoke Harness.*—April 2, 1867.—The horses are hitched to the rear ends of the yoke arms and push against the neck yoke, which is connected by a chain to the tongue near the axle.

Claim.—First, so constructing and applying a horse yoke harness that the pressure or draft is brought evenly upon the shoulders or breast of the horse or horses instead of upon the upper part of their necks, substantially as described and shown.

Second, the suspension of the bow or bows in a nearly horizontal position from the hame or collar by the means substantially as described and for the purpose set forth.

Third, the diagonal or oblique back straps or tugs with one of their ends attached to the hame or collar and their other ends attached to the extremities of the bow, substantially as described.

Fourth, the central draft chain and short tugs, in combination with the bows and evener, applied substantially as described, for the purpose set forth.

63,358.—JOHN BLOCHER, Buffalo, N. Y.—*Running Gear of Land Carriages.*—April 2, 1867.—The wheel is fast to its spindle, which revolves in a clip and socket attached to the axle, the collar and nut on the spindle regulate the longitudinal position.

Claim.—In combination with the revolving wheel shafts a and axle d, the clip e, and collar f, and nut i, arranged and operating substantially in the manner and for the purposes set forth.

63,359.—ELIAM BOORSE, Philadelphia, Pa.—*Lantern.*—April 2, 1867.—Two of the wires of the guard frame are extended down through the base and form spring catches to connect the two portions of the lantern.

Claim.—The guards D D, when adapted to constitute springs to retain the chimney or globe upon the base A, substantially as described.

63,360.—DANIEL BOWMAN, Knoxville, Tenn.—*Mill-stone Dress.*—April 2, 1867; antedated March 28, 1867.—Explained by the claim.

Claim.—The mill-stone dress herein described, the same consisting of the upper stone having deep square-edged channels in the back, and feathered to the front side, and the lower stone with broad equally shallow furrows throughout and narrow lands, substantially as described, for the purpose specified.

63,361.—FREDERICK BUCKNAM, Portland, Me.—*Dish-pan and Drainer.*—April 2, 1867.—The drawer has an inclined bottom and slips on the track in the pan. A rack above the drainer receives the dishes.

Claim.—The combination with the pan A, constructed as described, of the slide drainer e having the rack c, all arranged and operating as and for the purposes set forth.

63,362.—BELLUS CALKINS and VERANOUS CALKINS, Varsburg, N. Y.—*Portable Fence.*—April 2, 1867.—The slats are pivoted at the ends where they connect with bars and to one another at their central point of junction so as to raise or lower at will. The supporting braces are hinged at top where they straddle the fence and are attached at bottom to stakes in the ground.

Claim.—First, a portable fence, made in sections, constructed in the manner and substantially as herein described.

Second, the combination and arrangement of the hinged brace bars D D and stakes E E, forming a portable brace for fences, constructed and adjusted in the manner substantially as herein set forth.

Third, the combination and arrangement of the foundation posts B, folding fence A A', top and bottom connecting bars F' and B', and adjustable braces D E', in the manner and substantially as herein described.

63,363.—J. CAMPBELL and A. D. KREWSON, Harrison, Ohio.—*Farm Gate.*—April 2, 1867.—The fixed latch pin is a continuation of one of the rails; slides up an incline on the post and is engaged by the notch in the gravitating latch plate. The eye shank of the upper hinge is extended to form a tension bar to adjust the gate after settling. The dogs pivoted on the lower bar vary in length to suit inequalities of the ground.

Claim.—First, the fixed tongue or latch a, in combination with the elevated plateau on which it rests, approached by the inclined planes on one or both sides, as and for the purpose set forth.

Second, the same in combination with the drop latch D, boxed into post C, and sliding perpendicularly therein, as set forth.

Third, the elements of the first claim, in combination with the screw-threaded and tapped shank H, of

the eye of hinge *b*, forming a brace rod by which the gate may be strained up should it sag.

Fourth, the provision of the dogs *w w'*, for holding the gate in an open position.

63,364.—JOHN COCHRANE, Wall township, N. J.—*Machine for Making Screws.*—April 2, 1867; antedated March 24, 1867.—The rolls have threads upon their peripheries corresponding in reverse to the shape of the required screw thread, and have the proper inclination to give the pitch of the thread by the inclination of the roll shafts. One of the dies has a denuded portion to admit the blank.

Claim.—First, the combination with each other of two rolls or revolving dies having projecting threads of proper form and arrangement upon their peripheries to produce the required screw upon the heated blanks, and working at the proper angle for the production of such screws, and having a denuded portion of reduced radius in the periphery of either or both of said rolls or revolving dies so as to permit the introduction of the blank bolts between them at the proper moment in each revolution, substantially as herein described.

Second, the combination with each other of two revolving rolls or dies, having the threaded portion of the periphery of either or both of them so formed or shaped as to produce, at each revolution, a screw of uniform diameter, or tapering or gimlet pointed, as may be required, constructed and operating substantially as herein described.

Third, the combination with each other of two rolls or revolving dies, having annular threads or portions thereof upon their peripheries of suitable form for making screws upon blanks and mounted upon axes or spindles that are so inclined to the axis of the bolt upon which the screw is to be formed as to make such annular threads conform to the angle of such required screw, whether such rolls are mounted on stationary bearings, or upon bearings that are so constructed and operated as to give a lateral movement to the rolls or revolving dies, to and from each other during the progress of the work as required in receiving the blank, and in making a screw thereon, or for imparting to the screw a uniform diameter, or a tapering or gimlet-pointed form, substantially as herein described.

63,365.—JOSEPH C. COULT, San Francisco, Cal.—*Apparatus for Concentrating and Condensing Volatile Metallic Substances.*—April 2, 1867.—The furnace is surrounded by a water chamber and leads into a tortuous flue surrounded by a water chamber having divisions through which the water circulates. This flue communicates with a water tank, after passing which the air is conducted to another flue in which the draft is accelerated by a steam blast.

Claim.—First, the arrangement of the furnace having fire on two sides, and the openings leading to the ore chamber, substantially as described and for the purposes set forth.

Second, the soot and spark chamber and the dry compartments having a continuous supply of cold water surrounding them to hasten condensation and concentration of volatile mineral substances, as described substantially and for the purposes set forth.

Third, the combined arrangement, broadly, as an improvement upon the Cault and Roach concentrator and condenser for the reduction of quicksilver ores, and the use of steam or water to produce draft to accomplish the same, all substantially as in the specification described and for the purposes therein set forth.

63,366.—CHARLES DANIELS, Birmingham, Conn.—*Hoop Skirt.*—April 2, 1867.—The upper portion of the skirt is of fabricated material and the connecting ring between it and the tapes is extensible on a central enclosed hoop.

Claim.—The combination of the fabricated part *B* with the hoops below when made adjustable, substantially in the manner specified.

63,367.—JOSEPH DARBY, Cortlandville, N. Y., assignor to himself, STEPHEN BREWER and WILLIAM W. WINTER, same place.—*Roofing Cement.*—April 2, 1867.—Composed of ground plaster, 1 qt.; water lime, 3 qts.; sand or gravel, 2 qts.; coal tar, 2 qts.; and sulphur, 2 oz.

Claim.—As a cement for roofs, walks, and other surfaces, the herein described composition of matter.

63,368.—F. W. DAVIDSON, Cleveland, Ohio.—*Steam Engine Valve.*—April 2, 1867.—The valves are of cylindrical form. The upper valve is connected with the governor and has a diametric longitudinal opening for the passage of steam; the lower valve has a similar opening for induction and has parts of its peripheries cut out for exhaust.

Claim.—The arrangement of the valves *D* and *E*, with reference to each other and the arrangement of the ingress and egress steam passages upon the principle and in the manner as herein set forth.

63,369.—JOHN DEERE, Moline, Ill., assignor to DEERE & Co., same place.—*Making Plows.*—April 2, 1867.—A brace connects the wing of the share with the landside. The template fits against the landside, and its curved edge forms a gauge in the conformation of the share.

Claim.—First, the welding brace *A*, constructed and arranged for use in the construction of plows, substantially as and for the purpose set forth.

Second, the template or test plate *T*, when constructed and adapted for use in the manufacture of plows, substantially as set forth.

63,370.—DANIEL A. DENISON, Troy, Mich.—*Gate.*—April 2, 1867.—The duplicate hooks on the opposite sides of the gate have a common shank, and serve in combination with staples to attach together the sliding gates.

Claim.—First, a gate latch formed by duplicate hooks *C* attached to common shank *C'*, operating simultaneously on both sides of the gate, substantially as set forth.

Second, the combination of the sliding gates *A A'*, double posts *B*, rollers *B'*, latch *C* and eyes *D*, substantially as set forth.

63,371.—DRAKE W. DENTON, Ithaca, N. Y.—*Roofing.*—April 2, 1867.—Coal tar is combined with sand, ground rock, &c., and has a thin layer of stuffing between it and the roof board to prevent cracking from shrinking of the sheeting.

Claim.—First, the use of wood-fiber matting, or other cushioning, padding, or matting material, not woven, made into paper, or felting, when used for the purpose of separating the roofing material from the roof board, and thus making the coal-tar roofing independent of the variations of the board by swelling and shrinkage, as described.

Second, I do not claim the mere use in roofing of hydraulic lime, but I do claim its use, substantially in the proportions herein described, for the purpose of so drying any convenient roofing material or mixture with coal tar, so that it shall prevent the flowing, settling, or sliding down of the coal-tar roofing, as described.

63,372.—WARREN W. DUTCHER, Milford, Mass.—*Loom Temple.*—April 2, 1867.—Improvement on the patent of H. Kayser, April 24, 1866, (No. 54,269). The disks between which the toothed wheels are placed, have arms perforated for the traverse of the supporting rod. The disks have recesses and journal pins to receive the wheels. The disk arms are angularly concavo-convex in transverse section to insure a rigid connection.

Claim.—As my improvement the combination as well as the arrangement of the disks or sections *b*, with a series of arms *d* to extend from them, substantially in manner and for the purpose of supporting them when together or in their proper relations to each other and the toothed wheels, as set forth.

Also, the application of each arm or wheel-carrier section to that, or the end support next to it, so that they shall so interlay or interlock with and support one another as to prevent one from being revolved or turned on their connection rod independently of the other when they are close together thereon, as described.

Also, each of the said arms, as constructed, with the aperture for receiving the supporting rod.

Also, the arrangement of the supporting rod with respect to the arms and the end supporters, viz: so as to go through all of them, and aid in fastening them together, as explained.

Also, each disk or divisional plate as made with a wheel-receiving recess *l* and journal *c*, arranged in it, as set forth.

63,373.—ALFRED E. ELY, Newton, Mass.—*Machine for Separating Fibrous Substances from Seed.*—April 2, 1867.—The elastic rolls seize and carry off the fibers; the other devices detain and remove the seeds, kernels, &c. The material is fed up to the grates, and the fiber drawn through by the roll; adhering seeds are removed by the obliquely-presented plates, or subsequently at the throats between the surfaces of the rapidly revolving roll and the successive more slowly revolving rolls. Plates cleanse the rolls of adhering material, and offers remove the fiber.

Claim.—First, an elastic roll, in combination with a concave grating E, substantially as described.

Second, an elastic roll, substantially as described, in combination with flat plates *a b c d*, &c., whether one or more, and whether with plain or serrated edges, when arranged and operating substantially as set forth.

Third, an elastic roll, substantially as described, in combination with hard rolls B C, or either of them, and whether smooth or corrugated, when arranged and operating substantially as set forth.

Fourth, an elastic roll, in combination with flat plates *a b c d*, &c., whether one or more, and whether plain or serrated, and hard rolls B C, or either of them, whether smooth or corrugated, arranged and operating substantially as described.

63,374.—H. A. ENGELS, C. H. ENGELS, and JOHN WIELAND, San Francisco, Cal.—*Malt Drying Apparatus.*—April 2, 1867.—The grain is fed by an endless conveyor, and continuously passed along each floor, and from floor to floor by automatic motions. The transverse blades which impel the grain are attached to arms, which revolve in the plane of their length, and thus act as intermittent shovellers. These forwarders rotate in different directions on the consecutive floors, so as to give a zigzag downward course to the grain, which drops to the floor below, after each impulse.

Claim.—First, the mode of malt drying, in which the grains are mechanically carried into and spread about the kiln, then therein turned and propelled by rakes, and at the same time submitted to a current of hot air, combined with the heat of steam pipes, in a manner substantially as described above.

Second, the combination and arrangement of elevator *h*, worm *p*, picking shaft *g*, kilns *i*, rakes *b*, shafts *r r*, funnels *a a* and *d d*, steam pipes *k k*, hot-air pipes *l n o o*, flue *m*, and chute *e f*, in a manner and for the purpose described.

63,375.—LEWIS FAGIN, Cincinnati, O.—*Steam Generator.*—April 2, 1867.—Horizontal boilers are arranged in vertical series with flues between them for the caloric current; the boilers are connected together by vertical necks and transverse horizontal tubes. Horizontal partial divisions give the caloric current a serpentine course downward.

Claim.—The arrangement of either cylinder or tubular boilers, one under the other, with the flue spaces between them arranged so that heated air shall pass under and between each successive tier alternately from the upper to the lower, the tubes or boilers being connected by vertical necks and transverse tubes D, as described and for the purpose set forth.

63,376.—LORENZO D. FERGUSON, Corning, N. Y.—*Burning Fluid.*—April 2, 1867.—Composed of benzine of 70°, 39 galls.; linsced oil, $\frac{1}{2}$ gall.; spirits of turpentine, $\frac{1}{2}$ gall.; pulverized rosini, 2 lbs.; melted bees-wax, 1 lb.; gum camphor, $\frac{1}{2}$ lb.; pulverized alum, $\frac{1}{2}$ lb.; sal soda, $\frac{1}{2}$ lb.

Claim.—A carbonized benzine fluid for illuminating purposes compounded of the ingredients or equivalents in the proportions substantially as described.

63,377.—JOSIAH FISU, Smelser, Wis.—*Plow.*—April 2, 1867.—Side plates and bolts connect the tongue to the beam, forming a hinge joint for the adjustment of depth of furrow. The plows are attached by bars to the beam, which is midway between them.

Claim.—The plate connecting the tongue and beam, marked Fig. 1, together with the plate attaching the team to the plow, and bars that the plows are attached to, for the uses as set forth in the description and specification.

63,378.—F. G. FLOYD and E. A. FLOYD, Macomb, Ill.—*Broad-cast Sower.*—April 2, 1867.—The bag of grain is carried on the shoulder, and the seeders revolved by hand. The seed opening is gaged by a slide, and the seed scattered by the rotary flanged disk.

Claim.—First, the revolving disk *d*, provided with the radial flanges *h*, having their outer ends projecting beyond the periphery of the disk, and curved in the manner shown, substantially as set forth.

Second, the combination of the frame *a*, hopper *b*, slide *i*, and revolving disk *d*, constructed as above set forth, all arranged for joint operation as herein described.

63,379.—ALBERT A. FREEMAN, Philadelphia, Pa.—*Axle Box.*—April 2, 1867.—Vertical V-shaped ridges on the hanger occupy corresponding depressions in the sides of the box, so as to maintain the latter in its proper position, and allow it free vertical movement. The guides can be set up or removed as they become worn.

Claim.—The V-shaped guides B B, adapted to and combined with the hanger A and box C, substantially in the manner and for the purpose described.

63,380.—CHARLES J. B. GAUME, Davenport, Iowa.—*Electro-Magnetic Engine.*—April 2, 1867.—The series of electro-magnets on the periphery of the wheel attract successively the iron plates on a wheel journaled in the same axis. A continuous wire is wrapped upon the series of cores, and the motion of the magnet wheel is the means of alternately making and breaking the circuit.

Claim.—The arrangement of the wheels F F, provided with the electro-magnetic coils, as described, with the wheel E, provided with the duplicate set of iron plates *k*, arranged radially as set forth, operating through the medium of the alternate battery connection and disconnection, substantially as described.

63,381.—JACOB HAGE, Shiloh, Ill.—*Plow.*—April 2, 1867.—The mold board and share are thicker at the front edge, and are made in one piece with the landside.

Claim.—First, as a new article of manufacture, the plow B when formed of one single piece of metal, substantially as described and set forth.

Second, the plow B, when constructed with an excess of metal in that side of the mold board and share nearest the landside, substantially as described and set forth.

63,382.—WILLIAM M. HALL and JOHN JOHNSON, Barrington, N. Y.—*Hay Loader.*—April 2, 1867.—The gear on the driving wheel, when in gear with the pinion of the spool, winds the rope that runs on the pulleys attached to the crane from which the horse-hay fork is suspended. The spool frame is lowered as required to engage its pinion with the device. The tines of the fork are clasped by throwing the weight on the central stem which latches in the head piece, and are opened by unlatching the stem and throwing the weight upon the outer cords.

Claim.—First, the fork head M, provided with the arched guide *m*, in combination with the hinged clasps N, having the cross-bars *n* attached thereto, stem O *o*, and socket K, when the several parts are constructed and arranged to operate substantially as and for the purpose described.

Second, the detachable driving spur wheel F, constructed and applied as described, in combination with hollow crane post B, provided with the hinged adjustable crane arm C and jointed arm D, upon which is mounted the spool G and its driving pinion, the whole arranged and operating substantially as and for the purpose specified.

63,383.—O. HANKS, Cincinnati, Ohio.—*Bag Holder.*—April 2, 1867.—The cross-frame, like a saw buck, travels on rollers, and at the upper ends of its arms has pins to hold the bags which are hooked to them.

Claim.—The side pieces A A A A, the cross-pieces B B and C C, the pins or hooks D D D D, the wheels or rollers F F F F, the bolts or pins E E, the whole being combined in the manner and for the purpose as herein set forth.

63,384.—GEORGE D. HART, Lycoming county, Pa.—*Cultivator*.—April 2, 1867.—The blades are attached to twin standards, one leg of each being hinged by the adjustable plate below the frame, and the other end passing through a socket to be fastened above by a wooden key; on meeting with an obstruction, the key breaks, allowing the blade to swing back. The plates with their attachments are adjustable as to relative distance under the frame and as to divergence by sliding the slotted end of the frame in front.

Claim.—The combination of the standards A, attached to the plate C by hinge and standards A', with its tenon at the upper end, as shown in Fig. 1, with the blades or cutters B, the plates C, when provided with the slots g and the notches h and the frame or support O, all constructed and arranged substantially as described and set forth.

63,385.—HAYWARD A. HARVEY, New York, N. Y.—*Wire Staple*.—April 2, 1867.—Alternate indentations and protuberances are formed in each leg of the staple to increase the hold in the wood.

Claim.—A staple with the legs thereof formed with protuberances and depressions, substantially as described.

63,386.—C. F. HERRICK, Independence, Iowa.—*Curtain Support*.—April 2, 1867.—The band is held by a spring in the fastener, and runs over a roller attached to a clamped strap surrounding the rod of the curtain.

Claim.—First, the spring P, points a, and back piece A' constructed and arranged as set forth in combination with the band C, for the purpose specified.

Second, the strap B, clamp d, roller e, and band C, arranged and operating as and for the purpose described.

63,387.—P. J. HERSHEY, Clarence, N. Y.—*Well Tube*.—April 2, 1867.—The lower end of the tube enters the shield to cover the fine slits therein while driving, and the tube closes the key slits when drawn sufficiently to uncover the fine slits for the entrance of the water.

Claim.—The shield A, having fine slits B made therein for the entrance of water below the coarse or key slits, in combination with the coarse or key slits D', which are kept closed by the tube C in all the movements thereof in the shield, substantially as set forth.

63,388.—JACOB C. HORTON, New York, N. Y., and SAMUEL K. HAWKINS, Lansingburg, N. Y.—*Apparatus for Measuring Fluid*.—April 2, 1867.—The stems of the induction and eduction valves at each end of the cylinder are connected by a lever pivoted at its midlength, and having a perpendicular arm arising from the pivoted part. The guide ledges and springs of the reciprocating plate which is connected to the ends of the piston rod operate the valves by this perpendicular arm whose upper end passes along one side of the central ledge, and at the end of the stroke is transferred by the spring to the other side.

Claim.—First, in combination with the measuring cylinder, reciprocating piston, the valves a b c d, and oscillating cross-bars k, with arms k', and connecting rods l, the reciprocating plate C, with ledges and springs as described to operate the valves, all being constructed and arranged substantially in the manner set forth.

Second, in combination with a measuring cylinder and reciprocating piston, as described, an induction and eduction valve at each end of the cylinder, so constructed and arranged that they will be automatically opened and closed by the movement of the piston in the order herein set forth, whether described by the precise mechanism herein described or by any other equivalent mechanism.

Third, in combination with a measuring cylinder with induction and eduction valves, as described, and a reciprocating piston, the reciprocating plate C, with ledges and springs, substantially as described, to operate the valves by means of any suitable connecting mechanism between said plate and the valves.

Fourth, the reciprocating plate C, with ledges and springs, substantially as described, as a means of operating valves to regulate the flow or passage of any

kind of liquids or fluids, whether in a meter or other machine to which the same may be applicable.

63,389.—JAMES L. JACKSON, New York, N. Y., assignor to DAVID N. ROPES, Orange, N. J.—*Fan*.—April 2, 1867.—The handles are pivoted to the leaves at the small end, and corresponding in shape are a protection to them when shut. The leaves are connected by straps passing through slots therein.

Claim.—The fan with its outer leaves a a' connected to the adjacent leaves by straps d, and the remaining leaves retained by straps g g', whereby the outer leaves protect and enclose all the leaves when closed and form a handle for the fan when extended, substantially as represented and described.

63,390.—GUSTAVUS A. JASPER, Charlestown, Mass.—*Apparatus for Sifting and Separating Sugar*.—April 2, 1867.—The reciprocating sieves are arranged in a frame one below the other. One end of each sieve is left open to allow the sugar to fall on the discharge spouts, which are arranged alternately on opposite sides of the frame. The sugar passes alternately through the sieves and conducting troughs, and is discharged below.

Claim.—The arrangement of chutes, sieves, discharging spouts, and mechanism for operating such sieves, substantially as described.

63,391.—W. JEGGLE and L. A. BROOKS, Chicago, Ill.—*Condenser*.—April 2, 1867.—A series of cones are attached to the extremity of the exhaust pipe, so that the steam is condensed in the spaces between said cones, and is returned through the medium of pipes attached thereto to the reservoir from which the boiler is supplied.

Claim.—The arrangement and combination of the cones A C D E, pipes H K and F, when the whole is constructed substantially as and for the purpose set forth.

63,392.—MELVIN JINCKS, Danville, N. Y.—*Boring Bits*.—April 2, 1867.—The shank of the bit carries countersink tools, a gage and a boring bit, which can be changed as desired.

Claim.—The shank A, as constructed in combination with the gage f, cutter g, marker e, and an adjustable bit, substantially as and for the purpose described.

63,393.—CHARLES C. JOHNSON, Springfield, Vt.—*Clothes Pin*.—April 2, 1867.—The spring jaws are attached by a thin metallic plate, the ends of which are bent to fit the eyeslets.

Claim.—The metallic eyelet hinge connection made and applied to the two levers of the clothes pin, substantially as described.

63,394.—JOHN JOHNSON, Saco, Me.—*Collecting Gold from River Bottoms*.—April 2, 1867.—The short leg of the siphon is placed in contact with an auriferous sand bank, and its longer leg has exit at a lower level to discharge the said sand and water upon the concentrator and saver. A simple pipe with an artificial current therein may be used where no fall is feasible.

Claim.—The system herein set forth for the recovering of gold from the beds of rivers.

63,395.—ERNST KAMSIUS, Davenport, Iowa.—*Stovepipe Damper*.—April 2, 1867.—The valve has semi-rotation in the drum and acts as a deflector. Scrapers on the valve and drum act as stops, and serve to clean the vertical sides of the drum and valve respectively.

Claim.—The form of the valve B and C, with the scraper E attached to clean the inside of cylinder F. Also, the scraper D, attached to cylinder F, for cleaning outside of valve B.

Also, the damper drum as a radiator and damper combined, all as herein set forth.

63,396.—FREDERICK KOPFENFELS and GUSTAV BRUECK, New York, N. Y.—*Fan*.—April 2, 1867.—A perforated sachet is secretly attached to the fan for perfuming the air while the fan is in motion.

Claim.—The combined fan and perfumed sachet, constructed as specified, as a new article of manufacture.

63,397.—CHRISTIAN KUDER, Rochester, N. Y.—*Clothes Stick*.—April 2, 1867.—The prongs on the end keep the clothes from slipping off the stick, and the collar keeps the water from running down the stick to the hand.

Claim.—As a new article of manufacture, the laundry or clothes stick S, constructed substantially as herein shown and described, with the ring or rim r, and hooks or points i, for the purposes set forth.

63,398.—ISAAC LAMPLUGH, Peoria, Ill.—*Shearing and Punching Machine*.—April 2, 1867.—The shear blade has a backward projection, to which the punch lever is pivoted so as to work simultaneously with it.

Claim.—The improved combined punching and shearing machine, constructed and operating substantially in the manner and for the purposes described.

63,399.—ELBRIDGE LAWTON, New York, N. Y., and THOMAS J. JONES, Summit, N. J., assignors to C. J. EAMES, New York, N. Y.—*Ferrule for Boiler Tubes*.—April 2, 1867.—The ferrule has a thread which screws into the end of the tube and has an exterior flange which covers the end of the tube and contains packing.

Claim.—In stopping boiler tubes, the use of a ferrule c, with projecting lips a a, when attached to the tubes by means of a screw cut upon its surface, so that the tubes themselves shall be made to answer the purpose of stays or braces for the tube sheet, substantially as above represented and set forth.

63,400.—JOEL LEE, Galesburg, Ill.—*Petroleum Stove*.—April 2, 1867.—The supply pipe has a packing of porous wood through which the petroleum flows in its course to the burner, which is formed beneath the open center of a horizontal coil in the pipe.

Claim.—First, packing the conducting tube with wood in the manner and for the purpose set forth.

Second, a gas generator made of a coiled tube to encircle the jet of gas, the lower point being turned so as to allow the gas to flow through the center of the circle and burn against the bottom of the cooking vessel, substantially as set forth.

63,401.—NOYES LIDDELL, Lafayette, N. Y.—*Corn Planter*.—April 2, 1867.—The feed-wheel cups have adjustable bottoms to regulate the quantity of seed. The edges of the cups are beveled to prevent cracking the grain. Tubes carry the seed from the wheels to the hollow teeth. The seed is scattered by wedge-shaped bars attached to the points of the teeth. Angular harrows clear the track for the teeth, and scrapers behind cover stray seed and are followed by rollers. The feed wheels are actuated by gearing from the driving wheels. One of the gear wheels contains a pawl and ratchet to allow the machine to be backed without reversing the feed wheels.

Claim.—The hopper A, seeding cylinder B, cup C, lever O, with its attached gear wheels, the harrow F, tooth D, cover G, and roller H, when constructed, arranged, and operating as and for the purpose specified.

63,402.—W. N. LOCKWOOD, Woodcock, Pa.—*Washing Machine*.—April 2, 1867.—The rollers have circumferential ridges with angular longitudinal notches. The upper roller is turned by a winch and is journaled in a fixed frame, which has pendant arms with slots in which the boxes of the lower roller slides. The lower roller is raised by a spiral spring connected to its shaft by levers and links. In operating, the rollers are within a tub which stands on the foundation bench.

Claim.—The levers H, springs J K, links G, and roller E, in combination with the roller L, arms C, and slotted stays D, arranged in the manner and operating conjointly, substantially as and for the purpose set forth.

63,403.—OBED LONG, Joliet, Ill.—*Machine for Bending Bars of Metal*.—April 2, 1867.—The bar is clamped between the sliding and stationary jaws. A forked lever pivoted to the bed is oscillated to bring its friction roller against the end of the bar and lap it around the mandrel or nipple, which are supported upon the stationary jaw.

Claim.—First, the lever k, with the friction roller l, combined with the slotted plates n n, constructed as and for the purposes described.

Second, the use of the trip e and the weight f, with the crank shaft d and the connecting rods c e, constructed and arranged for the purpose of operating the head block, as described.

Third, the adjustable former h, in combination with the nipple m and the gage j.

Fourth, a combination of all the parts described, substantially as and for the purposes set forth.

63,404.—T. S. C. LOWE, New York, N. Y.—*Apparatus for Manufacturing Ice*.—April 2, 1867.—The described expansion chamber and water cooler are used in connection with machinery for making ice by the frigorific effect of the expansion of previously liquefied carbonic acid gas. The water is conducted from the coolers to the freezers and the ice removed from the chambers by dropping the doors.

Claim.—First, the expansion chamber G, in an apparatus for manufacturing ice by artificial process, when constructed with fixed freezers G¹, around and in immediate contact with which the cold gas or vapor circulates, substantially as described.

Second, in such an apparatus, fixed freezers G¹, in combination with plungers G², arranged to operate substantially as and for the purpose set forth.

Third, the elastic stoppers G⁴, when used for the purpose and substantially as set forth.

Fourth, the combination of fixed freezers G¹, elastic stoppers G⁴, and falling doors G³, or their equivalents, substantially as and for the purpose set forth.

Fifth, in combination with the expansion chamber G the eduction pipe I and water tanks H, enclosing the same for the utilization of the cold gas or vapor passing from the expansion chamber so as to reduce the temperature of the water before entering the freezers, substantially as set forth.

63,405.—T. S. C. LOWE, New York, N. Y.—*Apparatus for Condensing Carbonic Acid and Applying the same for Refrigerating*.—April 2, 1867.—The devices are used in connection with machinery for the manufacture of ice by the frigorific effects of the expansion of carbonic acid gas previously liquefied by mechanical pressure. They refer to means for the condensation, preservation, and quantitative emission of the fluid into the expansion chamber.

Claim.—First, so arranging and operating an apparatus for condensing and retaining under pressure, in the form of a liquid, substances which in their normal state are gases, that the heat generated in condensation shall be taken up by the water in a cooler C, and the liquid be condensed in a condenser E', which is maintained at a temperature below that of the cooler.

Second, in such an apparatus, the combination of a condensing pump B, cooler C, dryer D, and the condenser E', substantially as set forth.

Third, the mode, substantially as set forth, of inducing the flow of the liquefied product of condensation from the condenser E' into a gage F', or their receiver.

Fourth, the mode, substantially as set forth, of regulating the temperature of the expansion chamber by pipes F leading thereto, connected respectively with the upper and lower parts of the condenser E'.

Fifth, the combination of the condenser E', pipe F', gage F', and expansion chamber G, substantially as and for the purpose set forth.

63,406.—JOHN MADDEN, Cleveland, Ohio.—*Bread Cutter*.—April 2, 1867.—The loaf is placed on the slide, the edge to be cut resting against the gage; the motion of the slide brings the loaf against the knives, severing the slice. After retraction the loaf is again fed up to the gage and the operation repeated.

Claim.—The slide B, hand piece b, and guard F, in combination with the way A', knives C C', and side piece E, substantially as and for the purpose set forth.

63,407.—THOMAS T. MARKLAND, JR., Philadelphia, Pa.—*Machine for Sharpening Saws*.—April 2, 1867; antedated February 26, 1867.—The rest upon which the saw is clamped has adjustable radial arms, and is adjustable in distance from and inclination to the sharpening disk, which is removable and has os-

collating adjustment in a vertical plane. Wings upon the disk shaft throw a current of air to clear the saw plate from dust and keep it cool.

Claim.—First, a reversible and portable rest B, connected with the standards C, adjusted by means of the set screws *j j*, and arranged and operating substantially as described and for the purpose specified.

Second, the clamping disk D and clamping plate E, when arranged in relation to the rest B and saw F, substantially as and for the purpose set forth.

Third, the combination of the clamping board P with the rest B, operating substantially as described and for the purpose specified.

Fourth, the combination of the shaft J, having arms *g g*, with the swivel plate K, the said arms being adjusted by the set screws *u u*, substantially as described and for the purpose specified.

Fifth, the slotted finger or catch strip G, when arranged and operating in relation to the saws E and O, substantially as described.

Sixth, the fans *x*, arranged in relation to emery wheel H, substantially in the manner described and for the purpose specified.

63,408.—HORACE MAXSON, Hopkinton, R. I., and JOB JOHNSON, Brooklyn, N. Y.—*Machinery for Making Rope.*—April 2, 1867.—The reversible twisting head and its driving shaft move from end to end of the machine, and then turning move to the other end, thus drawing off and twisting strands from spools at alternate ends, without any loss of time in running back.

Claim.—First, the traveling carriage *d*, carrying the reversible head *g* and spindle *f*, in combination with the spools *b* supplying yarn at each end of the ropewalk, as and for the purposes set forth.

Second, the shaft *e* and miter gearing, in combination with the spindles *f* and carriage *d*, for twisting the strands in a ropewalk, as and for the purposes set forth.

Third, the endless rope *h* and pulley *n*, applied in the manner as set forth, in combination with the traveling carriage *d* and spindles *f*, substantially as specified.

Fourth, the pulleys 3 4 5 and 6 and ropes or belts and shaft *x*, in combination with the clutch lever 9 and pulleys 7 and 8, for moving the carriage *d* in either direction, or allowing it to remain stationary, as and for the purposes specified.

Fifth, the supports *s* or *t*, fitted to rock or turn down, in combination with the traveling carriage *d* and reversible head *g*, substantially as and for the purpose specified.

63,409.—EDWARD B. McDOWELL and THOMAS W. WILSON, Philadelphia, Pa.—*Apparatus for Separating High and Low Wines.*—April 2, 1867.—The hydrometer and the extended arm of the tube containing mercury are balanced against each other on a post adjustably fixed to the box bottom. The device is so arranged that any influence the heat may have on the hydrometer may be balanced by the mercury in the tube. The high wine overflow is high up and the low wine through a vertical pipe whose end is at a less elevation and stopped by a cylindrical valve attached to the hydrometer lever.

Claim.—First, the combination of a thermometrical tube and a hydrometer with a balancing lever, the same being arranged to operate together, substantially as and for the purpose described.

Second, in combination with the subject-matter of the above claim, the application of a valve to the lever, so that the said valve will be operated thereby in relation to the outlet tube beneath it, substantially as and for the purpose described.

63,410.—JOHN MCTAGGART, Rochester, N. Y.—*Grain Cleaner.*—April 2, 1867.—The perforated cylinder is strengthened by corrugating it circumferentially.

Claim.—The peculiar form and arrangement of corrugations, when combined with the perforations or their equivalents, substantially as specified.

63,411.—WILLIAM J. MEHARY, Philadelphia, Pa.—*Spark Arrester.*—April 2, 1867.—The inner casing forms a hood over the pipe and is covered with wire gauze, below which is suspended a conical deflector, by which the sparks are directed downward

into the inner casing, from whence they pass into the reservoir below through the annular opening between the pipe and the casing.

Claim.—The inner casing D, its wire-gauze cover E, and deflector H, the casing B, chimney A, and the annular opening *b*, the whole being constructed and arranged substantially as and for the purpose herein set forth.

63,412.—JOHN O. MELLE, St. Louis, Mo., assignor to L. G. QUINLIN, JR.—*Drying Apparatus.*—April 2, 1867.—The grain is forwarded by a series of spiral rotary conveyers through troughs whose double bottoms form chambers for the passage of hot air or steam.

Claim.—The hollow spiral or spirally-flanged conveyers C, in combination with a double bottom trough B and chamber *b²*, substantially in the manner and for the purpose herein set forth.

63,413.—T. S. C. LOWE, New York, N. Y.—*Manufacturing Ice.*—April 2, 1867.—Ice is manufactured by the expansion of condensed carbonic acid gas which is liquefied by a pump, the heat set free during condensation being removed by a refrigerant. The liquefied result is expanded in a chamber where it takes up the caloric in the water. Special devices are cited in the claims.

Claim.—First, compressing carbonic acid or other equivalent gaseous body into a liquid by a pump, and then permitting it to expand in a close chamber in contact with the exterior surface of the vessels or pipes containing the water or other substance to be refrigerated.

Second, compressing carbonic acid or other equivalent gaseous body into a liquid by a pump and then permitting it to expand in a close chamber in contact with the exterior surface of the vessels or pipes containing the water or other substance to be refrigerated, and then returning the gas to the condensing pump to be recompressed and re-used.

Third, compressing carbonic acid or other equivalent gaseous body by a pump having sufficient power to convert it into a liquid, removing the heat evolved by compression by exposing the pipe containing the compressed gas to the action of cold currents of water or air in contact with the surface thereof, and then permitting it to expand in a close chamber in contact with the exterior surface of the vessels or pipes containing the substance to be refrigerated.

Fourth, compressing carbonic acid or other equivalent gaseous body by a pump having sufficient power to convert it into a liquid and removing any watery vapor or moisture from the compressed gas by passing it through chloride of calcium or equivalent absorbent.

Fifth, introducing the cold current of water or air to the cooling coil at the point most distant from the pump and causing it to flow along the pipe toward the pump and escape from the point nearest the compressing pump.

63,414.—HENRY MELLISH, Walpole, N. H., assignor to DAVID LYMAN, WASHINGTON WHITNEY, and GILMAN WAITE.—*Machine for Cutting Out the Bodies of Fruit Baskets.*—April 2, 1867.—The log of wood revolves within a sliding cutter so that a helical shaving which forms the body of the basket is cut from the outside of the log. The side openings and grooves and lip at the lower edge for the attachment of the bottom are also cut simultaneously.

Claim.—First, the two parallel rings *J J'*, enclosing the log and traversed along as the work proceeds and carrying the cutting apparatus, substantially in the manner herein set forth.

Second, in combination with a machine cutting conical spiral shavings, the knife R, carried on a rolling device as represented and adapted to measure off and cut uniform length of such shaving, as herein specified.

Third, cutting holes or slots in the bodies of baskets made from shavings by means of the cutters Z, or their equivalents, arranged and operating as specified.

Fourth, the supplementary cutters M and N, arranged and operating as and for the purpose herein specified.

63,415.—HENRY MELLISH, Walpole, N. H., assignor to DAVID LYMAN, WASHINGTON WHITNEY and GILMAN WAITE.—*Machine for Cutting Toy Pails from*

Wood.—April 2, 1867.—The log is rounded to the larger diameter of the pail rim, a longitudinal radial kerf is cut therein and is then steamed. The sliding cutter removes a helical shaving from the periphery of the log, which at each rotation furnishes a blank for the sides of the pail.

Claim.—First, the conical scroll cutter head L, for supporting the knife or knives, arranged in the manner substantially as and for the purpose set forth.

Second, arranging or supporting the conical scroll cutter head L, in such a manner as to leave a space between the scroll and the frame of the slide rest to which it is attached, as and for the purposes set forth.

Third, the combination of the knife M and O, with the conical scroll cutter head L, when operating substantially as and for the purposes set forth.

Fourth, the helical ring B, with its cutter N, in combination the scroll cutter head L, substantially as and for the purposes set forth.

63,416.—FRANCISQUE MILLION, Paris, France.—*Gas Engine.*—April 2, 1867.—Air and gas in proper proportions for combustion are introduced from two air pumps to the cylinder and ignited by an electric spark. Between the pumps and the cylinder there is a mixing chamber furnished with slotted plates through which the fluids pass. The cylinder has a water jacket. The exhaust is through the body of the slide valve.

Claim.—First, the combination of the cylinder C, the pumps A and B, the branch receiving pipes *a* and *b*, and the mixer F, in such a manner that the air and gas to supply the engine shall be forced simultaneously through the mixer to supply the cylinder by the simultaneous action of the two pumps A and B, as set forth.

Second, the combination of the mixer F, represented in Figs. 4 and 5, composed of a folded plate of metal, as described, with the branch pipes *a*' and *b*', so constructed and arranged in combination with each other and the main pipe as to deliver the gas in the latter in thin, alternate layers, as set forth.

Third, the combination of the parts represented in Fig. 7, or their equivalents, with the cut-off rod in such a manner that the closing of the current shall be effected simultaneously with the closing of the cut-off valve, substantially as and for the purpose set forth.

Fourth, the combination with a gas-burning engine of a porous substance B, placed in the receiving pipe as represented in Fig. 8, substantially as and to the effect set forth.

63,417.—CHARLES C. MOORE, New York, N. Y.—*Blotter.*—April 2, 1867.—Improvement on his patent, December 5, 1865. The lower plate has a felt cushion around which a number of thicknesses of blotting paper are stretched, the overlapping ends of the paper being secured by the upper plate and clamping nut.

Claim.—The attachment of the lower plate of "C. C. Moore's improved blotter," one or more pieces of felt or other elastic material equivalent for the purpose, forming an elastic pad or springing cushion, substantially as herein described and for the purposes specified.

63,418.—JOHN MORTON, Winchester, Ind.—*Water Tank for Railroads.*—April 2, 1867.—The pipe has a sliding extension section; is hinged and counter-weighted, so that it may be disconnected and turned up. It has also a sliding extension. A cord connects by a bell crank to the weighted valve stem in the tank bottom, so as to govern the flow of water from the tank.

Claim.—First, in combination with the tank A and stationary pipe B, a horizontal adjustable connecting pipe D, arranged to operate substantially as and for the purpose set forth.

Second, the combination of the pipe B, adjustable connecting pipe D, and adjustable hinge E, substantially as set forth.

Third, the combination of the horizontally adjustable pipe D, and the ropes and weights H and swivel pulley I, substantially as and for the purpose set forth.

Fourth, the combination of the cord C², bell crank C¹ and valve C, with its stem and weights G, substantially as set forth.

63,419.—FRANCIS MUNSON, Chicago, Ill.—*Filing and Recording Bonds, &c.*—April 2, 1867.—The book has pages corresponding in style, size, and number

with the bonds, coupons, certificates, &c., on which pages the bonds, &c., when paid are attached, and thus preserved and canceled.

Claim.—First, the preserving, filing, and verifying of bonds, coupons, certificates, and all similar documents by the means and in the manner substantially as herein set forth.

Second, the book or register, constructed and used as and for the purposes set forth.

63,420.—ALFRED PARAF, Mulhouse, France.—*Cleaning Textile Fabrics and Yarns Soiled in Dyeing.*—April 2, 1867.—The object is to remove the stains on the whites of fabrics, which are soiled in dyeing or printing.

Claim.—In the process of cleaning of the whites of textile fabrics or yarns, which have been soiled during the dyeing operation by madder or other vegetable coloring matter, in lieu of and as a substitute for the soaping heretofore practiced, the use of animal charcoal either alone or in combination with vegetable charcoal, substantially in the manner hereinbefore described.

63,421.—WILLOUGHBY W. and V. J. PHILLIPS, Wellsville, N. Y.—*Mechanism for Operating the Picker Staff of Looms.*—April 2, 1867.—Each picker staff is pivoted to the lay, and is operated by a rod, which bears upon a cam on a shaft, which has its bearing in the lay. Pawls hinged to the frame operate the ratchets on the cam shaft, when the lay is in motion, and thus actuate the picker staffs.

Claim.—The ratchet wheels R R and pawls P P, in combination with the cams F F, bent rod *m*, spring S, picker staff B, rod *a*, and picker C, for operating the shuttle, substantially as described.

63,422.—MARTIN L. POWEL, Newcastle, Ind.—*Stove Pipe.*—April 2, 1867.—The collar has an oblique section at its junction with the stove pipe, is presented in the desired direction to meet the pipe which has an obtuse elbow.

Claim.—First, the collar A, constructed substantially as set forth, so as to be attached to the stove in any of the modes above set forth.

Second, the reversible elbow B, composed of any number of angles, the sum of which shall make an angle of 45°, constructed and operated substantially as and for the purposes set forth.

Third, the combination of the reversible collar and the reversible elbow B, constructed and operated in combination, substantially as and for the purposes set forth.

63,423.—J. E. PRUDEN, Birmingham, Conn.—*Adjustable Pole for Carriages.*—April 2, 1867.—One shackle is adjustable on the cross-bar of the pole, so as to adapt the latter to fit any carriage.

Claim.—The combination of the key bolt F, the inclined plate E, and the shackle A, when constructed and arranged so as to be adjustable, substantially in the manner specified.

63,424.—ANSEL WALLACE PUTNAM, Suisun, Cal.—*Combined Planter and Cultivator.*—April 2, 1867.—The planting and covering frames are connected, the latter being hinged behind the former. The furrower is regulated in depth by the rocker, or entirely withdrawn from the soil. Cultivator attachments may be substituted for the planting.

Claim.—First, the apparatus for furrowing and covering the seed, consisting of the marker S, the diverging plates T T and the converging plates V V, combined and arranged substantially as described.

Second, the wheel D and bent arm E, together with the sliding plates L L', and the regulating side P for dropping the seed, constructed and operated substantially as described.

Third, the rocking chair attached to the frame and the hinged arms h h, for the purpose of raising and lowering the frame, substantially as described.

63,425.—EZRA REED, OWEGO, N. Y.—*Wagon Seat.*—April 2, 1867.—The two boards which form the seat meet at an obtuse angle at their joining edges, and are secured in bars, inclined together to form an arch. Weight on the boards springs them flat, and flattens the arch of the bars which rest on the bed.

Claim.—A spring wagon seat, made either of wood or iron, when constructed in the manner and for the purpose substantially as herein set forth.

63,426.—JAMES H. RETNERSON, Pleasant Plain, Iowa.—*Cultivator.*—April 2, 1867.—The plows are attached to iron standards, which are hinged beneath the frame and are adjustable laterally and vertically, or shifted to throw the soil in or out.

Claim.—The manner of shifting the plows and beams either in or out by means of the slotted rods, and curved slotted bars of iron at D D D D, and the upright bar with holes, together with the movable cross timber and slide at E, also the manner of fastening the shovels to the beams by means of blocks of wood at H H H H.

Also, as an improvement the general construction and combination of the machine aside from the wheels, axle, and tongue.

63,427.—LAFAYETTE M. RICE, Oregon, Wis.—*Harvester Rake.*—April 2, 1867.—The rake is worked by the revolving wheel of the reaper; the rake is held securely at one end, and the free end lifted, being carried backward and forward with an oscillating and sliding motion.

Claim.—First, the combination of the five wheels X Z a b c, arranged substantially as set forth to affect the reciprocating motion of the rake.

Second, the combination of the connecting rod J, the crank I, the points or heads P O, the pin W, and the rods C D, to effect the raising of the rake and throwing it down.

63,428.—CHARLES L. ROBERTSON, Providence, R. I.—*Composition for Coating Wood, &c.*—April 2, 1867.—A composition made by boiling together linseed oil, 1 gall.; Prussian blue, 4 oz.; coach black, 4 oz.; black oxide of manganese, $\frac{1}{2}$ oz.; is reduced by naphtha, and applied to the wood, which is then heated in an oven to 120° or 150° Fah. It is then coated with a finishing composition, made by boiling together linseed oil, 1 gall.; Prussian blue, 3 oz.; and black oxide of manganese, $\frac{1}{2}$ oz.; reduced by naphtha, and is then heated for two hours to 150° Fah. The process develops an enamel, which resists boiling water and acids.

Claim.—A composition for coating articles of wood or other material, prepared substantially as herein described, which under the application of heat will develop the characteristics herein mentioned.

63,429.—FREDERICK O. ROGERS, Niles, Mich.—*Roofing.*—April 2, 1867.—The tarred felt is laid shingling upon the sheathing of the roof, is covered with a coating of pitch, and afterward with a composition of sand, 9 parts; salt, 1; hydraulic lime, 3; and coal tar sufficient to make it plastic at blood heat.

Claim.—A roof covered first with felt, or equivalent fibrous substance, then with roofing composition or pitch, and finally with the tar mortar, substantially as herein specified.

63,430.—THEODORE B. ROGERS, Wethersfield, Conn.—*Cultivator.*—April 2, 1867.—The cutter is obliquely set, and is secured by posts to the frame; the depth is regulated by bearers.

Claim.—The frame A, arm B, posts D, in combination with the blade E and bearers F, substantially as and for the purpose described.

63,431.—STEPHEN P. RUGGLES, Boston, Mass.—*Steam Generator.*—April 2, 1867.—A dome in the boiler intercepts the steam, and delivers it immediately to the motor without passing it through the column of water to the upper part of the boiler.

Claim.—Arranging a steam chamber or generator at or near the bottom of a closed steam boiler, as and for the purpose substantially as herein described.

63,432.—WARREN SADLER, Lockport, N. Y.—*Device for Salting and Seasoning Meat.*—April 2, 1867.—The tube contains a probe to make an opening in the meat. The probe is withdrawn, and salt inserted by means of a scoop.

Claim.—The instrument as shown and described, consisting of the tube A, probe C, and scoop D, operating as set forth.

63,433.—JOSEPH SCHEEN, New Haven, Conn.—*Baby Carriage and Velocipede.*—April 2, 1867.—The post of the caster wheel is rotated to guide the carriage by means of cross arms having the similitude of a bit, and the post rests on a spring in the socket of the guide wheel frame. The carriage is driven by alternate pressure on the stirrup levers, which actuate the crank shaft connecting by ratchets with the hubs of the wheels.

Claim.—First, the upright z, with its socket m and rubber spring n, or equivalent, in combination with the grinding wheel v, as set forth.

Second, the combination of the levers f, cranks g, ratchets d and wheels k, when constructed and arranged substantially as described.

63,434.—JULIUS SHELDON, New York, N. Y., assignor to GRISWOLD and SHELDON, same place.—*Hat Blocking Machine.*—April 2, 1867.—Improvement on the invention of Joseph De la Mar for blocking hats by means of stretching out the crown by means of expandible frame work, and stretching out the brim by clamps, which take hold of the brim, and are then raised from an inclined to a horizontal position. The expandible framework is raised and lowered by a screw stem, so as to adjust it to varying depths of hats. The ring serves several purposes, giving pressure to the clamps by means of springs, and forming a point of attachment for the inclined projections for giving the edge of the brim an extra stretch to overcome the shrinkage. The rim at the bottom "breaks" the band, and is changeable for varying sizes of hats.

Claim.—First, the combination of stem a, plate c and bars d, arranged substantially as described.

Second, the combination of the ring l, with the springs m, one separate spring for each clamp, arranged substantially as described and for the purpose specified.

Third, the rubber ring p, applied to the tip of the hat body, substantially as described.

Fourth, the combination of the ring o, with the ring l, the said ring o being made detachable, substantially as described and for the purpose described.

63,435.—LOUIS SIMONET, Paris, France.—*Apparatus for Forming Hats.*—April 2, 1867.—The hat is placed on a heated mold, over which fits a dome, whose lower edge is an elastic membrane, which assumes the shape of the hat; water is forced into the dome, and compresses the film on the hat, and the latter on its mold.

Claim.—First, locking and unlocking the dome b b, carrying the diaphragm o, and the several connections by a bayonet joint, constructed and arranged substantially as and for the purposes herein set forth.

Second, in combination with the turning dome b, and its connections, the fixed frame a and its connections, and the forcing means f, &c., the adjustable bracket i, supporting the water-carrying joint c, so that it can be moved horizontally and vertically, substantially as and for the purpose herein set forth.

Third, in combination with the dome b, diaphragm o, water joint or hinge c, mold a, and locking and unlocking means, as herein specified, the fluid reservoir a', constructed in and forming a part of the framing a, substantially as and for the purposes herein set forth.

63,436.—C. F. SMITH and J. SPETH, Aurora, Ill.—*Chimney.*—April 2, 1867.—The bricks have rectangular outer faces, and an inwardly curved inner face, adapted to form part of a flue, when associated with a similar brick, with or without the addition of common brick.

Claim.—The combination of the bricks A, when laid in chimneys, in combination with the common bricks B, substantially as set forth and described.

63,437.—SAMUEL SOLOMONS, London, England.—*Transparent Slide for Magic Lanterns.*—April 2, 1867.—The picture is printed by the chromolithographic process, in transparent colors, upon gelatine, and inclosed between glass slips.

Claim.—A magic lantern slide, consisting of a gelatine, or its equivalent, ornamented, as herein described, and confined between two plates of glass.

63,438.—GREENLEAF STACKPOLE, New York, N.

Y.—Bit Brace.—April 2, 1867; antedated March 18, 1867.—The jaws which clasp the bit are drawn into the socket, and against the shank of the tool by means of a thimble, whose spiral grooves act upon the projections on the shanks of the jaw pieces.

Claim.—The bit brace, constructed and operated substantially as herein described.

63,439.—JAMES STOTT, Philadelphia, Pa.—*Table Cutlery.*—April 2, 1867.—The scales are held in place by the bolsters; large openings for the tang rivet are cut in the scales to prevent the slipping of the latter.

Claim.—The blocks D and D', with their lugs e', and rivet j, constructed and adapted to the scales B and B', their openings i i, and recesses e e, and to the shank a, of a table knife, substantially as described for the purpose specified.

63,440.—LEVI H. THOMAS, Waterbury, Vt.—*Curtain Fixture.*—April 2, 1867; antedated March 27, 1867.—The top roll is rotated by a cord and held in the defined position by an elastic friction band which passes around the axis and a prong on the bracket.

Claim.—The elastic friction band G, in combination with the elongated roller arbor B and prong F, on the bracket E, operating substantially in the manner herein described for the purposes set forth.

63,441.—WILLIAM S. THOMPSON, Rochester, N. Y.—*Lantern.*—April 2, 1867.—The top or frame portion is connected by a bayonet fastening to the lower portion operating by the partial rotation of one part. The concentric lips on the annular connecting rings are so arranged that the inner one acts as a guide to center the other to bring the parts into ready coincidence.

Claim.—The combination and arrangement of the two slots i i, and apertures j j, concentric with the annular plates f m, and pins l l, with the parts A and E, of the lantern case, substantially as and for the purposes set forth.

Also, in combination therewith the concentric flanges n o, of the rims f m, the one fitting within and serving as a guide for centering the other, arranged and operating substantially as described.

63,442.—J. P. TIRRELL, North Bridgewater, Mass., assignor to himself, J. O. NASH, J. E. NASH, and IRA MERRITT.—*Machine for Forming the Barbs of Crocheting and Knitting Needles.*—April 2, 1867.—The hook or barb is cut by a revolving milling tool on the lower end of an inclined shaft; a support for the blank is pivoted to the bed piece, so as to be capable of revolution in a horizontal plane to present alternately opposite sides of the blank to the action of the milling tool.

Claim.—The combination of devices or their equivalents substantially as described, by means of which the needle blank is held and carried and acted upon by the milling tool, all as set forth.

63,443.—ROBERT C. TOTTEN, Pittsburg, Pa.—*Mold for Casting Grooved Rolls.*—April 2, 1867.—The concentric rings have angular, rectangular, or curved inner faces corresponding in number, size and shape to the grooves required in the chilled roll to be cast. The rings are associated with a sand or other non-metallic mold which forms the cylindrical surface of the roll.

Claim.—A series of metallic rings, each ring made in one or more pieces, with angular, rectangular, or curved inner faces for forming the grooves of a grooved chilled roll, such rings being packed in a mold made of sand or other non-metallic composition, or arranged substantially as described with other rings which form the cylindrical surface of the mold, the construction being substantially as above set forth.

63,444.—C. H. VAN EPS, Farmington, Iowa.—*Gate.*—April 2, 1867.—Each section of the gate is suspended on two vibrating bars, which hang perpendicularly when the gate is closed. The gate raises as it slides back, and when opened to its full width is caught by the latch bar which is pivoted to one of the vibrating bars and held open.

Claim.—The manner in which the gate c is hung by the means of vibrating bars d, being attached to beam e, and bottom bar of gate f.

Also, the latch g, for the purpose of holding the gate open, as herein set forth.

63,445.—WILLIAM WEAVER, Phoenixville, Pa.—*Machine for Coiling Wire.*—April 2, 1867.—The wire passes from the coil on a detachable shaft and through an adjustable friction guide to a spirally grooved former rotated by a winch.

Claim.—First, the frame A, with its standards B and B', and revolving former D, the whole being constructed, arranged, and operating substantially as and for the purpose described.

Second, the tension guide G, consisting of the jaws n n', with the projection g, and recesses o and v, the whole being arranged for use in connection with the revolving former D, substantially as described.

Third, the grooved cylinder i, constructed and adapted for attachment to the conical grooved sections h h', of the former D, substantially as and for the purposes specified.

Fourth, the former D, with its openings j, adapted for the reception of a detachable pin m, for the purpose set forth.

63,446.—GEORGE H. WELLS, Logansport, Ind., assignor to himself and JUDSON A. CLEVELAND, same place.—*Machine for Cutting Screws.*—April 2, 1867.—The cutters are four-sided prisms with cutting ends, and are separated by filets whose width determines the width of the thread, while that of the cutters determines that of the spaces. The gang of cutters is set up to its work by a cam. The hinged jaw of the clamp stock is fastened by a key, and the base plate adjusted by a movable leg.

Claim.—First, the combination of the stock A, hinged jaw H, and adjustable cutter C, substantially as described.

Second, the combination of the stock A, cutters C, bar E, cam F, constructed and arranged substantially as and for the purpose set forth.

Third, the combination of the stock A, jaw H, and adjustable leg B, substantially as described.

Fourth, the adjustable bearings K, in combination with the jaw H, and stock A, substantially as described.

Fifth, the combination of stock A, hinge and jaw H, set screws H², lug e, and wedge-formed key H¹, substantially as described.

63,447.—P. L. WEST, Bath, Ill.—*Cultivator.*—April 2, 1867; antedated March 19, 1867.—The plow posts are attached by rods and links to the swinging bar, which is connected by levers and rods to the treadles by which it is actuated. The operating handles are connected by links. Drops attached to the plow posts rest on the cross beam to hold the plows elevated. Additional plows are attached to posts pivoted to the frame behind segmental bars, which run through slots in the posts. The said plows are withdrawn from the ground by treadles which connect by cords to the plow posts.

Claim.—First, the construction and arrangement herein shown and described of the plows D D, their attachment links d², and their draft rods d.

Second, the device C, a C¹ C² C³ and e', for giving the plows D the requisite lateral motion.

Third, the combination and construction of the posts d¹ and props d¹, substantially as described and set forth.

Fourth, the construction and arrangement of the plows D¹ and the curved bars D³, also the device d² d³ d⁴ for raising the said plows up out of the ground, substantially as described and set forth.

63,448.—JOHN A. WIEDERSHEIM, Philadelphia, Pa.—*Barber's Brush.*—April 2, 1867.—The back is flexible and the rubbing portion consists of shreds of rubber.

Claim.—As an article of manufacture the barber's brush, the same consisting of a flexible back and a rubbing portion of elastic fringe C, substantially as herein represented and described.

63,449.—LEONARD WOOLWORTH, Albion, Wis.—*Cement.*—April 2, 1867.—Composed of paint skins, 3 qts.; linseed oil, $\frac{1}{2}$ pt.; Japan dryer, $\frac{1}{2}$ pt.; heat till hot enough to scorch a feather, remove from the fire and add rosin, 1 lb.; when cooled sufficiently, add glue, $\frac{1}{2}$ lb.

Claim.—The use of the new cement as herein described, using as materials for its composition the articles above enumerated.

63,450.—REUBEN W. DREW, Lowell, Mass.—*Revolving Fire-arm.*—April 2, 1867.—The ejector is tubular for the reception of its retracting spring, and slotted to receive its guide pin. The cartridge guard in a line with the ejector is hinged to allow the insertion of the cartridges or the ejection of the shells.

Claim.—First, the tubular sliding ejector, constructed and operating in the manner described.

Second, the arrangement of the hinged guard with devices for fastening the same in place when constructed and attached to the stock or frame in relation to the perforated cylinder, all in the manner described.

63,451.—ROBERT N. ADAMS, Greenfield, Ohio.—*Cotton Cultivator.*—April 2, 1867.—The machine straddles a row and the rotary cultivators operate on each side of it; they are driven by a chain from a drum on the main axle. A transversely oscillating hoe chops intermittently across the row so as to leave it in hills; the hoe is actuated by levers operated by cams on the inner faces of the driving wheels. In the rear follows a pair of scrapers which draw the soil to the row.

Claim.—First, the rotating hoes in combination with the endless chain and the two pulley wheels B' and C' constructed and arranged substantially as described.

Second, the thinner S in combination with the inclined cogs on the driving wheels, and the intermediate machinery by which a vibrating motion is given to said thinner, substantially as described.

Third, in combination with the vibrating thinner and the revolving hoes, the scrapers D D, constructed and arranged substantially as described.

63,452.—JOSHUA G. ALLEN, Philadelphia, Pa.—*Spirit Meter.*—April 2, 1867.—A float relieves an escapement which controls the motion of a weight or other power to move the stop cocks and valves for measuring and testing the spirits.

Claim.—First, the application of the escapement movement consisting of the lever L, acting upon the ratchet wheel S, or its equivalent, for the purpose of regulating, controlling, and calling into action the motive power and machinery used for turning and working the stop cocks and valves constructed substantially in the manner herein described and set forth.

Second, the bifurcation or division into two arms M and N of one end of the escapement lever L, constructed substantially in the manner and for the purpose herein set forth.

Third, the hole or perforation O, in the lower arm of the escapement lever L, for the purpose of allowing the rod Q, of the float or float pan R, to pass through it.

Fourth, the application of the float or float pan R, constructed substantially in the manner herein set forth and used for the purpose of regulating, moving, and controlling, or aiding in regulating, moving, and controlling the escapement lever L and attached machinery.

Fifth, the series of glass tubes or hydrometer chambers H, constructed substantially in the manner and for the purpose herein set forth.

Sixth, the graduation of the hydrometer chamber-tubes H, and their connection with the receiving cistern so as to indicate the depth or amount of liquid in the cistern.
